Chapter 1: About This Document

LiveCycle is an enterprise server platform that helps you automate and streamline business processes. LiveCycle comprises the following components:

- J2EE-based Foundation provides server capabilities and runtime environment
- Tools to design, develop, and test LiveCycle Applications
- Modules and Services are deployed on LiveCycle Server and provide functional services

For more information about the LiveCycle architecture and capabilities, see LiveCycle Overview.

This document is part of a larger documentation set available at LiveCycle Documentation page. It is advised that you start with the preparing guide and then move on to installation and configuration guide depending on whether you are performing a fresh installation (single server or cluster setup) or upgrading your existing LiveCycle deployment. For Turnkey deployment, which is only for evaluation purposes, see Installing and Deploying LiveCycle using JBoss Turnkey.

1.1 Who should read this document?

This guide provides information for administrators or developers who are responsible for installing, upgrading, configuring, administering, or deploying LiveCycle components. The information provided is based on the assumption that anyone reading this guide is familiar with J2EE application servers, operating systems, database servers, and web environments.

1.2 Conventions used in this document

The installation and configuration documentation for LiveCycle uses the following naming conventions for common file paths.

<table>
<thead>
<tr>
<th>Name</th>
<th>Default value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>[LiveCycle root]</td>
<td>Windows: C:\Adobe\Adobe LiveCycle ES3</td>
<td>The installation directory that is used for all LiveCycle modules. The installation directory contains subdirectories for LiveCycle Configuration Manager. This directory also includes directories related to the LiveCycle SDK and third-party products.</td>
</tr>
<tr>
<td></td>
<td>AIX, Linux, and Solaris: opt/adobe/livecycle_es3</td>
<td></td>
</tr>
</tbody>
</table>
Most of the information about directory locations in this guide is cross-platform (all file names and paths are case-sensitive on non-Windows operating systems). Any platform-specific information is indicated as required.

### 1.3 Additional information

The resources in this table can help you learn more about LiveCycle.

<table>
<thead>
<tr>
<th>For information about</th>
<th>See</th>
</tr>
</thead>
<tbody>
<tr>
<td>General information about LiveCycle and the modules</td>
<td>LiveCycle Overview</td>
</tr>
<tr>
<td>LiveCycle modules</td>
<td>LiveCycle Modules</td>
</tr>
<tr>
<td>Other services and products that integrate with LiveCycle</td>
<td>Adobe Developer Connection</td>
</tr>
<tr>

<td></td>
</tr>
</tbody>
</table>
Chapter 2: Introduction to Installation, Configuration, and Deployment Process

2.1 Installation, configuration, and deployment overview

Installing, configuring, and deploying LiveCycle involves the following processes:

- **Installing**: Install LiveCycle by running the installation program. Installing LiveCycle places all of the required files onto your computer, within one installation directory structure. The default installation directory is `C:\Adobe\Adobe LiveCycle ES3 (Windows)` or `opt/adobe/adobe_livecycle_es3` (non-windows); however, you can install the files to a different directory.

- **Configuring**: Configuring LiveCycle modifies various settings that determine how LiveCycle works. Assembling the product places all of the installed components into several deployable EAR and JAR files, according to your configuration instructions. Configure and assemble the components for deployment by running Configuration Manager. You can configure and assemble multiple LiveCycle modules at the same time.

- **Deploying**: Deploying the product involves deploying the assembled EAR files and supporting files to your application server on which you plan to run your LiveCycle. If you have configured multiple modules, the deployable components are packaged within the deployable EAR files. Components and LiveCycle archive files are packaged as JAR files.

  *Note: LiveCycle archive file use .lca file extension.*

- **Initializing the LiveCycle database**: Initializing the database to be used with LiveCycle creates tables for use with User Management and other components. Deploying any module that connects to the LiveCycle database requires you to initialize the LiveCycle database after the deployment process.

Before you begin to install and configure LiveCycle, ensure that you have prepared your environment as described in the applicable Preparing guides.

2.2 Selecting tasks for configuring and deploying

After you have installed LiveCycle, you can run Configuration Manager to:

- Configure LiveCycle modules in an EAR file for deploying to the application server or cluster of application servers
- Configure properties of the application server or cluster of application servers to support LiveCycle
- Validate application server or cluster configuration
- Deploy LiveCycle EAR files
- Initialize LiveCycle database
- Deploy LiveCycle components
- Validate LiveCycle component deployment
- Configure LiveCycle components
If you install Adobe® LiveCycle® Reader® Extensions 10, you can also specify and import the Reader Extensions Rights credential that is required for applying usage rights to PDF documents.

- Import LiveCycle Samples into LiveCycle (optional)

*Note*: In addition to the LiveCycle samples that you can import, you can access more samples from LiveCycle Developer Center.

### 2.3 Automatic vs. manual configuration

Although you can use Configuration Manager to configure the application server or cluster and set up data sources to the database, you may prefer to complete these steps manually for the following reasons:

- You have other applications running on the application server or cluster, and are concerned about possible conflicting configurations.
- Corporate security procedures for configuration management dictate finer control.
- You are performing deployments where automatic configuration is not available.

In the manual configuration case, do these tasks:

- Use Configuration Manager to configure LiveCycle components with the required font, temp, and GDS directories
- Manually configure the application server, configure data sources, and deploy LiveCycle EAR files
- Run Configuration Manager to initialize the database
- Run Configuration Manager to deploy LiveCycle components and validate the LiveCycle component deployment.
- Configure LiveCycle components.

### 2.4 Upgrading to LiveCycle

If you are upgrading to LiveCycle ES3 from LiveCycle ES Update or LiveCycle ES2, ensure that you completed the tasks that are described in Preparing to Upgrade to LiveCycle and refer to the Upgrading guide for your application server. The complete LiveCycle documentation is available at [http://www.adobe.com/go/learn_lc_documentation_10](http://www.adobe.com/go/learn_lc_documentation_10).

### 2.5 LiveCycle installation, configuration, and deployment lists

This section includes lists that you can use to step through the installation and configuration process. A list is provided for installing and configuring when using either the automatic method or the manual method.

- **Automatic method**: Refers to using Configuration Manager to configure the application server, configure and deploy LiveCycle EAR files, initialize the database, and deploy the modules to the server. Use the automatic method if you want to have limited input into the installation, configuration, and deployment of LiveCycle.
• **Manual method:** Refers to using Configuration Manager only to configure LiveCycle EAR files, initialize the database, and deploy the modules to the server. Configuring the application server, connecting to the database, and deploying LiveCycle EAR files to the server is done manually by the administrator by following the instructions later in this document. Use the manual method if you want to have precise input into the installation, configuration, and deployment of LiveCycle. For example, this method may be used in a locked-down server environment.

### 2.5.1 Automatic installation and deployment list

The following list includes the steps that are required for installing LiveCycle modules by using the automatic method. Note that your application server or cluster must be installed before you perform the installation:

- Ensure that you have the required software installed in the target environment. See the appropriate preparing guide at [http://www.adobe.com/go/learn_lc_documentation_10](http://www.adobe.com/go/learn_lc_documentation_10).
- Run the installation program. (See “3.3 Installing LiveCycle” on page 9.)
- Run Configuration Manager and select all the tasks on the Task Selection screen. It configures the LiveCycle EAR files, configures application server settings, deploys the EAR files and other components to the application server, initializes the LiveCycle database, and verifies the deployment. (See Configuring LiveCycle for Deployment chapter in this guide.)
- Access the Administration Console and User Management. (See “5.1.3.1 Accessing Administration Console” on page 20.)
- (Optional) Configure LDAP access. (See “5.5 Configuring LDAP access” on page 31.)

### 2.5.2 Manual installation and deployment list

The following list includes the steps that are required for installing LiveCycle by using the manual method. Your application server or cluster must be installed and configured before you perform the installation.

- Ensure that you have the required software installed and configured in the target environment.
- Ensure that you created and configured the application server in the target environment.
- Run the installation program.
- Run Configuration Manager and select the Configure LiveCycle EARs task. This task configures LiveCycle.
- Configure Application Server settings.
- Deploy the EAR files to the application server. You can do this manually or use Configuration Manager.
  
  **Note: (Cluster only)** Ensure that you deploy ear files to the application server on every node of the cluster. When deploying ear files to the application server, ensure that you map modules to the Cluster and the webserver.
- Run Configuration Manager to deploy LiveCycle component files, initialize the LiveCycle database, and (optionally) deploy product samples.
- Access Administration Console and User Management.
- (Optional) Configure LDAP access.
Chapter 3: Installing LiveCycle modules

3.1 Before you begin

3.1.1 Installation overview
Before you install the modules, ensure that your environment includes the software and hardware that is required to run LiveCycle. You should also understand the installation options and have the environment prepared as required. For more information, see the Preparing to Install (Single Server or Server Cluster) or Preparing to Upgrade guide. The complete LiveCycle documentation is available at http://www.adobe.com/go/learn_lc_documentation_10.

LiveCycle also provides a command line interface (CLI) for the installation program. See “Appendix - Install Command Line Interface” on page 49 for instructions on using the CLI. There is also a CLI for Configuration Manager. See “Appendix - Configuration Manager Command Line Interface” on page 52. These CLIs are intended to be used by advanced users of LiveCycle, in server environments that do not support the use of the graphical user interface of the installation program or of Configuration Manager, or for users who wish to implement batch (non-interactive) installation capabilities.

3.1.2 Checking the installer
Observe the following best practices with the installer files before you begin the installation process.

Check the DVD installation media
Ensure that the installation media that you received is not damaged. If you copy the installation media contents to the hard disk of your computer where you are installing LiveCycle, ensure that you copy the entire DVD contents on to the hard disk. To avoid installation errors, do not copy the DVD install image to a directory path that exceeds the Windows maximum path length limit.

Install LiveCycle either by using a local copy of the installation files or directly from the DVD. The installation could fail when LiveCycle is installed over the network. Also, do not use special characters in the local path (for example, the character '#').

Check the downloaded files
If you downloaded the installer from the Adobe web site, verify the integrity of the installer file using the MD5 checksum. Do one of the following to calculate and compare the MD5 checksum of the downloaded file with the checksum published on the Adobe download web page:

- **Linux**: Use the `md5sum` command
- **Solaris**: Use the `digest` command
- **Windows**: Use a tool such as WinMD5
- **AIX**: Use the `md5sum` command

Expand the downloaded archive files
If you downloaded the ESD from the Adobe web site, extract the entire lces_server_10_0_2_websphere_all_win.zip (Windows) or lces_server_10_0_2_websphere_all_unix.tar.gz (AIX, Linux, or Solaris) archive file to your computer. For Solaris, use the `gunzip` command to extract the .gz file.
Note: Be sure to keep the directory hierarchy unchanged from the original ESD file.

Note: The DVD installation media and downloaded ESD include CRX 2.3, a content repository based on JCR 2.0 technology, in the CRX directory. You can use CRX 2.3 as a data storage system. The terms of usage are governed by LiveCycle ES3 Supplemental Terms and Conditions. For information about using CRX 2.3, see http://dev.day.com/docs/en/crx/current.html.

3.2 Installation considerations

3.2.1 Installation paths

To successfully install, you need read, write, and execute permissions on the installation directory. The following installation directories are the defaults; however, you can specify a different directory as required:

- (Windows) C:\Adobe\Adobe LiveCycle ES3
- (AIX, Linux, or Solaris) /adobe/adobe_livecycle_es3

If the LiveCycle installation path contains international characters and the UTF-8 locale is not set on the system, LiveCycle does not recognize the fonts directory within the internationalized \[LiveCycle root\]. To avoid this issue, create a new fonts directory with the UTF-8 locale set and then run the Configuration Manager with UTF-8 locale, by adding the -Dfile.encoding=utf8 argument in the ConfigurationManager.bat or ConfigurationManager.sh script.

Important: When installing LiveCycle, do not use double byte or extended latin characters (such as â€œéêîòùûÄÖßÜ) in the installation path.

When you are installing the modules on UNIX-based systems, you must be logged in as the root user to successfully install the modules to the default location, which is opt/adobe/adobe_livecycle_es3. If you are logged in as a non-root user, change the installation directory to one that you have permissions (read-write-execute privileges) for. For example, you can change the directory to /home/[username]/adobe/adobe_livecycle_es3.

Note: On a UNIX-like system, when you copy/download files from the source (installation media), install.bin might lose the executable permissions. Ensure that you restore the write-execute permissions after copying/downloading the files.

On Windows, you must have administrator privileges to install LiveCycle.

When you run the LiveCycle installer, you should run it as the same user that installed WebSphere Application Server.

The Correspondence Management Solution is not supported on JBoss 4.2.1. So, if you plan to use Correspondence Management Solution on an upgraded version of LiveCycle, install higher version of JBoss.

3.2.2 Temporary directories

Temporary files are generated in the temp directory. In certain instances, the generated temporary files may remain after the installer is closed. You can remove these files manually.

The location for the temporary directory is specified while configuring and deploying LiveCycle using the Configuration Manager.

Important: Ensure that the temporary directory for your operating system meets the minimum requirements as outlined in the preparing guide. The complete documentation is available at http://www.adobe.com/go/learn_lc_documentation_10.

When installing on Linux, the installation program uses the logged-in user’s home directory as a temporary directory for storing files. As a result, messages such as the following text may appear in the console:
8

INSTALLING AND DEPLOYING ADOBE LIVECYCLE ES3 FOR WEBSHHERE

Installing LiveCycle modules

INSTALLING AND DEPLOYING ADOBE LIVECYCLE ES3 FOR WEBSHHERE

Installing LiveCycle modules

WARNING: could not delete temporary file /home/<username>/ismp001/1556006

When you complete the installation, you must manually delete the temporary files from the following directories:

- (Windows) TMP or TEMP path as set in the environment variables
- (AIX, Linux, or Solaris) Logged-in user’s home directory

On UNIX-based systems, a non-root user can use the following directory as the temporary directory:

- (Linux) /var/tmp or /usr/tmp
- (AIX) /tmp or /usr/tmp
- (Solaris) /var/tmp or /usr/tmp

3.2.3 Installing on a Windows staging platform for Linux or UNIX

LiveCycle can be installed and configured on Windows for deployment on a Linux or UNIX platform. You can use this functionality for installing on a locked-down Linux or UNIX environment. A locked-down environment does not have a graphical user interface installed. For the Linux or UNIX platform, the installation program installs binaries that are used by Configuration Manager to configure the product.

The computer running Windows can then be used as a staging location for the deployable objects, which can be copied to a Linux or UNIX computer for deployment to the application server. The application server on the Windows-based computer, and the Linux or UNIX target computer on which you want to install LiveCycle must be the same.

3.2.4 Configuring the JAVA_HOME environment variable

The JAVA_HOME environment variable must point to the Java SDK for your application server as outlined in the preparing guide. See Preparing to Install LiveCycle (Single Server) or Preparing to Install LiveCycle (Server Cluster) for more information.

3.2.5 General installation notes

- On Windows, improve the speed of installation by disabling any on-access virus scanning software during installation.
- If you are installing on UNIX-based systems and are not installing directly from a release DVD, set executable permissions on the installation file.
- To avoid permission issues during deployment, ensure that you run the LiveCycle installer and Configuration Manager as the same user who will run the application server.
- If you are installing on UNIX-based computers, the installation directory you specify should not contain any spaces.
- Ensure that the JAVA_HOME environment variable points to [appserver root]/java/.
- When configuring WebSphere on Windows, make sure that Configuration Manager is running using the appropriate JDK. WebSphere installations typically use the IBM JDK. If WebSphere is not using the IBM JDK, re-launch Configuration Manager using the [liveCycle root]/configurationManager/bin/ConfigurationManager.bat script.

Note: Do not use [liveCycle root]/configurationManager/bin/ConfigurationManager.exe.

- If errors occur during installation, the installation program creates the install.log file, which contains the error messages. This log file is created in the [liveCycle root]/log directory.
### 3.3 Installing LiveCycle

1. Start the installation program:
   - (Windows) Navigate to the `\server\Disk1\InstData\Windows_64\VM` directory on the installation media or folder on your hard disk where you copied the installer. Right-click the `install.exe` file and select Run as administrator.
   - (Non-Windows) Navigate to the appropriate directory, and from a command prompt, type `.install.bin`.
     - (AIX) `/server/Disk1/InstData/AIX/VM`
     - (Linux) `/server/Disk1/InstData/Linux/NoVM`
     - (Solaris) `/server/Disk1/InstData/Solaris/NoVM`

2. When prompted, select the language for the installation to use and click OK.

4. If you have a previous version of LiveCycle ES Update 1 or LiveCycle ES2 installed on the computer where you are running the installer, the Preparation for Upgrade screen appears.

   **Note:** *If you are performing an out-of-place upgrade on a new machine, this screen is not shown.*

   - Prepare to upgrade existing installation to Adobe LiveCycle ES3:
     - Do not select this option if you are performing a fresh installation.

   Select Next to continue.

5. On the Choose Install Folder screen, accept the default directory or click Choose and navigate to the directory where you intend to install LiveCycle, and then click Next. If you type the name of a directory that does not exist, it is created for you.

   Click Restore Default Folder to restore the default directory path.

6. (Windows only) On the Manual Installation Options screen, select the target deployment option and click Next:
   - Windows (Local): Select this option if you are installing and deploying LiveCycle on the local server.
   - Staged (Installed on Windows, targeting remote systems): Select this option if you plan to use Windows as a staging platform for your deployment and then select the target operating system on the remote server. You can select a UNIX operating system as the target for deployment even if you are installing on Windows. (See “3.2.3 Installing on a Windows staging platform for Linux or UNIX” on page 8.)

7. Read the Adobe LiveCycle ES3 License Agreement, select I accept to accept the terms of the license agreement and then click Next. If you do not accept the license agreement, you cannot continue.

8. On the Pre-Installation Summary screen, review the details and click Install. The installation program displays the progress of the installation.

10. Review the details on the Install Complete screen.

11. The Start Configuration Manager checkbox is selected by default. Click Done to run the Configuration Manager.

    **Note:** To run Configuration Manager later, deselect the Start Configuration Manager option before you click Done. You can start Configuration Manager later using the appropriate script in the `[LiveCycle root]/configurationManager/bin` directory. See the Configuring LiveCycle For Deployment chapter in this guide.
3.4 Next steps

You must now configure LiveCycle for deployment. You can also choose to run Configuration Manager later by using the ConfigurationManager.bat or ConfigurationManager.sh file located in [LiveCycle root]/configurationManager/bin.
Chapter 4: Configuring LiveCycle for deployment

4.1 Considerations when configuring and deploying LiveCycle

4.1.1 General Considerations

- You can override the default font for the Configuration Manager by adding the following JVM argument in [LiveCycle root]\ConfigurationManager\Bin\ConfigurationManager.bat (Windows) or [LiveCycle root]\ConfigurationManager\Bin\ConfigurationManager.sh (Linux, UNIX):
  -Dlcm.font.override=<FONT_FAMILY _NAME>
  For example:
  -Dlcm.font.override=SansSerif
  Restart the Configuration Manager after adding the JVM argument.

- During configuration, you must provide the location of the JDBC drivers for your database. The Oracle, SQL Server, and DB2 drivers are in the [LiveCycle root]/lib/db/[database] directory.

- Global Document Storage (GDS) directory: Specify the GDS directory that meets the requirements outlined in the Preparing to Install (Single Server or Server Cluster). For latest documentation, see http://www.adobe.com/go/learn_lc_documentation_10.

4.1.2 CLI versus GUI versions of Configuration Manager
This section describes the GUI version of Configuration Manager. For instructions about using the command line interface (CLI) version of Configuration Manager, see “Appendix - Configuration Manager Command Line Interface” on page 52.

<table>
<thead>
<tr>
<th>LiveCycle configuration task</th>

</tr>
</tbody>
</table>

### 4.1.3 Considerations for WebSphere application server

- Configuration Manager does not support deployment or undeployment of EAR files with custom file names. If your EAR files use a custom file name, you must manually deploy and undeploy them to the application server.

- If you are deploying components to WebSphere on a localized instance of the Windows operating system, the Configuration Manager deployment process reaches approximately 7% completion and then adobe-livecycle-websphere.ear fails to deploy. You must perform additional steps described in the Miscellaneous Errors section of the article adobe-livecycle-websphere.ear fails to deploy.

- If you are installing in a distributed environment to a secured server, you will encounter SSL handshake exceptions when running Configuration Manager. To avoid this error, run the following executable file before running Configuration Manager:

```bash
[appserver root]/bin/retrieveSigners.bat
```

The retrieveSigners utility retrieves the certificates from the WebSphere Deployment Manager server and adds them to the local server’s trust store. See the article Retrieving signers using the retrieveSigners utility at the client available from the IBM Information Center.

- Some Configuration Manager screens require you to provide the SOAP port of the application server or the deployment manager. For more information on how to determine SOAP ports of your WebSphere application server, see this blog.

- If you are configuring a remote application server, ensure that an application server is also installed on the same computer as Configuration Manager so that Configuration Manager can use the application server library files.

- You can determine the JNDI port number by logging in to WebSphere Administrative Console. On WebSphere admin console, click Servers > Server Types > WebSphere application servers > [server name] > Communications > Ports. You will need to provide the value for BOOTSTRAP_ADDRESS when you configure the application server using Configuration Manager.

### 4.1.4 Set the date, time, and time zone

Setting the date, time, and time zone on all servers connected to your LiveCycle environment will ensure that time-dependent modules, such as Adobe® LiveCycle® Digital Signatures 10 and Reader Extensions 10, function correctly. For example, if a signature appears to have been created in the future, it will not validate.

Servers that require synchronization are database servers, LDAP servers, HTTP servers and J2EE servers.
4.2 LiveCycle pre-configuration tasks

Note: Press F1 in Configuration Manager to view Help information for the screen you are viewing. You can view the configuration progress at any time by clicking View Progress Log.

1. If you did not start Configuration Manager automatically from the installation program, navigate to the [LiveCycle root]/configurationManager/bin directory and run the ConfigurationManager.bat/sh script.

2. If prompted, select a language for Configuration Manager to use and click OK.

3. On the Welcome screen, click Next.

4. Do not select any of the options on the Upgrade Task Selection screen and click Next.

5. On Correspondence Management Solution Selection screen, Correspondence Management Solution 10.0.2 option is selected by default. With this option selected, you will be presented with the configuration screens to configure Correspondence Management Solution.

   Click Next to continue.

   Note: This screen will appear only if Correspondence Management Solution is installed.

6. On the Modules screen, select Adobe LiveCycle ES3 modules you wish to configure and click Next.

7. On the Task Selection screen, select all the tasks you want to perform and click Next.

4.3 Configuring and deploying LiveCycle

Note: If you plan to install Correspondence Management Solution, ensure that you have run the Correspondence Management Solution installer before running the Configuration Manager. For more information, see Installing Correspondence Management Solution.

Configuring LiveCycle

1. On the Configure LiveCycle ES3 (1 of 5) screen, click Configure and click Next when done.

2. On the Configure LiveCycle ES3 (2 of 5) screen, click Next to accept the default directory locations, or click Browse to navigate to and change the directories that LiveCycle will use to access fonts, and then click Next.

   Note: Your right to use fonts provided by parties other than Adobe is governed by the license agreements provided to you by such parties with those fonts, and is not covered under your license to use Adobe software. Adobe recommends that you review and ensure that you are in compliance with all applicable non-Adobe license agreements before using non-Adobe fonts with Adobe software, particularly with respect to use of fonts in a server environment.

3. Click Browse on the Configure LiveCycle ES3 (3 of 5) screen to specify the Location of the temporary directory.

   Note: If you do not specify the temporary directory, the default system-configured temp location is used.

4. On the Configure LiveCycle ES3 (4 of 5) screen, click Browse to specify the path for the Global Document Storage (GDS) directory.

   Note: If you leave the GDS directory field empty, LiveCycle will create the directory in a default location in the application server directory tree. After you finish the configuration steps, you can access the location from Administration Console > Settings > Core System Settings > Configurations.
On the Configure Persistent Document Storage (5 of 5) screen, select the option for persistent document storage in addition to the GDS directory. Select one of the following:

- **Use GDS**: Use the file system-based GDS for all persistent document storage. This option provides the best performance, and a single location for GDS.
- **Use database**: Use the LiveCycle database for storing the persistent documents and long-lived artifacts. However, the file-system based GDS is also required. Using the database simplifies backup and restore procedures.

Click **Configure** to configure the LiveCycle EARs with this directory information and, after the configuration is complete, click **Next**.

**Configuring Acrobat for PDF Generator**

- **(Windows only)** On the Configure Acrobat For LiveCycle PDF Generator screen, click **Configure** to run the script that will configure Adobe Acrobat and required environment settings. Click **Next** when complete.

  **Note:** This screen will perform the desired configuration only when Configuration Manager is running locally. You must have Adobe Acrobat X already installed or this step will fail.

**LiveCycle Configuration Summary**

- **On the Configure LiveCycle ES3 Summary screen, click **Next**. Configured archives are placed in the **[LiveCycle root]/configurationManager/export** directory.**

**Configure Correspondence Management Solution**

**Important:** If you are installing Correspondence Management Solution on a non-Windows machine, ensure that you set the **ulimit (Open Files, -n)** parameter to **8192**. Otherwise, the configuration on this steps might fail with an error.

In **Correspondence Management Solution Configuration** screen, specify the path to the content repository for Correspondence Management Solution and click **Configure** to create the required repository files at the specified location. The default location is **[LiveCycle root]/crx-repository**.

**Note:** (Non-turnkey custom mode only) If your LiveCycle server is running remotely, select **Server is running on remote host**, and specify the path to the content repository on the remote host.

It configures the Correspondence Management Solution to bundle within the LiveCycle Core EAR file. Click **Next** to continue.

**Turnkey mode only** A backup (adobe-jboss-core-ear.orig) for the original LiveCycle Core EAR file is taken in the **[LiveCycle root]/deploy** folder. You can restore the EAR file in case you want to run the set up again without Correspondence Management Solution.

**Correspondence Management Solution Configuration Summary**

- **For a remote deployment, copy the content from the **[LiveCycle root]/configurationManager/export/crx-quickstart/ directory to the location on the remote host you specified on the Correspondence Management Solution Configuration screen.**

  **Note:** In case of clustered deployment, you must copy the content from the **[LiveCycle root]/configurationManager/export/crx-quickstart/ directory to the specified location on all cluster node hosts.**
Configuring your application server and database

1. On the Application Server Configuration Details screen, provide the information for the fields (all fields are mandatory) and then click **Verify Server Connection**. When the verification has completed successfully, click **Next**.

   **Note:** If WebSphere Administrative Security is off, User Name and Password fields can be left blank.

   **Note:** When using WebSphere Cluster or WebSphere Network Deployment server to configure a standalone WebSphere Application server, enter the port number of the deployment manager in the SOAP Port field.

2. On the Application Server Configuration Selection screen, select the tasks for Configuration Manager to perform, and click **Next**.

3. On the Server Settings Configuration screen (appears only if Configure Server Settings was selected), provide the information for the fields, and then click **Next**.

   **Note:** LCM does not configure -Dadobe.cache.multicast-address and -Dadobe.cache.bind-address jvm arguments. You may need to configure these arguments manually. See Modifying the JVM properties section for more details.

4. On the Datasource Configuration screen (appears only if Configure Datasource option is selected), provide the information for the fields and then click **Test Database Connection**. When the connection is tested successfully, click **Next**.

   You can choose to manually configure data sources rather than allowing Configuration Manager to configure them for you. To override automatic data source configuration, select **Manually configure data source in the WebSphere Administrative Console now before continuing**, at the bottom of the screen.

   Without exiting Configuration Manager, go to the application server administration console, and configure data sources as described in “9.5 Configuring the LiveCycle database connectivity” on page 71 in Installing LiveCycle for WebSphere Server Guide.

   **Note:** By default, Configuration Manager creates datasources at node level. To set the datasource at the server level, see how to create a JDBC provider for your database in “Appendix - Manually Configuring WebSphere” on page 68 in the Installing and Deploying LiveCycle for WebSphere guide.

5. On the Application Server Configuration screen, click **Configure**. When the process is completed, click **Next**.

6. On the Application Server Configuration Validation screen, select the tasks for validating and then click **Validate** and select Yes on prompt to deploy adobe-lcm-lcmvalidator.ear. When the process is completed, click **Next**.

**Choose installation verification sample (IVS) EAR files**

❖ (Forms, Output, and Assembler only) On the LiveCycle Installation Verification Sample (IVS) EAR files screen, you can install three service-specific sample applications. Select **Include IVS EARs in deployment set** and click **Next** to install these sample files.

   adobe-output-ivs-jboss.ear and adobe-forms-ivs-jboss.ear appears only if you selected respective modules in Modules screen.

   **Note:** Do not deploy the IVS EAR files to a production environment.

**Deploying LiveCycle EARs**

❖ On the Deploy LiveCycle ES3 EARs screen, select the EAR files to deploy, and then click **Deploy**. This operation may take several minutes to complete. When the deployment has completed successfully, click **Next**.
Configuring LiveCycle for deployment

Note: (WebSphere only) When Configuration Manager has started the execution of the IBM WebSphere® JACL deployment scripts, you cannot stop the deployment even if you exit or cancel Configuration Manager prior to deployment completion. No user action is required because the product EARs will be successfully deployed.

By default, Configuration Manager deploys the EAR files to the WebSphere default virtual host, default_host. To deploy the EAR files to a different virtual host, select the target host from the Virtual Host list.

To connect to the application server using a secure port while running Configuration Manager, do the following tasks:

a Add the crypto.jar file provided by IBM to the LiveCycle Configuration Manager path.

b Set the following JVM argument to disable hostname verification:

```
ssl.disable.url.hostname.verification.CWPKI0027I=CWPKI0027I
```

You can connect to the application server using this workaround only if you are using the default HTTPS port.

Initializing LiveCycle database

1 On the LiveCycle ES3 Database Initialization screen, verify that the hostname and port number provided for your application server is correct and then click Initialize. The database initialization task creates tables in the database, adds default data to the tables, and creates basic roles in the database. When the initialization has completed successfully, click Next. Restart the application server manually when you are prompted to do so.

Note: The data source definition files have to be modified to point to the database server and database. For more information, see Appendix - Manually Configuring Data Sources.

2 On the LiveCycle ES3 Information screen, enter LiveCycle ES3 User ID and Password whose default values are administrator and password respectively.

Click Verify Server Connection, and when complete, click Next.

Note: The server information that appears on this screen represents default values for the deployment.

Verifying the server connection helps narrow troubleshooting in case failures occur in the deployment or validation. If the connection test passes but deployment or validation fails in the next few steps, connectivity issues can be eliminated from the troubleshooting process.

Deploying Central Migration Bridge Service

❖ On the Central Migration Bridge Service Deployment Configuration screen, if applicable, select the Include Central Migration Bridge Service in deployment option and then click Next.

Deploying LiveCycle components

1 On the LiveCycle ES3 Component Deployment screen, click Deploy. The components that are deployed at this time are Java archive files that plug into the service container that is part of LiveCycle for purposes of deploying, orchestrating, and executing services. When the deployment has completed successfully, click Next.

2 On the LiveCycle Component Deployment Validation screen, click Validate. Click View Progress Log to view the validation progress and, when the validation has completed successfully, click Next.

Configuring LiveCycle components

❖ On the Configure LiveCycle ES3 Components screen, select the tasks to run with Configuration Manager, and click Next.

LiveCycle Server JNDI information

❖ On the LiveCycle Server JNDI Information screen, enter the host name and port number for the JNDI server. Provide location for Local Application Server Root Directory, and Click Test Connection. When complete, click Next.
Adobe® LiveCycle® 10 Connector for EMC® Documentum*

1. On the Specify Client for EMC Documentum screen, select **Configure Connector for EMC Documentum Content Server**, and specify the following settings. Enter the details, click **Verify**, and when complete, click **Next** to continue.
   - **Choose EMC Documentum Client Version:** Select the client version to use with the EMC Documentum Content Server.
   - **EMC Documentum Client Installation Directory Path:** Click **Browse** to select the directory path.
     
     **Note:** Configure Documentum 6.7 manually, LCM does not contain support for Documentum 6.7.

2. On the Specify EMC Documentum Content Server Settings screen, enter the EMC Documentum Server details, and then click **Next**. Press F1 for information about the details you need to enter.

3. On the Configure Connector for EMC Documentum screen, click **Configure Documentum Connector**. When completed, click **Next**.

4. On the Required Manual Configurations for Connector for EMC Documentum screen, review and perform the manual steps listed and then click **Next**.

Adobe® LiveCycle® 10 Connector for IBM® Content Manager

1. On the Specify Client for IBM Content Manager screen, select **Configure Connector for IBM Content Manager**, and enter a value for the IBM Content Manager Client Installation Directory Path. Click **Verify** and when complete, click **Next** to continue.

2. On the Specify IBM Content Manager Server Settings screen, enter the details of the IBM Content Manager Server, and click **Next**.

3. On the Configure Connector for IBM Content Manager screen, click **Configure IBM Content Manager Connector**. When complete, click **Next**.

4. On the Required Manual Configurations for Connector for IBM Content Manager screen, review and perform the manual steps listed and then click **Next**.

Adobe® LiveCycle® 10 Connector for IBM® FileNet

1. On the Specify Client for IBM FileNet screen, select **Configure Client for IBM FileNet Content Manager**, and specify the following settings.
   - **Choose IBM FileNet Client Version:** Select the client version that you want to use with the IBM FileNet Content Server.
   - **IBM FileNet Client Installation Directory Path:** Click **Browse** to select the directory path.
     
     Click **Verify**, and when complete, click **Next** to continue.

2. On the Specify IBM FileNet Content Server Settings screen, enter the required details, and click **Next**. Press F1 for more information.

3. On the Specify Client for IBM FileNet Process Engine screen, enter the required details, and click **Verify**. When complete, click **Next**.

4. On the Specify IBM FileNet Process Engine Server Settings screen, enter the required details and click **Next**. Press F1 for more information.

5. On the Configure Connector for IBM FileNet screen, click **Configure FileNet Connector**. When complete, click **Next**.

* Last updated 1/10/2013
6 On the Required Manual Configurations for Connector for IBM FileNet screen, review and perform the manual steps listed and then click Next.

Adobe® LiveCycle® 10 Connector for Microsoft® SharePoint®
On the Configure Adobe LiveCycle ES3 Connector for Microsoft SharePoint screen, do one of the following tasks:

• Deselect the Configure Adobe LiveCycle ES3 Connector for Microsoft SharePoint option to manually configure Microsoft Sharepoint later, and then click Next.

• Leave the Configure Adobe LiveCycle ES3 Connector for Microsoft SharePoint option selected. Enter the required values, and then click Configure SharePoint Connector. When complete, click Next.

Note: You can skip this step if you want to configure the Connector for Microsoft SharePoint later using Administration Console.

Configuring LiveCycle Server for native file conversions
❖ (PDF Generator only) On the Admin user credentials for native PDF conversions screen, enter the user name and password of a user with administrative privileges on the server computer, and then click Add user.

Note: You must add at least one administrative user for Windows 2008 Server. On Windows 2008 Server, User Account Control (UAC) must be disabled for the users you add. To disable UAC, click Control Panel > User Accounts > Turn User Account Control on or off and deselect Use User Account Control (UAC) to help protect your computer, then click OK. Restart the computer to apply these changes.

System readiness test for PDF Generator
❖ On the Adobe LiveCycle PDF Generator System Readiness Test screen, click Start to validate if the system has been appropriately configured for PDF Generator. Review the System Readiness Tool Report and click Next. Note that the system readiness test fails if LiveCycle is deployed on a remote machine.

Configuring LiveCycle Reader Extensions
❖ On the Reader Extensions Credential Configuration screen, specify the details that are associated with the Reader Extensions credential that activates the module services.

Note: You can skip this step at this time by selecting Configure later using LiveCycle ES3 Administration Console. You can configure the Reader Extensions credential by using Administration Console after you complete the deployment. (After logging in to Administration Console, click Home > Settings > Trust Store Management > Local Credentials.)

Click Configure and then click Next.

Configure Correspondence Management Solution
❖ On Configure Correspondence Management Solution Deployment screen, specify the User ID and password, and click Configure to package modified web applications and copy them to the LiveCycle EAR.

When the configuration is complete, click Next.

Importing LiveCycle samples, Summary, and Next Steps
1 (Optional) On the LiveCycle ES3 Samples Import screen, click Import. When the import has completed successfully, click Next or select Skip LiveCycle ES3 Samples Import and then click Next to import the samples at a later time.
**Important:** Do not import the LiveCycle Samples in a production environment. These samples create users with default passwords, which may be a security concern for your production environment.

2 Review the Configuration Manager task summary list and choose the appropriate options:
   - Select Launch Next Steps to view information about LiveCycle users and administrative interfaces to launch an html page containing step-by-step instructions to start and use LiveCycle.

Click **Finish** to exit the Configuration Manager
Chapter 5: Post-deployment tasks

5.1 General tasks

5.1.1 Perform a system image backup
After LiveCycle is installed and deployed into production areas and before the system is live, it is recommended that you perform a system image backup of the servers on which LiveCycle is implemented.

The LiveCycle database, GDS directory, and application servers must be part of this backup. This is a complete system backup that you can use to restore the contents of your computer if your hard drive or entire computer stops working. See the LiveCycle Backup and Recovery topic in Administration Help.

5.1.2 Restart the application server
When you first deploy LiveCycle, the server is in a deployment mode in which most modules are in memory. As a result, the memory consumption is high and the server is not in a typical production state. You must restart the application server to get the server back into a clean state.

5.1.3 Verify the deployment
You can verify the deployment by logging in to Administration Console. If you log in successfully, then LiveCycle is running on the application server and the default user is created in the database.

You can review the application server log files to ensure that components were deployed correctly or to determine the cause of any deployment issues you may encounter.

5.1.3.1 Accessing Administration Console
Administration Console is the web-based portal for accessing a variety of configuration pages where you can set run-time properties that control the way LiveCycle operates. When you log in to Administration Console, you can access User Management, Watched Folder, and Email client configuration, and administrative configuration options for other services. Administration Console also provides access to Applications and Services, which administrators use for managing archives and deploying services to a production environment.

The default user name and password for logging in is administrator and password. After you log in the first time, access User Management and change the password.

Before you access Administration Console, LiveCycle must be deployed and running on your application server.

For information about using Administration Console, see Administration Help.

1 Type the following URL in a web browser:
   http://[hostname]:[port]/adminui
   For example: http://localhost:9080/adminui

2 If you have upgraded to LiveCycle, enter the same administrator user name and password as that of your previous LiveCycle installation. In case of a fresh installation, enter the default user name and password.

3 After you log in, click Services to access the service administration pages or click Settings to access the pages on which you can administer settings for different modules.
5.1.3.2 Change default password
LiveCycle creates one or more default users during the installation. The password for these users is in the product documentation and is publicly available. You must change this default password, depending on your security requirements.

The LiveCycle administrator user password is set to “password” by default. You must change it in Administration Console > Settings > User Management.

5.1.3.3 View the log files
Events, such as run-time or startup errors, are recorded to the application server log files. If you have problems deploying to the application server, you can use the log files to help you find the problem. You can open the log files by using any text editor.

The following log files are located in the \appserver root\profiles[profilename]\logs[server name] directory:
- SystemErr.log
- SystemOut.log
- startServer.log

Note: Each time LiveCycle starts, the following error appears in the log:

This error occurs due to a different version of the IBM JSF engine expected by WebSphere. This is a known issue and this error can be safely ignored.

5.2 Accessing module web applications

After LiveCycle is deployed, you can access the web applications that are associated with the following modules:
- Reader Extensions
- Adobe® LiveCycle® Workspace 10
- Adobe® LiveCycle® Rights Management 10

After accessing the web applications by using the default administrator permissions to ensure that they are accessible, you can create additional users and roles so that others can log in and use the applications. (See Administration Help.)

5.2.1 Access the Reader Extensions web application

Note: You must apply a Reader Extensions credential and apply the user roles for a new user. (See “Configuring credentials for use with Reader Extensions” in LiveCycle Administration Help.)

1  Open a web browser and enter this URL:
   http://[hostname]:[port]/ReaderExtensions

2  Log in using the user name and password for LiveCycle.
   Note: You must have administrator or superuser privileges to log in. To allow other users to access the Reader Extensions web application, you must create the users in User Management and grant them the Reader Extensions Web Application role.
Post-deployment tasks

5.2.2 Access Workspace
1. Open a web browser and enter this URL:
   http://[hostname]:[port]/workspace
2. Log in using the user name and password for LiveCycle.

5.2.3 Access Rights Management
You must create a user with the Rights Management End User role in User Management and log in to the Rights Management administrator or end-user applications by using the login information that is associated with that user.

*Note:* The default administrator user cannot access the Rights Management end-user web application but you can add the appropriate role to its profile. You can create a new user or modify an existing user through Administration Console.

Access the Rights Management end-user web application
❖ Open a web browser and enter this URL:
   http://[hostname]:[port]/edc/Login.do

Access the Rights Management administration web application
1. Open a web browser and enter this URL:
   http://[hostname]:[port]/adminui
2. Click Services > LiveCycle Rights Management ES3.
   For information about setting up users and roles, see Administration Help.

Assign the Rights Management End User role
1. Log in to Administration Console. (See “5.1.3.1 Accessing Administration Console” on page 20.)
2. Click Settings > User Management > Users and Groups.
3. In the Find box, type all and, in the In list, select Groups.
4. Click Find and, for the required domains, click All Principals in the list that appears.
5. Click the Role Assignments tab and click Find Roles.
6. In the list of roles, select the check box next to Rights Management End User.
7. Click OK and then click Save.

5.2.4 Accessing User Management
By using User Management, administrators can maintain a database of all users and groups, synchronized with one or more third-party user directories. User Management provides authentication, authorization, and user management for LiveCycle modules, including Reader Extensions, Workspace, Rights Management, Adobe® LiveCycle® Process Management 10, Adobe® LiveCycle® Forms 10 and PDF Generator.

1. Log in to Administration Console.
2. On the home page, click Settings > User Management.
   *Note:* For information about configuring users with User Management, click User Management Help in the upper-right corner of the User Management page.

Last updated 1/10/2013
5.3 Configuring PDF Generator

If you installed PDF Generator as part of your LiveCycle, complete the following tasks:

5.3.1 Environment variables

If you installed the PDF Generator module and configured it to convert files to PDF, for some file formats, you must manually set an environment variable that contains the absolute path of the executable that is used to start the corresponding application. The table below lists the environment variables for the native applications that you have installed.

*Note: All environment variables and respective paths are case-sensitive.*

<table>
<thead>
<tr>
<th>Application</th>
<th>Environment variable</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adobe Acrobat</td>
<td>Acrobat_PATH</td>
<td>C:\Program Files (x86)\Adobe\Acrobat 10.0\Acrobat\Acrobat.exe</td>
</tr>
<tr>
<td>Adobe FrameMaker®</td>
<td>FrameMaker_PATH</td>
<td>C:\Program Files (x86)\Adobe\FrameMaker7.1\FrameMaker.exe</td>
</tr>
<tr>
<td>Notepad</td>
<td>Notepad_PATH</td>
<td>C:\WINDOWS\notepad.exe</td>
</tr>
<tr>
<td>OpenOffice</td>
<td>OpenOffice_PATH</td>
<td>C:\Program Files (x86)\OpenOffice.org 3</td>
</tr>
<tr>
<td>Adobe PageMaker®</td>
<td>PageMaker_PATH</td>
<td>C:\Program Files (x86)\Adobe\PageMaker 7.0\PageMaker.exe</td>
</tr>
<tr>
<td>WordPerfect</td>
<td>WordPerfect_PATH</td>
<td>C:\Program Files (x86)\WordPerfect Office 12\Programs\wpwin12.exe</td>
</tr>
<tr>
<td>Adobe Photoshop®</td>
<td>Photoshop_PATH</td>
<td>C:\Program Files (x86)\Adobe\Adobe Photoshop CS4\Photoshop.exe</td>
</tr>
</tbody>
</table>

*Note: The environment variable OpenOffice_PATH is set to the installation folder instead of the path to the executable.*

You do not need to set up the paths for Microsoft Office applications such as Word, PowerPoint, Excel, Visio, and Project, or for AutoCAD. The Generate PDF service starts these applications automatically if they are installed on the server.

Create a new Windows environment variable

1. Select Start > Control Panel > System.
2. Click the Advanced tab and click Environment Variables.
3. In the System variables section, click New.
4. Enter the environment variable name you need to set (for example, enter Photoshop_PATH). This folder is the one that contains the executable file. For example, type the following path:
   
   D:\Program Files\Adobe\Adobe Photoshop CS4\Photoshop.exe

Set the PATH variables on Linux or UNIX (OpenOffice only)

Execute the following command:

`export OpenOffice_PATH=/opt/openoffice.org3`

5.3.2 Setting the Adobe PDF Printer as the default printer

You must set the Adobe PDF Printer to be the default printer on the server. If the Adobe PDF Printer is not set as the default, PDF Generator cannot convert files successfully.
Set the default printer
1. Select Start > Printers and Faxes.
2. In the Printers and Faxes window, right-click Adobe PDF and select Set as Default Printer.

5.3.3 Configuring Acrobat Professional (Windows-based Computers Only)

Note: This procedure is required only if you upgraded to or installed Acrobat after you completed the LiveCycle installation. Upgrading Acrobat can be completed after you run Configuration Manager and deploy LiveCycle to the application server. Acrobat Professional root directory is designated as [Acrobat root]. Typically, the root directory is C:\Program Files\Adobe\Acrobat 10.0\Acrobat.

Configure Acrobat for use with PDF Generator
1. If an earlier version of Acrobat is installed, uninstall it by using Add or Remove Programs in the Windows Control Panel.
2. Install Acrobat X Pro by running the installer.
3. Navigate to the additional\scripts folder on the LiveCycle installation media.
4. Run the following batch file.
   Acrobat_for_PDFG_Configuration.bat [LiveCycle root]/pdfg_config
5. Open Acrobat and select Help > Check for updates > Preferences.

Validate the Acrobat installation
1. Navigate to a PDF file on your system and double-click it to open it in Acrobat. If the PDF file opens successfully, Acrobat is installed correctly.
2. If the PDF file does not open correctly, uninstall Acrobat and reinstall it.

Note: Ensure that you dismiss all the Acrobat dialog boxes that are displayed after the Acrobat installation is completed and disable the automatic updates for Acrobat. Set the Acrobat_PATH environment variable to point to Acrobat.exe (For example, C:\Program Files\Adobe\Acrobat 10.0\Acrobat\Acrobat.exe).

Configure native application support
1. Install and validate Acrobat as described in the previous procedure.
2. Set Adobe PDF printer as the default printer.

5.3.4 Configuring user accounts for multi-threaded file conversions

By default, PDF Generator can convert only one OpenOffice, Microsoft Word, or PowerPoint document at a time. If you enable multi-threaded conversions, PDF Generator can convert more than one of the documents concurrently by launching multiple instances of OpenOffice or PDFMaker (which is used to perform the Word and PowerPoint conversions).

Note: Only Microsoft Word 2007 and Microsoft PowerPoint 2007 are supported with multi-threaded file conversions. Microsoft Excel 2003 or 2007 versions are not supported.

If you need to enable multi-threaded file conversion, you must first perform the tasks outlined in the “Enabling multi-threaded file conversions” section of the Preparing to Install or Upgrade guide available on the LiveCycle documentation.
For Linux and Solaris users, you must create users and configure the system to remove the password prompts. The following section outlines the method to create a user and perform additional configurations.

5.3.4.1 Add user account
1. In Administration Console, click Services > LiveCycle PDF Generator ES3 > User Accounts.
2. Click Add and enter the user name and password of a user who has administrative privileges on the LiveCycle Server. If you are configuring users for OpenOffice, dismiss the initial OpenOffice activation dialogs.
   *Note: If you are configuring users for OpenOffice, the number of instances of OpenOffice cannot be greater than number of user accounts specified in this step.*
3. Restart the LiveCycle Server.

5.3.4.2 Additional configuration required for OpenOffice on Linux or Solaris
1. Add user accounts as described above.
2. Add entries for additional users (other than the administrator who runs the LiveCycle Server in the /etc/sudoers file. For example, if you are running LiveCycle as a user named lcadm on a server named myhost, and you want to impersonate user1 and user2, add the following entries to /etc/sudoers:
   ```bash
   lcadm myhost=(user1) NOPASSWD: ALL
   lcadm myhost=(user2) NOPASSWD: ALL
   ```
   This configuration enables lcadm to run any command on host 'myhost' as 'user1' or 'user2' without prompting for password.
3. Allow all the users that you added via Add a user account to make connections to the LiveCycle Server. For example, to allow a local user named user1 the permission of making the connection to the LiveCycle Server, use the following command:
   ```bash
   xhost +local:user1@
   ```
   For more details, refer to xhost command documentation.
4. Restart the server.

5.3.5 Installing East Asian characters in Windows Server 2003
When HTML files are converted to PDF by using PDF Generator, some East Asian languages, such as Japanese, Korean, and Chinese, and also right-to-left languages, such as Arabic, Armenian, Georgian, Hebrew, Indic, Thai, and Vietnamese, may not be displayed in the PDF file.

To ensure that these languages are displayed in Windows Server 2003, appropriate fonts must be present on the client and server.

Install East Asian characters in Windows Server 2003
1. Select Start > Control Panel and open Regional and Language Options.
2. Click the Languages tab and select Install Files for East Asian Languages.
3. Click the Advanced tab and select all the options under Code Page Conversion Tables.
   If converted PDF files are still missing fonts, verify that the Arial Unicode MS (TrueType) font (ARIALUNL.TTF) is present in the C:\WINDOWS\Fonts directory.
5.3.6 Adding fonts to PDF Generator

LiveCycle provides a central repository of fonts, which is accessible to all LiveCycle modules. Make the extra fonts available to non-LiveCycle applications on the server so that PDF Generator can use these fonts to create PDF documents that are created with these applications.

*Note:* Restart the application server after adding new fonts to the specified fonts folder.

5.3.6.1 Non-LiveCycle applications

The following list contains non-LiveCycle applications that PDF Generator can use for PDF generation on the server side:

**Windows-only Applications**
- Microsoft Office Word
- Microsoft Office Excel
- Microsoft Office PowerPoint
- Microsoft Office Project
- Microsoft Office Visio
- Microsoft Office Publisher
- AutoDesk AutoCAD
- Corel WordPerfect
- Adobe Photoshop CS
- Adobe FrameMaker
- Adobe PageMaker
- Adobe Acrobat Professional

**Multiplatform applications**
- OpenOffice Writer
- OpenOffice Calc
- OpenOffice Draw
- OpenOffice Impress

*Note:* In addition to these applications, your list may include additional applications that you added.

Of the above applications, the OpenOffice Suite (which includes Writer, Calc, Draw, and Impress) is available on Windows, Solaris, and Linux platforms, whereas other applications are available on Windows only.

5.3.6.2 Adding new fonts to Windows applications only

All the Windows-only applications that are mentioned above can access all the fonts that are available in the C:\Windows\Fonts (or equivalent) folder. In addition to C:\Windows\Fonts, each of these applications may have its own private fonts folders.

Therefore, if you plan to add any custom fonts to the LiveCycle fonts repository, ensure that the same fonts are available to the Windows-only applications also by copying these fonts to either C:\Windows\Fonts or to an equivalent folder.

Your custom fonts must be licensed under an agreement that allows you to use them with the applications that have access to these fonts.

Last updated 1/10/2013
5.3.6.3 Adding new fonts to other applications
If you added support for PDF creation in other applications, see the Help for these applications to add new fonts. In Windows, copying your custom fonts to the C:\Windows\Fonts (or equivalent) folder should be sufficient.

5.3.7 Configuring HTML to PDF conversions
The HTML-to-PDF conversion process is designed to use the settings from Acrobat X that override the settings from PDF Generator.

Note: This configuration is required to enable the HTML-to-PDF conversion process, otherwise this conversion type will fail.

5.3.7.1 Configure the HTML-to-PDF conversion
1. Install and validate Acrobat as described in “5.3.3 Configuring Acrobat Professional (Windows-based Computers Only)” on page 24.
2. Locate the pdffgen.api file in the [LiveCycle root]\plugins\x86_win32 directory and copy it to [Acrobat root]\Acrobat\plug_ins directory.

5.3.7.2 Enable support for Unicode fonts in HTML to PDF conversions
Important: The HTML-to-PDF conversion fails if a zipped input file contains HTML files with double-byte characters in filenames. To avoid this problem, do not use double-byte characters when naming HTML files.

1. Copy the Unicode font to any of the following directories as appropriate for your system:
   - Windows
     [Windows root]\Windows\fonts
     [Windows root]\WINNT\fonts
   - UNIX
     /usr/lib/X11/fonts/TrueType
     /usr/openwin/lib/X11/fonts/TrueType
     /usr/share/fonts/default/TrueType
     /usr/X11R6/lib/X11/fonts/ttf
     /usr/X11R6/lib/X11/fonts/truetype
     /usr/X11R6/lib/X11/fonts/TrueType
     /usr/X11R6/lib/X11/fonts/TTF
     /Users/cfqauser/Library/Fonts
     /System/Library/Fonts
     /Library/Fonts
     /Users/ + System.getProperty(<user name>, root) + /Library/Fonts
     System.getProperty(JAVA_HOME) + /lib/fonts
     /usr/share/fonts (Solaris)

Note: Ensure that the directory /usr/lib/X11/fonts exists. If it does not, create a symbolic link from /usr/share/X11/fonts to /usr/lib/X11/fonts using the ln command.
2 Modify the font-name mapping in the cffont.properties file located in the [/LiveCycle root]/deploy/adobe-generatedpdf-dsc.jar file:
   • Extract this archive, and locate the cffont.properties file and open it in an editor.
   • In the comma-separated list of Java font names, add a map to your Unicode system font for each font type. In the example below, kochi mincho is the name of your Unicode system font.
     ```
     dialog=Arial, Helvetica, kochi mincho
     dialog.bold=Arial Bold, Helvetica-Bold, kochi mincho ...
     ```
   • Save and close the properties file, and then repackage and redeploy the adobe-generatedpdf-dsc.jar file.
   **Note:** On a Japanese operating system, specify the font mapping in the cffont.properties.ja file as well, which takes precedence over the standard cffont.properties file.

   Fonts in the list are searched from left to right, using the first font found. HTML-to-PDF conversion logs return a list of all the font names that are found in the system. To determine the font name you need to map, add the font to one of the directories above, restart the server, and run a conversion. You can determine from the log files the font name to use for mapping.

   To embed the font in the generated PDF files, set the embedFonts property in the cffont.properties file to true (the default is false).

### 5.3.8 Modify Microsoft Visio default macro settings

When a Microsoft Visio file containing macros is submitted for conversion, the resultant Microsoft Office Visio Security Notice dialog causes the conversion to time out. To successfully convert files that contain macros, the default macro settings in Visio must be changed.

❖ In Visio, click **Tools > Trust Center > Macro Settings** and select either of the following options and then click **OK**:
   • Disable all macros without notification
   • Enable all macros

### 5.3.9 Installing the Network Printer Client

PDF Generator includes an executable file to install the PDF Generator network printer on a client computer. After the installation is complete, a PDF Generator printer is added to the list of existing printers on the client computer. This printer can then be used to send documents for conversion to PDF.

**Note:** The Network Printer Client installation wizard available in the Administration Console is supported only on Windows operating system. Ensure that you use a 32-bit JVM to launch the Network Printer Client installation wizard. You will encounter an error if you use a 64-bit JVM.

If the PDFG Network Printer fails to install on Windows or if you want to install the printer on UNIX or Linux platforms, use the operating system’s native Add Printer utility and configure it as described in "5.3.9.2 Configure PDFG Network Printer on Windows using the native Add Printer wizard" on page 29.

#### 5.3.9.1 Install the PDF Generator Network Printer Client

**Note:** Before installing the PDF Generator network printer client on Windows Server 2008, ensure that you have the Internet Printing Client feature installed on your Windows Server 2008. For installing the feature, see Windows Server 2008 Help.

1 Ensure that you successfully installed PDF Generator on your server.
2 Do one of the following:
   - From a Windows client computer, enter the following URL in your web browser, where [host] is the name of the server where you installed PDF Generator and [port] is the application server port used:
     \[http://[host]:[port]/pdfg-ipp/install\]
   - In Administration Console, click Home > Services > PDF Generator > PDFG Network Printer. In the PDFG Network Printer Installation section, click Click here to launch the PDFG Network Printer Installation.

3 On the Configure Internet Port screen, select Use the specified user account option, and provide the credentials of a LiveCycle user who has the PDFG Administrator/User role. This user must also have an email address that can be used to receive the converted files. To have this security setting apply to all users on the client computer, select Use the same security options for all users, and then click OK.
   
   **Note:** If the user’s password changes, then users will need to reinstall the PDFG Network Printer on their computers. You cannot update the password from Administration Console.

Upon successful installation, a dialog box appears, indicating that “The Printer Adobe LiveCycle PDF Generator ES3 has been successfully installed.”

4 Click OK. You will now have a printer named Adobe LiveCycle PDF Generator ES3 in your list of available printers.

### 5.3.9.2 Configure PDFG Network Printer on Windows using the native Add Printer wizard

1 Click Start > Printers and Faxes and double-click Add Printer.

2 Click Next, select A network printer, or a printer attached to another computer, and then click Next.

3 Select Connect to a printer on the internet or on a home or office network and type the following URL for the PDFG printer, where [host] is the server name and [port] is the port number where the server is running:
   \[http://[host]:[port]/pdfg-ipp/printer\]

4 On the Configure Internet Port screen, select Use the specified user account and provide valid User credentials.

5 In the Printer Driver Select box, choose any standard PostScript-based printer driver (for example, HP Color LaserJet PS).

6 Complete the installation by choosing appropriate options (for example, setting this printer as default).
   
   **Note:** The user credentials used while adding the printer must have a valid email ID configured in User Management to receive the response.

7 Configure the email service’s sendmail service. Provide a valid SMTP server and authentication information in the service’s configuration options.

### 5.3.9.3 Install and configure the PDF Generator Network Printer Client using Proxy server port forwarding

1 Configure port forwarding on the CC Proxy server on a particular port to the LiveCycle Server, and disable the authentication at proxy server level (because LiveCycle uses its own authentication). If a client connects to this Proxy server on the forwarded port, then all the requests will be forwarded to the LiveCycle Server.

2 Install PDFG Network Printer using the following URL:
   \[http://[proxy server]:[forwarded port]/pdfg-ipp/install\]

3 Provide the necessary credentials for authentication of the PDFG Network Printer.

4 The PDFG Network Printer will be installed on the client machine which you can use for PDF conversion using the firewall protected LiveCycle Server.
5.3.10 Changing File Block Settings
Change Microsoft Office trust center settings to enable PDFG to convert older versions of Microsoft office documents.

1. Click the File tab in any Office 2010 application. Under Help, click Options; the Options dialog box appears.
2. Click Trust Center, and then click Trust Center Settings.
3. In the Trust Center settings, click File Block Settings.
4. In the File Type list, uncheck open for the file type that you want to be converted by PDFG.

5.3.11 Watched folder performance parameters
To avoid java.io.IOException error messages indicating that not enough disk space is available to perform PDF conversions by using a watched folder, you can modify the settings for PDF Generator in Administration Console.
You must ensure that for WebSphere application server, the maximum transaction time-out and ORB service have the proper values.

Configure transaction time-out
1. Do the following:
   - Log in to WebSphere Administrative Console, click Servers > Server Types > WebSphere application servers, and then click the name of the server instance to configure (for example, server1).
2. Under Container Settings, click Container Services > Transaction Service.
3. Under General Properties, in the Total transaction lifetime timeout box, type 300 (or higher).
4. Ensure that the value in the Maximum transaction timeout box is greater than or equal to the Total transaction lifetime timeout.
5. Click OK or Apply and then click Save directly to master configuration.

Increase the CORBA time-out value
1. Do the following:
   - Log in to WebSphere Administrative Console, click Servers > Server Types > WebSphere application servers, and then click the name of the server instance to configure (for example, server1).
2. Under Container Settings, click Container Services > ORB Service.
3. Under General Properties, in the Request timeout box, type 360 and, in the Locate Request Timeout box, type 300.
4. Click OK or Apply and then click Save directly to master configuration.

Set performance parameters for PDF Generator
1. Log in to Administration Console and click Services > Applications and Services > Service Management.
2. In the list of services, navigate to and click PDFGConfigService, and then set the following values:
   - PDFG Cleanup Scan Seconds: 1800
   - Job Expiration Seconds: 6000
   - Server Conversion Timeout: Change the default of 270 to a higher value, such as 450.
3. Click Save and restart the server.
5.4 Final setup for Rights Management

Rights Management requires the application server to be configured to use SSL. (See Administration Help.)

5.5 Configuring LDAP access

5.5.1 Configure User Management (Local Domain)

1. Open a web browser, navigate to http://[host]:[port]/adminui, and log in. (See “5.1.3.1 Accessing Administration Console” on page 20.)
2. Click Settings > User Management > Domain Management, and then click New Local Domain.
3. In the appropriate boxes, enter the domain ID and name. (See “Adding local domains” in Administration help.)
4. (Optional) Disable account locking by deselecting the Enable Account Locking option.
5. Click OK.

5.5.2 Configure User Management with LDAP (Enterprise Domain)

1. Open a web browser, navigate to http://[host]:[port]/adminui and log in. (See “5.1.3.1 Accessing Administration Console” on page 20.)
2. Click Settings > User Management > Domain Management, and then click New Enterprise Domain.
3. In the ID box, type a unique identifier for the domain and, in the Name box, type a descriptive name for the domain.
   Note: When using DB2 for your LiveCycle database, the maximum permitted length of the ID is 100 single-byte (ASCII) characters or 50 double-byte characters or 25 four-byte characters. (See “Adding enterprise domains” in Administration Help.)
   Note: When using MySQL for your LiveCycle database, use only single-byte (ASCII) characters for the ID. (See “Adding enterprise domains” in Administration Help.)
4. Click Add Authentication and, in the Authentication Provider list, select LDAP.
5. Click OK.
6. Click Add Directory and, in the Profile Name box, type a name for your LDAP profile.
7. Click Next.
8. Specify values in the Server, Port, SSL, and Binding boxes, and in the Populate Page with box, select a directory settings option such as Default Sun ONE values. Also, specify values in the Name and Password box that would be used to connect to the LDAP database when anonymous access is not enabled. (See “Directory settings” in Administration Help.)
9. (Optional) Test your configuration:
   • Click Test. The screen displays a message indicating either a successful server test or any configuration errors that exist.
10. Click Next and configure the User Settings as required. (See “Directory settings” in Administration Help.)
11. (Optional) Test your configuration:
   • Click Test.
Post-deployment tasks

- In the Search Filter box, verify the search filter or specify a new search filter, and then click Submit. The screen displays a list of entries that match the search criteria.
- Click Close to return to the User Settings screen.

12 Click Next to configure the Group Settings as required. (See “Directory settings” in Administration Help.)

13 (Optional) Test your configuration:
   - Click Test.
   - In the Search Filter box, verify the search filter or specify a new search filter, and then click Submit. The screen displays a list of entries that match the search criteria.
   - Click Close to return to the Group Settings screen.

14 Click Finish to exit the New Directory page and then click OK to exit.

5.6 Enabling FIPS mode

LiveCycle provides a FIPS mode to restrict data protection to Federal Information Processing Standard (FIPS) 140-2 approved algorithms using the RSA BSAFE Crypto-C 2.1 encryption module.

If you did not enable this option by using Configuration Manager during LiveCycle configuration or if you enable it but want to turn it off, you can change this setting through Administration Console.

Modifying FIPS mode requires you to restart the server.

FIPS mode does not support Acrobat versions earlier than 7.0. If FIPS mode is enabled and the Encrypt With Password and Remove Password processes include the Acrobat 5 setting, the process fails.

In general, when FIPS is enabled, the Assembler service does not apply password encryption to any document. If this is attempted, a FIPSModeException is thrown, indicating that “Password encryption is not permitted in FIPS mode.” Additionally, the PDFsFromBookmarks element is not supported in FIPS mode when the base document is password-encrypted.

Turn FIPS mode on or off

1 Log in to Administration Console.

2 Click Settings > Core System Settings > Configurations.

3 Select Enable FIPS to enable FIPS mode or deselect it to disable FIPS mode.

4 Click OK and restart the application server.

Note: LiveCycle software does not validate code to ensure FIPS compatibility. It provides a FIPS operation mode so that FIPS-approved algorithms are used for cryptographic services from the FIPS-approved libraries (RSA).

5.7 Configuring HTML digital signature

To use the HTML digital signature feature of Forms, complete the following procedure.

1 Manually deploy the [LiveCycle root]/deploy/adobe-forms-ds.ear file to your application server.

2 Log in to Administration Console and click Services > LiveCycle Forms ES3.

3 Select HTML Digital Signature Enabled and then click Save.
5.8 Configure CSIv2 inbound transport

On the default Global Security enabled installation of IBM WebSphere, CSIv2 inbound transport option is set to SSL-required. This configuration causes Output and Forms components to fail. Ensure that you change CSIv2 inbound transport option to SSL-Supported: To change the option:

1. Log in to IBM WebSphere Administration Console.
2. Expand Security, and then click Global security.
3. In the Authentication section, expand RMI/IIOP security, and then click CSIv2 inbound communications
4. In CSIv2 Transport Layer section, set value of Transport to SSL-Supported.
5. Click Apply.

5.9 Enable ICEBrowser based HTML to PDF Conversions

LiveCycle ES3 supports ICEBrowser based HTML to PDF conversions. By default, ICEBrowser based HTML to PDF conversion is disabled. To enable ICEBrowser based HTML to PDF conversion, configure GeneratePDFService from LiveCycle Administration Console.

To configure GeneratePDFService:

1. Open LiveCycle Administration Console.
3. Select and open GeneratePDFService from the list of services.
4. In the Configuration tab, set Use Acrobat WebCapture (Windows Only) to false.
5. Set Use ICEBrowser based HTML to PDF to true.
6. Click Save.

5.10 Configuring Connector for EMC Documentum

Note: LiveCycle supports EMC Documentum, versions 6.0, 6.5 and 6.7 SP1 only. Make sure your ECM is upgraded accordingly.

If you installed Connector for EMC Documentum as part of your LiveCycle, complete the following procedure to configure the service to connect to the Documentum repository.

Configure Connector for EMC Documentum

1. Locate the adobe-component-ext.properties file in the [appserver root]/profiles/[profile name] folder (if the file does not exist, create it).
2. Add a new system property that provides the following Documentum Foundation Classes JAR files:
   - dfc.jar
   - aspectjrt.jar
   - log4j.jar
   - jaxb-api.jar
Post-deployment tasks

• (For Connector for EMC Documentum 6.5 only)
  • configservice-impl.jar,
  • configservice-api.jar

The new system property should take on this form:

\[\text{[component id].ext=[JAR files and/or folders]}\]

For example, using default Content Server and Documentum Foundation Classes installations, add to the file one of the following system properties on a new line, with no line breaks, and end the line with a carriage return:

• Connector for EMC Documentum 6.0 only:
  
  com.adobe.livecycle.ConnectorforEMCDocumentum.ext=
  C:/Program Files/Documentum/Shared/dfc.jar,
  C:/Program Files/Documentum/Shared/aspectjrt.jar,
  C:/Program Files/Documentum/Shared/log4j.jar

• Connector for EMC Documentum 6.5 only:
  
  com.adobe.livecycle.ConnectorforEMCDocumentum.ext=
  C:/Program Files/Documentum/Shared/dfc.jar,
  C:/Program Files/Documentum/Shared/aspectjrt.jar,
  C:/Program Files/Documentum/Shared/log4j.jar,
  C:/Program Files/Documentum/Shared/jaxb-api.jar,
  C:/Program Files/Documentum/Shared/configservice-impl.jar,
  C:/Program Files/Documentum/Shared/configservice-api.jar

  \textbf{Note: The above text contains formatting characters for line breaks. If you copy and paste this text, you must remove the formatting characters.}

• Connector for EMC Documentum 6.7 SP1 only:
  
  com.adobe.livecycle.ConnectorforEMCDocumentum.ext=
  C:/Program Files/Documentum/Shared/dfc.jar,
  C:/Program Files/Documentum/Shared/aspectjrt.jar,
  C:/Program Files/Documentum/Shared/log4j.jar,
  C:/Program Files/Documentum/Shared/jaxb-api.jar,
  C:/Program Files/Documentum/Shared/configservice-impl.jar,
  C:/Program Files/Documentum/Shared/configservice-api.jar,
  C:/Program Files/Documentum/Shared/commons-codec-1.3.jar
  C:/Program Files/Documentum/Shared/commons-lang-2.4.jar

  \textbf{Note: The above text contains formatting characters for line breaks. If you copy and paste this text, you must remove the formatting characters.}

3 (Connector for EMC Documentum 6.0 only) Delete the dfc.keystore file located in the C:\Documentum\config directory.

  \textbf{Note: This step is required due to incompatible JDK requirements for WebSphere and Documentum Foundation Classes of EMC Documentum 6.0.}

4 Open a web browser and enter this URL:

  \texttt{http://[host]:[port]/adminui}

5 Log in using the default user name and password:

  \textbf{User name:} administrator

  \textbf{Password:} password
6 Navigate to Services > LiveCycle ES3 Connector for EMC Documentum > Configuration Settings and perform these tasks:
   • Type all the required Documentum repository information.
   • To use Documentum as your repository provider, under Repository Service Provider Information, select EMC Documentum Repository Provider, and then click Save. For more information, click the Help link in the upper-right corner of the page in the Administration Help.

7 (Optional) Navigate to Services > LiveCycle ES3 Connector for EMC Documentum > Repository Credentials Settings, click Add, specify the Docbase information, and then click Save. (For more information, click Help in the upper-right corner.)

8 If the application server is not currently running, start the server. Otherwise, stop and then restart the server.

9 Open a web browser and enter this URL.
   {host}:{port}/adminui

10 Log in using the default user name and password:
   User name: administrator
   Password: password

11 Navigate to Services > Applications and Services > Service Management and select these services:
   • EMCDocumentumAuthProviderService
   • EMCDocumentumContentRepositoryConnector
   • EMCDocumentumRepositoryProvider

12 Click Start. If any of the services do not start correctly, check the settings you completed earlier.

13 Do one of the following tasks:
   • To use the Documentum Authorization service (EMCDocumentumAuthProviderService) to display content from a Documentum repository in the Resources view of Workbench, continue with this procedure. Using the Documentum Authorization service overrides the default LiveCycle authorization and must be configured to log in to Workbench using Documentum credentials.
   • To use the LiveCycle repository, log in to Workbench by using the LiveCycle super administrator credentials (by default, administrator and password).

You have now completed the required steps for this procedure. Use the credentials provided in step 19 for accessing the default repository in this case and use the default LiveCycle authorization service.

14 Restart the application server.

15 Log in to Administration Console and click Settings > User Management > Domain Management.

16 Click New Enterprise Domain, and type a domain ID and name. The domain ID is the unique identifier for the domain. The name is a descriptive name for the domain.

   **Note:** (WebLogic and WebSphere only) When using DB2 for your LiveCycle database, the maximum permitted length of the ID is 100 single-byte (ASCII) characters or 50 double-byte characters or 25 four-byte characters. (See “Adding enterprise domains” in Administration Help.)

   **Note:** When using MySQL for your LiveCycle database, use only single-byte (ASCII) characters for the ID. (See “Adding enterprise domains” in LiveCycle Administration Help.)

17 Add a custom authentication provider:
   • Click Add Authentication.
Post-deployment tasks

- In the Authentication Provider list, select Custom.
- Select EMCDocumentumAuthProvider and then click OK.

18 Add an LDAP authentication provider:
   - Click Add Authentication.
   - In the Authentication Provider list, select LDAP, and then click OK.

19 Add an LDAP directory:
   - Click Add Directory.
   - In the Profile Name box, type a unique name, and then click Next.
   - Specify values for the Server, Port, SSL, Binding, and Populate page with options. If you select User for the Binding option, you must also specify values for the Name and Password fields.
   - (Optional) Select Retrieve Base DN to retrieve base domain names, as required.
   - Click Next, configure the user settings, click Next, configure group settings, as required, and then click Next.
     For details about the settings, click User Management Help in the upper-right corner of the page.

20 Click OK to exit the Add Directory page and then click OK again.

21 Select the new enterprise domain and click Sync Now. Depending on the number of users and groups in your LDAP network and the speed on your connection, the synchronization process may take several minutes.
   (Optional) To verify the status of the synchronization, click Refresh and view the status in the Current Sync State column.

22 Navigate to Settings > User Management > Users and Groups.

23 Search for users that were synchronized from LDAP and perform these tasks:
   - Select one or more users and click Assign Role.
   - Select one or more LiveCycle roles and click OK.
   - Click OK a second time to confirm the role assignment.
     Repeat this step for all users that you assign roles to. For more information, click User Management Help in the upper-right corner of the page.

24 Start Workbench and log in by using the credentials for the Documentum repository:
   Username: [username]@[repository_name]
   Password: [password]

   After you log in, the Documentum repository appears in the Resources view within Workbench. If you do not log in using the username@repository_name, Workbench attempts to log in to the default repository.

25 (Optional) To install the LiveCycle Samples for Connector for EMC Documentum, create a Documentum repository named Samples, and then install the samples in that repository.
   After you configure the Connector for EMC Documentum service, see LiveCycle Administration Help for information about configuring Workbench with your Documentum repository.

5.10.1 Creating the XDP MIME format in a Documentum repository

Before users can store and retrieve XDP files from a Documentum repository, you must do one of these tasks:
   - Create a corresponding XDP format in each repository where users will access XDP files.
Configure the Connector for EMC Documentum service to use a Documentum Administrator account when accessing the Documentum repository. In this case, the Connector for EMC Documentum service uses the XDP format whenever it is required.

Create the XDP format on Documentum Content Server using Documentum Administrator
1 Log in to Documentum Administrator.
2 Click Formats and then select File > New > Format.
3 Type the following information in the corresponding fields:
   - **Name**: xdp
   - **Default File Extension**: xdp
   - **Mime Type**: application/xdp
4 Repeat steps 1 to 3 for all other Documentum repositories where users will store XDP files.

Configure the Connector for EMC Documentum service to use a Documentum Administrator
1 Open a web browser and enter this URL:
   http://[host]:[port]/adminui
2 Log in using the default user name and password: 
   - **User name**: administrator 
   - **Password**: password
3 Click Services > LiveCycle ES3 Connector for EMC Documentum > Configuration Settings.
4 Under Documentum Principal Credentials Information, update the following information and then click Save:
   - **User Name**: [Documentum Administrator user name]
   - **Password**: [Documentum Administrator password]
5 Click Repository Credentials Settings, select a repository from the list or, if none exist, click Add.
6 Provide the appropriate information in the corresponding fields and then click Save:
   - **Repository Name**: [Repository Name]
   - **Repository Credentials User Name**: [Documentum Administrator user name]
   - **Repository Credentials Password**: [Documentum Administrator password]
7 Repeat steps 5 and 6 for all repositories where users will store XDP files.

5.10.2 Add support for multiple connection brokers
LiveCycle Configuration Manager supports configuring only one connection broker. Use LiveCycle Administrator Console to add support for multiple connection brokers:
1 Open LiveCycle Administrator Console.
2 Navigate to Home > Services > LiveCycle ES3 Connector for EMC Documentum > Configuration Settings.
3 In the **Connection broker Host Name or IP Address**, enter comma seperated list of hostnames of different connection brokers. For example, host1, host2, host3.
4 In the Port Number of Connection broker, enter comma separated list of the ports of corresponding connection brokers. For example, 1489, 1491, 1489.

5 Click Save.

### 5.11 Configuring the Connector for IBM Content Manager

*Note: LiveCycle supports IBM Content Manager, version 8.4 only. Make sure your ECM is upgraded accordingly.*

If you installed the Connector for IBM Content Manager as part of your LiveCycle, complete the following procedure to configure the service to connect to the IBM Content Manager datastore.

**Configure Connector for IBM Content Manager**

1. Locate the adobe-component-ext.properties file in the [appserver root]/profiles/[profile name] folder. If the file does not exist, create it.

2. Add a new system property that provides the location of the following IBM II4C JAR files:
   - cmb81.jar
   - cmbcm81.jar
   - cmbicm81.jar
   - cmblog4j81.jar
   - cmbsdk81.jar
   -.cmbutil81.jar
   - cmbutilicm81.jar
   - cmbview81.jar
   - cmbwas81.jar
   - cmbwcm81.jar
   - cmgmt

*Note: cmgmt is not a JAR file. On Windows, by default, this folder is at C:/Program Files/IBM/db2cmv8/.*

- common.jar
- db2jcc.jar
- db2jcc_license_cisuz.jar
- db2jcc_license_cu.jar
- ecore.jar
- ibmjgssprovider.jar
- ibmjssesprovider2.jar
- ibmpkcs.jar
- icmrm81.jar
- jcache.jar
- log4j-1.2.8.jar
Post-deployment tasks

- xerces.jar
- xml.jar
- xsd.jar

The new system property looks similar to the following:

```
[jcomponent id].ext=[JAR files and/or folders]
```

For example, using a default DB2 Universal Database Client and II4C installation, in the file, add the following system property on a new line, with no line breaks, and end the line with a carriage return:

```
C:/Program Files/IBM/db2cmv8/cmgmt,
C:/Program Files/IBM/db2cmv8/java/jre/lib/ibmjgssprovider.jar,
C:/Program Files/IBM/db2cmv8/java/jre/lib/ibmpkcs.jar,
C:/Program Files/IBM/db2cmv8/java/jre/lib/xml.jar,
C:/Program Files/IBM/db2cmv8/lib/cmbview81.jar,
C:/Program Files/IBM/db2cmv8/lib/cmb81.jar,
C:/Program Files/IBM/db2cmv8/lib/cmbcm81.jar,
C:/Program Files/IBM/db2cmv8/lib/xsd.jar,
C:/Program Files/IBM/db2cmv8/lib/common.jar,
C:/Program Files/IBM/db2cmv8/lib/ecore.jar,
C:/Program Files/IBM/db2cmv8/lib/cmbicm81.jar,
C:/Program Files/IBM/db2cmv8/lib/cmbsdk81.jar,
C:/Program Files/IBM/db2cmv8/lib/cmbwas81.jar,
```

3 If the application server is not currently running, start the server; otherwise, stop and then restart the server.

You can now connect to the IBM Content Manager datastore from the IBMCMConnectorService Property Sheets by using the Use User Credentials as the login mode.

You have now completed the required steps for this procedure.

(Optional) If you want to connect to IBM Content Manager datastore from IBMCMConnectorService Property Sheets by using the Use Credentials From Process Context as the login mode, complete the following procedure.

Connect using Use Credentials from process context login mode

1 Open a web browser and enter this URL:

   http://[host]:[port]/adminui

2 Log in using the super administrator credentials. Default values set during installation are:

   **User name:** administrator  
   **Password:** password

3 Click **Services > LiveCycle ES3 Connector for IBM Content Manager**
4 Type all of the required repository information and click Save. For more information about the IBM Content Manager repository information, click the Help link in the upper-right corner of the page.

5 Do one of these tasks:
   • To use the IBM Content Manager Authorization service IBMCMAuthProvider to use content from an IBM Content Manager datastore, in the Processes view of Workbench, continue with this procedure. Using the IBM Content Manager Authorization service overrides the default LiveCycle authorization and must be configured to log in to Workbench by using IBM Content Manager credentials.
   • To use the System Credentials provided in step 4 to use content from an IBM Content Manager datastore, in the Processes view of Workbench, log in to Workbench by using the LiveCycle super administrator credentials (by default, administrator and password). You have now completed the required steps for this procedure. The System Credentials that are provided in step 4 use the default LiveCycle authorization service for accessing the default repository in this case.

6 Log in to the Administration Console, and click Settings > User Management > Domain Management.

7 Click New Enterprise Domain and type a domain ID and name. The domain ID is the unique identifier for the domain. The name is a descriptive name for the domain.

   Note: When using DB2 for your LiveCycle database, the maximum permitted length of the ID is 100 single-byte (ASCII) characters or 50 double-byte characters or 25 four-byte characters. (See “Adding enterprise domains” in LiveCycle Administration Help.)

   Note: When using MySQL for your LiveCycle database, use only single-byte (ASCII) characters for the ID. (See Adding enterprise domains in Administration Help.)

8 Add a custom authentication provider:
   • Click Add Authentication.
   • In the Authentication Provider list, select Custom, and then select IBMCMAuthProviderService and click OK.

9 Add an LDAP authentication provider:
   • Click Add Authentication.
   • In the Authentication Provider list, select LDAP and then click OK.

10 Add an LDAP directory:
   • Click Add Directory.
   • In the Profile Name box, type a unique name, and then click Next.
   • Specify values for the Server, Port, SSL, Binding, and Populate page with options. If you select User for the Binding option, you must also specify values for the Name and Password fields. (Optional) Select Retrieve Base DN to retrieve base domain names, as required. When finished, click Next.
   • Configure the user settings, click Next, configure group settings as required, and then click Next.
   For details about the above settings, click the Help link in the upper-right corner of the page.

11 Click OK to exit the Add Directory page and click OK again.

12 Select the new enterprise domain and click Sync Now. Depending on the number of users and groups in your LDAP network and the speed on your connection, the synchronization process may take several minutes.

13 To verify the status of the synchronization, click Refresh and view the status in the Current Sync State column.

14 Navigate to Settings > User Management > Users and Groups.
15 Search for users that were synchronized from LDAP and do these tasks:
   • Select one or more users and click **Assign Role**.
   • Select one or more LiveCycle roles and click **OK**.
   • Click **OK** a second time to confirm the role assignment.
Repeat this step for all users that you want to assign roles to. For more information, click the **Help** link in the upper-right corner of the page.

16 Start Workbench and log in using the following credentials for IBM Content Manager datastore:
   **Username:** [username]@[repository_name]  
   **Password:** [password]

   The IBM Content Manager datastore can now be used in the Processes view within Workbench when the login mode for IBMCMConnectorService orchestrable components is selected as **Use Credentials from process context**.

### 5.12 Configuring the Connector for IBM FileNet

LiveCycle supports IBM FileNet, versions 4.0, 4.5, and 5.0 only. Make sure your ECM is upgraded accordingly.

If you installed Connector for IBM FileNet as part of your LiveCycle, you must configure the service to connect to the FileNet object store.

Complete the following procedure to configure Connector for IBM FileNet.

**Configure Connector for IBM FileNet using FileNet 4.x or FileNet 5.0 and CEWS transport**

1. Log in to WebSphere Administrative Console, click **Servers > Server Types > WebSphere application servers**, and then click the name of the server instance to configure (for example, server1).
2. Under Server Infrastructure, click **Java and Process Management > Process Definition**.
3. Under Additional Properties, click **Java Virtual Machine**.
4. **(Only for FileNet 4.x)** Under Generic JVM arguments, add the location of the FileNet Configuration files as a Java option to the application server start command.
   ```
   -Dwasp.location= <configuration files location>
   ```
   For example, using a default FileNet Application Engine installation on a Windows operating system, add this Java option:
   ```
   -Dwasp.location=C:/Program Files/FileNet/AE/CE_API/wsi
   ```
5. Click **Apply** and then click **Save to Master Configuration**.
6. Locate the adobe-component-ext.properties file in the `/appserver root/profiles/[profile name]` folder (if the file does not exist, create it).
7. Add a new system property that provides the location of these FileNet Application Engine JAR files:
   For Filenet 4.x add following JAR files.
   ```
   • javaapi.jar
   • log4j-1.2.13.jar
   • soap.jar
   • wasp.jar
   ```
Post-deployment tasks

- builtin_serialization.jar (FileNet 4.0 only)
- wsdll_api.jar
- jaxm.jar
- jaxrpc.jar
- saaj.jar
- jetty.jar
- runner.jar
- p8cjares.jar
- Jace.jar
- (optional) pe.jar

For FileNet 5.0 add following JAR files

- Jace.jar
- javaapi.jar
- log4j.jar
- pe.jar
- stax-api.jar
- xlpScanner.jar
- xlpScannerUtils.jar

**Note:** Add the pe.jar file only if your deployment uses the IBMFileNetProcessEngineConnector service. The new system property should reflect this structure:

```
[component id].ext=[JAR files and/or folders]
```

For example, using a default FileNet Application Engine installation on a Windows operating system, add the following system property on a new line with no line breaks and end the line with a carriage return:

**Note:** The following text contains formatting characters for line breaks. If you copy this text to a location outside this document, remove the formatting characters when you paste it to the new location.

```
com.adobe.livecycle.ConnectorforIBMFileNet.ext=
C:/Program Files/FileNet/AE/CE_API/lib2/javaapi.jar,
C:/Program Files/FileNet/AE/CE_API/lib2/log4j-1.2.13.jar
```

8 (FileNet Process Engine Connector only) Configure the connection properties for the process engine as follows:

- Using a text editor, create a file with the following content as a single line and end the line with a carriage return:

  ```
  RemoteServerUrl = com:hp://[contentserver_IP]:[contentengine_port]/ wsi/FNCEWS40DIME/
  ```

- Save the file as WcmApiConfig.properties in a separate folder, and add the location of the folder that contains the WcmApiConfig.properties file to the adobe-component-ext.properties file.

  For example, if you save the file as c:/pe_config/WcmApiConfig.properties, add the path c:/pe_config to the adobe-component-ext.properties file.

  **Note:** The filename is case-sensitive.

9 Locate the file wsjaas.conf and add the following lines:
INSTALLING AND DEPLOYING ADOBE LIVECYCLE ES3 FOR WEBSHERE

Post-deployment tasks

FileNetP8 {com.filenet.api.util.WSILoginModule required;};
FileNetP8WSI {com.filenet.api.util.WSILoginModule required;};
FileNetP8Engine
   {com.ibm.ws.security.common.auth.module.proxy.WSLoginModuleProxy
      required delegate=com.ibm.ws.security.common.auth.module.
      WSLoginModuleImpl;};
FileNetP8Server
   {com.ibm.ws.security.common.auth.module.proxy.WSLoginModuleProxy
      required delegate=com.ibm.ws.security.common.auth.module.
      WSLoginModuleImpl;};
FileNetP8KerberosService
   {com.ibm.ws.security.common.auth.module.proxy.WSLoginModuleProxy
      required delegate=com.filenet.engine.authentication.kerberos.login.
      KrbServiceLoginModule;
      com.ibm.ws.security.common.auth.module.proxy.WSLoginModuleProxy required
delegate=com.ibm.ws.security.server.lm.ltpaLoginModule;
      com.ibm.ws.security.common.auth.module.proxy.WSLoginModuleProxy required
delegate=com.ibm.ws.security.server.lm.
      wsMapDefaultInboundLoginModule;};

Note: By default, the wsjaas.conf file is located in the folder [appserver root]/profiles/[profile name]/properties/.

10 If the application server is not currently running, start the server. Otherwise, stop and then restart the server.

11 (Applicable only if IBM FileNet and LiveCycle are installed on the same WebSphere application server) Verify that
these settings have been implemented correctly in the WebSphere Administrative Console by doing the following:

   • In the WebSphere Administrative Console navigation tree, click Security > Global security.
   • Under Authentication, click Java Authentication and Authorization Service > Application logins.
   • Click the FileNetP8 application login, and then click JAAS login modules.

If the values on this page do not match the following, modify them:

Module class name: "com.filenet.api.util.WSILoginModule"

Authentication Strategy: REQUIRED

Module Order: 1

Click OK or Apply, and then click Save directly to master configuration.

12 Open a web browser and enter this URL:
   http://[host]:[port]/adminui

13 Log in using the default user name and password:
   User name: administrator
   Password: password

14 Click Services > LiveCycle ES3 Connector for IBM FileNet.

15 Provide all of the required FileNet repository information and, under Repository Service Provider Information, select IBM FileNet Repository Provider.

   If your deployment uses the optional process engine service, under Process Engine Settings, select Use Process
   Engine Connector Service and specify the process engine settings. For more information, click the Help link in the
   upper-right corner of the page.
Note: The credentials that you provide in this step are validated later when you start the IBM FileNet repository services. If the credentials are not valid, an error is thrown and the services will not start.

16 Click Save and navigate to Services > Applications and Services > Service Management.

17 Select the check box next to each of these services and then click Start:
   - IBMFileNetAuthProviderService
   - IBMFileNetContentRepositoryConnector
   - IBMFileNetRepositoryProvider
   - IBMFileNetProcessEngineConnector (if configured)

If any of the services do not start correctly, verify the Process Engine settings.

18 Do one of the following tasks:
   - To use the FileNet Authorization service (IBMFileNetAuthProviderService) to display content from a FileNet object store in the Resources view of Workbench, continue with this procedure. Using the FileNet Authorization service overrides the default LiveCycle authorization and must be configured to log in to Workbench by using FileNet credentials.
   - To use the LiveCycle repository, log in to Workbench by using the LiveCycle super administrator credentials (by default, administrator and password). The credentials provided in step 16 use the default LiveCycle authorization service for accessing the default repository in this case.

19 Restart your application server.

20 Log in to Administration Console and click Settings > User Management > Domain Management.

21 Click New Enterprise Domain and then type a domain ID and name. The domain ID is the unique identifier for the domain. The name is a descriptive name for the domain.

   When using DB2 for your LiveCycle database, the maximum permitted length of the ID is 100 single-byte (ASCII) characters or 50 double-byte characters or 25 four-byte characters. (See “Adding enterprise domains” in Administration Help.)

22 Add a custom authentication provider:
   - Click Add Authentication.
   - In the Authentication Provider list, select Custom.
   - Select IBMFileNetAuthProviderService and then click OK.

23 Add an LDAP authentication provider:
   - Click Add Authentication.
   - In the Authentication Provider list, select LDAP and then click OK.

24 Add an LDAP directory:
   - Click Add Directory and, in the Profile Name box, type a unique name, and then click Next.
   - Specify values for the Server, Port, SSL, Binding, and Populate page with options. If you select User for the Binding option, you must also specify values for the Name and Password fields.
   - (Optional) Select Retrieve Base DN to retrieve base domain names, as required. When finished, click Next.
   - Configure the user settings, click Next, configure group settings as required, and then click Next.

   For details about the settings, click Help link in the upper-right corner of the page.

25 Click OK to exit the Add Directory page, and then click OK again.
26 Select the new enterprise domain and click Sync Now. Depending on the number of users and groups in your LDAP network and the speed on your connection, the synchronization process may take several minutes.

(Optional) To verify the status of the synchronization, click Refresh and view the status in the Current Sync State column.

27 Navigate to Settings > User Management > Users and Groups.

28 Search for users that were synchronized from LDAP and perform these tasks:

• Select one or more users and click Assign Role.
• Select one or more LiveCycle roles and click OK.
• Click OK a second time to confirm the role assignment.

Repeat this step for all users you want to assign roles to. For more information, click the Help link in the upper-right corner of the page.

29 Start Workbench and log in using the following credentials for the IBM FileNet repository:

User name: [username]@[repository_name]

Password: [password]

The FileNet object store should now be visible in the Resources view within Workbench. If you do not log in using the username@repository name, Workbench attempts to log in to the default repository specified in step 16.

30 (Optional) If you intend to install the LiveCycle Samples for Connector for IBM FileNet, create a FileNet object store named Samples and install the samples in that object store.

After you configure Connector for IBM FileNet, it is recommended that you see LiveCycle Administration Help for information about configuring Workbench functions properly with your FileNet repository.

5.13 Installing additional libraries for UNIX and Linux

On UNIX and Linux systems, ConvertPDFservice and XMLFormService require some additional system libraries. See LiveCycle UNIX system library dependencies in Hardening and Security guide for the list of required libraries.
Chapter 6: Advanced Production Configuration

This section describes advanced tuning for Adobe® LiveCycle® Output 10, Adobe® LiveCycle® Forms 10, and PDF Generator. This section should be completed only on a production system by an advanced application server administrator.

6.1 Configuring pool size for Output and Forms

The current default value for PoolMax is 4. The actual value to set depends on the hardware configuration and the expected usage in your environment.

For optimal use, we recommend that the lower limit of PoolMax not be less than the number of CPUs that are available. The upper limit must be determined by the load pattern on your server. Generally, the upper limit should be set to twice the number of CPUs cores on your server.

Modify the existing PoolMax value

1. Log in to the WebSphere Administrative Console.
3. Add the following properties for ConvertPdf:
   - com.adobe.convertpdf.bmc.POOL_MAX=[new value]
   - com.adobe.convertpdf.bmc.MAXIMUM_REUSE_COUNT=5000
   - com.adobe.convertpdf.bmc.REPORT_TIMING_INFORMATION=true
   - com.adobe.convertpdf.bmc.CT_ALLOW_SYSTEM_FONTS=true
4. Add the following properties for XMLFM:
   - com.adobe.xmlform.bmc.POOL_MAX=[new value]
   - com.adobe.xmlform.bmc.MAXIMUM_REUSE_COUNT=5000
   - com.adobe.xmlform.bmc.REPORT_TIMING_INFORMATION=true
   - com.adobe.xmlform.bmc.CT_ALLOW_SYSTEM_FONTS=true
5. (Cluster only) Repeat steps 2 to 4 for each server in the cluster.

6.2 PDF Generator

PDF Generator is capable of doing multiple PDF conversions simultaneously for some types of input files. This is enforced through the use of stateless session beans.
6.2.1 Configuring EJB Pool Size

Four different stateless session beans exist for enforcing independent pool sizes for the following types of input files:

- Adobe PostScript® and Encapsulated PostScript (EPS) files
- Image files, such as BMP, TIFF, PNG, and JPEG files
- OpenOffice files
- All other file types (except HTML files), such as Microsoft Office, Photoshop®, PageMaker®, and FrameMaker® files

The pool size for HTML-to-PDF conversions is not managed through the use of stateless session beans.

The default pool size for PostScript and EPS files and for image files is set to 3, and the default pool size for OpenOffice and other file types (except HTML) is set to 1.

You can configure the PS/EPS and image pool size to a different value based on your server hardware configuration, such as the number of CPUs, the number of cores within each CPU, and so on. However, it is mandatory that the pool size for the OpenOffice and other file types be left unchanged at 1 for proper functioning of PDF Generator.

This section describes how the pool size for PS2PDF and Image2PDF can be configured for each of the supported application servers.

The text that follows assumes that the following two LiveCycle application EARs are deployed on the application server:

- adobe-livecycle-websphere.ear
- adobe-livecycle-native-websphere-[platform].ear

where [platform] should be replaced with one of the following strings, depending on your operating system:

- (Windows) x86_win32
- (Linux) x86_linux
- (SunOS™) sparc_sunos
- (AIX) powerpc_aix

Configure the pool size for PS2PDF and Image2PDF

Refer to Distiller service settings and Generate PDF service settings under “Managing services” in the LiveCycle Administration Help.

6.3 Enabling CIFS on Windows

You will need to manually configure the Windows Server machine that host LiveCycle.

**Note:** Ensure that the server has a static IP address.

On Windows machines, you need to do the following:
6.3.1 Enable NetBIOS over TCP/IP
You need to enable NetBIOS over TCP/IP so that clients connecting to the LiveCycle Server can have their requests revolved for the server host name.

1. In the Local Area Connection Properties dialog box, on the General tab, select Internet Protocol, and then click Properties.
2. In the General tab of the Internet Protocol (TCP/IP) Properties dialog box, ensure that the server has a static IP address. Click Advanced.
3. In the Advanced TCP/IP Settings dialog box, select the WINS tab and select Enable NetBIOS over TCP/IP.

6.3.2 Add additional IP addresses

1. In the Local Area Connection Properties dialog box, on the General tab, select Internet Protocol, and then click Properties.
2. In the General tab of the Internet Protocol (TCP/IP) Properties dialog box, ensure that the server has a static IP address. Click Advanced.
3. In the Advanced TCP/IP Settings dialog box, select the IP Settings tab and click Add.
4. Specify a static IP address and click Add.

6.3.3 Disable SMB over NetBIOS registry (Windows Server 2003 only)
You must disable SMB over NetBIOS by editing the Windows registry.

1. In the Windows Registry Editor, navigate to HKEY_LOCAL_MACHINE > SYSTEM > CurrentControlSet > Services > NetBT > Parameters.
2. Set the DWORD SMBDeviceEnabled to 0. If it is not present, add a new DWORD value with name SMBDeviceEnabled and set it to 0.

6.3.4 Disable File and Printer Sharing (Windows Server 2008 only)

- Go to Network Settings, deselect File and Printer Sharing for Microsoft Clients, and click Apply.
Chapter 7: Appendix - Install Command Line Interface

7.1 Overview

LiveCycle provides a command line interface (CLI) for the installation program. The CLI is intended to be used by advanced users of LiveCycle or in server environments which do not support the use of the Graphical User Interface (GUI) of the installation program. The CLI runs in console mode with one interactive session for all install operations.

Before you install the modules using the CLI install option, ensure that you have prepared your environment required to run LiveCycle according to the Preparing guide for fresh single server installation, cluster setup, or upgrade, as appropriate. The completed LiveCycle documentation is available at http://www.adobe.com/go/learn_lc_documentation_10.

For an overview of the installation process, see “3.1 Before you begin” on page 6.

After you start the installation process, follow the on-screen instructions to choose your installation options. Respond to each prompt to proceed to the next step in the installation.

Note: If you want to change a choice that you made on a previous step, type back. You can cancel the installation at any time by typing quit.

7.2 Install LiveCycle

1. Open a command prompt and navigate to the folder in the installation media or your hard disk that contains the installer executable:
   - (Windows) server\Disk1\InstData\Windows_64\VM
   - (Linux) server/Disk1/InstData/Linux/NoVM
   - (Solaris) server/Disk1/InstData/Solaris/NoVM
   - (AIX) server/Disk1/InstData/AIX/VM

2. Open a command prompt and run the following command:
   - (Windows) install.exe -i console
   - (Non-Windows) ./install.bin -i console

   Note: Entering the command without the -i console option launches the GUI-based installer.

3. Respond to the prompts as described in the following table:
If an error occurs, you can review the install.log in the log directory of your installation:

- (Windows) [LiveCycle root]/log
- (AIX, Linux, Solaris) [LiveCycle root]/log
7.4 Uninstalling LiveCycle in console mode

Note: If you had installed LiveCycle using the command line option, you can uninstall LiveCycle ES3 only by running the uninstaller from the command line. If you want a silent uninstallation, omit the “-i console” flag.

1 Open a command prompt, and navigate to the directory which contains the uninstall script:

Note: On UNIX systems, you should manually navigate to the directory that contains the uninstall script because the directory name contains spaces.

- (Windows) cd C:\Adobe\Adobe LiveCycle ES3\Uninstall_Adobe LiveCycle ES3
- (UNIX-like systems) cd opt/adobe/adobe livecycle es3/Uninstall_Adobe_livecycle ES3

2 Type the following command at the prompt and press Enter:

- (Windows) Uninstall Adobe LiveCycle ES3 -i console
- (AIX) ./Uninstall_adobe_livecycle_ES3 -i console
- (Linux, Solaris) ./Uninstall Adobe Livecycle ES3 -i console

3 Follow the on-screen instructions.

<table>
<thead>
<tr>
<th>Prompt</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Uninstall LiveCycle ES3</td>
<td>Press Enter to continue uninstallation. Enter quit to close the uninstall program.</td>
</tr>
<tr>
<td>Uninstalling...</td>
<td>After the uninstallation starts, the rest of the uninstallation process is completed and the cursor returns to the prompt. Note that some items may not be removed. Also, any folder created after installing LiveCycle are not removed. You must remove these files and folders manually.</td>
</tr>
<tr>
<td>Uninstall Complete</td>
<td></td>
</tr>
</tbody>
</table>
Chapter 8: Appendix - Configuration Manager Command Line Interface

LiveCycle provides a Command Line Interface (CLI) for the Configuration Manager. The CLI is intended to be used by advanced users of LiveCycle, for example in server environments which do not support the use of the Graphical User Interface (GUI) of the Configuration Manager.

8.1 Order of operations

The Configuration Manager CLI must follow the same order of operations as the GUI version of the Configuration Manager. Ensure that you use the CLI operations in this order:

1. Configure LiveCycle.
2. Validate application server topology.
3. Validate the database connectivity.
4. Configure the application server.
5. Validate the application server configurations.
8. Validate LiveCycle.
9. Deploy the LiveCycle modules.
10. Validate the LiveCycle module deployment.
11. Check system readiness for PDF Generator.
12. Add administrator user for PDF Generator.
13. Configure Connector for IBM Content Manager.
15. Configure Connector for EMC Documentum.
17. Configure Correspondance Management.

8.2 Command Line Interface property file

The Configuration Manager CLI requires a property file containing the defined properties for your LiveCycle environment. The template for the properties file, cli_propertyFile_template.txt, is located in the [LiveCycle root]/configurationManager/bin folder. You must create a copy of this file and edit the values. You can customize this file based on the Configuration Manager operations you intend to use. The following section describes the properties and values required.
You should create the property file according to your installation. Use one of the following methods.

- Create a property file and populate the values according to your installation and configuration scenarios.
- Copy the property file cli_propertyFile_template.txt to use them as cli_propertyFileupgrade_template.txt template and edit the values based on the Configuration Manager operations you intend to use.
- Use the GUI of the Configuration Manager and then use the property file created by the GUI version as the CLI version property file. When you run the [LiveCycle root]/configurationManager/bin/ConfigurationManager.bat file, the userValuesForCLI.properties file is created in the [LiveCycle root]/configurationManager/config directory. You can use this file as input for the Configuration Manager CLI.

*Note:* In the CLI properties file, you must use the escape character (\) for Windows paths directory separator (\). For example, if the Fonts folder to be mentioned is C:\Windows\Fonts, in the Configuration Manager CLI script, you should enter it as C:\\Windows\\Fonts.

### 8.3 General configuration properties

#### 8.3.1 Common properties

Common properties are:

**WebLogic and WebSphere specific properties:** Required for the Configure the Application Server, Deploy LiveCycle, Validate Application Server Topology and Validate Application Server Configurations operations.

**LiveCycle Server specific properties:** Required for the Initialize LiveCycle and Deploy LiveCycle Components operations.

These properties are required for the following operations:

- Initialize LiveCycle
- Deploy LiveCycle components.

<table>
<thead>
<tr>
<th>Property</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>targetServer.topologyType</td>
<td>server or cluster</td>
<td>The type of application server topology for which you are deploying LiveCycle.</td>
</tr>
<tr>
<td>targetServer.name</td>
<td>String</td>
<td>The name assigned to the application server/admin server node or cluster.</td>
</tr>
<tr>
<td>targetServer.adminHost</td>
<td>String</td>
<td>The hostname of the server where the application server is installed.</td>
</tr>
<tr>
<td>targetServer.adminHost</td>
<td>localhost</td>
<td>The hostname of the server where the application server is installed.</td>
</tr>
<tr>
<td>targetServer.adminPort</td>
<td>Integer</td>
<td>The port number the admin server uses to listen for SOAP requests.</td>
</tr>
<tr>
<td>targetServer.adminUserID</td>
<td>String</td>
<td>The administrative user ID to use when accessing the application server.</td>
</tr>
<tr>
<td>localServer.appServerRootDir</td>
<td>Default: (Windows) C:\Program Files\IBM\WebSphere\AppServer (Linux, Solaris) /opt/IBM/WebSphere/AppServer (AIX) /usr/IBM/WebSphere/AppServer</td>
<td>The root directory of the application server instance that you are configuring locally (on which you plan to deploy LiveCycle or that you will use to communicate with a remote server on which you plan to deploy LiveCycle).</td>
</tr>
</tbody>
</table>
### 8.3.2 Configure LiveCycle properties

These properties only apply to the configure LiveCycle operation.

<table>
<thead>
<tr>
<th>Property</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AdobeFontsDir</td>
<td>String</td>
<td>Location of the Adobe server fonts directory. This path must be accessible from the server being deployed to.</td>
</tr>
<tr>
<td>customerFontsDir</td>
<td>String</td>
<td>Location of the customer fonts directory. This path must be accessible from the server being deployed to.</td>
</tr>
<tr>
<td>systemFontsDir</td>
<td>String</td>
<td>Location of the system fonts directory. This path must be accessible from the server being deployed to.</td>
</tr>
<tr>
<td>LCTempDir</td>
<td>String</td>
<td>Location of the temporary directory. This path must be accessible from the server being deployed to.</td>
</tr>
</tbody>
</table>
8.3.3 Configure or validate application server properties

8.3.3.1 Configure or Validate WebSphere properties
The Configuration Manager can configure or validate your WebSphere application server as required by LiveCycle.

These properties apply to the following operations:
- Configure Application Server
- Validate Application Server Topology
- Validate Application Server Configurations
- Validate Database Connectivity

8.3.3.2 Application server properties

<table>
<thead>
<tr>
<th>Property</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \text{LCGlobalDocStorageDir} )</td>
<td>String</td>
<td>The global document storage root directory. Specify a path to an NFS shared directory used to store long-lived documents and to share them among all cluster nodes. Specify this property only when deploying LiveCycle components in a clustered environment. This path must be accessible from the server being deployed to.</td>
</tr>
<tr>
<td>( \text{EnableDocumentDBStorage} )</td>
<td>true or false</td>
<td>Enables or disables document storage in database for persistent documents. Even if you enable document storage in database, you will need the file system directory for GDS.</td>
</tr>
<tr>
<td>( \text{contentServices.myfacesDir} )</td>
<td>String</td>
<td>Directory where myfaces jars will be copied and used as shared libs</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Property</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \text{jvm.initialHeapSize} )</td>
<td>Default: 256</td>
<td>The initial heap size, in MB, for the JVM.</td>
</tr>
<tr>
<td>( \text{jvm.maxHeapSize} )</td>
<td>Default: 1792</td>
<td>The maximum heap size, in MB, for the JVM.</td>
</tr>
<tr>
<td>( \text{WebLogic and WebSphere Cluster only} )</td>
<td></td>
<td></td>
</tr>
<tr>
<td>( \text{cache.useUDP} )</td>
<td>true</td>
<td>Set the value to true if LiveCycle uses UDP to implement caching. Set to false if LiveCycle uses TCP to implement caching.</td>
</tr>
</tbody>
</table>
8.3.4 Deploy LiveCycle properties

These Deploy LiveCycle properties only apply to the deploy LiveCycle operation.
8.3.5 Initialize LiveCycle properties

These initialize LiveCycle properties only apply to the initialize LiveCycle operation.

<table>
<thead>
<tr>
<th>Property</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>deployment.includeIVS</td>
<td>false</td>
<td>Specifies whether IVS EAR files are included in the deployment. It is recommended not to include IVS EAR files in a production environment.</td>
</tr>
<tr>
<td>targetServer.virtualHost</td>
<td>String</td>
<td>Virtual host of your WebSphere application server. The default values are admin_host, default_host, proxy_host.</td>
</tr>
</tbody>
</table>

8.3.6 Deploy LiveCycle Components properties

These properties apply to the following operations:
- Deploy LiveCycle Components
- Validate LiveCycle Component Deployment
- Validate LiveCycle Server.

<table>
<thead>
<tr>
<th>Property</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>

8.3.12 Command Line Interface Usage

Once you have configured your property file, you must navigate to the [LiveCycle root]/configurationManager/bin folder.

To view a complete description of the Configuration Manager CLI commands, type: `ConfigurationManagerCLI help <command name>`.

Last updated 1/10/2013
Configure LiveCycle CLI usage
The Configure LiveCycle operation requires the following syntax:

```
configureLiveCycle -f <propertyFile>
```

Where:

- `-f <propertyFile>`: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.

Extract CRX Bundles in LiveCycle
The Extract CRX Bundles operation requires the following syntax:

```
extractCRXInstallationContent [- crx_password<password>] -f <propertyFile>
```

Where:

- `-f <propertyFile>`: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.

Configure Correspondence Management
The Configure Correspondence Management operation requires the following syntax:

```
configureCRXRepository -f <propertyFile>
```

Where:

- `-f <propertyFile>`: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.

8.3.12.1 Configure LiveCycle CLI Usage
The Configure LiveCycle operation requires the following syntax:

```
configureLiveCycle -f <propertyFile>
```

Where:

- `-f <propertyFile>`: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.

8.3.12.2 Configure the Application Server CLI Usage
The Configure the Application Server operation requires the following syntax:

```
configureApplicationServer -targetServer_AdminPassword <password> -f <propertyFile> [-skip <configurationsToSkipList>]
```

Where:

- `-targetServer_AdminPassword <password>`: Allows you to set the Administrator password on the command line. If this argument is present, it will override the targetServer_AdminPassword property in the property file.
- `-f <propertyFile>`: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.
- `-skip <configurationsToSkipList>`: This is an optional parameter which allows you to list the application server components you do not want to configure. Specify the excluded components in a comma separated list. Valid options are Datasource or Core.
8.3.12.3 (WebSphere and Weblogic Only) Deploy LiveCycle CLI Usage

The Deploy LiveCycle operation requires the following syntax:

`deployLiveCycle -f <propertyFile>`

Where:

- `-f <propertyFile>`: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.

  **Important:** You must restart your application server after you complete Deploy LiveCycle operation.

8.3.12.4 Initialize LiveCycle CLI Usage

The initialize LiveCycle operation requires the following syntax:

`initializeLiveCycle -f <propertyFile>`

Where:

- `-f <propertyFile>`: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.

8.3.12.5 Deploy LiveCycle Components CLI Usage

The Deploy LiveCycle Components operation requires the following syntax:

`deployLiveCycleComponents -f <propertyFile> -LCAdminPassword <password>`

Where:

- `-f <propertyFile>`: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.

- `-LCAdminPassword <password>`: Allows you to set the Admin password on the command line. If this argument is present, it will override the targetServer.adminPassword property in the property file.

8.3.12.6 Validate Application Server Topology CLI Usage

The Validate Application Server Topology operation is optional and requires the following syntax:

`validateApplicationServerTopology -f <propertyFile> -targetServer_AdminPassword <password>`

Where:

- `-f <propertyFile>`: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.

- `-targetServer_AdminPassword <password>`: Allows you to set the Admin password on the command line. If this argument is present, it will override the targetServer.adminPassword property in the property file.

8.3.12.7 Validate database connectivity CLI Usage

The validate database connectivity operation is optional and requires the following syntax:

`validateDBConnectivity -f <propertyFile> -datasource_dbPassword <password>`

Where:

- `-f <propertyFile>`: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.
• -datasource_dbPassword <password>: Allows you to set the database user password on the command line. If this argument is present, it will override the datasource.dbPassword property in the property file.

8.3.12.8 Validate Application Server Configurations CLI Usage
The Validate Application Server Configurations operation is optional and requires the following syntax:
validateApplicationServerConfigurations -f <propertyFile> -targetServer_AdminPassword <password>
Where:
• -f <propertyFile>: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.
• -targetServer_AdminPassword <password>: Allows you to set the Admin password on the command line. If this argument is present, it will override the targetServer.adminPassword property in the property file.

8.3.12.9 Validate LiveCycle Server CLI Usage
The Validate LiveCycle Server operation is optional and requires the following syntax:
validateLiveCycleServer -f <propertyFile> -LCAdminPassword <password>
Where:
• -f <propertyFile>: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.
• -LCAdminPassword <password>: Allows you to set the Admin password on the command line. If this argument is present, it will override the targetServer.adminPassword property in the property file.

8.3.12.10 Validate LiveCycle Component Deployment CLI Usage
The Validate LiveCycle Component Deployment operation is optional and requires the following syntax:
validateLiveCycleComponentDeployment -f <propertyFile> -LCAdminPassword <password>
Where:
• -f <propertyFile>: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.
• -LCAdminPassword <password>: Allows you to set the Admin password on the command line. If this argument is present, it will override the targetServer.adminPassword property in the property file.

8.3.12.11 Check system readiness for PDF Generator
The Checking system readiness for PDF Generator operation requires the following syntax:
pdfg-checkSystemReadiness

8.3.12.12 Adding administrator user for PDF Generator
The adding administrator user for PDF Generator operation requires the following syntax:
pdfg-addAdminUser -f <propertyFile>
Where:
• -f <propertyFile>: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.
8.3.12.13 Configure Connector for IBM Content Manager

The Configure Connector for IBM Content Manager operation is optional and requires the following syntax:

IBMCM-configurationCLI -f <propertyFile>

Where:

- `-f <propertyFile>`: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.

  **Important:** Modify the `<propertyFile>` called `cli_propertyFile_ecm_ibmcm_template.txt` located in the `[LiveCycle root]/configurationManager/bin/` directory.

Perform the following steps manually to complete the configuration for Connector for IBM Content Manager.

1. Copy the `adobe-component-ext.properties` file from `[LiveCycle root]/configurationManager/configure-ecm/websphere` to the following `[appserver root]/profiles/[profile_name]` directory.
2. Restart the Application Server.
3. Start the following services from LiveCycle Administration Console
   - `IBMCMAuthProviderService`
   - `IBMCMConnectorService`

8.3.12.14 Configure Connector for IBM FileNet

The Configure Connector for IBM FileNet operation is optional and requires the following syntax:

`filenet-configurationCLI -f <propertyFile>`

Where:

- `-f <propertyFile>`: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.

  **Important:** Modify the `<propertyFile>` called `cli_propertyFile_ecm_filenet_template.txt` located in the `[LiveCycle root]/configurationManager/bin/` directory.

Perform the following steps manually to complete the configuration for Connector for IBM Content Manager.

1. Copy the `adobe-component-ext.properties` file from `[LiveCycle root]/configurationManager/configure-ecm/websphere` to the following `[appserver root]/profiles/[profile_name]` directory.
2. Locate the `wsjass.conf` file in the `[appserver root]/profiles/[profile_name]/properties` directory and add to it contents of `wsjass.conf` file available in `[LiveCycle root]/configurationManager/configure-ecm/websphere` directory.
3. (Only for FileNet 4.x) Add the Java option `-Dwasp.location=[FileNetClient root]/wsi` to the Application Server startup options.
4. Restart the Application Server.
5. Start the following services from LiveCycle Administration Console
   - `IBMFileNetAuthProviderService`
   - `IBMFileNetContentRepositoryConnector`
   - `IBMFileNetRepositoryProvider`
   - `IBMFileNetProcessEngineConnector (If configured)`
8.3.12.15 Configure Connector for EMC Documentum

The Configure Connector for EMC Documentum operation is optional and requires the following syntax:

documentum-configurationCLI -f <propertyFile>

Where:

- `-f <propertyFile>`: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.

**Important:** Modify the `<propertyFile>` called cli_propertyFile_ecm_documentum_template.txt located in the `[LiveCycle root]\configurationManager\bin\` directory.

Perform the following steps manually to complete the configuration for Connector for EMC Documentum.

1. Copy the `adobe-component-ext.properties` file from `[LiveCycle root]/configurationManager/configure-ecm/websphere` to the following `[appserver root]/profiles/[profile_name]` directory.
2. Restart the Application Server.
3. Start the following services from LiveCycle Administration Console
   - EMCDocumentumAuthProviderService
   - EMCDocumentumRepositoryProvider
   - EMCDocumentumContentRepositoryConnector

8.3.12.16 Configure Connector for Microsoft SharePoint

The Configure Connector for Microsoft SharePoint operation is optional and requires the following syntax:

sharepoint-configurationCLI -f <propertyFile>

Where:

- `-f <propertyFile>`: A property file containing the required arguments. For more information on creating a property file, see Command Line Interface property file.

**Important:** Modify the `<propertyFile>` called cli_propertyFile_ecm_sharepoint_template.txt located in the `[LiveCycle root]\configurationManager\bin\` directory.

8.4 Examples Usage

From the `C:\Adobe\Adobe LiveCycle ES3\configurationManager\bin`, type:

```
ConfigurationManagerCLI configureLiveCycle -f cli_propertyFile.txt
```

Where `cli_propertyFile.txt` is the name of the property file you created.

8.5 Configuration Manager CLI Logs

If an error occurs, you can review the CLI logs located here in the `[LiveCycle root]\configurationManager\log` folder. The log file generated will have a naming convention such as lcmCLI.0.log where the number in the filename (0) will increment when the log files are rolled over.
8.6 Next steps

If you used Configuration Manager CLI to configure and deploy LiveCycle, you can now do the following tasks:

- Verify the deployment. (See “5.1.3 Verify the deployment” on page 20.)
- Access Administration Console. (See “5.1.3.1 Accessing Administration Console” on page 20.)
- Configure LiveCycle modules to access LDAP. (See “5.5 Configuring LDAP access” on page 31.)
Chapter 9: Appendix - Manually Configuring WebSphere

Note: This appendix describes how to manually configure your application server for Adobe LiveCycle ES3. The Configuration Manager provides an option to automatically complete these steps for you. If you deselect this option, you will need to complete the steps in this appendix.

For information about how to automatically configure your application server, see “4.3 Configuring and deploying LiveCycle” on page 13.

At this point in the installation process, you have already installed LiveCycle files and run Configuration Manager to configure the LiveCycle deployable archives. Now, you can manually configure the database connectivity with the application server.

9.1 Setting directory permissions

The LiveCycle application will extract files to the [appserver root]/installedApps directory. Therefore, it is important that writable permissions be given to that directory. If writable permissions cannot be given, the section below describes how to modify the location for the extracted files.

Note: It is recommended that you modify the location of the extracted files to [appserver root]/profiles/<profile_name>/installedApps.

9.1.1 Modify the location for the extracted files

1. Log in to the WebSphere Administrative Console.
2. Click Servers > Server Types > WebSphere Application servers and click your server name, such as server1.
4. Under Additional Properties, click Java Virtual Machine and then click Custom Properties.
6. Set the value of adobeidp.RootDirectory to the path where Adobe native files should be extracted, such as [appserver root]/profiles/<profile_name>/installedApps.
7. Click OK or Apply.
8. In the Messages box, click Save directly to master configuration, and then restart the application server.

9.2 Configuring JVM arguments

You must configure the JVM arguments and custom properties.

Configure the JVM arguments

1. In the WebSphere Administrative Console navigation tree, do the following for your application server:
   - Click Servers > Server Types > WebSphere application servers
In the right pane, click the server name.

4 Under Additional Properties, click Java Virtual Machine.

5 In the Initial Heap Size box, type 256 and, in the Maximum Heap Size box, type 1792.

*Note: This value depends on the hardware configuration and the available memory. If you are using an x86/64-bit server, you can set the Maximum Heap Size to 1792 or higher.*

6 In the Generic JVM arguments box, add the following arguments.

- `-Xgcpolicy:gencon`
- `-Dfile.encoding=utf8`
- `-DentityExpansionLimit=10000`

*Note: Add the `-Xgcpolicy:gencon` JVM argument only if WebSphere is using the IBM JDK. However, do not add this argument in case of WebSphere on Solaris operating system.*

7 Click OK or Apply, and then click Save directly to the master configuration.

8 In the right pane, under Additional Properties, click Custom Properties, and then click New.

9 In the Name box, type `java.net.preferIPv4Stack` for IPv4 or `java.net.preferIPv6Stack` for IPv6 and, in the Value box, type `true`.

10 Click OK or Apply and then click Save directly to master configuration.

### 9.3 Configuring WebSphere time-out settings

Creating a large number of users can be done by using a single invocation of the `CreateLocalUsers` API. The API is expected to persist all the new users or rollback all changes in the event of a failure. Therefore, the API is required to operate in a single transaction to support rollback. Because a transaction's lifetime is limited by the application server settings (usually 30 seconds), the number of inserts that can be performed in the given time frame is limited. As a result, bulk insert APIs such as `CreateLocalUser` fail when the number of users exceeds a certain limit. This limit is decided again by the transaction’s lifetime.

You must modify the following time-out settings:

- Transaction time-out value
- CORBA time-out value
- SOAP request time-out value

#### Configure transaction time-out

1 In the WebSphere Administrative Console navigation tree, do the following for your application server:

   Click Servers > Server Types > WebSphere application servers

2 Click the server name in the right pane.

3 Under Container Settings, click Container Services > Transaction Service.

4 Under General Properties, in the Total transaction lifetime timeout box, type 300 (or higher).

5 Ensure that the value in the Maximum transaction timeout box is greater than or equal to the Total transaction lifetime timeout.
6 Click **OK** or **Apply** and then click **Save** directly to master configuration.

**Increase the CORBA time-out value**

1 In the WebSphere Administrative Console navigation tree, do the following for your application server:
   - Click **Servers > Server Types > WebSphere application servers**
2 Click the server name in the right pane.
3 Under Container Settings, click **Container Services > ORB Service**.
4 Under General Properties, in the **Requesttimeout** box, type **360** and, in the **Locate Request Timeout** box, type **300**.
5 Click **OK** or **Apply** and then click **Save** directly to master configuration.

**Increase the SOAP request time-out value**

1 Navigate to your 
   - `appserver root` directory and search for all files named `soap.client.props`. Multiple files may have this name. For example, the following files may require modifications. Modification of the template profile definitions is required only if profiles will be created using these templates:
   - `appserver root/profileTemplates/default/documents/properties/soap.client.props`
   - `appserver root/profileTemplates/cell/default/documents/properties/soap.client.props`
   - `appserver root/cip/profileTemplates/minimal/documents/properties/soap.client.props`
   - `appserver root/profiles/AppSrv01/properties/soap.client.props`
2 Open the file in a text editor, find the **com.ibm.SOAP.requestTimeout** property, change the value from 180 to 1800, and then save the file(s).
   
   **Note:** Repeat this step for each file.
3 In the WebSphere Administrative Console navigation tree, do the following for your application server:
   - (WebSphere 6.1) Click **Servers > Application servers**.
   - (WebSphere 7.0) Click **Servers > Server Types > WebSphere application servers**.
4 Click the server name in the right pane.
5 Under Server Infrastructure, click **Administration > Administration Services**.
6 Under Additional Properties, click **JMX connectors** and, in the right pane, click **SOAPConnector** in the list.
7 On the next screen, click **Custom Properties**, and then click **requestTimeout** in the list.
8 Under General Properties, in the Value box, change 600 to 1800.
9 Click **OK** or **Apply** and then click **Save directly to master configuration**.

**Note:** Increase the SOAP request time-out value beyond 1800 if EAR deployment fails with **The system failed to make the SOAP RPC call: invoke error**.

### 9.4 Configuring throttling for PDF Generator

PDF Generator requires a throttling configuration to be added to the application server configuration.

1 In the WebSphere Administrative Console navigation tree, do the following for your application server:
   - Click **Servers > Server Types > WebSphere application servers**

Last updated 1/10/2013
2 Click the server name in the right pane.

4 Under Additional Properties, click Java Virtual Machine and, on the next screen, click Custom Properties.

5 Click New and, in the following boxes, type the corresponding text to create a new property:

   **Name:** com.ibm.websphere.ejbcontainer.poolSize

   **Value:**
   
   LiveCycleES3#adobe-pdfg-bmc-invoker-ejb.jar#NativeToPDFInvoker=1,1:
   LiveCycleES3#adobe-pdfg-bmc-invoker-ejb.jar#OpenOfficeToPDFInvoker=1,1:
   LiveCycleES3#adobe-pdfg-bmc-invoker-ejb.jar#ImageToPDFInvoker=3,3:
   LiveCycleES3#adobe-pdfg-bmc-invoker-ejb.jar#PSToPDFInvoker=3,3

   **Note:** You must manually type the value. You cannot copy and paste the value from this document.

   In the example, LiveCycleES3 is the name of the LiveCycle core application as shown in the WebSphere Application Server. If this name is different, all four instances of the string LiveCycleES3 in the value parameter must be replaced with the actual application name.

   **Description:** Adobe PDF Generator Throttling Configuration

6 Click OK or Apply and then click Save directly to master configuration.

### 9.5 Configuring the LiveCycle database connectivity

To enable WebSphere and LiveCycle deployment to connect to the LiveCycle database, create a database connection for LiveCycle by installing the database drivers and then setting up a data source.

Install drivers for the type of database that you use for the LiveCycle database. The drivers must be placed in the installation directories of the application server.

Configure the data source to connect to the database. For WebSphere, you can configure a DB2, an Oracle, or a SQL Server data source.

You will need the following information from tasks you performed in Preparing to Install LiveCycle (Single Server).

- Database name
- Server name
- User name
- Password

#### 9.5.1 Configure J2C authentication for data source

You must configure the J2C authentication for your data source before you configure the data source.

1 In the WebSphere Administrative Console navigation tree, click the following:

   Security > Global Security

2 In the right pane, under Authentication, click Java Authentication and Authorization Service > J2C authentication data and then click New.

3 Provide the appropriate information in these boxes:
Alias: Type a name that is appropriate for the database user (for example, type IDP_DS/db2-db2user).

User ID: Enter a user ID. This ID is the login credential that is used to access whichever database will be used with the IDP_DS data source (for example, db2user).

Password: Type a password for this user.

4 Click OK or Apply and then click Save directly to master configuration.

9.5.2 Configuring DB2 database connectivity

Configuring the DB2 data source requires you to install the DB2 database drivers, create a DB2 JDBC provider on WebSphere, create the data source on WebSphere, and then configure the corresponding connection pool. In addition, WebSphere connecting to DB2 requires a custom property to avoid thread deadlock.

Note: These procedures apply to both DB2 9.1 and DB2 9.5.

Install the DB2 database driver
1 In the [appserver root] directory, create a directory named db2libs.
2 Copy the db2jcc.jar files from one of these locations to the [appserver root]/db2libs directory:
   - The Java directory under your [dbserver root] directory, such as [dbserver root]/ibm/Sqllib/java (Windows) or [dbserver root]/java (Linux or UNIX)
   - (for DB9.5 only) [LiveCycle root]/lib/db/db2

Create a DB2 JDBC provider
1 In the WebSphere Administrative Console navigation tree, click Environment > Websphere Variables and, in the right pane, click DB2UNIVERSAL_JDBC_DRIVER_PATH.
2 In the Value box, type the path to the db2libs directory.
3 Click OK or Apply and then click Save directly to master configuration.
4 In the navigation tree, click Resources > JDBC > JDBC Providers.
5 In the Scope drop-down list in the right pane, select Node=NodeName, Server=ServerName as the level, and then click New.
6 In the Step 1 pane, set the following configuration:
   - In the Database type list, select DB2.
   - In the Provider type list, select DB2 Universal JDBC Driver Provider.
   - In the Implementation type list, select Connection pool data source. Notice that for each Configuration Manager configuration script, the field implementation class name is com.ibm.db2.jcc.DB2ConnectionPoolDataSource.
   - In the Name box, either keep the default DB2 Universal JDBC Driver Provider or type LiveCycle - DB2 - IDP_DS.
7 Click Next and, in the Step 2 pane, click Next again.
8 In the Step 3 pane, click Finish and then click Save directly to master configuration.

Create the DB2 JDBC data source:
1 In the navigation tree, click Resources > JDBC > JDBC Providers and, in the right pane, click the provider that you created in the Create a DB2 JDBC provider section.
2 Under Additional Properties, click Data sources and then click New.
3 In the Enter basic data source information pane, set the following configurations and then click Next:
   • In the Data source name box, type Livecycle - DB2 - IDP_DS.
   • In the JNDI name box, type IDP_DS.
4 In the Enter database specific properties for the datasource pane, type the driver type, database name, server name, and port number of the database that you created in "9.5.1 Configure J2C authentication for data source" on page 71. Ensure that Use this data source in container managed persistence (CMP) is selected, and then click Next.
5 In the Setup security aliases pane, set the following configurations:
   • In the list under Component-managed authentication alias, select the authentication alias that you created for this data source in "9.5.1 Configure J2C authentication for data source" on page 71, and then click Next.
   • In the Mapping-configuration alias list, select DefaultPrincipalMapping.
   • In the Container-managed authentication alias list, select the authentication alias that you created for this data source in "9.5.1 Configure J2C authentication for data source" on page 71.
6 Click Finish in the Step 4 pane.
7 Click OK or Apply and then click Save directly to master configuration.
8 Change the statement cache size. Do the following tasks:
   • In WebSphere Administrative Console, click JDBC > Data sources.
   • Click the data source you just created and under Additional Properties, click WebSphere Application Server data source properties.
   • Change the value of the Statement cache size field to 80.
   • Click OK or Apply and the click Save directly to the master configuration.
9 Select the data source you just created and select Test Connection to ensure that the data source connection is functioning correctly.

Configure LiveCycle - DB2 - IDP_DS connection pools
1 In the navigation tree, click Resources > JDBC > JDBC Providers and, in the right pane, click the JDBC provider you just created (either DB2 Universal JDBC Driver Provider or LiveCycle - db2 - IDP_DS) as used as an example when creating the DB2 JDBC provider.
2 Under Additional Properties, click Data sources and then select Livecycle - DB2 - IDP_DS.
3 On the next screen, under Additional Properties, click Connection Pool Properties and set the properties as follows:
   • In the Maximum connections box, type 30 (or higher if required).
   • In the Minimum connections box, type 1.
4 Click OK or Apply and then click Save directly to master configuration.

Configure the custom property for DB2
1 In the navigation tree, click Resources > JDBC > Data sources and, in the right pane, click the data source that you created.
2 Under Additional Properties, click Custom properties and then click New.
3 In the Name box, type useRRSetEquals and in the Value box, type true.
4 Click OK or Apply and then click Save directly to master configuration.
Create the DB2 JDBC data source for Rights Management

**Note:** This section applies only if you have Rights Management installed.

1. In the navigation tree, click Resources > JDBC > JDBC Providers and then click the provider that you created in the Create a DB2 JDBC provider section.
2. Under Additional Properties, click Data sources and then click New.
3. In the Enter basic data source information pane, set the following configurations and then click Next:
   - In the Data source name box, type Livecycle - DB2 - RM_DS.
   - In the JNDI name box, type EDC_DS.
4. In the Enter database specific properties for the datasource pane, type the driver type, database name, server name, and port number of the database that you created in “9.5.1 Configure J2C authentication for data source” on page 71.
5. Ensure that Use this data source in container managed persistence (CMP) is selected, and then click Next.
6. Set the following configurations in the Setup security aliases pane:
   - In the list under Component-managed authentication alias, select the authentication alias that you created for this data source in “9.5.1 Configure J2C authentication for data source” on page 71, and then click Next.
   - In the Mapping-configuration alias list, select DefaultPrincipalMapping.
   - In the Container-managed authentication alias list, select the authentication alias that you created for this data source in “9.5.1 Configure J2C authentication for data source” on page 71.
7. Click Finish in the Step 4 pane.
8. Click OK or Apply and then click Save directly to master configuration.
9. Change the statement cache size. Do the following tasks:
   - In WebSphere Administrative Console, click JDBC > Data sources.
   - Click the data source you just created and under Additional Properties, click WebSphere Application Server data source properties.
   - Change the value of the Statement cache size field to 80.
   - Click OK or Apply and the click Save directly to the master configuration.
10. Select the data source you just created and select Test Connection to ensure that the data source connection is functioning correctly.

Configure LiveCycle- DB2 - RM_DS connection pools for Rights Management:

**Note:** This section applies only if you have Rights Management installed.

1. In the navigation tree, click Resource > JDBC > JDBC Providers and, in the right pane, click the JDBC provider you just created called DB2 Universal JDBC Driver Provider for RM.
2. Under Additional Properties, click Data sources and then select Livecycle - DB2 - RM_DS.
3. On the next screen, under Additional Properties, click Connection Pool Properties and set the properties as follows:
   - In the Maximum connections box, type 20 (or higher if required).
   - In the Minimum connections box, type 1.
4. Click OK or Apply and then click Save directly to master configuration.
Configure the custom property for DB2:
1. In the navigation tree, click Resources > JDBC > Data sources and, in the right pane, click the data source that you created in the Create the DB2 JDBC data source for Rights Management section.
2. Under Additional Properties, click Custom properties and then click New.
3. In the Name box, type useRRASetEquals and in the Value box, type true.
4. Click OK or Apply and then click Save directly to master configuration.

Set default isolation level
1. Log in to WebSphere Integrated Solutions Console.
2. In the WebSphere Administrative Console navigation tree, click Resources > JDBC > Data Sources.
3. From the drop-down list in the right pane, select Node=NodeName, Server=ServerName. All data sources under the node are displayed.
4. Click LiveCycle - DB2 - IDP_DS with JNDI name IDP_DS.
5. Click Custom Properties.
6. Search for webSphereDefaultIsolationLevel property, and click to open it for edit.
7. Set value as 2. The value 2 denotes Read Committed.
8. Click Apply and then click OK.
9. In the Messages box at the top of the page, click Save directly to master configuration.
10. Restart WebSphere.

9.5.3 Configuring Oracle database connectivity
Configuring the Oracle data source requires you to install the Oracle database drivers, create a Oracle JDBC provider on WebSphere, create the data source on WebSphere, and then configure the corresponding connection pool.

Install the Oracle 11g database driver
1. In the [appserver root] directory, create a directory named db_driver.
2. Copy the ojdbc6.jar for JDK 1.6 driver file from the [LiveCycle root]\lib\db\oracle directory to the directory created in step 1.

Create the Oracle JDBC provider
1. In the WebSphere Administrative Console navigation tree, click Environment > Websphere Variables and, in the right pane, click ORACLE_JDBC_DRIVER_PATH.
2. Under General Properties, in the Value box, type the path to the database driver file, ojdbc6.jar for JDK 1.6, that you created in the Install the Oracle 11g database driver section.
3. Click OK and then click Save directly to master configuration.
4. In the navigation tree, click Resources > JDBC > JDBC Providers.
5. In the Scope drop-down list in the right pane, select Node=NodeName, Server=ServerName as the level, and then click New.
6. In the Step 1 pane, set the following configuration:
   - In the Database type list, select Oracle.
   - In the Provider type list, select Oracle JDBC Driver.
In the **Implementation type** list, select **Connection pool data source**.

In the **Name** text box, modify the default content or leave it as is.

7 Click **Next** and, in the Step 2 pane, accept the default database class path and click **Next** again.

8 In the Step 3 pane, click **Finish**, and then click **Save** directly to master configuration.

**Create the Oracle JDBC data source**

1 In the navigation tree, click **Resources** > **JDBC** > **JDBC Providers** and, in the right pane, click the provider that you created in the *Create the Oracle JDBC provider* section.

2 Under Additional Properties, click **Data sources** and then click **New**.

3 In the **Enter basic data source information** pane, set the following configurations and then click **Next**:
   - In the **Data source name** box, type **Livecycle - oracle - IDP_DS**.
   - In the **JNDI name** box, type **IDP_DS**.
   - In the list under Component-Managed Authentication and XA Recovery Authentication, select the authentication alias that you created for this data source in “9.5.1 Configure J2C authentication for data source” on page 71.

4 In the **Enter database specific properties for the datasource** pane, type the following line in the **URL** field:

   `jdbc:oracle:thin:@[hostname]:[port]:[SID]`

   where `[hostname]` is the IP address of the database server, `[port]` is the port that the database is listening on (default 1521), and `[SID]` is the service ID of the database.

5 *(Oracle RAC only)* In the **Enter database specific properties for the datasource** pane, type the following connection URL in the **URL** field:

   `jdbc:oracle:thin:@(DESCRIPTION=(ENABLE=broken) (ADDRESS_LIST=(ADDRESS=(PROTOCOL=TCP) (HOST=yourhost1) (PORT=1521)) (ADDRESS=(PROTOCOL=TCP) (HOST=yourhost2) (PORT=1521))) (LOAD_BALANCE=on) (FAILOVER=on)) (CONNECT_DATA=(SERVER=dedicated) (SERVICE_NAME=service.yourcompany.com) (FAILOVER_MODE=(TYPE=session) (METHOD=basic) (RETRIES=10) (DELAY=3)))`

Replace the highlighted text in the connection URL with the following values:

- **yourhost1**: The name, IP address, or fully-qualified domain name of the first node in the cluster that hosts the database.

- **yourhost2**: The name, IP address, or fully-qualified domain name of the second node in the cluster that hosts the database.

  Note: The cluster hosting the database could have n nodes. **yourhost1** and **yourhost2** are examples in the case of a two-node cluster.

- **service.yourcompany.com**: The service name for the Oracle RAC database.

6 Select **Oracle 11g data store helper**.

7 Click **Next** and, in the **Setup security aliases** pane, click **Finish**.

8 Click **Save** directly to master configuration.

9 Select the data source you just created to modify additional parameters and set the following configuration:

   - In the **Container-managed authentication alias** list, select the authentication alias that you created for this data source in “9.5.1 Configure J2C authentication for data source” on page 71.
In the Mapping-configuration alias list, select DefaultPrincipalMapping.

10 Click OK or Apply and then click Save directly to master configuration.

11 Change the statement cache size. Do the following tasks:

- In WebSphere Administrative Console, click JDBC > Data sources.
- Click the data source you just created and under Additional Properties, click WebSphere Application Server data source properties.
- Change the value of the Statement cache size field to 80.
- Click OK or Apply and the click Save directly to the master configuration.

Configure LiveCycle- oracle - IDP_DS connection pools:

1 In the navigation tree, click Resources > JDBC > JDBC Providers and, in the right pane, click the Oracle JDBC Driver data source you just created.

2 Under Additional Properties, click Data sources and then select Livecycle - oracle - IDP_DS.

3 On the next screen, under Additional Properties, click Custom Properties and then change oracle9iLogTraceLevel to null (no value).

4 Under Additional Properties, click Connection Pool Properties and, in the Maximum connections box, type 30.

5 Click OK or Apply and then click Save directly to master configuration.

Configure the custom property for Oracle:

1 In the navigation tree, click Resources > JDBC > Data sources and, in the right pane, click the data source that you created in the Create the Oracle JDBC data source section.

2 Under Additional Properties, click Custom properties and then click New.

- In the Name box, type useRRASetEquals and in the Value box, type true.

3 Click OK or Apply and then click Save directly to master configuration.

Create the Oracle JDBC data source for Rights Management

Note: This section applies only if you have Rights Management installed.

1 In the navigation tree, click Resources > JDBC > JDBC Providers and, in the right pane, click the provider that you created in the Create the Oracle JDBC provider section.

2 Under Additional Properties, click Data sources and then click New.

3 In the Enter basic data source information pane, set the following configurations and then click Next:

- In the Data source name box, type Livecycle - oracle - RM_DS.
- In the JNDI name box, type EDC_DS.
- In the list under Component-Managed Authentication and XA Recovery Authentication, select the authentication alias that you created for this data source in “9.5.1 Configure J2C authentication for data source” on page 71.

4 In the Enter database specific properties for the datasource pane, type the following line in the URL field:

   jdbc:oracle:thin:@[server_host]:[port]:[SID]

   where [server_host] is the IP address of the database server, [port] is the port that the database is listening on (default 1521), and [SID] is the service ID of the database.
5 Select Oracle 11g data store helper.
6 Click Next and, in the Setup security aliases pane, click Finish.
7 Click Save directly to master configuration.
8 Select the data source (RM_DS) you just created to modify additional parameters and then set the following configuration:
   • In the Container-managed authentication alias list, select the authentication alias that you created for this data source in “9.5.1 Configure J2C authentication for data source” on page 71.
   • In the Mapping-configuration alias list, select DefaultPrincipalMapping.
9 Click OK and then click Save directly to master configuration.
10 Change the statement cache size. Do the following tasks:
   • In WebSphere Administrative Console, click JDBC > Data sources.
   • Click the data source you just created and under Additional Properties, click WebSphere Application Server data source properties.
   • Change the value of the Statement cache size field to 80.
   • Click OK or Apply and the click Save directly to the master configuration.

Configure LiveCycle- oracle - RM_DS connection pools for Rights Management:
Note: This section applies only if you have Rights Management installed.
1 In the navigation tree, click Resources > JDBC > JDBC Providers and, in the right pane, click the Oracle JDBC Driver data source you just created.
2 Under Additional Properties, click Data sources and then select Livecycle - oracle - RM_DS.
3 On the next screen, under Additional Properties, click Connection Pool Properties and, in the Maximum connections box, type 20.
4 Click OK or Apply and then click Save directly to master configuration.

Configure the custom property for Oracle:
1 In the navigation tree, click Resources > JDBC > Data sources and, in the right pane, click the provider that you created in the Create the Oracle JDBC data source for Rights Management section.
2 Under Additional Properties, click Custom properties and then click New.
3 In the Name box, type useRRASetEquals and in the Value box, type true.
4 Click OK or Apply and then click Save directly to master configuration.

9.5.4 Configuring SQL Server database connectivity
Configuring the SQL Server data source requires you to install the SQL Server database drivers, create a SQL Server JDBC provider on WebSphere, create the data source on WebSphere, and then configure the corresponding connection pool.

Install the SQL Server database driver
If you have not done so already, copy the SQL Server JDBC Driver from [LiveCycle root]/lib/db\mssql to the [appserver root]/idplib\ directory.
Note: Make a note of the directory location where you install the driver on your system.
Create the SQL Server JDBC provider
1 In the WebSphere Administrative Console navigation tree, click Environment > WebSphere Variables and, in the right pane, click one of the following:
   - MICROSOFT_JDBC_DRIVER_PATH
2 Under General Properties, in the Value box, type the path to the sqljdbc4.jar file that you created in the Install the SQL Server database driver section, and then click OK.
3 In the Messages box, click Save directly to master configuration.
4 In the navigation tree, click Resources > JDBC > JDBC Providers.
5 In the Scope drop-down list in the right pane, select Node=NodeName, Server=ServerName as the level, and then click New.
6 In the Create new JDBC provider pane, set the following configurations and then click Next:
   - In the Database type list, select SQL Server.
   - In the Provider Type list, select Microsoft SQL Server JDBC Driver.
   - In the Implementation type list, select Connection Pool Data Source.
   - In the Name box, type Microsoft SQL Server JDBC Driver, or accept the default value.
7 In the Enter database class path information pane, replace the existing entry with the following, and then click Next:
   - ${MICROSOFT_JDBC_DRIVER_PATH}/sqljdbc4.jar
   Note: For WebSphere, if you have set the WebSphere variable MICROSOFT_JDBC_DRIVER_PATH, the database class path information is populated automatically.
8 In the Summary pane, click Finish and then click Save directly to master configuration.

Create the SQL Server data source for LiveCycle
Follow the steps below to create the SQL Server data source for your application server version.
1 In the navigation tree, click Resources > JDBC > JDBC Providers and, in the right pane, click the provider that you created in the Create the SQL Server JDBC provider section.
2 Under Additional Properties, click Data sources and then click New.
3 In the Enter basic data source information pane, set the following configurations and then click Next:
   - In the Data source name box, type Livecycle - SQLServer - IDP_DS.
   - In the JNDI name box, type IDP_DS.
4 In the Enter database specific properties for the data source pane, enter the database name, server name, and port.
5 In the Setup security aliases pane, set the following, and click Next.
   - In the Component managed authentication alias list, select the authentication alias that you created for this data source in “9.5.1 Configure J2C authentication for data source” on page 71.
   - In the Mapping-configuration alias list, select DefaultPrincipalMapping.
   - In the Container managed authentication alias list, select the authentication alias that you created for this data source in “9.5.1 Configure J2C authentication for data source” on page 71.
6 In the Summary pane, click Finish, and then click Save directly to the master configuration.
7 Set the data store helper class for the data source. Do the following tasks:
   • In the navigation tree, click Resources > JDBC > Data sources and, in the right pane, click the data source that you created.
   • In the next screen, under Data store helper class name, select Specify a user-defined data store helper, and replace the existing entry with the following text:
     com.ibm.websphere.rsadapter.GenericDataStoreHelper

8 Change the statement cache size. Do the following tasks:
   • In WebSphere Administrative Console, click JDBC > Data sources.
   • Click the data source you just created and under Additional Properties, click WebSphere Application Server data source properties.
   • Change the value of the Statement cache size field to 80.
   • Click OK or Apply and the click Save directly to the master configuration.

Configure LiveCycle - SQLServer - IDP_DS connection pools
1 In the navigation tree, click Resources > JDBC > JDBC Providers and, in the right pane, click the provider that you created earlier for WebSphere.
   • Microsoft SQL Server JDBC Driver.
2 Under Additional Properties, click Data sources and then select Livecycle - SQLServer - IDP_DS.
3 On the next screen, under Additional Properties, click Connection Pool Properties and, in the Maximum connections box, type 30.
4 9. Click OK or Apply and then click Save directly to master configuration.

Configure the custom property for SQL Server
1 In the navigation tree, click Resources > JDBC > Data sources and, in the right pane, click the data source that you created in the Create the SQL Server data source for LiveCycle section.
2 Under Additional Properties, click Custom properties and then click New.
3 In the Name box, type useRRASetEquals and in the Value box, type true.
4 Click OK or Apply and then click Save directly to master configuration.

Create SQL Server data source for Rights Management
Follow the steps below to create the SQL Server data source for your application server version.
1 In the navigation tree, click Resources > JDBC > JDBC Providers and, in the right pane, click the provider that you created in the Create the SQL Server JDBC provider section.
2 Under Additional Properties, click Data sources and then click New.
3 In the Enter basic data source information pane, set the following configurations and then click Next:
   • In the Data source name box, type Livecycle - SQLServer - RM_DS.
   • In the JNDI name box, type EDC_DS.
4 In the Enter database specific properties for the data source pane, in the Data store helper class name box, replace the existing entry with the following:
   com.ibm.websphere.rsadapter.GenericDataStoreHelper
5 In the Setup security aliases pane, set the following, and click Next.
   • In the Component managed authentication alias list, select the authentication alias that you created for this data source in “9.5.1 Configure J2C authentication for data source” on page 71.
   • In the Mapping-configuration alias list, select DefaultPrincipalMapping.
   • In the Container managed authentication alias list, select the authentication alias that you created for this data source in “9.5.1 Configure J2C authentication for data source” on page 71.
6 In the Summary pane, click Finish, and then click Save directly to the master configuration.
7 Change the statement cache size. Do the following tasks:
   • In WebSphere Administrative Console, click JDBC > Data sources.
   • Click the data source you just created and under Additional Properties, click WebSphere Application Server data source properties.
   • Change the value of the Statement cache size field to 80.
   • Click OK or Apply and the click Save directly to the master configuration.

Configure LiveCycle - SQLServer - RM_DS connection pools
1 In the navigation tree, click Resources > JDBC > JDBC Providers and, in the right pane, click the provider that you created earlier for WebSphere.
   • SQL Server Provider.
2 Under Additional Properties, click Data sources and then select Livecycle - SQLServer - RM_DS.
3 On the next screen, under Additional Properties, click Connection Pool Properties and, in the Maximum connections box, type 20.
4 Click OK or Apply and then click Save directly to master configuration.

Configure the custom property for SQL Server
1 In the navigation tree, click Resources > JDBC > Data sources and, in the right pane, click the data source that you created in the Create SQL Server data source for Rights Management section.
2 Under Additional Properties, click Custom properties and then click New.
3 In the Name box, type useRRASetEquals and in the Value box, type true.
4 Click OK or Apply and then click Save directly to master configuration.

Map the Windows login to the LiveCycle database user

Note: You must already have a user account created and associated with your Windows domain.

Note: When you run Configuration Manager, database validation will fail if you use Windows authentication as the authentication mode for your database. You can safely ignore this error during the configuration steps.

1 Using Microsoft SQL Server Management Studio, connect to the database server that hosts the LiveCycle database.
2 Set the Authentication mode to Windows authentication.
3 Under Security > Logins, create a new account for the Windows domain user and select Windows authentication.
4 Click User Mapping on the Login - New screen and set the database and default schema for the new user.
5 Select db_owner as the Database role and click OK.

To verify that you created the user, expand the LiveCycle database in the navigation tree and open Security > Users. The new user is listed there.
Configure integrated security on Windows to make a trusted connection with SQL Server
1. Start the application server by using the Windows domain user. If WebSphere Application Server is running as a service, it should be started by using the Windows domain user account.
2. Start the WebSphere Administrative Console by typing `http://[host]:[port]/IBM/console` in the URL line of a web browser.
3. In the navigation tree, click Resources > JDBC > Data Sources and, in the right pane, click IDP_DS.
4. In the right pane, under Additional Properties, click Custom Properties, and on the next screen, click integratedSecurity.
5. On the next screen, under General Properties, type `true` in the Value box.
6. Click OK or Apply and then click Save directly to the master configuration.
7. In the navigation tree, click Resources > JDBC > Data Sources and, in the right pane, click RM_DS.
8. In the right pane, under Additional Properties, click Custom Properties, and on the next screen, click integratedSecurity.
10. Click OK or Apply and then click Save directly to the master configuration.
11. Open the Services control panel and stop the IBM WebSphere Application Server <version> - <node> service.
12. Right-click the service name and click Properties > Log On.
13. Change the default Log On property from Local System to the Windows domain user account that you configured in the Map the Windows login to the LiveCycle database user section and then restart the service.
14. On the computer where the application server is installed, add sqljdbc_auth.dll to the Windows systems path (C:\Windows).

   Note: The sqljdbc_auth.dll file is in the same location as the Microsoft SQL JDBC 3.0 driver installation (default is [InstallDir]/sqljdbc_3.0/enu/auth/x86).

9.6 Next step
You must now deploy the LiveCycle EAR files to the application server. See “4.3 Configuring and deploying LiveCycle” on page 13.
Chapter 10: Manually Deploying to WebSphere

This chapter describes how to manually deploy LiveCycle modules to WebSphere. This chapter applies only if you chose not to deploy LiveCycle to your WebSphere Application Server automatically. For information about how to automatically deploy LiveCycle to your application server, see “4.3 Configuring and deploying LiveCycle” on page 13.

At this point in the installation process, you have already installed LiveCycle files, run Configuration Manager to configure the LiveCycle deployable archives, and manually configured your WebSphere Application Server. Now you must manually deploy the LiveCycle deployable archives.

10.1 About deploying LiveCycle modules

Before you deploy LiveCycle, ensure that you completed these tasks:

- Installed the required software and files, and know the location of the directories you will be working with. If you did not complete this task, see Preparing to Install LiveCycle (Single Server).
- Run Configuration Manager to configure LiveCycle modules according to your system and application server requirements. To add a module to your deployment, you can run Configuration Manager to make the changes and then redeploy the updated EAR file.

  If you are deploying LiveCycle for the first time, initialize the database by using Configuration Manager after you deploy the EAR files.
  
  If you are using an external web server, see your web server documentation for information about the configuration that is required to allow access to the application server.

10.1.1 Summary of deployable components

During the deployment process, you need to deploy the following components for LiveCycle:

- adobe-livecycle-native-websphere-[OS].ear
- adobe-livecycle-websphere.ear
- adobe-workspace-client.ear

After LiveCycle is configured using Configuration Manager, these files are located in the [LiveCycle root]/configurationManager/export/ directory.

10.2 Deploying to WebSphere

Deploy LiveCycle modules to WebSphere by deploying the component EAR files to the application server using the WebSphere Administrative Console.

Before deploying to WebSphere, start the application server or the cluster. After you deploy the required components, stop and restart the application server or cluster before you start any services.
To deploy the EAR files:
1. In the WebSphere Administrative Console navigation tree, click Applications > New Application.
2. In the right pane, click New Enterprise Application and then select Remote file system or Local File System.
3. Click Browse, navigate to one of the EAR files in Summary of deployable components, and select the EAR file.
4. Select Show all installation options and parameters and expand Choose to generate default bindings and mappings.
5. Select Generate Default Bindings and click Next.
6. In the left column of the Summary pane on the right, select the last step and click Finish.
7. When the EAR file is installed successfully, in the Messages box, click Save directly to Master Configuration.
8. Repeat these steps for each of the EAR files in Summary of deployable components.

### 10.3 Starting the application

After deploying the module, you need to start the applications. When the red “X” beside the name of the application changes to a green arrow, the application has been deployed and started successfully. WebSphere displays an error message if it cannot start the application.

For information about WebSphere error messages, see your WebSphere Application Server documentation.

To start an application in WebSphere:
1. In the WebSphere Administrative Console navigation tree, click Applications > Application Types > WebSphere Enterprise applications.
2. Select any or all of the LiveCycle applications that you want to start and click Start. The red “X” beside the status of each application changes to a green arrow, indicating that the application is running.
Chapter 11: Appendix - Configuring the Connector for Microsoft SharePoint on the SharePoint Server

The Connector for Microsoft SharePoint allows you to integrate workflows from both the LiveCycle and the SharePoint development perspectives. This module includes a LiveCycle service and a sample SharePoint feature that facilitates end-to-end connection between the two systems.

The service provides search, read, write, delete, update, and check in/out capabilities with a SharePoint repository. SharePoint users can initiate LiveCycle processes such as an approval process from within SharePoint, convert documents to Adobe PDF, and manage the rights on a file in PDF or native formats. In addition, from within the SharePoint context, you can automate running LiveCycle processes from within SharePoint workflows.

11.1 Installation and configuration

After you configured the LiveCycle installation, carry out the following steps to configure the connector on the SharePoint server.

11.1.1 System requirements for the SharePoint server

Ensure that your server that runs the SharePoint site meets the following requirements:

- Microsoft SharePoint Server 2007 or 2010
- Microsoft .NET Framework 3.5

11.1.2 Installation considerations

Keep in mind the following before you plan your installation:

- If you are using Microsoft SharePoint Server 2007, the installation process stops and restarts the Windows IIS Server when installing Connector for Microsoft SharePoint on the SharePoint server.
- Before you run the installation, ensure that none of the other sites or web applications is using services on the IIS Server. Consult your IIS Administrator before you proceed with the installation.
- (For SharePoint server 2010 Farmed installation) The SharePoint administration service is running on the centeral administration server of sharepoint server Farm. (For SharePoint server 2010 Standalone installation) The SharePoint administration service is stopped on the sharepoint server.
11.2 Installation and configuration on the SharePoint server 2007

11.2.1 Extract the web part installer
When you installed the LiveCycle server, the web part installer for SharePoint server named Adobe LiveCycle Connector-2007.zip was created in the \[LiveCycle root\]\plugins\sharepoint folder. Copy this file to a folder on the Windows server that hosts SharePoint, and then extract the files.

11.2.2 Edit the batch file
The folder extracted from the web part installer contains a batch file named Install.bat. You must update this batch file with the file and folder paths relevant to your SharePoint server.

1 Open the Install.bat file in a text editor.
2 Locate the following lines in the file and change them:

   @SET GACUTILEXE="C:\Program Files\Microsoft SDKs\Windows\v6.0A\Bin\ gacutil.exe"
   @SET TEMPLATEDIR="c:\Program Files\Common Files\Microsoft Shared\ web server extensions\12\TEMPLATE"
   @SET WEBAPPDIR="C:\Inetpub\wwwroot\wss\VirtualDirectories\<port>"
   @SET SITEURL="http://<SharePoint Server>:<port>/SiteDirectory/<site name>/"
   @SET STSADM="C:\Program Files\Common Files\Microsoft Shared\ web server extensions\12\bin\stsadm.exe"

   • GACUTILEXE: Change the path to the folder where the GAC utility is located.
   • TEMPLATEDIR: Change the template directory path of the IIS Server on your system.
   • WEBAPPDIR: Change the path of the WEBAPPDIR of the IIS Server on your system if it differs from the default value included in the batch file.
   • SITEURL: Change the URL of the SharePoint site on your system on which you want to activate the LiveCycle feature.
   • STSADM: Change the path to the folder where the STSADM utility is located.

   Note: The LiveCycle feature is installed on a web application on the SharePoint server. The LiveCycle feature will be activated only on the site that you have provided the site URL for. You can activate the LiveCycle feature for other SharePoint sites later from the Site Settings page of those sites. See SharePoint Help for more information.

3 Save and close the file.

11.2.3 Run the batch file
Navigate to the folder where the edited batch file is present, and then run the Install.bat file.
Keep in mind that the SharePoint site will be unavailable for other services during the time the batch file runs.

When you run the batch file, the following occur:

   • Registers the AdobeLiveCycleConnector.dll and AdobeLiveCycleWorkflow.dll files. These dynamic libraries integrate the LiveCycle features with the SharePoint server.
   • Uninstalls any previously installed SharePoint connector.
   • Copies the template files to the WSS \TEMPLATE directory.
11.2.4 Copy the Service Model configuration to the IIS Web Application folder

You must copy the SharePoint Connector-specific configuration settings to the web application home directory of the IIS Server. This adds the LiveCycle feature to the web application.

1. Navigate to the `sharepoint-webpart` folder that was created when you extracted the LiveCycle feature installer.

2. Open the `AdobeLiveCycleConnector.dll.config` file in a text editor.

3. Copy the contents between `<system.serviceModel>` and `</system.serviceModel>` tags (including both the starting and ending tags), and then close the file.

4. Navigate to the web application home directory on the IIS Service on your computer that you specified in the batch file. Typically, the folder is `C:\Inetpub\wwwroot\wss\VirtualDirectories\<port>`.

5. Create a backup copy of the `web.config` file and then open the original file in a text editor.

6. Append the contents that you copied before the `</configuration>` tag.

7. Save and close the file.

11.3 Installation and configuration on the SharePoint server 2010

11.3.1 Edit Environment Variables

Append path of stsadm.exe to PATH environment variable. The default path of stsadm.exe is `C:\Program Files\Common Files\MicrosoftShared\Web Server Extensions\14\BIN`.

11.3.2 Extract the web part installer

When you installed the LiveCycle server, the web part installer for SharePoint server named Adobe LiveCycle Connector-2010.zip was created in the `[LiveCycle root]\plugins\sharepoint` folder. Copy this file to a folder on the Windows server that hosts SharePoint, and then extract the files.

11.3.3 Install and Activate Connector

1. (Optional) Select options for SharePoint Server Context menu before installing connector. See “11.3.4 Enable/Disable features” on page 88 for detailed steps.

2. Run following commands in the listed order to install Connector for SharePoint Server. Ensure that you run `stsadm -o enumsolutions` after each command to verify that the changes have been propagated to all the servers. Run `stsadm -o enumsolutions` repeatedly, until the resultant xml contains `<state>pending</state>` tag.

   install.bat -create
   install.bat -add
   install.bat -deploy
   install.bat -install

Last updated 1/10/2013
3 Activate the connector from SharePoint Web Application. To activate the connector:
   a Open SharePoint Web Application in a browser.
   b Click Site Settings.
   c Click Site Collection Features.
   d Click Activate for Adobe LiveCycle Connector and Adobe LiveCycle Workflow feature.

11.3.4 Enable/Disable features
You can change options of context menu and disable other features on SharePoint Sites. For the Sharepoint Connector installed with default set of options, following options are enabled on SharePoint Server:

- Convert to Adobe PDF
- Enable for commenting by adobe reader.
- Secure with Adobe Policy.
- Invoke Adobe LiveCycle Processes

You may make changes to Elements.xml file to change above options and to enable or disable another features. To make changes to Elements.xml

1 Navigate to the folder containing extracted contents of Adobe LiveCycle Connector-2010.zip file.
2 Take backup of Elements.xml file. The default location of Elements.xml is $< Directory containing Extracted Adobe LiveCycle Connector-2010.zip File >\TEMPLATE\FEATURES\LiveCycle\Elements.xml$
3 Open the Elements.xml file in a text editor.
4 Delete or comment the CustomAction elements of features that you want to disable.

11.3.5 Uninstalling Connector for Microsoft SharePoint Server 2010

1 Deactivate SharePoint Connector from Shrepoint Web Application. To deactivate SharePoint Connector
   a Open SharePoint Web Application in a browser.
   b Click Site Settings.
   c Click Site Collection Features.
   d Click Deactivate for Adobe LiveCycle Connector and Adobe LiveCycle Workflow Features

2 On the command prompt, run the following commands in the given order. Ensure that you run `stsadm -o enumsolutions` after each command to verify that the changes have been the propagated to all the servers. Run `stsadm -o enumsolutions` repeatedly, until the resultant xml contains `<state>pending</state>` tag.

   Install.bat -uninstall
   Install.bat -retract
   Install.bat -delete
