

# ADOBE® CAPTIVATE®

Help and tutorials

What's new

# What's new in Adobe Captivate 6 update (for subscription and Adobe Software Assurance customers)

---

**Drag-and-drop interactions** Make eLearning fun with drag and drop games, quizzes, and learning modules that users can access on desktops and iPads. Choose from a variety of drag-drop combinations based on what a drop target can accept, reject, or replace with while providing audio feedback for every user attempt. For more information see [Drag-and-drop interactions](#).

**HTML5 support for PowerPoint** Import your Microsoft PowerPoint project including text, shapes, audio and animations into Adobe Captivate and publish them directly to HTML5.

**Adobe Captivate App Packager** Embed a range of HTML5 animations and synchronize them with your Adobe Captivate course. Publish the course as an app to multiple mobile platforms, including Windows RT—Metro using the PhoneGap Service.

**Note:** *You need to purchase PhoneGap service separately.*

---

Overview on building HTML5 native apps using Adobe Captivate App Packager....

[Read More](#)

<http://blogs.adobe.com/captivate/2012/11/new-...>

by **Suresh Jayaraman, Adobe Systems.**

[Contribute your expertise to Adobe Community Help](#)

**Enhanced interactions library** Easily create engaging courses with a large library of professionally designed interactions, including Hangman and Jigsaw, which can be customized to suit your needs. For more information on interactions, see [Smart Learning Interactions](#).

**Enhanced quizzing with HTML5** Output all your quizzes with Matching, Short Answer, and Fill in the blanks question types to HTML5.

**Record system audio** With Adobe Captivate 6.1, record system audio along with narration in an Adobe Captivate course. Use the system audio edit options to modify and synchronize the system audio across your course. For more information, see [System audio](#).

**Publish HTML5 courses to Adobe Connect** Make your content more 'mobile' by publishing as HTML5 to Adobe Connect. Leverage the 'pause-resume anywhere' feature to provide seamless learning experience to your users on virtually any device or any browser.

# What's new in Cp 6

---

**High-definition Screencast** Create high-definition product demos with a new capture-as-a-video workflow. Preview them instantly and publish them to YouTube, social media (Twitter, Facebook), or as MP4 files. Use the edit mode to enhance your videos with Pan and Zoom effects, or add more objects and Picture-In-Picture videos (PIP). Also, add or edit mouse paths and points that you recorded in the video. See [Creating video projects](#) for more information.

**HTML5 Publishing** Publish your Adobe Captivate projects in HTML5 format for use on devices such as iPad and iPhones. See [Publish projects as HTML5 files](#) for more information.

**Themes** Spend less time and effort to liven up your courses. Choose from attractive, professionally designed themes that blend backgrounds, styles, fonts, and layouts. Apply them within and across projects to maintain a consistent look and feel. You can also customize themes to suit your requirements. For more information, see [Themes](#).

**Smart shapes** Add a wide range of shapes, including circles, rectangles, triangles, callouts, arrows, lines, banners, and flowchart symbols, to your eLearning content. Customize them and convert them into buttons. For more information, see [Smart shapes](#).

**Reflections** Add a new dimension to text, images, and even videos using reflections. See [Add reflection to objects](#) for more information.

**Object grouping** Group a set of smart shapes, images, or other objects so that you can work with them collectively. Resize, rotate, time, flip, move, or format all the objects in the group as if they were a single object. See [Group objects](#) for more information.

**Hyperlinks** Insert text hyperlinks to direct learners to other sections of the course or external sources for more information. See [Insert hyperlinks](#) for more information.

**Text margins and custom bullets** Improve the appearance and readability of text by adding margins and custom bullets.

**Pre-test and branch-aware quizzing** Use pre-tests to assess the knowledge, skill level, or training needs of individual learners. Based on the results, direct learners to the appropriate section, and quiz them at the end to gauge what they have learned. See [Insert pretests](#) for more information.

**Partial and negative scoring** Assign a score to each correct option when a question has more than one correct answer. Discourage guesswork by penalizing learners for wrong answers. See [Multiple-choice question slides](#) and [Quiz properties](#) for more information.

**Remediation** Make eLearning content more effective and improve the percentage of successful outcomes using the all-new remedial workflow. When answering a quiz question incorrectly, let learners revisit the relevant section, understand the concept correctly, and retry the question. See [Allow users to return to quiz](#) for more information.

**Enhanced integration with SCORM and AICC compliant LMSs** Publish your courses effortlessly to leading LMSs such as Moodle, Blackboard, and Saba, rest assured that your scoring data will integrate smoothly with your LMS. See [Learning management system \(LMS\)](#) for more information.

**Smart learning interactions** Insert aesthetically designed interactive elements to eLearning content with just a click. Select from a wide range of stunning out-of-the-box interactions such as Process, Accordion, and Pyramid, customize the content and appearance, and you're done. Click Insert > Interactions, choose the interaction, and double-click the text placeholders to type your text.

**Ready-to-use character images** Choose different personas, for example, a business executive or a medical practitioner, to add to your Adobe Captivate projects. Click Insert > Characters, choose a category, and click the image you require.

**Roundtrip with Microsoft PowerPoint (enhanced)** Import your existing presentations, including PowerPoint 2010 slides in eLearning projects. Bring in objects, animations and multimedia, easily update the content, and keep your PowerPoint and Adobe Captivate projects in sync with the dynamically linked import option.

Workspace

# Adobe Captivate Library

---

## Library overview

### Import objects into the Library

## Library overview

[To the top](#) <sup>↑</sup>

An Adobe Captivate library is a repository of resources, such as, audio files, images, and animations. Every Adobe Captivate project contains its own library.

Resources or 'items' are automatically added to the library when you use them in the project. However, you can also import them into the library and use them when needed.

By default, the Library panel is displayed in all the preset workspaces, except in the Quizzing workspace. To hide (or show) the Library panel, select Window > Library.

The items in the library are categorized and organized in folders, such as, Audio, Images, and Media. The following information is displayed for each item:

- Name
- Type
- Size (in kilobytes)
- Use Count, which indicates the number of times the item is used in the project.
- Date Modified

**Note:** Click the title of any of these columns to sort the list of items within each folder.

Using the Library panel, you can do the following:

- Edit the properties of the items.
- Reuse the items within a project as well as across other Adobe Captivate projects by exporting or importing them.
- Synchronize the items with their source files. You can also open and edit the source files directly in the supported programs.

## Import objects into the Library

[To the top](#) <sup>↑</sup>

You can import objects from other Adobe Captivate projects or templates into the library of your current project.

1. Select File > Import > External Library.
2. In the Open dialog box, navigate to and select the Adobe Captivate project or project template from which you want to import objects.
3. Click Open. The external library panel appears.
4. Drag-and-drop the required items from the external library panel to the current project's library.

# Branching panel

---

## Panes in the Branching panel

### Editing the links between slides

### Grouping slides using the Branching view

The Branching panel (Window > Branching View) provides a visual representation of all links between the slides in a project and lets you quickly edit those links. Using this panel, you can analyze and interpret how the slides in a project are interlinked.

The Branching panel is particularly helpful when creating instructional materials containing question slides and specifying different paths for right and wrong answers. For example, you can set one action (such as “Go to the next slide”) when a user supplies a correct answer, and you can set a different action (such as “Jump To Slide”) when a user supplies an incorrect answer. Using the Branching view, you can easily make changes to the branching design.

You can also export the Branching view of an existing Adobe Captivate project into a BMP, JPEG/JPG, PNG, or a GIF file.

---

## Panes in the Branching panel

[To the top](#) <sup>14</sup>

### Preview pane

This pane is at the bottom of the panel and displays all the slides in the project. If the pane is not visible, click the arrow at the bottom of the panel.

The rectangle in the pane indicates the slides that are currently displayed in the main pane. To bring a different set of slides into the main pane, click and move the rectangle to the required area.

### Main pane

This pane is at the center of the panel and is the main area where you interpret and edit the branches in your project. The arrows between the slides indicate how they are related to each other.

**Black Arrow** Indicates that the slide from which the arrow originates does not have any interactive object. During runtime, after this slide's duration elapses, the next slide (to which the arrowhead points) appears.

**Green Arrow** Indicates that the slide from which the arrow originates contains an interactive object. When users click this object during runtime, the slide to which the arrowhead points appears.

**Red Arrow** Points to the slide that appears when users fail to click an interactive object on the slide from which the arrow originates. When you click an arrow, a pop-up appears and shows the name of the object that links the slides.

Options in this pane:

**Create Slide Group** Combines the selected slides into a single group. For more information on grouping slides, see Grouping slides using the Branching view.

**Expand Slide Group** Displays all the slides belonging to the selected group. The slides in a group are by default in a collapsed state.

**Collapse Slide Group** Combines the expanded slides of a group back into a group.

**Remove Slide Group** Ungroups the grouped slides.

**Export Branching View** Export the Branching view as a BMP, JPEG/JPG, PNG, or a GIF file using the dialog box that appears.

**Zoom** Zooms the main view in or out based on the value selected in the list or the slider.

For more information on using this pane for editing the slide links, see Editing the links between slides.

### Unlinked slides pane

This pane lists all the slides that are not linked to any slide in the project. If this pane is not visible, click the arrow on the left of the panel.

---

## Editing the links between slides

[To the top](#) <sup>14</sup>

To change the linkage of a slide, double-click the thumbnail of the slide, and in the pop-up that appears, choose an option in the Action (Success) list.

To change the linkage of an interactive object, double-click the thumbnail of the slide, and click the object. In the pop-up that appears, choose an option from the Action (Success) and Action (Failure) lists, and click the Save icon.

For example, consider Slide 1 has a button. When users click the button, Slide 4 must appear and when the button is not clicked (Failure), Slide 23 must appear. Using the pop-up box, you can specify the slides for success and failure events accordingly. If the target slide (Slide 23) contains

an interactive object that brings the users back to Slide 1, a reverse-link to Slide 1 appears below the slide.

The Action (Success) and Action (Failure) lists show the following options:

- Go to the Next Slide
- Go to the Previous Slide
- Jump to Slide

To assign other actions such as send an email or open a URL or a file, use the Property Inspector of the slide. The Advanced Interaction panel (Project > Advanced Interaction) helps you view all the interactions in the project.

---

## Grouping slides using the Branching view

[To the top](#) <sup>↑</sup>

1. Click in the panel (not on any slide), hold down the mouse button, and move the mouse over the slides you want to group.

A rectangular marquee appears and the selected slides are highlighted with a bold border around them.

2. Click the Create Slide Group icon. A single group slide appears in the panel.

- To expand the group, click the arrow on the group slide, or select the group slide and click the Expand Slide Group icon.
- To ungroup the slides, select the group slide and click the Remove Slide Group icon.

**Note:** Use the Property Inspector to name the group slide. For more information, see [Name slide groups and mark them](#).

# Customizing the workspace

---

- [Rearrange document windows](#)
- [Move panels](#)
- [Dock and undock panels](#)
- [Add and remove panels from docks](#)
- [Stack floating panels](#)
- [Resize panels](#)
- [Collapse and expand panel icons](#)
- [Save customized workspaces](#)
- [Switch workspaces](#)
- [Rename and delete workspaces](#)

You can create a custom workspace by rearranging and resizing document windows and panels. You can save the customized workspaces and switch between them.

---

## Rearrange document windows

[To the top](#) <sup>+</sup>

When you open more than one file, the Document windows are tabbed. To rearrange the tabbed Document windows, drag and drop the window's tab to the new location.

---

## Move panels

[To the top](#) <sup>+</sup>

- To move a panel, drag it by its tab.
- To move a panel group, drag the title bar.

As you drag the panels, you see blue highlighted drop zones, areas where you can drop the panels. If you drag to an area that is not a drop zone, the panel floats freely in the workspace.

**Note:** *The position of the mouse pointer, rather than the position of the panel, activates the drop zone.*

Press Ctrl (Windows) or Command (Mac OS) while moving a panel to prevent it from docking. Press Esc while moving the panel to cancel the operation.

---

## Dock and undock panels

[To the top](#) <sup>+</sup>

A *dock* is a collection of panels or panel groups displayed together, generally in a vertical orientation. You dock and undock panels by moving them into and out of a dock.

- To dock a panel, drag it by its tab into the dock, at the top, bottom, or in between other panels.
- To dock a panel group, drag it by its title bar (the solid empty bar above the tabs) into the dock.
- To remove a panel or panel group from a dock, drag it out of the dock by its tab or title bar. You can also drag it into another dock or make it free-floating.
- To resize a panel, move the mouse over the edges of the panel. When double-sided arrow appears, drag the panel to the required size.

---

## Add and remove panels from docks

[To the top](#) <sup>+</sup>

If you remove all panels from a dock, the dock disappears. You can create a dock by moving panels to the right edge of the workspace until a drop zone appears.

- To remove a panel, right-click (Windows) or Control-click (Mac) its tab and then select Close, or deselect it from the Window menu.
- To add a panel, select it from the Window menu and dock it wherever you want.

---

## Stack floating panels

[To the top](#) <sup>+</sup>

When you drag a panel out of its dock but not into a drop zone, the panel floats freely. The floating panel allows you to position it anywhere in the workspace. You can stack floating panels or panel groups so that they move as a unit when you drag the topmost title bar.

- To stack floating panels, drag a panel by its tab to the drop zone at the bottom of another panel.
- To change the stacking order, drag a panel up or down by its tab.

**Note:** *Be sure to release the tab over the narrow drop zone between panels, rather than the broad drop zone in a title bar.*

- To remove a panel or panel group from the stack, so that it floats by itself, drag it out by its tab or title bar.

---

[To the top](#)

## Resize panels

- To minimize or maximize a panel, panel group, or stack of panels, double-click a tab. You can also single-click the tab area (the empty space next to the tabs).
- To resize a panel, drag any side of the panel when the mouse cursor turns into an arrow.

---

[To the top](#)

## Collapse and expand panel icons

You can collapse panels to icons to reduce clutter on the workspace. In some cases, panels are collapsed to icons in the default workspace.

- To collapse or expand all panel icons in a column, click the double arrow at the top of the dock.
- To expand a single panel icon, click it.
- To resize panel icons so that you see only the icons (and not the labels), adjust the width of the dock until the text disappears. To display the icon text again, make the dock wider.
- To collapse an expanded panel back to its icon, click its tab, its icon, or the double arrow in the panel's title bar.
- To add a floating panel or panel group to an icon dock, drag it in by its tab or title bar. (Panels are automatically collapsed to icons when added to an icon dock.)
- To move a panel icon (or panel icon group), drag the icon. You can drag panel icons up and down in the dock, into other docks (where they appear in the panel style of that dock), or outside the dock (where they appear as floating, expanded panels).

---

[To the top](#)

## Save customized workspaces

By saving the current size and position of panels as a named workspace, you can restore that workspace even if you move or close a panel. The names of saved workspaces appear in the workspace switcher in the Application bar.

1. Go to Window > Workspace > New Workspace.
2. Type a name for the new workspace, and click OK.

Any changes that are made to the workspace are saved automatically. To revert to the default state of a workspace, select Window > Workspace > Reset [*Workspace Name*].

---

[To the top](#)

## Switch workspaces

Select a workspace from the workspace switcher in the Application bar.

---

[To the top](#)

## Rename and delete workspaces

Select Window > Workspace > Manage Workspace.

- To rename a workspace, select the workspace and click Rename.
- To delete a workspace, select the workspace and click Delete.

# Disable confirmation messages

---

Confirmation messages appear when you perform important, and often permanent, actions in Adobe Captivate. The confirmation messages give you an opportunity to reconsider your decisions when deleting information or changing key attributes.

If you find that certain messages are not necessary for the way you work or are slowing down your work, you might want to disable them.

1. In an open project, select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
  2. In the Category panel, select Global > General Settings.
  3. Click Confirmation Messages in the General Settings panel.
  4. In the Confirmation Messages dialog box, deselect the options for which you do not require confirmation messages.
- 

# Filmstrip

The Filmstrip displays all the slides in the project in the order in which they appear when published.

You can change the order of a slide by dragging it to a new location within the Filmstrip. To select multiple slides, hold down the Shift or Control key when clicking on slides. To select all slides, press Control+A.

To change the size of the thumbnails in the Filmstrip, right-click (Windows) or Control-click (Mac OS) on any slide, select Filmstrip, and then select Small, Medium, or Large.

If a slide has a label (short title) assigned, the label appears under the slide. It might be easier to move slides and jump to a specific slide if you have assigned labels instead of just using the slide number.

**A.** Slide Label **B.** Slide Number

A handycam icon  appears at the bottom of slides if the slide was recorded in:

- Video Demo mode
- Full Motion Recording (FMR) mode. You can record in the FMR mode by pressing F9 (to start FMR) and F10 (to end FMR) while doing Automatic or Manual recording.

If a slide has an audio file associated with it, the audio icon appears at the bottom of the slide. You can click the sound icon  to show a menu with sound options such as Play, Import, and Edit.

If a slide is locked, the lock icon appears on the upper-right corner of the slide. You can click the lock icon  to unlock the slide.

If a slide contains mouse movement, the mouse icon  appears at the bottom of the slide. You can click the mouse icon to modify some of mouse properties. For more information on mouse properties, see [Change mouse properties](#).

# Grids

---

## Work with grids

### Change the dimensions of a grid

The Snap To Grid option helps you position objects accurately on a page. A grid is a set of lines to which the objects “stick” when the Snap To Grid feature is enabled. When you bring an object close to a grid line, the object snaps to the line much in the same way as iron sticks to a magnet. For example, you can stack objects accurately one above the other using a grid.

---

## Work with grids

[To the top](#) <sup>4</sup>

- Select View > Show Grid. The grid is displayed as a matrix of dots on the slide.
- Select View > Snap To Grid.
- Select View > Snap To Object

Snap To Object is applicable only when you are drawing objects on a slide and not when you are editing or moving them. When both Snap To Grid and Snap To Object options are selected, the Snap To Object option takes precedence.

---

## Change the dimensions of a grid

[To the top](#) <sup>4</sup>

1. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select General Settings from the Global menu.
3. Change the Grid Size value. The smaller the value, the smaller is the gap between the dots in the grid.

# Panels

---

To show or hide panels, select Window and then select the name of the panel.

**Filmstrip** Displays a thumbnail view of the slides in the project in the order of their appearance. For more information, see Filmstrip.

**Question Pool** Displays a thumbnail view of the slides in question pools from where quiz questions are randomly picked at run-time. For more information, see Random question slides.

**Master Slide** Displays the slides that define background and common objects, such as logos, headers, and footers for other slides. For more information, see Master slides.

**Timeline** Displays the timeline of a slide and its objects. For more information, see Timeline.

**Library** Displays all the resources, such as, images and audio files that are currently available for a project. For more information, see Adobe Captivate Library.

**Properties** Displays the properties associated with the selected slide or object.

**Quiz Properties** Displays the properties associated with quiz slides.

**Slide Notes** Displays notes that are added for a slide. For more information, see Slide notes.

**Widget** Displays widgets available in the widget gallery that you can add to a slide. For more information, see Widgets.

**Comments** Displays review comments provided by reviewers. For more information, see View or sort comments in the Adobe Captivate project.

**Effects** Displays the effects applied to the selected object on the slide. For more information, see Object effects.

**Skin Editor** Displays the options for the 'skin' of the project output. Using this panel, you can switch between the interfaces for playback control, table of contents, and borders, and edit their settings. For more information, see Skins.

**Advanced Interaction** Lists the names of all the interactive objects, widgets, questions, and hidden slides in the project. For more information, see Edit object information using the Advanced Interaction panel.

**Branching View** Displays the linkage between the slides in the project and lets you edit the way the slides and objects are linked. For more information on Branching View, see Branching panel.

**Progress Indicator** Indicates the progress of the conversion of non-flash video files into FLV/F4V format by Adobe Media Encoder (AME). For more information, see Inserting non-Flash video file formats.

**HTML5 Tracker** Shows the objects and features that are not supported in HTML5 output. When you make changes to these objects in the project, this panel updates the list accordingly. For more information, see Publish projects as HTML5 files

# Shortcut keys

## Magnification shortcuts

## Shortcut keys for recording

## Change shortcut keys for recording

Shortcut keys provide an easier and quicker way to navigate and use Adobe Captivate. They let you use keyboard key combinations instead of a mouse or program menu. The common shortcut keys are listed in the table.

Shortcut key	Action
F1 (Win & Mac)	Open Adobe Captivate Help (To access dialog-box-level help, click the Help button on individual dialog boxes.)
F2 (Win & Mac)	Rename the selected object
F3 (Win & Mac)	Test view the current slide
F4 (Win & Mac)	Preview the project
F5 (Win & Mac)	Record audio
F6 (Win & Mac)	Import audio
F7 (Win & Mac)	Perform a spelling and grammar check
F8 (Win only)	Preview project from current slide
F9 (Win only)	Show the Advanced Interaction panel
F10 (Win only)	Preview the current slide and the following "N" slides
F12 (Win), Command+F12 (Mac)	Preview the project in a web browser
Page Up (win & Mac)	Scroll to the previous slide
Page Down (win & Mac)	Scroll to the next slide
Alt+A (Win), Option+A (Mac)	Create question pool
Alt+Up, Down, Left, Right Arrows (Win), Option+Up, Down, Left, Right Arrows	Click the object, click a resize handle, and use these options to resize the object in the selected direction by 1 pixel
Control+A (Win), Command+A (Mac)	Select all
Control+B (Win), Command+B (Mac)	Find audio in the Library/Change text to Bold
Control+C (Win), Command+C (Mac)	Copy (slide in Filmstrip, and selected object on stage)
Control+D (Win)	Duplicate (slide in Filmstrip, and selected object on stage)
Control+E (Win), Command+E (Mac)	Extend the length of the object display time to the end of the slide on the Timeline
Control+F (Win), Command+F (Mac)	Find/replace a particular object in the project Library
Control+I (Win), Command+I (Mac)	Increase the indent (selected object on stage)/Change text to Italics. Indentation is equal to the grid size.
Control+L (Win), Command+L (Mac)	Sync the selected object to the playhead
Control+M (Win), Command+M (Mac)	Merge the selected object with the background

Control+N (Win), Command+N (Mac)	Open new project
Control+O (Win), Command+S (Mac)	Open the project
Control+Q (Win), Shift+Option+R (Mac)	Insert a random question slide
Control+R (Win), Command + R (Mac)	Start/record new capture project
Control+S (Win), Command+S (Mac)	Save
Control+T (Win), Command+T(Mac)	Open project template
Control+U (Win)	Underline the selected text
Control+V (Win), Command+V (Mac)	Paste what is on the clipboard (for example, slide, image, object, and so on)
Control+W (Win), Command+W (Mac)	Close the project
Control+X (Win), Command+X (Mac)	Cut (selected object on stage)
Control+Y (Win), Command+Y (Mac)	Redo
Control+Z (Win), Command+Z (Mac)	Undo
Control+Enter (Win), Command+Enter (Mac)	Preview the project
Control+Alt+A (Win), Command+Option+A (Mac)	Export PowerPoint slides as animation
Control+Alt+B (Win), Command+Option+B (Mac)	Show or hide Filmstrip
Control+Alt+C (Win), Command+Option+C (Mac)	Show the Closed Captioning dialog box
Control+Alt+D (Win), Shift+Option+D (Mac)	Update the Library
Control+Alt+E (Win), Command+Option+E (Mac)	Edit points of polygon drawing object
Control+Alt+F (Win), Command+Option+F (Mac)	Find in the Library
Control+Alt+G (win), Command+Option+G (Mac)	Create a slide group and autoadjust the rollover area
Control+Alt+H (Win), Command+Option+H (Mac)	Hide the selected object
Control+Alt+I (Win), Command+Options+I (Mac)	Find PowerPoint slides in the Library
Control+Alt+J (Win), Command+Option+J (Mac)	Edit PowerPoint slides
Control+Alt+K (Win), Command+Option+K (Mac)	Lock the selected object
Control+Alt+L (Win), Command+Option+L (Mac)	Show or hide the Library
Control+Alt+M (Win), Command+Option+M (Mac)	Insert master slide
Control+Alt+N (Win), Command+Option+N (Mac)	Show slide notes
Control+Alt+O (Win), Command+Option+O (Mac)	Record additional slides
Control+Alt+P (Win), Command+Option+P (Mac)	Remove a slide group.
Control+Alt+Q (Win), Option+Shift+Q (Mac)	Show the Question Pools Manager
Control+Alt+S (Win only)	Edit PowerPoint slide
Control+Alt+T (Win), Command+Option+T (Mac)	Show or hide the Timeline
Control+Alt+U (Win), Command+Option+U (Mac)	Library usage
Control+Alt+V (Win), Command+Option+V (Mac)	Import video file

Control+Alt+X (Win), Command+Options X (Mac)	Show/hide the SWF-Commenting pane
Control+Alt+Z (Win), Command+Option+Z (Mac)	Show/hide the Widget panel
Shift+F7 (Win & Mac)	Show objects style manager
Shift+F8 (Win), Command + , (Mac)	Preferences dialog box
Shift+F9 (Win), Shift+Command+F9 (Mac)	Actions dialog box
Shift+F10 (Win), Shift+Command+F10 (Mac)	Table of contents
Shift+F11 (Win), Shift+ Command+F11 (Mac)	Skin Editor panel
Shift+F12 (Win), Shift+Option+F12 (Mac)	Publish the file
Shift+A (Win & Mac)	Insert Animation placeholder
Shift+F (Win & Mac)	Insert Flash video placeholder
Shift+R (Win & Mac)	Insert rollover caption placeholder
Shift+O (Win & Mac)	Insert rollover image placeholder
Shift+C (Win & Mac)	Insert Text Caption placeholder
Shift+V (Win & Mac)	Insert video place holder
Shift+M (Win & Mac)	Insert Image placeholder
Shift+Q (Win), Option + Q (Mac)	Insert Question slide placeholder
Shift+X (Win & Mac)	Insert Text Animation placeholder
Shift+Alt+A (Win), Shift+Option+A (Mac)	Show Audio Management panel
Shift+Alt+W (Win), Shift+Option+W (Mac)	Close all the open projects
Shift+Alt+O (Win), Shift+Option+O (Mac)	Insert recording slide placeholder
Shift+Alt+P (Win), Shift+Option+P (Mac)	Import Photoshop file
Shift+Alt+S (Win), Shift+Option+A (Mac)	Show Speech Management panel
Shift+Alt+V (Win), Shift+Option+V (Mac)	Paste as Background
Shift+Alt+Up, Down, Left, Right Arrows (Win), Shift+Option+Up, Down, Left, Right Arrows	Click the object, click a resize handle, and use these options to resize the object in the selected direction by 10 pixel
Shift+Control+A (Win), Shift+ Command+A (Mac)	Add an animation object
Shift+Control+B (Win), Shift+Command+B (Mac)	Add a new button
Shift+Control+C (Win), Shift+ Control+C (Mac)	Add a new text caption
Shift+Control+D (Win), Command+Shift+D (Mac)	View slide properties
Shift+Control+E (Win), Shift+Command+E (Mac)	Insert a new zoom area
Shift+Control+F (Win), Shift+Command+F (Mac)	Insert an FLV file
Shift+Control+H (Win), Shift+Command+H (Mac)	Hide/show slide
Shift+Control+I (Win), Shift+Command+I (Mac)	Decrease the indent
Shift+Control+J (win), Shift+Command+J (Mac)	Insert a blank slide
Shift+Control+K (Win), Shift+Command+K (Mac)	Add a new click box

Shift+Control+L (Win), Shift+Command+L (Mac)	Insert a highlight box
Shift+Control+M (Win), Shift+Command+M (Mac)	Add a new image
Shift+Control+N (Win), Shift+Command+N (Mac)	Add a new animation slide
Shift+Control+O (Win), Shift+Command+O (Mac)	Add a new rollover image
Shift+Control+P (Win), Shift+Command+P (Mac)	Import PPT
Shift+Control+Q (Win), Shift+Q (Mac)	Insert a question slide
Shift+Control+R (Win), Shift+Command+R (Mac)	Insert a rollover caption
Shift+Control+S (Win), Shift+Command+S (Mac)	Save the project with different name
Shift+Control+T (Win), Shift+Command+T (Mac)	Insert a text entry box
Shift+Control+U (Win), Shift+Command+U (Mac)	Insert the mouse
Shift+Control+W (Win), Shift+Command+W (Mac)	Insert a widget
Shift+Control+X (Win), Shift+Command+X (Mac)	Insert a text animation
Shift+Control+Y (Win), Shift+Command+Y (Mac)	Copy the background
Shift+Control+Z (Win), Shift+Command+Z (Mac)	Insert Slidelet
Shift + Control + Alt + B (Win), Shift+Command+Option+B (Mac)	Show Branching View
Shift+Control+Alt+S (Win), Shift+Command+Option+S (Mac)	Insert an image slide
Shift+Control+Alt+E (Win), Shift+Command+Option+E (Mac)	Show/Hide effects panel
Shift+Control+V (Win), Shift+Command+V (Mac)	Insert stencil slides
Shift+Control+G (Win), Shift +Command+G (Mac)	Edit gradient

## Magnification shortcuts

[To the top](#)

Shortcut key	Magnification level
Control+1 (Win), Command + 1 (Mac)	100%
Control+2 (Win), Command + 2 (Mac)	200%
Control+3(Win), Command + 3 (Mac)	300%
Control+4 (Win), Command + 4 (Mac)	400%
Control+ - (Win), Command + - (Mac)	Zoom out
Control++ (Win), Command + + (Mac)	Zoom in
Control + 0 (win), Command + 0 (Mac)	Best Fit Zoom / Center Align Workspace

## Shortcut keys for recording

[To the top](#)

The following table lists the default shortcut keys used during recording. These shortcuts should be used only after you start the recording process. The same keys function differently when you are editing a project.

Shortcut key	Action

Control+R (Win), Command + R (Mac)	Start/record new capture project
Control+Alt+O (Win), Command+Option+O (Mac)	Record additional slides
End (Win), Command+Enter (Mac)	Stop recording
Delete (Win & Mac)	Delete the current selection
Pause (Win), Command+F2 (Mac)	Pause or resume recording
Print Screen (Win), Command +F6 (Mac)	Capture a screenshot manually
F4 (Win & Mac)	Preview project
F3 (Win & Mac)	Preview single slide
F2 (Win & Mac)	Edit caption text
F12 (Win & Mac)	Preview project in browser
F4 (Win), Command+F4 (Mac)	Auto panning
F3 (Win), Command+F3(Mac)	Manual panning
F7 (Win), Command+F7(Mac)	Stop panning
F9 (Win), Command+F9 (Mac)	Start Full Motion Recording
F10 (Win), Command+F10 (Mac)	Stop Full Motion Recording
F11 (Win), Command+F11 (Mac)	Snap recording window to mouse
F12 (Win), Command+F12 (Mac)	Toggle mouse capture

## Change shortcut keys for recording

[To the top](#)

1. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select Keys from the Recording menu.
3. To change keys, click once in one of the text boxes and, on the keyboard, press the key or key combination you want to use. For example, click inside the To Stop Recording text box and then press Shift+Alt+4. The key combination you entered now appears in the To Stop Recording text box. You can use almost any key, including the Control, Alt, Shift+Control, and Shift+Alt keys. For example, you could change the stop recording key to Alt+R.

# Timeline

- Show or hide the Timeline
- Rearrange the Timeline panel
- Change the zoom level of the Timeline panel
- Change the order of object layers
- Hide objects during editing
- Timeline for slidelets
- Lock objects
- Set time for objects and slides using the Timeline
- Preview a slide using the playhead

The Timeline is a visual representation of the timing of all objects on a slide. The Timeline provides an easy way to view, at a high level, all objects on a slide and their relationship to each other.

With the Timeline, you can organize objects and precisely control the timing of objects. For example, on a slide that contains a caption, an image, and a highlight box, you can display the caption, then the image 4 seconds later, and then the highlight box 2 seconds after that. The Timeline also shows any audio associated with the slide or with objects on the slide. You can easily coordinate the timing of audio with the slide using the Timeline.

**A.** Show/Hide All Items **B.** Lock/Unlock All Items **C.** Playhead **D.** Timeline Header **E.** Fly-Out Menu **F.** Move the Playhead to the beginning **G.** Stop **H.** Play **I.** Move the Playhead to the end **J.** Mute **K.** Elapsed Time **L.** Selected Start Time **M.** Selected Duration **N.** Slide Duration **O.** Zoom Slider

The major components of the Timeline are objects, the header, and the playhead. The objects on a slide are displayed as stacked bars in the right pane of the Timeline. The header at the top of the Timeline indicates time in seconds (and parts of seconds). The playhead shows the point in time in which the slide is being viewed.

The Timeline header shows time, in minutes:seconds format. For example, 01:05 indicates 1 minute and 5 seconds. The markings help you see exactly when objects appear.

You can use the Timeline to hide or lock objects easily. This is useful when a slide contains many objects and you need to edit the objects separately.

## Show or hide the Timeline

To the top

Select Window > Timeline.

## Rearrange the Timeline panel

To the top

By default, the Timeline panel is docked at the bottom of any slide in an Adobe Captivate project. You can move, resize, group, or dock the Timeline panel to suit your requirement.

## Change the zoom level of the Timeline panel

To the top

Use the slider in the Timeline panel. The center of the slider indicates 100% zoom. To increase the zoom level, drag the slider to the right. To reduce the zoom level, drag the slider to the left.

## Change the order of object layers

1. Move the mouse over the object in the Timeline panel until the hand icon appears and drag the object up or down to reposition it.
2. If you have two objects that overlap on the slide, you need to select the object you want in front by setting the stacking order.

Changing the stacking order consists of moving objects to the back and front of the slide Stage. The key point to remember is that objects at the back of the Stage appear behind other objects. Use one of the following methods to set the stacking order:

- Right-click (Windows) or Control-click (Mac OS) an object on the slide, click Arrange, and select one of the object order options. If necessary, right-click (Windows) or Control-click (Mac OS) other objects on the slide and adjust their order.

**Bring To Front** This option brings the selected object to the top. When the project plays, the object appears on top of all others.

**Send To Back** This option sends the selected object to the background. When the project plays, the object appears behind all others.

**Bring Forward** This option moves the object one layer forward.

**Send Backward** This option moves the object one layer back.

- On the Timeline, move the mouse over an object until the hand appears and drag the object up or down to change its position in the stacking order. Moving an object higher in the stacking order moves it to the front of the Stage, while moving an object lower moves it to the back of the Stage.

## Hide objects during editing

❖ In the Timeline, click the dot below the eye icon in the layer that you want to hide.

The object disappears from the slide and an X icon appears in the column. To display the object on the slide, click the X icon.

When you hide an object layer, it is hidden only on the Stage. You can still view the layer when it is previewed or published.

## Timeline for slidelets

A slidelet is a slide within a slide. A slidelet has its own Timeline. All the objects in the slidelet are displayed in its Timeline. When you select a slidelet, the Timeline changes automatically to that of the slidelet. To display the Timeline for the slide containing the slidelet, click anywhere outside the slidelet. For more information on slidelets, see Rollover slidelets.

## Lock objects

❖ In the Timeline, click the dot below the lock icon in the layer that you want to lock.

The layer and its corresponding object cannot be edited or moved until you unlock the layer. To unlock the layer, click the lock icon.

## Set time for objects and slides using the Timeline

You can change the amount of time an object or slide appears in the movie using its Property Inspector or by using the Timeline. You may find this feature useful in several situations. For example, you may want to set exact object timing when coordinating a voice-over with a highlight box; you may want the highlight box to appear only when the voice-over says, "Enter the date here."

- Move the mouse over the left or right edge of the slide or object on the Timeline until the resize pointer appears. Click and drag the edge to the required position in the Timeline.
- To set two objects to appear at the same time, align their left and right edges. For example, you can set a highlight box to appear at the same time as an image so that the highlight box can appear over the image.
- To adjust the display time of interactive objects (such as text entry boxes, click boxes, and buttons) rest the pointer over the line between Active and Inactive in the bar until the slider handle appears. Drag the slider to adjust the display time.

You can select multiple objects and move them at the same time. Hold down the Shift key and click objects to select consecutive stacked objects in the Timeline, or to select nonconsecutive objects, hold down the Control key and click the objects to move.

You can determine whether keystrokes are played slowly or quickly in a project. If the project has many keystrokes, increasing the speed will make the pace of the project faster. However, if keystrokes are critical in the project, you may want them to play slowly so users can view them clearly. Use the Timeline to change keystroke speed. Keystrokes are contained in a Timeline object named Typing.

You determine the speed at which the mouse moves on any individual slide in a project. A high mouse speed increases the pace at which the project plays. However, if mouse movements are complicated, you may want to decrease the mouse speed so users can view all movements. Mouse movement is contained in a Timeline object named Mouse. To shorten the amount of time it takes for the mouse movement to play, move the mouse pointer over the left edge of the Mouse object until the resize pointer appears. Click and drag the edge to the left.

## Preview a slide using the playhead

The red line that moves across the Timeline is the playhead. The playhead moves through the Timeline to indicate how the currently displayed slide appears in the project. It is a quick and efficient way to preview a single slide and check object timing.

To see how the playhead functions, press F3. You can stop a playhead when it is playing by clicking it. To drag the playhead to a required position, move the mouse over its "head" in the area displaying the time. When the pointer appears, drag the playhead to the required position.

❖ Do one of the following to preview a slide:

- "Scrub" the slide by dragging the playhead to the left or right. As you move the playhead, objects appear and fade as they will when users view the slide. Scrubbing gives you the ability to control the pace and view the slide at any speed from very slowly to very quickly.
- With the playhead in any location on the Timeline, press the Spacebar or F3 to begin playing the slide.
- With the playhead in any location on the Timeline, press ▶ in the lower-left corner of the Timeline. (To end playback, press ■, or to wait, press )

# Toolbars

## Rearranging the Object Toolbar

Toolbars provide you an easier access to the most commonly used menus. You can quickly complete a task or a procedure by clicking the buttons on the toolbar instead of navigating to the menu.

You can hide or show toolbars according to your requirements. To show or hide a toolbar, select Window and then select the name of the toolbar.

**Main Options** Shortcuts to frequently performed actions, such as, save, record, and preview.

**Object Toolbar** Shortcuts for adding Adobe Captivate objects, such as, text captions, buttons, and highlight boxes. Using this toolbar you can also draw smart shapes, such as, lines and rectangles, and also set the stroke and fill colors.

**A.** Smart Shapes **B.** Smart Shapes fly-out **C.** Insert Text Caption **D.** Insert Rollover Caption **E.** Insert Image **F.** Insert Rollover Image **G.** Insert Highlight Box **H.** Insert Rollover Slidelet **I.** Insert Zoom Area **J.** Insert Mouse **K.** Insert Click Box **L.** Insert Button **M.** Insert Text Entry Box **N.** Insert Text Animation **O.** Insert Animation **P.** Insert Video **Q.** Insert Interaction

**Align** Shortcuts for aligning different objects on a slide. For more information, see Align objects.

## Rearranging the Object Toolbar

By default, the tools in the toolbar are arranged in a single column. Click the double arrow at the top of the toolbar to make it horizontal or to arrange the tools in two columns.

**Note:** To make the toolbar horizontal, ensure that the toolbar is free-floating and is not grouped with any other panel.

To make the toolbar free-floating, drag it out of the panel group using the two horizontal dotted lines at the top of the bar.

Horizontal dotted lines

# Undoing and redoing actions

---

You can reverse the previous action by using the Undo command.

- From the Edit menu, select Undo [*Name of the recent action*] or press Control+Z.

Each click reverses one more action. Continue clicking Undo (or pressing Control+Z) to remove as many of the previous changes as necessary.

When the Undo command is unavailable (dimmed), you cannot undo the previous action.

Adobe Captivate tracks actions from the time you open a project until the time you close the project. Therefore, you can undo as many times as you need to, as long as the project remains open.

You can reverse the action of the Undo command by using the Redo command.

- After you have used the Undo command, from the Edit menu, select Redo or press Control+Y.

## Creating Projects

# Create projects

---

- [Create a project to include software simulation](#)
- [Create a project from PowerPoint presentations](#)
- [Create a project from images](#)
- [Create a project starting with blank slides](#)
- [Create template-based projects](#)

---

## Create a project to include software simulation

[To the top](#) <sup>+</sup>

You can create an Adobe Captivate project by recording events in an application or screen area on your computer. The following modes of recording are available.

### Automatic Recording

Adobe Captivate captures screenshots automatically and places them in separate slides. For more information, see [Automatic recording](#).

### Manual Recording

You can manually capture screenshots using this option. The chosen set of screenshots appears sequentially in separate slides after the recording is complete. For more information, see [Manual recording](#).

For more information, see [Recording Projects](#).

---

## Create a project from PowerPoint presentations

[To the top](#) <sup>+</sup>

You can import an entire PowerPoint presentation, or only selected slides into an Adobe Captivate project. Each PowerPoint slide is imported as a separate slide in the Adobe Captivate project. You can later edit the PowerPoint presentations from within Adobe Captivate.

---

## Create a project from images

[To the top](#) <sup>+</sup>

Projects created from images can be viewed as a slideshow. Each image is imported into a separate slide.

1. Select File > New Project > Image Slideshow.
2. In the New Image Slideshow dialog box, set the dimensions of the project.
3. Click OK, and select the images that you want to add to your project.
4. If the Resize/Crop image dialog box appears, set the following options:

***note:** You see the Crop/Resize dialog box only when an image exceeds the height or width limits of the project. If you are inserting more than one slide, only those images that exceed the dimension limits are displayed in the dialog box.*

**Fit To Stage** Resizes the image to fit the dimensions of the slide.

**Crop** Displays a bounding box with dimensions corresponding to that of the project. Resize the handles of the box to select the area that you want displayed on the slide. If you selected Constrain Proportions, Adobe Captivate maintains the height-to-width ratio of the bounding box.

**Zoom** You can zoom in and zoom out of the image by moving the slider. Alternatively, you can choose from a list of standard zoom sizes from the menu.

**Constrain Proportions** Maintains the height-to-width ratio of the bounding box used to crop the image. This option is enabled only when you choose to crop the image. When you disable this option, resize the bounding box, and enable the option again; the new dimensions are used thereafter to calculate the ratio.

In addition to the above options, you can also set tone controls (brightness, sharpness, and contrast) and adjust color ranges (alpha, hue, and saturation). You can also flip or rotate the image.

## Create a project starting with blank slides

You can start with a blank project, and then import slides or images from PowerPoint presentations, images, or other Adobe Captivate projects. You can also add a software demonstration, or interactive simulation by recording additional slides.

1. Select File > New Project > Blank Project.
2. Select a preset size in the Select list, or specify a custom width and height for the project.
3. Click OK.

The default theme is applied to the new project. The theme contains a set of master slides that you can use for title, content, and question slides. For more information, see [Themes](#).

---

## Create template-based projects

Adobe Captivate templates allow you to improve consistency across similar projects or modules of a project and reduce the effort required to create new projects.

### Create a storyboard and workflow

No matter what project you want to create, it is helpful to do some planning before you start taking screenshots. Consider first what you want the user to do, learn, or achieve as a result of viewing your project. Defining this goal allows you to create a comprehensive plan for success. Once you have defined the action you want the audience to take, you can create the “core” of the project.

Every movie tells a story. A storyboard is a written version of that story either in the form of text or graphics. It tells you whether you have a clear understanding of what you are about to present to your audience. You can use the 5W, 1H rule adopted in journalism to get your story straight— who, what, when, where, why, and how.

You can create a workflow readily when you have a storyboard in place. A workflow is the flow of information in a project that follows the rules you create for it. For example, you can have a nonlinear presentation in which you can move back and forth between slides, skip slides, or set rules for slide sequence. Defining the workflow in advance helps you complete your project earlier, with minimal changes during the editing cycle.

If your project includes a great deal of text (captions), a script is the best place to begin. Scripts use text-based pages. They are like pages in a book: logical, sequential, and containing as much detail as you care to provide.

### Create project templates

When you want to create similar projects or similar modules in a project, use project templates to ensure consistency and save time. Project templates are especially useful when multiple authors are working on different project modules or on similar projects.

Project templates help achieve the following:

- Consistency across Adobe Captivate projects.
- Reduced development time for multiple projects due to reuse of design.
- Reuse of project preferences across multiple projects.

In a collaborative environment where the designers work separately from the people creating the content, designers use templates to ensure consistency across projects. Content developers do not have to worry about the workflow of the project, the various standards involved, or the creation of the layout. All they have to do is follow the instructions in the template and provide the required content in the relevant placeholders.

Creating a repository of templates requires a disciplined effort involving all stakeholders. However, the effort pays for itself over time in terms of reduced development time for projects.

An Adobe Captivate project template consists of the following:

- Slides with placeholders for various Adobe Captivate objects
- Placeholders for the following:
  - Recording slides
  - Question slides.
- Master slides. For more information on Master Slides, see [Master slides](#).

You can define and use object styles along with the project templates to ensure a uniform appearance for your projects.

When you create a project using a template, the placeholders in the template are marked with a placeholder icon. The icon disappears when you insert an object into a placeholder.

**Note:** *The placeholder objects are not visible when you preview or publish a project created with a project template.*

In addition to placeholders, you can add all Adobe Captivate objects and supported media to templates. The template serves as a ‘stencil’ only. Users can change the objects and placeholders without any restriction when creating a project from the template.

To make a project template more effective, add slide notes providing information or instructions. Include information on the recommended types and properties of objects, media, or slides that users are to insert in the placeholders.

1. Select File > New Project > Project Template.
2. Specify the dimensions of the project template, and click OK.
3. Set preferences for the template using the Edit > Preferences dialog box. The preferences are automatically applied when you use the project template to create a project.
4. Choose the look and feel for projects based on the template by clicking Themes > Themes. The Themes bar appears. Click the required theme from the Themes bar.

You can also modify the theme to suit your requirements. For more information on themes, see [Themes](#).

**Note:** *If you do not want to use themes, you can create your own layouts by inserting placeholder objects on the slides (Insert > Placeholder Objects).*

5. To insert placeholders for slides, select Insert > Placeholder Slides, and choose the type of slide placeholder.
6. Insert other Adobe Captivate objects, and required media.  
Best practice is to add all objects or media that do not change from project to project (for example, a logo) as actual objects. Use placeholders for objects or media that are specific to the project.
7. Save the file. The file is saved with a .cptl extension.

## Create projects from project templates

1. Select File > New Project > Project From Template.
2. Navigate to the template file and click Open.
3. Double-click the placeholder and do the following:
  - For placeholder objects, use the respective dialog box to add objects to the placeholder. The placeholder is converted to a concrete object.
  - For recording slide placeholders, double-click the placeholder slide to start recording.
  - For question slide placeholders, double-click the placeholder slide to insert a question slide.

## Adobe also recommends

- Microsoft PowerPoint

[Legal Notices](#) | [Online Privacy Policy](#)

# Customize the project size

---

When you start creating a new project, you are prompted to choose a predefined size for the project. You can also specify a custom Width and Height for your project.

If you want to reuse the custom size frequently, you can save the project size and assign a name to it. By doing so, you get to choose the custom size from the Select menu the next time you create a project.

1. In the New *<type of project>* Project dialog box, click Customize. The Custom Project Size dialog box appears.
2. Click New and type a name for the custom size. For example, "Size for Adobe Projects."
3. Specify the height and width.
4. Click Save and then click OK.

The saved custom size now appears in the Select list of the New *<type of project>* Project dialog box.

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Enable backup file creation

---

Adobe Captivate creates a backup file for your project when you save it. When you re-save the project, the changes are saved to the backup file too. The backup file is saved with a .bak extension.

If your project file gets corrupt, use the backup file to recover your project. Rename the backup file using a .cptx extension, and open it. Changes that you made after the last save, however, are not reflected in the backup file.

The provision to create a backup file is enabled by default in the Preferences dialog box. You can choose to disable the option if it interferes with the speed of saving the project.

**Note:** *The size of the backup file might be larger than that of your main project.*

1. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select General Settings from the Global menu.
3. Select Generate Project Backup.

# Themes

---

- [Constituents of a theme](#)
- [Templates and themes](#)
- [Apply themes](#)
- [Customize themes](#)
- [Reuse themes across projects](#)

Themes help your project look better with coordinated colors, well-planned layouts for slides, fonts and effects. When you create a project, a default theme is applied to the project. You can change the theme by choosing one of the preloaded themes that are shipped along with Adobe Captivate. You can customize a theme, save it as a different theme, and reuse it for other projects.

---

## Constituents of a theme

[To the top](#) <sup>1</sup>

Each theme consists of the following:

- Master slides (a minimum of seven)
  - Main master slide, prefixed with the name of the theme
  - Content master slide
  - Question master slides (5 numbers)
- Object styles. For example, the 'Woody' theme contains styles such as Woody caption style, Failure, and Success captions.
- Skin and TOC settings related to the theme
- Recording defaults

For a description about these slides, see [Master slides](#).

You can modify each of these component of a theme. For more information, see [Customize a theme](#).

The Themes bar (Themes > Themes) shows a representative content master slide of a theme.

---

## Templates and themes

[To the top](#) <sup>1</sup>

The difference between templates and themes is that templates decide 'when' and 'where' content (including media) is to be placed while themes decide how the project looks. For example, consider that you want a standard approach to all the elearning courses developed by your team. You require a pretest followed by content and then a post-test. You can create a template with the required type of slide placeholders and also decide the number of slides that each of these sections contain.

On the other hand, if you need an aquatic theme for the project background with coordinated colors for the slides, you apply a theme.

The recommended workflow is to use a theme within the project template. By doing so, you can ensure that the projects based on the template use a standard theme.

---

## Apply themes

[To the top](#) <sup>1</sup>

Click Themes > Apply Theme, and then select a theme (CPTM file).

A visual representation of a theme is shown in the Themes bar. To view the bar, click Themes > Themes. The Themes bar appears at the top of the workspace. Use the drop-down at the top of the Themes bar to filter the themes or browse for more themes.

 *For Adobe Captivate to apply themes effectively, ensure that you use uniform styles for objects. For example, all text captions can be of a one single style.*

You can apply themes to projects directly or use them in project templates for a standard look and feel.

When you apply a theme to a project:

- For each slide in the project, Adobe Captivate compares the linked master slide layout with those on the master slides in the theme you apply. If a matching layout is found, the slide is mapped to that master slide. If a match is not found, Adobe Captivate creates a new master slide and then maps the slide.
- Objects, layouts, skin editor, and TOC that use default settings of the existing theme are mapped to the respective default styles in the applied theme. Any overrides to these elements are not retained in the project.

When you copy and paste a slide into another project, the theme of the target project is applied to the slide. If the slide contains objects and layouts that were overridden, the overridden settings are retained.

When you record a software simulation in a project, default captions and highlight boxes are mapped to the corresponding styles in the project theme.

---

## Customize themes

[To the top](#) <sup>14</sup>

You can customize a theme by editing the constituent master slides, object styles, skin, and TOC settings.

For information on customizing:

- Master slides, see [Master slides](#).
- Object styles, see [Object style](#).
- Theme settings in the skin of a project, see [Skins](#).
- Theme settings in TOC, see [Table of contents \(TOC\)](#).
- Recording defaults, see [Set recording preferences](#).

To save a customized theme, click Themes > Save Theme. Themes are saved as CPTM files.

---

## Reuse themes across projects

[To the top](#) <sup>15</sup>

1. If you have modified a theme, save the changes by clicking Theme > Save Theme. The themes are saved as CPTM files.  
Changes to master slides, object styles, skin editor, and TOC theme settings now become a part of the saved theme.
2. Open the project in which you want to reuse the theme.
3. Click Themes > Apply Theme, and browse for the theme (CPTM file) that you saved earlier.

## Recording Projects

# Record video demonstrations

---

## Edit videos

## Publish video projects

## Insert videos in CPTX files

1. Click Video Demo on the Welcome screen. Or, click File > Record New Video Demo.

The recording window, marked by a red box, and the recording options appear.

2. Click Screen Area or Application based on what you want to record and specify the associated options:

**Screen Area** Select this option when you want to capture all events that occur within an area on the screen.

**Custom Size** Select this option if you want to customize the dimensions of the recorded project. You can choose from a list of standard sizes, or define a custom size. The selected application is automatically resized to fit inside the boundaries of the recording area. Best practice is to have a clear idea of the dimensions of the project before you start recording it.

**Full Screen** Select this option if you want to set the size of the recording window to the size of your computer monitor. The entire computer screen is treated as the recording window. If you work on dual monitors, you can choose the monitor that you want to use for recording. Recording in this mode can potentially produce very large projects and output file sizes due to the large screen resolution on monitors.

**Application** Select this option to specify the application which you want to record. The Select The Window To Record drop-down lists all the open applications on your computer. Click the required application from this list.

**Application Window** Select this option if you want to record the entire application window. The dimensions of the application are not altered. The recording rectangle is resized to fit the application.

**Application Region** Select this option if you want to record defined areas in an application. For example, if you are recording a window that has three frames, the recording window snaps to individual frames when the mouse moves over them. The dimensions of the application are not altered. The recording rectangle is resized to fit the defined area in the application.

3. Do one or all of the following:

- Select a panning mode if you want the recording window to follow your movements across the screen. For more information, see [Panning](#).
- If you are adding narration during recording, select the type of audio input. In the patch for subscription and Adobe Software Assurance customers, you can select System Audio to record audio from your computer's speakers, for example, the sound you hear when error messages pop-up. For more information, see [System Audio](#).

System audio is not supported on Windows XP.

- To change the default settings that Adobe Captivate uses when recording a video demo, click Settings. For more information on customizing recording preferences, see [Set video recording preferences](#).

4. Click Record.

5. Press End key (in Windows) or Cmd + Enter (Mac OS) when you have completed the recording.

**Note:** Alternatively, on Windows, click the task icon or the system tray icon to stop recording. On Mac, click the dock icon or the status bar icon.

The preview of the recorded video appears and starts playing. You can do one or all of the following:

- Publish the recorded video as an MP4 file and save it on your computer. To do so, click . For more information, see [Publish video as an MP4 file](#).
- Directly publish the video to YouTube, Twitter, or Facebook. To do so, click . For more information, see [Publish video to YouTube](#).
- Edit the video in Adobe Captivate and enhance it by adding captions, PIP videos, and pan and zoom effect. You can then publish the video to YouTube, Twitter, Facebook, or save it as an MP4 file.

To edit the video, click Edit. See [Edit videos](#) for more information.

## Edit videos

You can enter the video editing mode by clicking Edit in the video preview window.

Edit button in the video preview window

A .CPVC file opens in Adobe Captivate. You can now edit the video to split or trim it, add effects, audio, and the following objects:

- Text captions
- Highlight boxes
- Images
- Smart shapes
- Mouse
- Animation
- Picture-In-Picture videos (PIP video)

See Noninteractive Objects and Media for information on adding these objects.

A .CPVC file is slightly different from the regular Adobe Captivate project or a CPTX file. The following table summarizes these differences:

CPTX file	CPVC file
Is based on a 'slide' paradigm. After recording, you can see the individual slides in the Filmstrip.	Is not based on the 'slide' paradigm. After recording, the file contains a single video clip that you can see in the Timeline.
You can edit every slide in the Filmstrip by clicking them.	You can edit the video clip to cut, copy, or trim it between two points using the Video Editing options in the Properties.
You can insert both interactive and non-interactive objects.	You can insert only the non-interactive objects, text captions and highlight boxes.
You can insert quizzes.	You cannot add quizzes directly. You can create a separate CPTX project with assessments, publish the CPVC files as MP4 files, and insert into the CPTX project.
You can preview the whole project, the current slide, or specific slides.	You can preview either the whole project or the current frame on stage.

### Properties of a video demo project

Click anywhere on the stage outside the recorded video to view the properties of the video demo in the Property Inspector.

**Stage** Click to change the fill color of the project background. You can also apply gradient fills or pattern fills for the background. For more information on gradient fills, see Apply gradient fills and Apply texture fills.

**Background** Click <<browse icon>> to select an image as the background. This background is visible on the frames that do not contain the recorded video. For example, you split the video and insert objects such as a text caption between the video clips. The background is applied to the frame with the text caption.

**note:** If the image you choose is larger than the dimensions of the video frame, the *Resize/Crop Image dialog box* appears. Choose appropriate options to continue.

**Start Time** Indicates from which point in Timeline the video is published. By default, the value is set to the beginning of the video clip.

**End Time** Indicates until which point in Timeline the video is published. By default, the value is set to the end of the video clip.

Use Start Time and End Time options to publish a portion of the video. For example, if the total length of the video is 60 seconds, you can publish a portion of the video from 10 to 45 seconds.

### Properties of recorded video clips

**Name** Type a unique name for the video clip.

**Audio** Specify the transition, edit, or remove the audio associated with the video clip. See [Add audio to a video project](#) for more information.

### Properties of PIP videos

**Name** Type a unique name for the video clip.

**Shadow** Click to apply shadow to the video clip. Choose the direction and a preset or customize the shadow effect by clicking Custom. For more information, see [Apply shadows to objects](#).

**Reflection** Click to apply reflection to the video clip. Click the required preset. For more information, see [Add reflection to objects](#).

**Transform** Resize the dimensions of the video clip or modify the position of the clip by specifying X and y values. You can also rotate the clip by specifying an angle.

**Audio** Specify the transition, edit, or remove the audio associated with the video clip. See [Add audio to a video project](#) for more information.

### Timeline in video projects

The Timeline in video projects is different from CPTX projects in terms of how objects and videos are grouped:

- In video projects, unlike CPTX projects, all objects are placed in a single layer in the Timeline
- PIP videos and recorded video clips are placed in different layers
- Audio and recorded video clips are placed in the same layer

### Add pan and zoom effect

The pan and zoom effect helps you draw users' attention to a specific area or an action in the video. For example, in a software simulation, you can pan the screen to a group of icons and then zoom in closer to a specific icon.

1. Play the video file using the Play button in the Timeline.
2. Pause (click the play button again) at the point where you require the pan and zoom effect.
3. Click Pan & Zoom in the Timeline. The Pan and Zoom icon appears in the video clip and the Pan & Zoom panel appears.

The Pan & Zoom panel displays the frame at the point you chose in the video.

*Pan & Zoom icons in Timeline*

To move the pan and zoom point to a different location on the video clip, drag-and-drop the icon.

4. To specify the area to be magnified, resize the blue box around the frame using the handles. Then, drag-and-drop the box to the required position on the frame. The smaller the box, the greater is the magnification.  
You can also specify the magnification value in terms of percentage using the Scale slider or box.
5. Use the Speed slider to specify how fast Adobe Captivate has to zoom in.

To delete a pan and zoom point, click the icon in the timeline and press the Delete key.

## Apply transitions to video

1. Click the transition icon that appears at the beginning and end of the video clip.

Transition icons in Timeline

2. Choose a transition effect from the Transitions panel. To see a preview of a transition effect, hover your mouse over the effect.
3. In the Speed list at the top of the Transition panel, click the required speed for the transition.

To remove the transition effect, click the transition icon, and click No Transition from the Transitions panel.

## Split recorded video clips

You can split the video clip to insert separator text or videos (PIP). For example, you can split the video clip to insert a summary of what users learnt until that point in the video.

When you split a video clip, the resultant clips continue to exist on the same layer in the Timeline.

Here's an example of how you can insert separator text between two parts of a video clip:

1. Click the video clip in the Timeline.
2. Click to play the video and click the icon again to pause at the point where you want to split the video.
3. Click Split in the Timeline. The Timeline now shows two video clips.

**Note:** Other objects, such as, text captions or highlight boxes in the project are also split along with the video clip. Preview the video to adjust the timing of these objects.

4. Drag-and-drop the second clip to create space for the text that you want to insert.
5. Click Insert > Text Caption. The default text caption appears on a separate layer on the Timeline.
6. Drag-and-drop the text caption in the Timeline and position it so that it corresponds to the space between the two parts of the video clip.
7. Preview the project to check the timing of the text caption.

**Note:** The text caption appears as a separate frame or a slide. The background of this screen is the one that you set for the video project. To change the background, drag-and-drop the stage anywhere outside the video, and then click Stage in the Property Inspector.

You can make the transition between the video clips interesting by adding effects. When you split a video clip, a transition icon appears at the split point in the Timeline. Click the icon to choose an effect from the Transitions panel.

**Note:** Each video clip has a transition icon at the beginning and end. If you move the second video clip, another transition icon appears at the beginning of the clip. When you merge the transition icons by placing the video clips adjacent to each other, the transition effect used in the subsequent video clip is retained.

## Trim video clips

You can trim video clips to cut unwanted portions of the video.

1. Click the video clip in the Timeline.
2. Click to play the video and click the icon again to pause at the point where you want to trim the video.
3. Click Trim in the Timeline. Start and end markers that define the region for trimming appear on the video clip.
4. Click  or  to move the start and end trim markers to the current playhead position. You can also click and drag the trim markers left or right to choose the portion of the video clip for trimming.

**Note:** Objects, such as, text captions or highlight boxes that are within the cross section of the trim markers are also cut along with the

video clip.

5. Click Trim in the Timeline.

Two separate video clips appear with transition icons. Click the icon to choose a transition effect.

## Add audio to a video project

You can record or import an audio clip (WAV or mp3 files):

- As background audio for the entire project (Audio > Import to > Background; Audio > Record to > Background).
- As background or narration for any PIP in the project. Click the PIP in the Timeline, and then click Audio > Import To > PIP, or Audio > Record To > PIP.
- As video narration to individual video clips in the project. Click the video clip, and then click Audio > Import To > Video Narration, or Audio > Record To > Video Narration.

If you have split a video clip into multiple clips, you can add separate audio clips to each video clip. To do so, right-click the video clip, and choose Record To or Import To.

You can record audio as narration for the entire project at once using Audio > Record To > Project Narration.

For information on editing audio, see Edit audio.

## Edit mouse points

Click the mouse icon and modify the properties in the Property Inspector:

1. Click Edit > Edit Mouse Points. The mouse icons appear on the video clip in the Timeline indicating the frames that have mouse actions.

Mouse point icons in the Timeline

2. Click the mouse icon and modify the properties in the Property Inspector:

**Options** Choose the required pointer. Click Browse for any pointers stored on your local disk.

**Double Mouse Size** Choose to double the size of the pointer.

**Show Mouse** Toggle to show or hide the mouse action. When you hide the mouse action, the mouse icon is still visible on the video clip. However, when you play the video, the action from the previous mouse point to the hidden one is not visible.

**Smoothen Mouse Path** By default, the mouse path is rough, traced by the actual movement of the mouse during recording. Select this option to make the mouse path smooth either using a straight line or a curve.

**Reduce Speed Before Click** Select this option to slow the mouse movement down before the click occurs. This option is useful for a long mouse path that moves quickly and stops suddenly.

*note: This option appears only if you have selected Smoothen Mouse Path.*

**Show Mouse Click** Adds a visual click effect to the mouse movement.

**Default** Displays a quick, small burst of color when the user clicks the slide. You can select a color for the color burst.

**Custom** Select this option to use a SWF file as a visual click effect. Adobe Captivate includes two effects you can use. Test them by clicking the pop-up menu, selecting one, and then clicking Play. View the effect in the small preview window on the right.

3. To apply the modified properties to multiple mouse points in the video, click  and click one of the options.

## Insert mouse actions

In addition to the mouse actions that you capture while recording the video, you can insert new mouse actions into the video.

1. Click the video clip in the Timeline.

2. Click to play the video and click the icon again to pause at the point where you want to insert a mouse action.
3. Click Insert > Mouse. A pointer appears on the frame at the playhead point. Adobe Captivate plots the mouse position based on the coordinates derived from the previous and the subsequent mouse points.
4. Drag-and-drop the pointer to the required place on the frame.
5. Edit the properties using the Property Inspector. For details on the different properties you can edit, see [Change mouse properties](#).

## Recording additional video

1. In the CPVC file, click Insert > Video Recording.

For information on recording video from within CPTX files, see [Insert videos in CPTX files](#).

2. Select the recording options and the area you want to record, and click Record.

The new video clip appears after the existing video clips on the Timeline.

---

## Publish video projects

[To the top](#)

### Publish video as an MP4 file

1. In the full screen mode, click . In the CPVC file, click File > Publish.
2. Specify a title for the project.
3. Specify a folder in which the project must be published. By default, the project is published in the folder specified in the project preferences.
4. Click one of the options in the Select Preset list.

Adobe Captivate automatically sets the video settings based on the option you select. If necessary, you can customize the settings by selecting the Customize Video Settings check box.

After publishing a project as an MP4 file, you can do the following:

- Upload it to the device stores or to YouTube. You can also share the video over social media, such as Twitter and Facebook. See [Publish projects as MP4 files](#) for information.
- Distribute the file to your users as a stand-alone video over email or host it on your web server.
- Stream or embed the MP4 file using Flash.

### Publish video to YouTube

In the full screen mode, click . In the CPVC file, click File > Publish to YouTube.

See [Upload projects to YouTube directly from Adobe Captivate](#) for more information.

### Publish a specific portion of the video

1. Drag-and-drop the black start and end markers to define the portion of the video you want to publish.

You can also specify the Start and End time in the Property Inspector. Click anywhere on stage outside the video to view the Start and End time.

2. Do one of the following actions:
  - Click File > publish to publish the portion of the video as an MP4 file. See [Publish video as an MP4 file](#) for more information.
  - Click File > Publish to YouTube to publish the portion of the video directly to YouTube. See [Upload projects to YouTube directly from Adobe Captivate](#) for more information.

---

## Insert videos in CPTX files

[To the top](#)

Click the Record additional slides icon () , and then click Video Demo in the recording options.

The recording video appears in the Filmstrip with the webcam icon.

*Webcam icon with the video slide*

To edit the video, click the slide, and then click Edit Video Demo in the Property Inspector. For information on editing videos, see [Edit videos](#). Click Exit at the upper-left corner to save the changes to the video file and return to the CPTX file.

---

 Twitter™ and Facebook posts are not covered under the terms of Creative Commons.

[Legal Notices](#) | [Online Privacy Policy](#)

# Pause while recording projects

---

You can pause while recording an Adobe Captivate project. Any action performed after a project is paused is not recorded.

1. Open Adobe Captivate and begin recording a new project or slide.
2. When you want to pause recording, press the Pause/Break key (on Windows) or Cmd + F2 (on Mac OS) on the keyboard. When you want to restart recording, press Pause/Break or Cmd + F2 again.

**Note:** You can change the keys that you want to use for pausing or resuming projects in the Preferences dialog box.

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Record software simulations

---

## Record additional slides for existing projects

### Mark slides to revisit after recording

#### Recording tips

1. Select File > Record New Software Simulation. The recording window appears.
2. Click Screen Area or Application.

**Application** Select this option if you want to specify the application which you want to record as part of your project. In the Select Application menu, select the application that you want to record and select one of the following:

**Custom Size** Select this option if you want to customize the dimensions of the recorded project. You can choose from a list of standard sizes, or define a custom size. The selected application is automatically resized to fit inside the boundaries of the recording area. Best practice is to have a clear idea of the dimensions of the project before you start recording it.

**Application Window** Select this option if you want to record the entire application window. The dimensions of the application are not altered. The recording rectangle is resized to fit the application.

**Application Region** Select this option if you want to record defined areas in an application. For example, if you are recording a window that has three frames, the recording window snaps to individual frames when the mouse moves over them. The dimensions of the application are not altered. The recording rectangle is resized to fit the defined area in the application.

**Screen Area** Select this option when you want to capture all events that occur within an area on the screen.

**Custom Size** Select this option if you want to record your project using a specific dimension. You can choose from a list of standard sizes, or create your own custom size window.

**Full Screen** Select this option if you want to set the size of the recording window to the size of your monitor screen. The entire computer screen is treated as the recording window. If you work on dual monitors, you can choose the monitor that you want to use for recording. Recording in this mode can potentially produce very large projects and output file sizes due to the large screen resolution on monitors.

3. Click Automatic or Manual in the Recording Type area. For more information, see Automatic recording, and Manual recording.
4. Do one or all of the following:
  - Select a panning mode if you want the recording window to follow your movements across the screen. For more information, see Panning.
  - If you are adding commentary during recording, select the type of audio input.
  - To change the default settings that Adobe Captivate uses when recording, click Settings at the bottom of the recording options. For more information on customizing recording preferences, see Set recording preferences.
5. Click Record.
6. If you have selected Manual recording, press Print Screen (Windows) or Command+F6 (Mac) every time you want to take a screenshot during the procedure.
7. Press End key (in Windows) or Cmd + Enter (Mac OS) when you have completed recording.

**Note:** Alternatively, on Windows, click the task icon or the system tray icon to stop recording. On Mac, click the dock icon or the status bar icon.

The recorded slides are now inserted in a new Adobe Captivate project.

For a demonstration of the recording process, see [www.adobe.com/go/learn\\_recordtutorial\\_en](http://www.adobe.com/go/learn_recordtutorial_en).

---

## Record additional slides for existing projects

To the top <sup>14</sup>

1. Open the project in which you want to record additional slides.
2. Click the Record Additional Slides icon (  ).
3. In the Record Additional Slides dialog box, select the slide after which you want the recorded slides to be inserted and click OK.  
The recording window appears.
4. Set the recording options and click Record.

**Note:** You can record a video as an additional slide by selecting *Video Demo* in the recording options.

The newly recorded slides are inserted into your project after the slide you selected.

You can also add slides by importing them from other Adobe Captivate projects or PowerPoint presentations.

[To the top](#)

## Mark slides to revisit after recording

Sometimes, while recording simulations, you may click an option that you initially did not plan for. This action can result in unwanted slides in your recorded project. To locate such unwanted screen captures later after recording the entire project can be an arduous task, especially if you have many slides.

To locate the slides you want to delete or revisit in a recorded project, press Ctrl + Shift + Z while recording. For example, if you click an option on the screen and realized that it was a wrong action during recording, press Ctrl + Shift + Z.

The slide that corresponds to the action is marked with an Undo marker and is hidden in the project.

Slide with the 'Undo' marker

The Undo marker is basically a transparent text caption on the slide. If you want to retain the slide, select the caption, and press Delete. Also, right-click the slide, and click Show Slide to unhide the slide.

**Note:** Note: You can change the keyboard shortcut for the undo marker in Preferences (Edit > Preferences > Recording > Keys (Global)).

To edit the slide, right-click on the slide in the Filmstrip and click Show slide. To delete the marker, click it and press Delete.

[To the top](#)

## Recording tips

The following tips and tricks can help you create Adobe Captivate projects quickly and easily, while also giving you professional, high-quality results:

**Use automatic recording as far as possible** Even for projects that need a few manually generated screenshots, consider automatic recording. Set the autorecord option, but press Print Screen (Windows) or Command+F6 (Mac) whenever you want to take an extra screenshot. This method is effective if you are recording a website that contains many pop-ups, frames, and special effects. Adobe Captivate plays a camera shutter sound each time a screenshot is automatically captured. To generate a screenshot at a place where you do not hear the sound, press Print Screen to manually take a screenshot.

For example, if you are recording Microsoft Internet Explorer, there can be dynamic HTML or Flash menus that appear only when the mouse rolls over them. Adobe Captivate does not automatically capture the change that occurs on mouse rollover. Press Print Screen to manually capture the change.

**Go slowly when recording, particularly when recording websites in Internet Explorer** Perform actions more slowly than you would normally during recording. It is especially important to go slowly when capturing actions on a website in Internet Explorer. If you are manually recording, ensure that each web page is loaded before capturing a screenshot.

**Wait for the camera shutter sound** During autorecording, wait for the shutter sound before performing another action.

If you are manually recording, Adobe Captivate captures screenshots each time you press a designated key or key combination. The default capture key is the Print Screen key. Each time you want to capture a screenshot, press the Print Screen key; you'll hear the camera shutter sound.

# Set recording preferences

## Panning

[Set global recording preferences](#)

[Set video recording preferences](#)

[Change keyboard shortcuts for recording](#)

[Set Preferences for the different modes](#)

[Change recording defaults for objects](#)

Adobe Captivate uses a default set of preferences for panning and other settings when recording or creating projects. You can customize these preferences using the various options available in the Preferences dialog box.

## Panning

[To the top](#)

Use panning when you want the recording window to follow the movement of your mouse pointer across the screen. Panning helps you capture events across a large screen even when the recording window is smaller than the size of the screen.

The following panning options are available in Adobe Captivate:

**Automatic Panning** The recording window automatically moves along with the pointer whenever you move the mouse during recording.

**Manual Panning** You must manually move the recording window to the area where the next event takes place. In all other respects, It is like the automatic panning option.

## Set global recording preferences

[To the top](#)

Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS). In the Preferences dialog box, select Settings from the Recording menu.

Option	Description
Narration	Records audio as you record the project. You cannot enable camera sounds or keyboard tap sounds when you have chosen narration for a project.
Actions in real time	Record actions using their actual speed.
Camera sounds	A “camera shutter” sound is played whenever a screenshot is captured during recording. It is helpful to turn on this sound so you know exactly when a screenshot is captured, especially when using the autorecording feature. The camera sound is not included in the finished project.
Keystrokes	Records keyboard actions like typing text on the screen. Adobe Captivate records keyboard input, but does not create a slide for every character that is typed.
Hear keyboard tap sounds	Determines whether keyboard press sounds are audible during recording. The keyboard press sounds are not included in the finished project.
Recording Window	The red border of the recording window is not displayed during recording.
Task Icon	Hides the task icon during recording. This option is available only on Windows.
System Tray Icon	Hides the system tray icon during recording. This icon is the small Adobe Captivate icon that is displayed in the system tray in the lower-right corner of the computer screen. Use this option if you do not want to record the icon when recording the project.
Move new windows inside recording area	Adobe Captivate automatically moves any new window during

	recording into the recording window. Use this option when recording an application in which many dialog boxes open as you use the application.
Drag and drop actions	Adobe Captivate switches automatically to video mode when recording drag-and-drop actions.
Mouse Wheel Actions	Adobe Captivate switches automatically to video mode when recording mouse movements.

## Set video recording preferences

[To the top](#)

Adobe Captivate automatically captures some actions in the video mode during autorecording. You can choose to disable this feature in the Preferences dialog box. You can also set options to optimize the size of the video SWF file and set the color mode for the video file.

Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS). In the Preferences dialog box, select Video Demo from the Recording menu.

Option	Description
Show mouse in Video Demo Mode	Displays mouse movements when the video is played.
Working folder	Location of the generated temporary video file on your computer.

## Change keyboard shortcuts for recording

[To the top](#)

You can choose your own keyboard shortcuts for actions that are involved when recording a project using the Preferences dialog box. For example, the End key (in Windows) or Cmd + Enter (Mac OS) is used to stop recording a project in Adobe Captivate. You can change that by entering a different key in the dialog box.

1. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select Keys - (Global) from the Recording menu.
3. Click inside the field that you want to change.
4. Type the keyboard shortcut.

## Set Preferences for the different modes

[To the top](#)

Some of the options for recording modes are disabled in Adobe Captivate. The reason for disabling the options is based on the logic for recording in that mode. However, you can still enable some of the options if you have a special requirement.

For example, one wouldn't usually add text captions in an assessment movie. So, the options for text captions are not enabled in Adobe Captivate. You can enable them in the Preferences dialog box if you have a special requirement.

1. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select Modes from the Recording menu.
3. In the Mode menu, select the recording mode you want to customize. Then, choose the objects you want to be inserted automatically during recording:

Option	Description
Add Text Captions	Automatically creates captions based on user and system actions performed during autorecording. The text captions use the labels in the application to describe a step. For example, if the user clicks File in the menu bar, a text caption with the text, "Select the File menu" is created automatically.
Convert Tool Tips To Rollover Captions	Automatically converts any tool tips on the screens you are capturing to rollover captions. Tool tips are small floating text windows that appear when the mouse hovers over buttons. This option is not selected by default for any of the recording modes.
Use Smart Shapes Instead of Captions	Inserts the specified smart shape for captions.

Show Mouse Location And Movement	Displays mouse movements during autorecording.
Add highlight boxes on click	Automatically adds a highlight box around the area where the mouse is clicked.
Add Click Boxes On Mouse Click	<ul style="list-style-type: none"> <li>• Automatically creates click boxes whenever you click screens you are autorecording.</li> <li>• Enables or disables the hint, success, and failure captions.</li> <li>• Sets the number of times the user can click before the movie moves to the next slide.</li> <li>• Enables cursor display when the user moves the mouse over the mouse areas</li> </ul>
Automatically Add Text Entry Boxes For Text fields	<ul style="list-style-type: none"> <li>• Automatically creates text entry boxes whenever you click text boxes you are autorecording.</li> <li>• Enables or disables the hint, success, and failure captions.</li> <li>• Sets the number of times the user can enter text within the same text entry box before the movie moves to the next slide.</li> </ul>

**Note:** The options mentioned in the table are enabled or disabled based on the recording mode you have chosen.

## Change recording defaults for objects

[To the top](#) <sup>1</sup>

Adobe Captivate uses a default set of styles when inserting objects such as text captions and highlight boxes during recording. You can change these default settings using the Preferences dialog box.

Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS). In the Preferences dialog box, select Defaults from the Recording menu. Change the styles for the objects as required.

To create a new object style, click Create New Style and create a new style in the Object Style Manager.

[More Help topics](#)

# Types of recording

---

[Automatic recording](#)

[Manual recording](#)

[To the top](#) <sup>↑</sup>

## Automatic recording

When you record using automatic recording, Adobe Captivate captures screenshots automatically and places them on separate slides. Mouse, keyboard, or system events are the common triggers for capturing screenshots. Automatic recording is the most commonly used recording method in Adobe Captivate.

In the recording options (File > Record New Software Simulation) , you choose one of the following autorecording modes:

- Demonstration mode
- Training mode
- Assessment mode
- Custom mode

Depending on the mode, one or more of the following objects are added automatically during the recording. You can change recording preferences for the various modes. The descriptions for the various modes assume that you have not changed the default recording preferences.

**Text Captions** Text captions are used to point out certain areas on a slide, explain concepts, or provide users with additional information. Text captions can be created automatically or manually. If you are autorecording a project, you can have Adobe Captivate automatically create text captions. Text captions are generated for the various mouse and keyboard events.

The text captions use the labels in the application to describe a step. For example, if the user clicks File in the menu bar, a text caption with the text, "Select the File menu" is created automatically. You can later edit the captions to your requirements. When the user views the movie, the actions performed during recording are displayed along with the captions

**Text Entry Boxes** Text entry boxes are Adobe Captivate objects that require user input. During recording in some of the modes, text entry boxes with default hint, success, or failure captions are added to the slides. You can later edit the text in these captions.

**Click Boxes** A click box is an object in Adobe Captivate that designates an area around the place where the mouse was clicked during recording. Click boxes help users try out an application or website using the movie. After viewers click a click box, you can have the project perform different actions. For example, the project resumes playing, opens a new project, or opens a specific website.

**Highlight boxes** Highlight boxes are transparent, colored rectangles that can be placed over areas on a slide to draw attention to the area. You can edit the formatting, color, transparency, and size of all highlight boxes. If you automatically record a project or slides, Adobe Captivate creates a highlight box for the area on which a mouse event occurs. If you have an existing project, you can also add highlight boxes manually.

## Demonstration mode

Use the demonstration mode when you want to demonstrate a procedure or feature. The movie produced in this mode however, does not provide any scope for user interaction. The user can only passively view actions that were performed when the project was recorded.

When recording a movie in the demonstration mode, Adobe Captivate does the following:

- Adds text captions using the labels of the controls in the application. For example, if the user clicks File in the menu bar, a text caption with the text, "Select the File menu" is created automatically.
- Adds highlight boxes to highlight those areas where the mouse is clicked.
- Adds text that is typed manually during the recording.

See Record software simulations for more information.

## Training mode

Use the training mode when you want the user to try the procedure during the movie. The movie moves to the next slide only after the user has performed the previous action correctly.

When recording slides in training mode, Adobe Captivate does the following:

- Adds click boxes at places where the user must click the mouse.
- Adds text entry boxes for user input. The failure and hint captions are added to each text entry box.

See Record software simulations for more information.

## Assessment mode

Use the assessment mode when you want to test how well the user has understood a procedure. You can set a score for every correct click. You can also set the number of times the user can attempt a procedure. When the user fails to click the right option in the number of attempts provided, the movie moves to the next step. The user does not get any score for the failed attempt.

When recording slides in assessment mode, Adobe Captivate does the following:

- Adds click boxes at places where the user must click the mouse.
- Adds text entry boxes for user input. The failure caption is added to each text entry box.

See Record software simulations for more information.

## Custom mode

Use the custom mode when working on a project where you need a mix of features available in the other modes. This mode allows you to achieve the highest level of customization in Adobe Captivate. Using the custom mode, you can create a project that is part demo, part training, and also includes assessment. None of the Adobe Captivate objects are added by default during recording in the Custom mode.

For example, let us consider a movie meant for training the user on editing a file. In the first few slides for simpler tasks like opening the application and opening the file, you can retain the slides created in the demo mode. When you move to the slides describing the procedure for editing, you can add the various objects with which the user can interact. Finally, you can provide for assessment slides at the end of the project.

See Record software simulations for more information.

## Multimode recording

When you record an Adobe Captivate project, you can choose to record in more than one mode. Multimode recording helps you save time when working on projects that require outputs in more than one autorecording mode.

See Record software simulations for more information.

---

## Manual recording

[To the top](#) 

You can create a project manually by taking screenshots during recording. Use manual recording when you want to pick and choose a few screenshots during the recording process. The procedure can get tedious for complicated procedures involving many steps.

See Record software simulations for more information.

## [Convert slide notes to speech or closed captioned text](#)

## [Install text to speech converters](#)

## [Using third-party voices for speech text](#)

## [Resolving the, “unable to decode and import the selected wav - mp3 file” error](#)

## [Add speech text to multiple slides](#)

## [Disable closed captions in a slide](#)

## [Delete slide notes](#)

You can add slide notes and convert them into an audio file using the text-to-speech converter in Adobe Captivate. You can also convert slide notes to closed captioned text. Unlike slide notes, closed captioned text appears on the slide during runtime.

You can also use slide notes to communicate with users who do not have any audio equipment or are hearing impaired. Slide notes are a good location for adding extra information about a slide, such as numerical details, supporting materials, or footnote text.

---

## Add slide notes

[To the top](#) <sup>4</sup>

1. Select Window > Slide Notes.
2. In the Slide Notes panel, click the + icon to add a new slide note.
3. Type the slide notes

Slide notes can act as instructions for developers or as reminders for unfinished items. Notes are not displayed when the movie is played.

Slide notes are automatically imported when you import slides from Microsoft PowerPoint.

If you export your project to Microsoft Word to create handouts, you have the option to include slide notes in the document. This can be useful when you want to add extra information for reviewers when you publish the project as a Microsoft Word document.

---

## Convert slide notes to speech or closed captioned text

[To the top](#) <sup>4</sup>

You can convert text in the slide notes into an audio file using text-to-speech software from NeoSpeech™. The following voices from NeoSpeech are supported in Adobe Captivate:

- Kate: English female voice
- Paul: English male voice
- Bridget: British English female voice
- Julie: US English female voice
- Chloe: Canadian French female voice

You can install NeoSpeech using the Adobe Captivate installation CD or download it from the Adobe website. For detailed instructions on how to install NeoSpeech, see [Install text to speech converters](#).

**Note:** You can also use *third-party voices* or the voices installed with your operating system. See [Using third-party voices for speech text](#).

When you use NeoSpeech voices, you can modify different aspects of the narration using the native NeoSpeech tags. See [www.adobe.com/go/learn\\_neospechtags\\_en](http://www.adobe.com/go/learn_neospechtags_en) to know how you can tweak the speed, pitch, and volume of NeoSpeech voices.

When you convert text to speech, the audio file is inserted into the corresponding slide. Multiple slide notes are merged into a single audio file and appear on the Timeline as a single object. You can also convert slide notes in the panel to closed captions in a single click.

The audio file pauses at locations where you have inserted commas or periods in the slide notes.

When you play the movie:

- The slide notes are read aloud to the user.
- The closed caption text on the slide is displayed to the user.

1. To convert the slide notes to audio:

- a. Select the check boxes in the text-to-speech column and corresponds to the notes you want to convert to audio.
- b. Click Text-to-Speech.
- c. In the Speech Management dialog box, select a speech agent and click Generate Audio.

To convert additional text to speech, click the + icon, type the text, and then click Generate Audio.

**Note:** When you edit a slide note, you must click Generate Audio again for the changes to be applied.

## 2. To convert the slide notes to closed captions:

- a. Select the check boxes in the closed captions column and corresponds to the notes you want to convert to closed captions.

**Note:** The closed captioning check boxes are greyed out if you the slide does not contain an audio. If a slide contains video closed captions and then you add audio closed captions, the latter takes precedence.

- b. Click Closed Captioning.
- c. Click the + icon to add additional closed captions. Click the '-' icon to remove closed captions.
- d. To time a closed caption, click the header of the caption that displays the start and end time, and drag the playhead in the audio clip.
- e. Click CC Project Settings to change the font, size, color, background, and the number of lines in which the captions must be displayed.
- f. To enable the display of closed captions in the published projects, go to Project > Skin Editor, and click Closed Captioning.  
The 'CC' button appears in the playbar. While playing or previewing the project, click the 'CC' button to view the closed captions.

---

## Install text to speech converters

To the top <sup>14</sup>

If you have not installed the text-to-speech software during installation, do one of the following:

- Install using the Adobe Captivate installation CD. Re-run the installation CD and do one of the following:
  - (Windows only)Click Install Text To Speech Voices in the autoplay options.
  - Run the .exe (Windows) or the .app (Mac) file in the Add-ons/NeoSpeech Text To Speech Voices folder on the installation CD.
- Download the installer from one of the following appropriate locations:
  - Windows 32-bit: [http://www.adobe.com/go/captivate6\\_voices\\_installer](http://www.adobe.com/go/captivate6_voices_installer)
  - Windows 64-bit: [http://www.adobe.com/go/captivate\\_voices\\_installer\\_win64](http://www.adobe.com/go/captivate_voices_installer_win64)
  - Mac: [http://www.adobe.com/go/captivate\\_voices\\_installer\\_mac](http://www.adobe.com/go/captivate_voices_installer_mac)

If you have problems installing the text to speech software, see [www.adobe.com/go/learn\\_ttsmac\\_en](http://www.adobe.com/go/learn_ttsmac_en).

---

## Using third-party voices for speech text

To the top <sup>14</sup>

You can purchase voices from third-party vendors and use them seamlessly in Adobe Captivate.

**Note:** Ensure that these voice comply with your operating system's speech APIs.

Install the voices on your computers using the installers provided by the vendors. The new installed voices get listed in the Speech Agent list of the Audio > Speech Management dialog box.

---

## Resolving the, “unable to decode and import the selected wav - mp3 file” error

To the top <sup>14</sup>

This error might be displayed when you are using Adobe Captivate on Windows Vista. You must register the Adobe DLL to fix this error.

1. Close Adobe Captivate.
2. Run Command Prompt in the admin mode.
3. Enter the location of the directory where you have installed Adobe Captivate.
4. Run regsvr32 NSAudio.dll. The message, “Registration of DLL successful” is displayed.

5. Right-click Adobe Captivate in the Program Files menu, and select Run As Administrator.

---

[To the top](#) <sup>4</sup>

## Add speech text to multiple slides

You can add speech text to multiple slides using the Speech Management dialog box. To add variety to the movie, you can choose different speech agents for different slides. For example, you can use a male voice and a female voice for alternate slides.

1. Select Audio > Speech Management.
2. In Speech Management dialog box, select the slides to which you want to add the slide notes, and click the + icon.
3. Type the slide notes in the highlighted areas.
4. To generate audio for the slide notes:
  - a. Select the slide notes to be converted to audio.
  - b. In the Speech Agent list, select the voice that you want to use for the audio.
  - c. Click Generate Audio.

**Note:** When you edit a slide note, you must click Generate Audio again for the changes to be applied.

---

[To the top](#) <sup>4</sup>

## Disable closed captions in a slide

You can prevent closed captions from appearing when the movie is played. Clear the check boxes in the closed captions column corresponding to the notes in the Slide Notes panel.

---

## Delete slide notes

[To the top](#) <sup>4</sup>

To delete slide notes, click next to the arrow that corresponds to the slide notes and then click the '-' icon.

# Add slides

---

- [Record additional slides for a project](#)
- [Copy slides from other projects](#)
- [Enable rescaling of slides during import](#)
- [Duplicate slides](#)
- [Insert blank slides](#)
- [Insert new or stencil slides](#)
- [Insert images as slides](#)
- [Insert slides from a PowerPoint presentation](#)
- [Insert animation slides](#)

Adobe Captivate offers a wide variety of options for adding slides to a project, including recording, importing, and copying. You can add different types of slides such as blank, image, quiz, or animation.

---

## Record additional slides for a project

[To the top](#)

There may be cases in which you record an Adobe Captivate project and begin working at the slide level, only to realize that you need to record a few more slides. In this case, you probably don't want to rerecord the entire project but just a few actions. Adobe Captivate allows you to do this by recording new slides and inserting the slides in an existing project. For more information, see [Record additional slides for existing projects](#).

---

## Copy slides from other projects

[To the top](#)

1. In an open project, right-click (Windows) or Control-click (Mac OS) the slide to copy. To select multiple slides, press Shift or Control on the keyboard, click the slides, and then right-click (Windows) or Control-click (Mac OS).
2. Select Copy.
3. Open the Adobe Captivate project in which you want to paste the slides.
4. Right-click (Windows) or Control-click (Mac OS) the slide after which you want the new slide or slides to appear. (For example, if you want to paste the copied slide as Slide 6 of your project, click the slide currently labeled Slide 5.)
5. Select Paste.

---

## Enable rescaling of slides during import

[To the top](#)

Adobe Captivate can automatically resize the content of imported slides according to the dimensions of the project to which the slide is being imported.

1. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. Select General Settings from the Global menu.
3. Select Rescale Imported/Pasted slide.

---

## Duplicate slides

[To the top](#)

Duplicating slides is an easy way to expand your projects. For example, if you carefully design a slide with a certain background color, layout, caption, and highlight box, you can simply duplicate that slide and change some of the elements or text to add more information to your project.

 *Master Slides are another way of achieving uniform look and feel for multiple slides.*

❖ In an open project, do one of the following:

- Right-click (Windows) or Control-click (Mac OS) the slide to copy and select Duplicate.
- Select a slide and press Control+D.

To select multiple slides, press Shift or Control on the keyboard while clicking the desired slides. To select all slides, right-click (Windows) or Control-click (Mac OS) on a slide and select Select All Slides.

The slide or slides you selected are duplicated and placed in the project. You can edit and work with the new slides just like the original slides.

---

## Insert blank slides

1. In an open project, right-click (Windows) or Control-click (Mac OS) the slide after which you want the new blank slide or slides to appear.
2. Select Insert > Blank Slide.

The new slide is added to your project. You can edit and work with the new slide just like other slides in the project.

### Adobe recommends

 [Have a tutorial you would like to share?](#)

#### Insert blank slides

A video tutorial on how to add blank slides to projects.

## Insert new or stencil slides

'Stencil' slides are those that inherit the master slide associated with the slide that you select.

1. In an open project, right-click (Windows) or Control-click (Mac OS) the slide after which you want the new slide to appear.
2. Select Insert > New Slide.

A new 'stencil' slide appears in the Filmstrip. You can edit the slide as required. You can also associate a different master slide using the Property Inspector (General > Master Slide list).

### Adobe recommends

 [Have a tutorial you would like to share?](#)

#### Insert stencil slides

A video tutorial on how to insert stencil slides.

## Insert images as slides

Image slides are slides that have an image inserted into their background.

1. Open an Adobe Captivate project.
2. Right-click (Windows) or Control-click (Mac OS) the slide after which you want the new image slide or slides to appear.
3. Select Insert > Slide > Image Slide.
4. Browse to and select the image that you want to import in the Open dialog box.
5. If the image that you are trying to import is larger in dimensions than that of your slide, the Resize/Crop Image dialog box appears. Do one of the following:

**Fit To Stage** Resizes the image to fit the dimensions of the slide.

**Crop** Displays a bounding box with dimensions corresponding to that of the project. Resize the handles of the box to select the area that you want displayed on the slide. If you selected Constrain Proportions, Adobe Captivate maintains the height-to-width ratio of the bounding box.

**Zoom** You can zoom in and zoom out of the image by moving the slider. Alternatively, you can choose from a list of standard zoom sizes from the menu.

**Constrain Proportions** Maintains the height-to-width ratio of the bounding box used to crop the image. This option is enabled only when you choose to crop the image. When you disable this option, resize the bounding box, and enable the option again; the new dimensions are used thereafter to calculate the ratio.

In addition to the above options, you can also set tone controls (brightness, sharpness, and contrast) and adjust color ranges (alpha, hue, and saturation). You can also flip or rotate the image.

## Insert slides from a PowerPoint presentation

You can add PowerPoint slides to the end of a project or within a project.

1. In an open project, select Insert > Slide > PowerPoint slide.
2. Select a PowerPoint presentation and click Open.
3. Select Import Slides and Insert After The Selected Slide Below to add new slides after the slide you select from the list and click OK.
4. In the Convert PowerPoint Presentations dialog box, do the following:
  - Clear the Include check box of a slide to exclude from importing.
  - Clear the Linked check box to remove the linkage to the source PowerPoint file.
  - Specify how the slides must advance: Automatically or upon the click of mouse.

---

## Insert animation slides

[To the top](#) <sup>1</sup>

You can insert a SWF, AVI, or animated GIF file as a new slide.

**Note:** *Adding animation as a slide is most appropriate with larger animation files.*

1. In an open project select Insert > Slide > Animation Slide.
2. Navigate to the animation file you want to insert (SWF, AVI, or animated GIF) and click Open. The animation slide is generated and added to the project.

It is important to set the correct frame rate. All imported animation files play at the rate selected in the project Preferences dialog box, regardless of the rate prior to when the file is imported. The default setting is 30 Flash frames per second and is appropriate in most cases. You may need to change the rate if you are embedding your Adobe Captivate SWF file in another SWF file that has a frame rate different than 30.

When you create an animation slide, the amount of time the slide is displayed in the project automatically defaults to the length of the animation file itself. For example, if the animation file that you use to create a new animation slide is only 1.2 seconds in length, the animation slide appears for 1.2 seconds. To change the duration of the slide, click the slide in the Filmstrip, and in the Property inspector, enter a new number of seconds in Display Time. Or use the Timeline to change the slide display time.

# Change slide order

---

To reorder slides, select them and drag them to the new position in the Filmstrip.

 You can select multiple slides by pressing Shift or Control on the keyboard while clicking the desired slides. To select all slides, select Edit > Select All.

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Delete slides

---

Deleting a slide permanently removes the slide from the project.

❖ Do one of the following:

- Right-click (Windows) or Control-click (Mac OS) the slide you want to delete, and select Delete from the menu.
  - Select the slide, and press Delete.
- 

[Legal Notices](#) | [Online Privacy Policy](#)

# Edit slides

---

[Change background color of slides](#)

[Using images in the background](#)

[Editing background images](#)

[Add plain text to a slide](#)

[Edit text recorded on a slide](#)

[Label slides](#)

[Move to a specific slide](#)

Use the Property Inspector (Windows > Properties) of the slides to edit them.

---

## Change background color of slides

[To the top](#)

By default, the slides use the background color that is set in the corresponding master slides.

1. Select the slide (s) in the Filmstrip. To select multiple slides, hold down the Ctrl or the Shift key while selecting the slides.
2. In the Property inspector, clear the Use Master Slide Background check box.  
Now, the background set in the project preferences is used as default.
3. To use a background other than the one set in the project preferences, clear the Project Background check box and click the Stage color palette.
4. Do one of the following:
  - Select a color for the background.
  - Click  to apply a gradient fill. For more information on gradients, see [Apply gradient fills](#).
  - Click  to apply a pattern or an image as the background fill. For more information on using pattern fills, see [Apply texture fills](#).

---

## Using images in the background

[To the top](#)

By default, the slides use the background that is set in the corresponding master slides.

1. Select the slide (s) in the Filmstrip. To select multiple slides, hold down the Ctrl or the Shift key while selecting the slides.
2. In the Property inspector, clear the Use Master Slide Background check box.
3. Click the browse icon below the Background area.
  - If the library does not contain any image, you will be prompted to browse for the image. Navigate to the location of the image, select it, and click Open.
  - If the library already contains images, you will be prompted to choose an image from the library. Select an image and click OK. To use an image that does not exist in the library, click Import in the Select Image from Library dialog box.

---

## Editing background images

[To the top](#)

Click the edit icon in the General section of the slide's Property Inspector. Edit the required attributes of the image in the Resize/Crop Image dialog box.

---

## Add plain text to a slide

[To the top](#)

As you edit a project, you may want to add some text to the slide but not have the text appear as a text caption over the slide. There is an easy trick you can use to add plain text to a slide: simply add the text as a transparent text caption.

1. Open the slide on which you want to insert the text caption.
2. Select Insert > Standard Objects > Text Caption.
3. In the Property Inspector, select Transparent as the Caption Type in the General area.

**Note:** If you create a transparent caption, avoid underlining text. Underlined text might affect the quality of the text.

## Edit text recorded on a slide

When you record text being typed, a new slide is created for every line break. Each line of typed text is treated as a single object and appears as a separate layer on the Timeline. You can replace text recorded on a slide with new text along with typing effects. For example, if you have recorded text being typed in an editing program and you want to change the recorded text on the slide later, you can use this option.

Before you record text being typed, ensure that the option to record keystrokes has been enabled. For more information, see [Set global recording preferences](#).

1. In an open project, right-click (Windows) or Control-click (Mac OS) the Typing layer in the Timeline, and select **Replace With Text Animation**.
2. In the General area of the Property Inspector, select one of the options in the Effect menu.
3. Click **Properties**, type the replacement text on the slide, and then click **OK**.

The text on the slide is replaced with the entered text. In the Timeline, the typing text object is replaced with the text animation object, and the overwritten text appears on the object in the Timeline.

## Label slides

It is easier to identify and keep track of slides using their label instead of their slide number. The label of the slide appears under the slide.

To label a slide, open the slide and enter a name for it in the Label text box of the Property Inspector.

## Move to a specific slide

To jump to a specific slide, type the number of the slide in the Application Bar at the top of the Workspace.

# Group slides

---

## [Create a slide group](#)

## [Name slide groups and mark them](#)

## [Expand or collapse a slide group](#)

## [Ungroup slides](#)

When the number of slides becomes unmanageable, you can group them. By expanding and collapsing groups, you can view subsets of the slides instead of all slides at once. Groups also provide a useful overview for the project, and they provide a convenient way of deleting or hiding multiple slides at once (for example, slides that you don't want to publish).

To help associate slides with their group, you can mark grouped slides with the same border color. The color is not displayed when the project is run.

---

## Create a slide group

[To the top](#)

1. In an open project, click a slide that you want to group, and use Control-click or Shift-click to select the other slides for the group.
2. Right-click (Windows) or Control-click (Mac OS) and select Group > Create.

The selected slides are grouped into a single group slide with their numbers and descriptions displayed on it.

---

## Name slide groups and mark them

[To the top](#)

1. Click the group slide in the Filmstrip.
2. In the Property Inspector, type a name for the slide group in the Title text box. This title appears at the bottom of the grouped slide.
3. From the Color palette, select a color for the border of all the slides in the group. This color is not displayed when the project is run.

---

## Expand or collapse a slide group

[To the top](#)

Right-click (Windows) or Control-click (Mac OS) the group slide and select Group > Expand or Group > Collapse.

 *A faster way is to click the arrow icon on top of the group slide.*

---

## Ungroup slides

[To the top](#)

Right-click (Windows) or Control-click (Mac OS) the group slide and select Group > Remove.

# Hide slides

---

## Hide slides

### Include or exclude hidden slides when publishing handouts

Adobe Captivate allows you to hide an individual slide in a project; the slide stays in the project but is hidden from view when the project is played. This option is useful in several situations, such as if others are reviewing the project, but information on certain slides is changing so you want to hide the slides until they are correct.

---

## Hide slides

[To the top](#) <sup>4</sup>

Right-click (Windows) or Control-click (Mac OS) a slide and select Hide Slide. The slide is dimmed in the Filmstrip and the eye is displayed at the bottom of the slide.

To show the slide, right-click (Windows) or Control-click (Mac OS) and select Show Slide or click the eye icon at the bottom of the slide in the Filmstrip.

---

## Include or exclude hidden slides when publishing handouts

[To the top](#) <sup>4</sup>

1. In an open project, select File > Publish.
2. Select Print on the left panel.
3. In Type, select Handouts.
4. In the Handout Layout Options area, select Include Hidden Slides.
5. Click Publish.

# Lock slides

---

Adobe Captivate gives you the option to lock individual slides. When you lock a slide, all objects on the slide can be viewed but not edited. This feature is useful if you want to send your project to others for review but do not want them to make changes to objects.

You can tell that a slide is locked by looking for the small lock icon. This icon appears below a locked slide in the Filmstrip.

✦ In an open project, right-click (Windows) or Control-click (Mac OS) the slide you want to lock and select Lock Slide.

💡 *To select multiple slides, press Shift or Control on the keyboard while clicking on the required slides. To select all slides, Edit > Select All.*

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Master slides

---

[Viewing master slides](#)

[Adding a master slide](#)

[Add objects to master slides](#)

[Using master slides](#)

[Editing Master slides](#)

[Reusing Master slides](#)

Master slides define background and common objects such as logos, headers, and footers for your slides. They provide a uniform appearance for your entire project.

All the artefacts on a master slide, such as, objects and placeholders reflect on the slide that is linked with the master slide.

A group of master slides make up a theme. For more information on themes, see Themes.

When you create a blank project or a project from template, Adobe Captivate uses the default (Blank) theme. A theme contains the following types of master slides:

**Main master slide** The main master slide is the first slide in the Master Slide panel. The name of this slide is the same as the name of the theme. Objects and background color of this master slide appear on all other master slides. Each theme has one main master slide.

**Content master slides** Contains layouts and objects that you can use for content slides, for example, a Title master slide can be used for the title of the project. A theme can contain one or more content master slides.

**Question master slides** Each theme contains a separate master slide for the following question types:

- Matching
- Hot spot
- Likert
- Other question types: multiple choice, fill-in-the-blank, true-false question, short answer, and sequence questions
- Result slide

Each question master slide contains placeholder questions, answers, and captions with the style related to the theme.

Each slide, except main master slide, contains placeholders for different objects such as text caption, images, or a generic content placeholder. A content placeholder lets you insert any of the following:

- Text caption
- Text animation
- Image
- FLV or F4V video (event video)
- SWF animation

You can insert new quiz and content master slides or edit an existing slide to suit your requirements.

---

## Viewing master slides

[To the top](#) <sup>4</sup>

1. Select Window > Master Slide.
2. To view and edit a master slide on stage, select it in the master slide panel.

### Master slide panel

The Master slide panel displays all master slides your project has. Unless you have added additional master slides, the Master Slide panel displays the slides associated with the current theme of the project.

### Timeline

There is no timing information for master slides. The timeline for a master slide helps only to order, lock, or hide the objects added to it.

---

## Adding a master slide

[To the top](#) <sup>4</sup>

To add additional master slides, do one of the following actions:

- Insert > Quiz Master Slide and then choose the required type of slide
- Insert > Content Master Slide

Though a project contains multiple master slides, you can link a slide to only one master slide.

Use the Property Inspector (Window > Properties) to:

- **Label the master slide:** Specify a unique label in the text box.
- **Provide background color:** Deselect Project Background and then select a color from Stage.
- **Insert background images:** Click the Browse icon  to select a background image.

---

## Add objects to master slides

[To the top](#) <sup>1</sup>

You can insert the following standard objects to a master slide:

- Text Caption
- Rollover Caption
- Rollover Image
- Highlight Box

All other standard objects are disabled.

You can also insert the following:

- Text Animation
- Widget
- Image
- Animation
- FLV/F4V files (event video)

**Note:** *You cannot add audio to a master slide.*

You can add placeholder objects on a master slide. While authoring, you can double-click the placeholders on the slides based on the master slide and insert appropriate content.

To add objects to a master slide,

1. Select the master slide in the master slide strip.
2. Add objects in the same way as you do in the slides in your project.

---

## Using master slides

[To the top](#) <sup>1</sup>

When you work on your project slides, use the Property Inspector (Window > Properties) to:

- **Link to a different master slide:** In the Master Slide drop-down list, make appropriate selection. You can also apply a Master Slide to a group of slides.
- **Display master slide objects on top of the objects in your slide:** Check Master Slide Object on Top.

**Note:** *Objects on the main master slide are always below the objects on other master slides in the Z-order.*

Master slide maintains its own timeline. Therefore, master slide objects are not shown on the timeline of the linked slide. You cannot adjust the timeline of master slide objects or change their Z-order on a project slide timeline.

- **Use master slide background:** Select this option to use background color or background image from master slide.

---

## Editing Master slides

[To the top](#) <sup>1</sup>

Objects on a master slide can be modified only on the master slide. The objects cannot be selected or edited on the slide that inherits the master slide.

On the slides in the Filmstrip, you can edit or delete the placeholders that are inherited from a master slide.

---

## Reusing Master slides

[To the top](#) <sup>1</sup>

- **Duplicate master slide:** Right-click (Windows) or Control-click (Mac OS) and then select duplicate.

**Copying contents:** Select the contents and then click copy.

- **Import/Export:** You cannot import or export master slides, but you can copy and paste them across projects.
- **Import/Export to XML/Microsoft Word:** Like the content on your project slides, you can import/export the master slide content to XML and Microsoft word.

[Legal Notices](#) | [Online Privacy Policy](#)

# Slide properties

## Properties panel

You can set the properties for a slide using the Property inspector (Window > Properties).

## Properties panel

[To the top](#)

**Label** The name of the slide. The slide label appears under the slide in the Filmstrip. It is a good practice to name slides. When multiple users are working on the same project, naming slides helps to identify them easily.

**Accessibility** Click to open the Slide Accessibility dialog box, which lets you add or type in text that can be read to users with disabilities who use screen readers. You can import slide notes to enable accessibility for them. For more information, see [Add accessibility text to slides](#).

**Master Slide** Select the master slide that must be linked to the slide.

**Master Slide Objects on Top** Select to place the objects in the master slide on top of other objects on the slide.

**Use Master Slide Background** Select to use the background of the master slide as the slide background.

**Project Background** Select to use the background settings in the project preferences for the slide. This option is available only if you deselect the Use Master Slide Background option.

**Stage** Click the box to access the color palette and choose a background color for the slide. You can also apply a gradient fill or a pattern fill to the background.

**Note:** *This option is available if you have not selected project or master slide background.*

**Background** Select to change the background image on the slide by selecting an image from the project's Library. This option is available when Use Master Slide Background option is not selected.

**Quality** Select the quality level for the slide: Low (8-bit), Optimized, JPEG, and High Quality.

**Note:** *Selecting the Optimized, JPEG, or High Quality format may increase the file size and the time needed to download your project. You should only use a format other than Low (8-bit) when appropriate.*

**Display Time** Use to change the duration for which the slide plays. The maximum value is 1 hour (3600 seconds).

**Transition** Select a transition effect for the slide. Transition effects make the slide transition interesting and eye-catching.

## Action options

You can define the navigation options every time the user views a slide or moves away from the slide. The On Enter menu displays the actions that you can set for the slide when it is displayed. The On Exit menu displays actions that you can set when the user exits the slide. The following list describes actions available in both the menus:

**Note:** *The options Go To Previous Slide, Go To Next Slide, Go To Last Visited Slide, Jump To Slide, and No Action are available only in the On Exit menu.*

**Continue** The movie moves to the next defined action.

**Open URL Or File** A web browser opens with the specified web page if the user has Internet connectivity. Alternatively, you could open a specified file for the user.

**Open Another Project** Opens the specified Adobe Captivate project.

**Send E-mail To** A draft of the default e-mail editor opens with the e-mail address specified in the To field.

**Execute JavaScript** Adobe Captivate runs the specified JavaScript.

**Execute Advanced Actions** Adobe Captivate runs the script written using the application.

**Play Audio** Adobe Captivate plays the specified audio when the slide is played. The duration for which the audio is played is equal to the duration of the slide or the selected audio file, whichever is shorter. If users perform any action on the slide, for example, pause the slide, the audio stops and does not play again.

**Note:** *If you use multiple Play Audio actions in Advanced Actions, only the audio corresponding to the first Play Audio action is played.*

**Show** When the user performs the required action, the specified hidden object is made visible

**Hide** When the user performs the required action, the specified object is hidden from the user.

**Enable** When the user performs the required action, it activates another object in the project. This option is available only for interactive objects.

**Disable** When the user performs the required action, it disables another object in the project. This option is available only for interactive objects.

**Assign** When the user performs the required action, a new value is assigned for a variable.

**Increment** When the user performs the required action, the value of the specified variable is incremented accordingly.

**Decrement** When the user performs the required action, the value of the specified variable is decremented accordingly.

**Apply Effect** When the user performs the required action, the effect associated with the specified object is applied.

**Go To The Previous Slide** The movie moves to the previous slide.

**Go To The Next Slide** The movie moves to the next slide.

**Go To The Slide Last Visited** The movie moves to the previously viewed slide.

**Return To Quiz** Takes users back to:

- The last attempted question slide if users answered it incorrectly or skipped the question.
- The question after the last attempted question slide if users answered the question correctly.

**Jump To Slide** The movie moves to the specified slide.

**No Action** Nothing happens when the user exits the slide.

### Audio options

**Fade In [#] Seconds** Specifies the time for audio to fade in to full volume.

**Fade Out [#] Seconds** Specifies the time for audio to fade out to silence.

**Loop Audio** Plays the audio file continuously till the slide exits.

**Stop Background Audio** Stops playing any background audio associated with the slide.

**Add Audio** Displays the Slide Audio dialog box that you can use to record audio for the slide.

# Slide transitions

---

Transitions are special effects that appear when one slide changes to another. Transitions signal the end of one slide and the beginning of another.

1. In the Filmstrip, click the slide for which you want to add a transition effect.
  2. In the General area of the Property Inspector, select one of the effects from the Transition list.
  3. If you want to apply the transition to all slides, select multiple slides in the Filmstrip and specify the required transition effect.
- 

[Legal Notices](#) | [Online Privacy Policy](#)

# Tips for introductory slides

---

- Add sound. Adobe Captivate makes it easy to add sound to projects, and sound is very powerful in an introduction. You can add existing sound files or record your own voice-over. You can include a welcome message or play some appropriate music.
  - 💡 *Adobe Captivate contains a gallery that has buttons, sounds, and animations (in SWF format) for you to use in your projects. By default, the gallery is stored in the following location when you install Adobe Captivate: C:\Program Files\Adobe\Adobe Captivate 6\Gallery (on Windows); /Applications/Adobe Captivate 6/Gallery (on Mac OS).*
- Use special effects. If you are going to use special effects in your project, why not start off with them? Special effects (such as fading, for example) create a polished and professional look right from the start.
- Use animated text. For an easy and impressive introductory slide, use the Adobe Captivate animated text feature. This is a fast way to create a sophisticated look for your project.
- Use captions strategically. Add multiple captions to your introductory slide and then carefully set their timing so they fade in and out, one at a time.

## Adding and Managing Objects

# Edit object information using the AdvancedInteraction panel

---

The Advanced Interaction panel (Project > Advanced Interaction) provides an overview of all interactive objects in your project. The objects are grouped slide-wise.

This panel contains the following information that helps you analyze the actions and properties associated with the interactive objects:

**Slide/Object** This column shows the slide number and label, or the type of object.

**Instance Name** This column shows the name of the object's instance.

**On Success** This column shows the navigation that follows the slide if the user successfully completes an object's action. For more information, see Project navigation using interactive objects.

**Attempts** This column shows the maximum number of attempts you have set as a limit for an interactive object.

**On Failure** If an object or slide has the possibility of failure (for example, if an incorrect answer is selected in a multiple-choice question), this column shows where the slide leads after failure. For more information, see Project navigation using interactive objects.

**Shortcut** View and edit keyboard shortcuts for a slide or object in this column.

**Time Limit** This column shows the time limit for specific objects.

**Points** This column shows the total points associated with each scoreable object or question slide.

**Add To Total** indicates the total value if scored objects are included in the total points.

**Include In Quiz** Indicates whether the interactive object carries a score for the overall project quiz.

**Report Answers** Indicates whether or not your project quiz scores are integrated with a learning management system (LMS).

**Objective ID and Interaction ID** These columns contain the ID numbers, if you assign them, for integration with a learning management system (LMS).

**Note:** To make reviewing the project information easier, click the print icon to print the tabular view of the interactions in the panel.

To edit the properties of objects:

1. In an open project, select Project > Advanced Interaction, or press F9.

The Advanced Interaction panel appears, populated with a collapsible list of all interactive objects in the project.

2. Filter the list by clicking the buttons at the top of the dialog box that correspond to the object types that you want to view.

**Note:** You can choose to filter by all scorable objects, click boxes, text entry boxes, buttons, questions, or hidden slides.

3. Click a slide title or object to select it. The Property Inspector of that object appears and lets you edit the properties.

---

 Twitter™ and Facebook posts are not covered under the terms of Creative Commons.

[Legal Notices](#) | [Online Privacy Policy](#)

# Add reflection to objects

---

You can add reflection to all objects and placeholders, except the following:

- Mouse
- Click box
- Rollover area
- Zoom area
- Rollover slidelet
- Text animation
- Zoom destination
- Answer items in question slides

1. Select the object on the slide. You can also select multiple objects by holding down the Shift key (Windows) or the Control key (Mac).
2. In the Property Inspector, click Reflection in the Shadow & Reflection accordion. The reflection is added to the object with default settings. If you have added a reflection to any object before, those reflection settings are applied by default.
3. To modify the reflection, click one of the preset options.
4. To add reflection to multiple objects, click  and choose one of the options.

**Important:** To get object reflection in the published output, choose Flash Player 10 or later in the publish settings.

---

# Align objects

- [Align multiple objects on a slide](#)
- [Aligning objects on the Timeline](#)
- [Align objects with the grid](#)

---

## Align multiple objects on a slide

[To the top](#)

If you have multiple objects on a slide, Adobe Captivate can automatically and perfectly align the objects for you. This is an easy way to create precise and professional-looking project slides.

You have many options for aligning objects both vertically and horizontally. Some of the alignment options depend upon the location of the anchor object. The anchor object is simply the first object you select. You might want to select the largest object or the object that appears first as the anchor object. So that you can easily identify the anchor object, it appears with white resizing handles, while any subsequent objects you select appear with black resizing handles.

The alignment is based on the registration point of an object, which is the upper left corner of the surrounding box of the object. This point is constant in Adobe Captivate and cannot be changed. In objects with thick strokes, the registration point is in the center of the strokes. For more information on registration points, see [this blog](#) by Lieve Weymeis.

1. Open the slide in which you want to align the objects. The slide must contain multiple objects.
2. Select Window > Align.
3. Select the objects on the slide by holding down the Shift key and clicking the individual objects.
4. Do one of the following:
  - Click an alignment option on the alignment toolbar.
  - Right-click (Windows) or Control-click (Mac OS) the selected objects, choose Align, and select the appropriate option from the pop-up menu.

The x (horizontal) and y (vertical) coordinates of the mouse are automatically displayed in the lower-right corner of the Adobe Captivate project window as you move the mouse. Knowing exact coordinates can help you place objects in a precise location on a slide. When aligning objects, it can be helpful to display the grid.

You can move objects using only the keyboard. Select an object and press an arrow key on your keyboard to move 1 pixel at a time. To move an item by the number of pixels defined in the grid, select an object and press Control+arrow key.

To change the height or width of an object by 1 pixel, hold Alt and press an arrow key. Similarly, hold Alt+Shift and an arrow key to change the size 15 pixels at a time.

---

## Aligning objects on the Timeline

[To the top](#)

The Timeline lets you align objects easily. For example, you can align objects to the playhead, the start of a slide, the end of a slide, another object, or a point in time.

### Display the Adobe Captivate Timeline

1. In an open project, double-click a slide that contains objects you want to align.
2. If it is not open already, show the Timeline by clicking the splitter bar. To expand the Timeline, click the display arrow. You can also open the Timeline from the View menu by selecting the Show Timeline option, or using Control+Alt+T.

### Align an object to the playhead

When you sync an object to the playhead, the object moves to the location of the playhead in the Timeline.

- Right-click (Windows) or Control-click (Mac OS) an object on the Timeline and select Sync With Playhead.

*Sync with Playhead*

## Align an object to the start of a slide

- Click an object on the Timeline and drag it to the left side of the Timeline.

## Extend the playing time of an object to the end of a slide

- Right-click (Windows) or Control-click (Mac OS) an object on the Timeline and select Show For Rest Of Slide.

## Align an object to a point in time

- Click an object on the Timeline and drag it to the left or right so that the left edge of the object bar aligns with the correct time in the header.

For example, if you have a caption that currently appears at the same time the slide displays, but you want a slight delay, drag the caption so that its left edge aligns with 2s (a 2-second delay) or 4s (a 4-second delay) in the header.

You can select multiple objects and move them at the same time. Hold down the Shift key and click objects to select consecutive stacked objects in the Timeline or to select nonconsecutive objects, hold down the Control key and click the objects to move.

You can adjust the zoom level of the Timeline easily. Click in the Timeline ruler and spin the mouse wheel on your mouse to increase or decrease the zoom level. Alternatively, use keystrokes to change the zoom level. Click the ruler and then press Control+[ to decrease the zoom level, Control+] to increase the zoom level, or Control+W to set the zoom level so that all objects will fit in the current Timeline.

---

## Align objects with the grid

[To the top](#) <sup>4</sup>

Adobe Captivate contains an optional grid that you can display while working on individual slides. The grid lets you more accurately place and position objects on a slide.

You can also select the Snap To Grid option if you want objects that are placed near grid lines to automatically “snap” to the nearest lines.

### Display the grid

Select View > Show Grid in an open project.

The grid, a light pattern of dots, appears on the slide.

### Align objects with grid lines

Select View > Snap To Grid in an open project.

To test the snap-to-grid behavior, add an object such as a highlight box to the slide, and then move the box. As you move the box, it automatically lines up with the grid lines.

### Change the grid scale

1. In an open project, select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Category panel, select Global.
3. In the Grid Size field, enter a new value for Grid size. Larger numbers display fewer grid lines; smaller numbers display many grid lines for more precise object placement.

The x (horizontal) and y (vertical) coordinates of the mouse are automatically displayed in the lower-right corner of the Adobe Captivate project window as you move the mouse. Knowing exact coordinates can help you place objects in a precise location on a slide.

You can move objects using only the keyboard. Select an object and press an arrow key on your keyboard to move 1 pixel at a time. To move an item by the number of pixels defined in the grid, select an object and press Control+arrow key.

# Apply shadows to objects

## Apply shadows through object effects

You can apply shadow effects to all objects in Adobe Captivate, including the placeholder objects. You can also apply shadow effects to objects on Master Slides.

1. Select the object on the slide. You can also select multiple objects by holding down the Shift key (Windows) or the Control key (Mac).
2. In the Property Inspector, click Enable in the Shadow accordion. The shadow is applied to the object with default settings. If you have applied a shadow to any object before, those shadow settings are applied by default.
3. To modify the shadow, do one or both of the following actions:
  - Click one of the options in the Direction check list.
  - Click one of the preset options, or specify the required properties, such as, color (with transparency), distance, blur, and angle.

**Note:** You can modify these properties even after selecting a preset.
4. To apply the effect to multiple objects, click  and choose one of the options.

[To the top](#)

## Apply shadows through object effects

Select the object and click Add Effect > Filters > DropShadow in the Effects panel (Windows > Effects).

If you apply a shadow to an object using both Property Inspector and Effects panel, both settings are applied based on the effect's timeline.

For example, consider that you have applied a gray color shadow to a rectangle using the Property Inspector. You then apply the shadow object effect to the rectangle, and specify the color as green. You time the effect such that it gets triggered 2 seconds after the slide begins and lasts until the end of slide.

When the project is played, the gray shadow is displayed for the first 2 seconds. After 2 seconds, both gray and green color shadows are displayed for the rest of the slide.

Here are the differences between the two methods of applying shadows to objects:

Through Property Inspector	Through Effects panel
The shadow is applied to the object instantly.	The shadow is applied based on the timeline of the shadow effect.
The shadow is visible to you at edit time, on stage.	The shadow is not visible during edit time. You can see the effect applied during the preview or in the published output.
The shadow can be merged with the slide background by clicking 'Merge with Background'.	The shadow cannot be merged with the slide background.

# Change the display order of objects

---

Adobe Captivate lets you add multiple objects, such as captions, highlight boxes, animations, or images to slides. You specify the order in which objects appear. Use the Timeline to precisely adjust the timing of all objects on a slide.

1. In an open project, navigate to the slide that contains the objects whose order you want to change.
2. Change the order and timing of objects as required.

For example, move the mouse over the left or right edge of an object on the Timeline until the resize cursor appears. Then drag the edge left or right to change when and for how long the object appears.

If you have an object that currently appears at the same time the slide appears, but you want a slight delay, move the mouse over the center of the object on the Timeline until the hand appears; then drag the entire object so the left edge aligns with 2s (a 2-second delay) or 4s (a 4-second delay) in the header.

3. If you have two overlapping objects on the slide, specify the object you want to appear frontmost by setting the stacking order. To change the stacking order, move objects to the back or front of the slide Stage. The key point to remember is that objects at the back of the Stage appear behind other objects. Use one of the following methods to set the stacking order:
  - Right-click (Windows) or Control-click (Mac OS) an object on the slide and select one of the object order options. If necessary, Right-click (Windows) or Control-click (Mac OS) other objects on the slide and adjust their order.
  - In the Timeline, move the pointer over an object until the hand appears. Then drag the object up or down to change its position in the stacking order. Moving an object higher in the stacking order moves it to the front of the Stage. Moving an object lower moves it to the back of the Stage.

**Note:** *If the order for a slidelet is changed, the objects it contains are also moved back or forward along with the slidelet.*

# Controlling the visibility of objects

---

You can hide an object on a slide, and define conditions that must be satisfied for the object to be displayed.

The following example illustrates how to hide an image on a slide until the user clicks the Show Image button.

1. Select Insert > Image to insert an image on the slide.
2. In the Property Inspector, type a name for the image in the Name text box. For example, My\_Image.
3. Clear the Visible check box.
4. Select Insert > Standard Objects > Button.
5. In the Action area of the Property Inspector, select Show in the On Success list, and then select My\_Image in the Show list.

When you play the movie, the image appears only when you click the button.

---

# Copy, paste, and duplicate objects

---

[Copy an object to a different slide](#)

[Copy an object to multiple slides](#)

[Copy objects from other projects](#)

[Duplicate objects](#)

After you have created an object, you can copy that object and paste it onto the same slide, a different slide in your project, or several slides in your project at the same time. This can save you a great deal of time, especially if you create intricate objects with specific sizes, colors, and formatting.

 You can also copy and paste objects between different projects.

**Note:** To reuse media objects that appear in the Library, simply drag the object from the Library onto the slide.

When objects from a slide are copied into a slidelet, the following properties of the objects are modified:

- If timing for the object is specified as Rest Of Slide or Rest Of Project, it is changed to Rest Of Slidelet.
- The option Synchronize With Project loses its validity for FLV files.

---

## Copy an object to a different slide

[To the top](#)

1. Open the slide that contains the object.
2. Right-click (Windows) or Control-click (Mac OS) the object and select Copy.
3. Open the slide to which you want to copy the object.
4. Right-click (Windows) or Control-click (Mac OS) the slide and select Paste.

---

## Copy an object to multiple slides

[To the top](#)

1. Open the slide that contains the object.
2. Right-click (Windows) or Control-click (Mac OS) the object and select Copy.
3. In the Filmstrip, select the slides to which you want to copy the object. Hold down the Shift key and click consecutive slides, or hold down the Control key and select any slides, even if they are not consecutive.
4. Right-click (Windows) or Control-click (Mac OS) a selected slide and select Paste.

---

## Copy objects from other projects

[To the top](#)

You can copy and paste objects from other projects. This strategy can save you a great deal of time. For example, suppose you have created a detailed object in another project. Simply copy and paste the object into any new projects you create.

**Note:** To reuse media objects from another Adobe Captivate project, open that project Library from within your current project Library. Then drag objects directly onto a slide or into the current project Library for easy reuse.

1. Open the Adobe Captivate project that contains the object you want to copy.
2. Right-click (Windows) or Control-click (Mac OS) the object, and select Copy.
3. Open the Adobe Captivate project to which you want to add the object copied in the previous steps.
4. Right-click (Windows) or Control-click (Mac OS) the slide to which you want to add the object.
5. Select Paste.

---

## Duplicate objects

[To the top](#)

Duplicating objects is an easy way to reuse content. For example, you can duplicate a detailed caption and change some of the text to quickly add more information to your project.

**Note:** To reuse media objects that appear in the Library, simply drag the object from the Library onto the slide.

1. Open the slide that contains the object you want to duplicate.

2. Right-click (Windows) or Control-click (Mac OS) the object and select Duplicate.

The object you selected is duplicated and the new object is placed on the slide. You can edit and work with the new object just like the original object.

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Group objects

## Object groups and z-order

### Ungroup objects

To work with your projects faster, you can group objects on a slide. Grouping lets you move, rotate, or edit multiple objects as if they were a single object. For example, you select a group and apply a shadow effect. Changes made to the group are applied to all the objects in the group at the same time.

1. Hold down the Shift key (on Win) or Command key (on Mac) and click the objects that you want to group. You can also select existing groups to combine them into a single group.

**Note:** *Nested grouping is not supported in Adobe Captivate.*

2. Click Edit > Create Group.
3. In the Property Inspector, specify a name for the group, if required.

A new 'folder' (for example, Group\_1) comprising the grouped objects is created in the Timeline.

When you hover your mouse over an object in a group, the outline of the group is marked with dashed-lines.

Grouped objects on a slide

When you select an object for grouping, all related objects also get grouped. For example, if you select the 'Success caption' associated with a click box, failure, hint captions and the click box are also grouped.

You cannot group the following objects:

- Slidelet
- Mouse
- Audio
- Question items and answers

On question slides, you can group only objects, such as, highlight boxes and buttons.

You can ungroup a group of objects and group them again as necessary.

---

## Object groups and z-order

[To the top](#)

The 'group' folder in the Timeline is created on the layer of the object with the highest z-index. In the 'group' folder, the objects are stacked with the descending order of z-index (from top to bottom of the Timeline).

You can change the z-order of the grouped objects in one of the following ways:

- Right-click the object stack, click Arrange, and choose the appropriate option.
- Drag-and-drop the object stack at the required level (z-index0).

---

## Ungroup objects

[To the top](#)

- To ungroup all objects in a group, click the group, and then click Edit > Ungroup.

To remove a specific object from the group, click the group and then click the object. Right-click on the object, and click Remove From Group.

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Manage Library objects

---

[View objects in the Library](#)

[Reuse an object listed in the Library](#)

[Reuse an object in a different project Library](#)

[Delete unused objects from the Library](#)

---

## View objects in the Library

[To the top](#)

1. Select Window > Library.

The Library panel appears.

2. Open a folder (Audio, Backgrounds, Images, Media) to view the objects in that category.
3. Click an individual object to display it in the Library preview pane.

 *In addition to viewing image files, you can play audio and animation files in the Library preview pane.*

---

## Reuse an object listed in the Library

[To the top](#)

1. Select Window > Library.
2. In the Library panel, expand the folder for the category of object you want to reuse.
3. Click the object that you want to reuse and preview the object in the preview pane.
4. Drag the object to the selected slide or slidelet. The object becomes a part of the slide or slidelet depending on where it is placed.

**Note:** *After you copy the object to the slide, editing the properties of the object will not affect other instances of that object in the project.*

---

## Reuse an object in a different project Library

[To the top](#)

1. Select Window > Library.
2. In the toolbar of the Library panel, click the browse icon.
3. Navigate to, and select, the project that contains the objects you want to reuse and click Open.

The library for the other project opens in a separate and expandable window.

4. Click to select the object that you want to reuse.
5. Drag the object to the selected slide stage or to the appropriate folder in your current project Library.

The new objects now appear in your current project Library, even if you dragged them directly onto a slide. You can reuse them as many times as you want.

**Note:** *After you open the Library of another Adobe Captivate project, that project stays in the Open Library menu. You can quickly access that project Library at any time.*

---

## Delete unused objects from the Library

[To the top](#)

1. In the Library panel (Window > Library) of your project, click . The unused items are highlighted in the Library.
2. Click .

More Help topics

# Managing objects with the Main Options toolbar

---

The Main Options toolbar contains the following icons to help you manage objects:

- Cut, copy, paste, delete, and duplicate
- Record additional slides for the current project
- Record audio
- Record background audio
- Collaborate (using Acrobat.com)
- Bring selected object to front
- Send selected object to back
- Bring selected objects forward in z-order
- Send selected objects backward in z-order
- Snap to object
- Show/hide grid
- Snap to grid

# Merge objects into a slide

---

You can merge any object that you create and place on a slide, including images, captions, click boxes, highlight boxes, text entry boxes, and buttons. Merging permanently removes the interactivity of the object, making it an image of the object.

The merging feature is useful in several situations. For example, suppose you import a large image into a slide that contains other objects. You can merge the image into the slide so that it becomes a static background for the other objects. You can also make text a permanent part of a slide by creating a transparent text caption and then merging the caption.

1. Open the slide that contains the object you want to merge.
2. Right-click (Windows) or Control-click (Mac OS) the object that you want to merge into the slide, for example, an image, caption, or click box.
3. Select Merge Into Background from the pop-up menu.
4. The object is merged into the slide.

**Note:** *Merging objects in a slidelet into the background will merge the object into the slidelet background.*

---

# Object effects

---

- [Showing and hiding the Effects panel](#)
- [Options on the Effects panel](#)
- [Creating event-based animation triggers](#)
- [Applying effects to objects](#)
- [Defining motion paths for objects](#)
- [Modifying object effects](#)
- [Creating custom effects in Adobe Flash](#)
- [Saving and deleting effects](#)

Object effects help you quickly draw users' attention to the required objects on a slide. To see the effects that you can apply to objects, select an object, go to Window > Effects, and click .

For a detailed description of these effects, see [this post](#) on Lieve Weymeis's blog.

You can create effects in Adobe Flash and use them in Adobe Captivate. For more information, see [Creating custom effects in Adobe Flash](#).

For an overview of object effects, see [www.adobe.com/go/learn\\_cp\\_objecteffects\\_en](http://www.adobe.com/go/learn_cp_objecteffects_en).

---

## Showing and hiding the Effects panel

[To the top](#)

Go to Windows menu, and then click Effects.

---

## Options on the Effects panel

[To the top](#)

**Effect Properties** Properties of an effect that is applied to an object.

**Live Preview Mode** Shows how the object effect looks when the video is played.

**Animation Trigger** The trigger for a specific object effect. The triggers can be time-based or event-based. Object effects with the time-based trigger are applied after the previous object is played. Object effects with event-based triggers are applied when specific events occur, such as, a click of a button or an entry to a specific slide.

For a specific object, you can apply effects with both time-based and event-based triggers. Object effects with event-based triggers take precedence over effects with time-based triggers.

---

## Creating event-based animation triggers

[To the top](#)

1. Select the object that is the base for the event. For example, to apply an effect to an object after a specific slide begins, select the slide.
2. In the Actions panel, select Apply Effect in the On Enter or On Success drop-down lists.
3. In the Object Name drop-down list, select the object to which you want to apply an effect.

An event-based animation trigger for the selected object is created and listed in the Effects panel. You can choose the event-based trigger while applying an effect to this object.

---

## Applying effects to objects

[To the top](#)

1. Right-click (Windows) or Control-click (Mac OS) the object and then select Effects.
2. In the Animation Trigger drop-down list, select a trigger for the effect. By default, the time-based trigger is selected. To apply the object effect when a specific event occurs, create an event-based trigger, and then select it in the Effects panel.
3. Click  and select the effect to apply to the object. To use an already saved effect, click Browse and locate the XML file that corresponds to the effect.

You can create a sequence of effects by applying multiple effects to a single object.

4. Click Live Preview Mode to preview the effect on the object. Click Edit Mode to return to the editing mode.
5. To apply the effect to multiple objects, click  and select either
  - **Apply To All Items** To apply the effect to all objects that belong to the object type.
  - **Apply To All Items Of Same Style** To apply to all objects that use the same object style.

## Defining motion paths for objects

1. Right-click (Windows) or Control-click (Mac OS) the object and select Effects.
2. In the Animation Trigger drop-down list, select a trigger for the effect. By default, the time-based trigger is selected. To apply the object effect when a specific event occurs, create an event-based trigger, and then select it in the Effects panel.
3. Click , select Motion Path, and then select the type of motion path you want to apply.
4. Click the symbol that appears at the right corner of the object. The direction of the motion path indicated by an arrow appears.
5. To change the direction of motion, click the arrowhead and drag it in the new direction.

## Modifying object effects

Use the Effect Properties panel in the Effects panel to modify the properties of an object effect. To show or hide properties, change the default values, or the range of values, edit the <effect\_config> section in the XML file of the object effect. The XML files for the default object effects are at <Installation folder>/Gallery/Effects (Windows) \Applications\ Adobe Captivate 6\Gallery\Effects (Mac OS).

## Creating custom effects in Adobe Flash

You can save the classic tweens as XML files in Flash and then use the effects in Adobe Captivate. To select and apply an effect created in Flash, select the object, click  in Window > Effects panel, and then click Browse.

You can create the effects with any default duration you want. For a 30 fps project, an effect with 60 frames has a default duration of 2 seconds.

To make the parameters of the effect available on the user interface for editing, edit the XML file to specify the required parameters. These parameters appear on the left side of the Effects panel.

To enable editing of parameters:

1. Open the XML file and in the Keyframes element, identify the property that you want to make available for editing on the user interface.
 

This property typically has a numerical value assigned to it. For the list of properties that the Keyframes element can contain and their description, see [www.adobe.com/go/learn\\_cp\\_flashactionsript\\_en](http://www.adobe.com/go/learn_cp_flashactionsript_en).
2. Change the numerical value of the property in the Keyframes element to a string.
3. Add a new element, effect\_config to the XML file. In this element, add a config\_item element for every property that you want to make available for editing on the user interface. For details on the elements and attributes that you can add in this element, see XML elements for effects configuration parameters.
4. In the config\_item element (child of effect\_config), add the attribute property\_value.
5. Specify the string that you assigned to the property in step 2 as the value for this attribute.
6. Add the other attributes, such as type and default\_value. For more information, see XML elements for effects configuration parameters.
7. Repeat steps 4, 5, and 6 to enable editing for as many properties as you want.

## XML elements for effects configuration parameters

The hierarchy of the effect\_config element is as follows:

```
<effect_config>
  <config_item>
    <effect_property type="number" property_value="BLUR_X" default_value="50">
  </config-item>
  <config_item>
    <effect_property type="list" property_value="QUALITY" default_value="1">
      <list_items>
        <list_item>
        </list_item>
      </list_items>
    </effect_property>
  </config_item>
  <config_item>
    <effect_property type="color" >
      <effect_sub_property>
      </effect_sub_property>
    </effect_property>
```

```

</config_item>
</effect_config>

```

Element	Attribute	Value	Type	Description
effect_config	effect_type	motion_path		Use this attribute to display the handles for editing the x and y coordinates of the motion path.
config_item	display_name		String	Specify the name of the configuration item (property) displayed to users on the Effects panel.
effect_property	property_value This attribute is mandatory.		String	Specify the value of the configuration item. This value must be the same as the one that corresponds to the appropriate property in the 'Keyframes' element.  For example, in the Glow.XML file (Gallery > Effects > Filters), the Keyframe element contains BLUR_X as the value for blurX. To make the value of 'blur' editable from the user interface, add BLUR_X as the property_value in the effect_config element.
	default_value		Number	Specify the default value displayed on the user interface.
	valid_range Syntax: valid_range="{{0,255}}"		Number	Specify the range of values applicable for the configuration item. For example, valid_range="{{0,255}}" indicates that the lowest value is 0 and the highest is 255.  You can specify the attribute 'modifiers' to modify the value specified on the user interface.
	type This attribute is mandatory.	number		Use this type to indicate that the configuration item is a number. You can specify the following attributes with this type: <ul style="list-style-type: none"> <li>• valid_range</li> <li>• increment</li> <li>• modifiers</li> <li>• decimal_places</li> </ul>
		list		Use this type to indicate

				<p>that the configuration item is a drop-down list. You can specify the following attributes with this type:</p> <ul style="list-style-type: none"> <li>• name</li> <li>• value</li> </ul>
		color		<p>Use this type to indicate that the configuration item is to be associated with a color palette. You can specify the following attributes with this type:</p> <ul style="list-style-type: none"> <li>• rgb</li> <li>• alpha</li> </ul>
		bool		<p>Use this type to indicate that the configuration item is a Boolean. The configuration item is associated with a check box.</p> <p>The default value can be true or false.</p>
		separator		<p>Use this type to separate the configuration items with a horizontal space on the user interface.</p> <p>This type can be used only for the config_item element.</p>
	increment		Number	<p>Specify the value by which the parameter must be incremented when you click the parameter value, hold-down the mouse button, and move the mouse.</p>
	<p>modifiers</p> <p>Syntax: modifiers="{offset:0,multiplier:0.01}"</p>	<ul style="list-style-type: none"> <li>• offset</li> <li>• multiplier</li> </ul>	Number	<p>Use this attribute to modify the value specified on the user interface. Use Offset to increase or decrease the value specified on the user interface. To decrease the user-specified value, use a negative number as the Offset.</p> <p>Use multiplier to multiply the value specified on the user interface by a number.</p> <p>This attribute can be used with the type 'number' only.</p>
	decimal_places		Number	<p>Specify the number of decimal places to be allowed for the configuration item. For example, a value of 3</p>

				allows you to specify 0.001 and not 0.00001.
list_item (child of effect_property and list_items)	name		String	Specify the name of the list item(s).
	value		Number	Specify the value that must be posted back to the Keyframes section when users select a list item.
effect_sub_property (child of effect_property)	rgb			Use this attribute to specify the default hexadecimal RGB number. For example, specify rgb="ff0000" for red.  This attribute is valid for the type 'color' only.
	alpha		Number	Use this attribute to specify the default transparency of the color.  This attribute is valid for the type 'color' only.

## Best practices for creating effects in Flash

- Ensure that the FPS of the Flash application you are creating for effects is 30.
- Ensure the value of 'property\_value' in the effect\_config section of the effect file (XML file) is the same as that of the one in the Keyframe section.
- Break a single effect into multiple effects if the number of parameters is more than five. You can then create a sequence of these effects to achieve the desired result.
- Avoid exporting an effect created using frame by frame animations in Flash. You cannot achieve the desired results when such effects are used in Adobe Captivate.  
  
Instead, create effects using classic tweens and import these tweens into Adobe Captivate.
- Group the effect parameters by keyframes. You can use the 'separator' type to group related properties.
- Check if the XML file of the effect exported from Flash is valid, before using it in Adobe Captivate. To do so, open the XML file in a browser or an XML editor.

## Saving and deleting effects

[To the top](#)

1. Click  in the Effects panel.
2. Browse to the location where you want to save the effect or the effect sequence, and click Save. The effect sequence is saved as an XML file.
3. To delete an effect, select the effect, and then click .

After saving an effect sequence, you can apply it to another object in the project.

When you use the effect sequence again (at least once) in the project, it becomes available in the Advanced Actions dialog box.

**Note:** However, when you apply the effect sequence using this dialog box, the result of the effect may differ. For example, the duration of the effect does not get scaled proportionately based on the object's timeline. See [www.adobe.com/go/learn\\_introtoeffects\\_en](http://www.adobe.com/go/learn_introtoeffects_en) for more information.

# Object style

---

## [Customize object styles](#)

## [Editing object styles](#)

## [Export, import, and delete object styles](#)

## [Finding objects with specific styles](#)

Object style is a set of visual attributes, such as color and font. Objects in a project automatically inherit the styles defined in the theme applied to the project.

You can do the following with object styles:

- Customize object styles by modifying the predefined style attributes
- Import or export custom object styles from one project to another
- Search for objects that use a specific style

---

## Customize object styles

[To the top](#) <sup>+</sup>

1. Go to Edit > Object Style Manager.
2. From the list of objects, select the object for which you want to customize the style.  
**Note:** *Runtime Dialog is for the messages that are displayed when users click the Submit All button. For more information on Submit All, see Submitting all answers simultaneously.*
3. Click Clone, and then enter a name for the custom style.
4. Specify the style properties, and click OK.
5. To apply the style to an object, select the object and then select the object style from the Properties panel.

---

## Editing object styles

[To the top](#) <sup>+</sup>

### Edit object styles using the Properties panel

The changes made to the object styles using the Properties panel are applied only to the selected instances of an object. When an object style is modified using this panel, the name of the style is prefixed with a '+' mark. This mark indicates that the style is now in an overridden state.

- Click  to apply the changes to objects that use specific styles. Click  to merge the changes into the style. To replace any overridden instances of the style in the project, select Replace Overridden Styles.
- Click  to create a style that contains the modifications.

### Edit object styles using the Object Style Manager

1. Go to Edit > Object Style Manager.
2. From the list of objects, select the object whose style you want to edit.
3. From the list of styles, select the style you want to edit.
4. Modify the properties of the style as required.
5. Do either of the following:
  - To apply the changes and continue working with the Object Style Manager, click Apply.
  - To apply the changes and exit the Object Style Manager, click OK.

The changes made to the object styles using the Object Style Manager are applied to all instances of the object. However, instances of objects that are in the overridden state (indicated by a '+' mark in the Properties panel) are not updated with the changes. To update such objects, select the objects and click  in the Properties panel.

---

## Export, import, and delete object styles

[To the top](#) <sup>+</sup>

❖ Go to Edit > Object Style Manager.

- To export, select an option in the Export drop-down list and then click Export. Select a location to store the object style (in .cps format).
- To import, click Import and then select the .cps file that corresponds to the required object style.
- To delete, select the style to delete. Select a style to replace the current style, and then click OK.

---

## Finding objects with specific styles

[To the top](#) <sup>1</sup>

1. Go to Edit > Find And Replace. The Find And Replace panel appears.
2. Select the type of object in the Search In drop-down list.
3. Select the style in the Style drop-down list.
4. Do either of the following:
  - To find the objects that use the specified style one after the other, click Find Next.
  - To find all the objects in the project that use the specified style, click Find All. The search results are grouped slide-wise in the Find And Replace panel.

# Resize and reposition objects by pixel

---

You can change the X and Y coordinates and the width and height of the objects in the Transform area of the Property Inspector.

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Rotate objects

---

## Object rotation and object effects

### Rotation of objects in a slidelet

You can apply a 2D rotation to objects on a slide. 2-D rotation is turning of an object by an angle about a fixed point, which in Adobe Captivate is the center of the object.

You can rotate all objects except the following:

- Slidelet
- Mouse
- Answers for question slide objects
- Zoom destination and Zoom source

1. Click the object that you want to rotate. A rotation symbol appears at the top handle of the object.
2. Click the symbol and move the mouse in the direction. While you move the mouse, Adobe Captivate displays a dotted-line preview of the position of the object on the stage.
3. Release the mouse button when the object is positioned in the required angle.

Alternatively, select the object on stage, and specify the angle of rotation in the Property Inspector (Transform accordion > Angle).

When you rotate objects with text, the text is also rotated along with the object.

To reset the rotation angle to 0°, double-click the rotation symbol.

**Note:** *The rotation is not applied to animations and slide videos while they are played on stage. Adobe Captivate applies the rotation appropriately in the project preview and published output of the project.*

---

## Object rotation and object effects

[To the top](#) <sup>4</sup>

You can rotate objects through object effects too. If you apply a rotation object effect to an already rotated object, it rotates further when the effect gets triggered.

For example, consider that you have rotated a rectangle by 45°. You then apply the rotation object effect to the rectangle, and specify the angle as 30°. You time the effect such that it gets triggered 2 seconds after the slide begins and lasts until the end of slide.

When the project is played, the rectangle is rotated by 45° for the first 2 seconds. For the rest of the slide, the rectangle is rotated by 75°.

---

## Rotation of objects in a slidelet

[To the top](#) <sup>4</sup>

The rotation of objects within a slidelet is limited by the boundaries of the slidelet. This means, if you rotate an object and a portion of it potentially protrudes out of the slidelet boundary, then the rotation does not take effect.

# Noninteractive Objects and Media

# Smart shapes

---

From an expert:

[Insert smart shapes](#)

[Edit smart shapes](#)

[Flip smart shapes \(available only in the update for subscription and Adobe Software Assurance customers only\)](#)

[Apply gradient fills](#)

[Apply texture fills](#)

[Change the stroke and fill properties](#)

[Place text inside smart shapes](#)

[Replace smart shapes](#)

[Use smart shapes as buttons](#)

[Duplicate smart shapes](#)

[Snap lines to objects](#)

[Resize rollover area to the bounding box of other objects](#)

Smart shapes include many categories of readily-available shapes such as arrows, buttons, or basic shapes. You can insert and modify such shapes quickly and easily in your Adobe Captivate projects.

You can also convert smart shapes to rollover or any freeform shapes. You can use smart shapes as buttons too. See [Use autoshapes as buttons](#) for more information.

You can configure a standard look and feel for smart shapes using the Object Style Manager (Edit > Object Style Manager). See [Object style](#) for more information.

**Note:** You can search for smart shapes, and text within them, using the Find dialog box.

---

## Insert smart shapes

[To the top](#)

1. Click the slide on which you want to insert the smart shape.
2. Click  in the object toolbar and click a shape. The mouse pointer turns into a '+' mark.
3. Click and drag the mouse on the stage to draw the smart shape.
4. Adjust the shape using the white and yellow handles.

Handles for resizing smart shapes

---

## Edit smart shapes

[To the top](#)

1. To convert a smart shape to a freeform shape, right-click the shape, and click Convert To Freeform Shape.  
Black handles appear on the outline of the shape.

Convert smart shape to freeform shape

2. Click a black handle to see a bezier curve that lets you transform the line into a curve. You can also change the position of the point by clicking and dragging the black handle.

Bezier curves in freeform shapes

3. Click anywhere outside the shape to save the edits.

To edit the shape again, right-click the shape and click Edit Points.

To use a smart shape as a rollover shape, right-click the shape, and click Convert To Rollover Shape.

---

## Flip smart shapes (available only in the update for subscription and Adobe Software Assurance customers only)

[To the top](#)

Click the smart shape and drag one of the handles in the desired direction. For example, to flip an arrow to left, click the handle at the tip of the arrow head and drag it all the way to the left so that it flips along the Y-axis.

Arrow flipped along Y-axis

---

## Apply gradient fills

[To the top](#)

Use gradient fills to blend colors to create various effects. You can apply gradient fills to slides and drawing objects. You can also choose a gradient fill for projects' background (Preferences > Global > Defaults > Background color).

1. Select the slide or the drawing object to which you want to apply the gradient fill.
2. In the Property Inspector, click the Stage (for slides), or the Fill (for drawing objects) box.
3. Click  at the top of the box.
4. Click a preset in the preset row.

Observe that the selected slide or the object changes dynamically on the stage to reflect the changes you do the gradient fill.

5. To edit the colors, click the color stops and choose the required color.

**Note:** For drawing objects, set the transparency for the colors (in percentage) using the option adjacent to the Fill palette in the Property Inspector.

To delete a color stop, click it and press the Delete key on your keyboard. You can even drag the color stop out of the gradient box.

6. To reverse the positioning of colors, click the Reverse Colors icon.
7. Choose the direction for the gradient from the Direction row.
8. Click the Linear Gradient icon for a linear gradient, or click the Radial gradient icon for a radial gradient.
9. Click a pattern in the Pattern list.
10. Click the Add To Custom Gradients icon. The gradient fill and the related settings that you used are saved in the Custom Gradients row for future use.

**Note:** Custom gradients are available for use across all projects that you create subsequently.

To delete a custom gradient, click the delete icon and then click the custom gradient. All custom gradients are deleted if you delete the Adobe Captivate preferences folder.

## Edit a gradient fill

You can edit the length, position, and angle (for linear fill) of the gradients on Stage.

**Note:** To edit the colors, patterns, and direction of the gradient, use the Property Inspector.

1. Select the slide or the drawing object.
2. Click Edit > Edit Gradient.

A line with a thick start and end point appears on the selected object. The start point is denoted with a circle and the end point is denoted with a square.

3. To position the line at the required location on the slide or object, drag the start point.
4. To change the angle or the length of the gradient fill, click the end point and drag it in the required direction. Hold down the Shift key (Windows) or Control key (Mac) while you move the line to rotate the gradient by 15° shifts.

You can also rotate the line to change the angle of the gradient fill. To do so, hover your mouse over the line. When the cursor changes to a rotation symbol, drag the mouse in the required direction.

---

## Apply texture fills

[To the top](#)

1. Select the object to which you want to apply the texture fill.
2. In the Fill & Stroke accordion of the Property Inspector, click the Stage (for slides) or the Fill (for drawing objects) box.
3. In the dialog box that appears, click  at the top.
4. Click a texture from the available presets or click the browse icon adjacent to the Custom Image box to choose an image.

If the image that you choose is larger than the object, the Resize/Crop Image dialog box appears. To automatically scale the image to fit the object, click Fit to Stage. To crop the image, click Crop, and then click and drag the blue box on the image to specify the part of the image you want to retain.

- Click Stretch to apply the texture or the image to the entire object.
- Click Tile to apply the texture or the image in a tile pattern. Choose the direction of tiling from the Tile Type list.

---

## Change the stroke and fill properties

[To the top](#)

Select the object, and set the fill and stroke properties for the object in the Property Inspector (Window > Properties) in the Fill & Stroke area.

You can set the following stroke properties for straight lines:

- Transparency of the line
- Style of the stroke, such as dashes or dots

- Color of the stroke
- Thickness (width) of the stroke
- Arrowheads, circles, diamonds, or squares at the ends of a line

You can set the following stroke and fill properties for the other smart shapes:

- Fill color
- Gradient fill
- Pattern or image fill
- Transparency of the fill color
- Style of the stroke, such as dashes or dots
- Color of the stroke
- Width of the stroke
- Gradient fill for the stroke
- Corners of the object: You can smooth the corners of a rectangle or square to varying degrees by changing the values for its corner radius.

---

## Place text inside smart shapes

[To the top](#)

1. Right-click (Windows) or Control-click (Mac OS) the object, and then select Add Text. You can also double-click the object and start typing the text at the cursor.
2. Add text in the text area that appears within the object, and use the Character area of the Property Inspector (Window > Properties) to format the text.

To edit text within objects, right-click (Windows) or Control-click (Mac OS) the object and then select Edit Text. The text in the text area within the object is made available for editing. The text option is not available when you have selected the line tool.

To add effects to text, click the object and then click  in the Character accordion of the Property Inspector.

---

## Replace smart shapes

[To the top](#)

Right-click the smart shape and click Replace Smart Shape. Click the required shape from the Smart Shape panel.

---

## Use smart shapes as buttons

[To the top](#)

You can convert any smart shape into an interactive button. To do so, select the smart shape and click Use As Button in the Property Inspector.

Converting smart shapes into buttons provides you more flexibility in the design of project templates and master slides. The buttons created from smart shapes act as perpetual buttons when used on master slides that are associated with the slides.

You can insert smart shapes and convert them into buttons on question slides too. For buttons created from smart shapes, you can assign points using the Reporting accordion in the Property Inspector. For information on the properties in this accordion, see [Properties of buttons](#).

---

## Duplicate smart shapes

[To the top](#)

- Right-click (Windows) or Control-click (Mac OS) the object and then select Duplicate.

---

## Snap lines to objects

[To the top](#)

When drawing straight lines, you can make them snap to the contours of other Adobe Captivate objects, including free-form objects. Use this option when you want to precisely connect the end of a straight line to the periphery of an object.

To snap lines to objects, do the following:

1. Click the Snap To Object icon.
2. Draw the object (rectangle, oval, free-form polygon, and so on).

When you now draw a straight line, the line snaps to the contours of objects with which it comes in contact.

---

## Resize rollover area to the bounding box of other objects

- Right-click (Windows) or Control-click (Mac OS) the rollover area, and select Auto Adjust Rollover Area.

When you now move the rollover area over an object, it assumes the shape of the bounding box of that object. If there are overlapping objects, the rollover area is resized to the dimensions of the object with the highest z-order.

- 1.

# Text captions

---

## [Tips for creating text captions](#)

### [Text caption properties](#)

### [Add text and text captions](#)

### [Edit text captions](#)

### [Captions in other languages](#)

### [Creating custom text caption styles](#)

### [Import and export text captions](#)

### [Restore default settings for recording modes](#)

You can use text captions for the following:

#### **Draw attention to specific areas of the slide**

Use text captions to point out menu options or icons or to focus user attention on easily overlooked details. When you are not using voice-over narration, you can use text captions instead.

#### **Add text to a slide**

The only way in which you can add plain text to a slide in Adobe Captivate is using transparent text captions. For more information, see [Add plain text to a slide](#).

You decide how text captions appear (font, size, color, and so on). Adobe Captivate provides a wide variety of predefined text caption styles, but you can also create custom styles that match the standards of your company.

The following types of captions are available in Adobe Captivate:

**Regular** Use regular captions to “talk” to the viewer about features on the screen. You can have Adobe Captivate automatically generate text captions based upon what is recorded. For example, when you click the File menu during recording, Adobe Captivate creates a text caption that says “Select the File menu item.” It then places the text caption on the slide showing the action. Alternatively, you can insert such text captions into the slides manually and edit them.

**Captions for interactive objects** Interactive objects are associated with success, failure, and hint captions. These captions are automatically generated for the objects when you record in some of the modes.

**Success** The success caption is displayed when the user performs the desired action on the object.

**Failure** The failure caption is displayed when the user performs an action other than what is set in the application.

**Hint** You can use hint captions to help users when they are unable to perform a certain task. Hint captions are displayed when the user moves the mouse over the object.

---

## Tips for creating text captions

[To the top](#) <sup>1</sup>

Here are some tips for creating captions:

- If the caption is strictly text on the slide, use the Transparent caption style.
- Don't use fonts that are not available on most computers. For example, if you use FF Confidential, and the user doesn't have it on the local computer, some other font is substituted.
- Create a style sheet by formatting a caption and selecting the Apply Properties To All Captions In The Movie check box in the Text Caption dialog box. All captions in the SWF file or captions you create use the font, alignment, and caption style you set.
- Captions can be used as a script for narrations. When you click the Audio button on the main toolbar to open the Slide Audio dialog box, click the Captions And Slide Notes option. If a caption is attached to the slide, you see it in the Record Audio dialog box as a script.
- Narrating a caption actually adds an extra degree of accessibility to the demo.

---

## Text caption properties

[To the top](#) <sup>1</sup>

Use the Property Inspector (Window > Properties) of a text caption to customize it.

### Text Caption

**Name** Enter a unique name for the object. You can use this name when defining the visibility conditions for the object.

**Visible** Deselect this option if you want the object to be invisible on the slide. The object can be made visible using the Show option. For more information, see [Controlling the visibility of objects](#).

**Style** Select a style for the text caption. To define a new style, select Edit > Object Style Manager. For more information on object styles, see [Object style](#).

**Accessibility** Click to add accessible text to the object. For details, see [Customize accessibility text for objects](#).

## General

**Caption Type** Displays the types of captions available in Adobe Captivate. Each text caption type is named, and a small thumbnail image shows what the text caption looks like.

**Note:** *When adding or modifying a text caption, select the caption type before setting the style and format of text in a caption. This ensures that style and format changes to text are retained.*

**Callout Type** Five text caption callout types are available. Many of the text caption styles contain text captions with directional callouts. You can select a text caption that points in the most appropriate direction.

## Character

Use this area to provide the font specifications such as color, style, format, and size for the text.

## Format

Use this area to specify text alignment, indentation, numbering, and line spacing.

**Margins** Adjust the top, bottom, and side margins between the text and the caption outline, click the required options in Margins and specify a value.

**Insert** Double-click the text caption and then click:

-  to insert symbols, such as, copyright or trademark symbols.
-  to insert system or user-defined variables.
-  to insert hyperlinks.

## Shadow and reflection

**Shadow** Select the check box to apply shadow to the text caption. Choose one of the presets. You can customize a preset by clicking Custom.

**Direction** Select the direction: inner or outer. The preview of the selected direction is displayed on stage.

**Color** click to select a color for the shadow. Specify the alpha for the color, in percentage, in the adjacent field.

**Blur** Specify a value, in pixels, for the blur of the shadow.

**Angle** Specify the angle for the shadow.

**Distance** specify the distance, in pixels, at which the shadow must be displayed.

**Reflection** Select the check box to add reflection to the text caption. Choose one of the presets.

## Timing

**Display For [Time]** Duration for which the text caption is displayed in the slide. From the pop-up menu, select one of the following options:

**Specific Time** The duration for which the text caption appears on the slide. Set the time in seconds by typing the value in the field, or by using the scroll arrows.

**Rest Of Slide** The text caption is displayed for the entire duration of the slide.

**Rest Of Project** The text caption is displayed for the entire duration of the project. For example, you can use this option to display a text caption that displays the name of the company.

**Appear After [#] Seconds** The text caption appears on the slide after the specified duration.

## Transition

**Effect** Transition effect for the highlight box. You can apply a fade in or fade out effect and set the time for the fading effects.

**In [#] Seconds** Time for the caption to fully fade into view.

## Add text and text captions

### Add a text caption

If you change the settings in the Property Inspector for text captions, they become the default settings. Any text captions that you create use the new settings.

 If you add a transparent text caption, avoid using bold text; regular text appears clearer than bold text on most monitors.

1. In an open project, select the slide to which you want to add a text caption.
2. Select Insert > Standard Objects > Text Caption. You can also right-click (Windows) or Control-click (Mac OS) in the slide, choose Insert > Standard Objects from the pop-up menu, and then choose Text Caption.
3. Set the various options for the text caption.
4. For properties with the  icon, select either
  - **Apply To All Items** To apply the effect to all objects that belong to the object type.
  - **Apply To All Items Of Same Style** To apply to all objects that use the same object style.

### Add plain text to a slide

To add text to the slide without making it appear as a text caption, add the text as a transparent text caption.

**Note:** If you create a transparent caption, avoid underlining text because doing so can decrease text quality when the project is viewed.

 After adding the transparent text caption, you may want to merge the caption with the slide background.

1. In an open project, select the slide to which you want to add a transparent text caption.
2. Select Insert > Standard Objects > Text Caption.
3. In the General area of the Property Inspector, select transparent as the Caption Type.
4. Change other options as required.

To add superscript to a slide, select the text, and

- (On Windows) Press Control + shift + "+". To add a subscript, select the text, and press Control + "-".
- (On Mac OS) Press Cmd + shift + "+". To add a subscript, select the text, and press Cmd + "-".

### Insert text as a variable

1. Move the cursor to the position in the text where you want to insert the variable.
2. In the Format area of Property Inspector, click the Insert Variable icon.
3. Select one of the following in the Variable Type menu:
  - To insert a variable that you have previously created, select User. Select the variable from the Variables menu. For more information, see [Create a user-defined variable](#).
  - To insert a system variable, select System. Select a system variable from the Variables menu. To filter system variables by their category, select the corresponding option from the View By menu. When you do not choose a category, all the system variables are listed in the menu.
4. To change the maximum number of characters that the variable can accommodate, enter a value in the Maximum Length field. If the number of characters exceed the value specified in this field, the extra characters are not displayed.

**Note:** Spaces are also considered for the character count.

5. To create a variable or to change the values of a selected variable, click Variables.
6. Click OK.

When you preview the project, the value of the variable is displayed inside the text caption.

## Insert symbols and special characters

1. In the Format area of Property Inspector, click the Insert button.
2. Select a symbol that you want to insert from the menu.
3. For more options, click Other, select the character that you want to insert, and then click OK.

## Insert hyperlinks

You can hyperlink text in text captions or drawing objects to do a multitude of things, such as, open a web page, slide, or execute advanced actions, when users click the text.

1. Select the phrase or word you want to hyperlink. You can hyperlink text in text captions or drawing objects.
2. Click  in the Format accordion of the Property Inspector and specify one of the options in the Link To list. For the description of the options, see [Project navigation using interactive objects](#).

**Note:** Only Web Page and Open File actions are supported when a variable is inserted in the object that contains hyperlinks.

You can format the text using the options available in the Character accordion of the Property Inspector.

To modify an hyperlink, click  in the Format accordion of the Property Inspector.

To delete an hyperlink, click  in the Fromat accordion of the Property Insepector.

## Add effects to text

You can apply effects to text in:

- Captions
- Drawing objects including smart shapes
- Static text (that do not change at run-time) in questions slides

1. Click the caption or the autoshape.
2. Click the text effects icon () in the Character accordion of the Property Inspector, and do one of the following:
  - Click an effect from the presets. To make changes to the preset effects, click Edit Effects.
  - Click + to create a custom effect. Select the required options from the list and click OK. To save the settings for future use, click Save. The saved effect appears along with the presets.  
**note:** To delete a custom effect, click the effect and then click .
  - Click Clear Effects to remove the effect from the text.

**Note:** The text effects are not applied if you insert a variable along with the text. However, the text effects are applied back when you remove the variable.

## Add text captions automatically during recording

When you record projects or record additional slides for projects, Adobe Captivate can automatically create text captions based upon the action recorded. For example, if you record the action of selecting the File menu, Adobe Captivate can automatically add a text caption that reads "Select File menu" on the same slide.

Actions that generate text captions include the following: selecting menus and menu items; pressing buttons; changing values in locations such as lists, combo boxes, or check boxes; and opening child windows.

1. In an open project, select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select Modes under the Recording menu.
3. Select the mode of recording for which you want to automatically generate the text captions.
4. Select Add Text Captions.

After you finish recording and the project is generated (including the automatically created captions), view the individual slides in Edit mode to see the captions.

**Note:** Adobe Captivate can automatically generate text captions for all standard Windows user interface elements. It might not, however, support nonstandard user interface elements, including menu text in applications created with Delphi®.

## Edit text captions

### Edit a text caption

If you are resizing a text caption, you cannot make the text caption smaller than the bitmap used to create the text caption. For example, the text caption style "Pill" uses bitmaps sized approximately 18 pixels (wide) x 16 pixels (high), so these bitmaps could not be resized to 15 x 12 pixels. However, any of the text caption bitmaps can be made larger. If you need very small text captions, consider creating custom captions.

To edit a text caption, use the Property Inspector (Window > Properties).

 *If you have a detailed slide that contains text captions and other objects, you might want to make the text caption a permanent part of the background.*

### Copy text captions

You can copy and paste text captions between slides. This is a great time-saver, especially if you use the same text caption on multiple slides.

1. In an open project, select the slide containing the text caption you want to copy.
2. Right-click (Windows) or Control-click (Mac OS) the text caption and select Copy.
3. Navigate to the slide where you want to paste the caption.
4. Right-click (Windows) or Control-click (Mac OS) in the slide and select Paste.

 *You can copy and paste more than one text caption at a time by Control-clicking (Windows) or Command-clicking (Mac OS) the text captions. Right-click (Windows) or Control-click (Mac OS) one of the selected text captions and choose Copy.*

### Moving and resizing text captions

You can resize text captions manually or automatically and move text captions to new locations on a slide. To move text captions on a slide, select the text caption, and drag it to the new location.

**Note:** *If you are resizing a text caption, you cannot make the caption smaller than the bitmap used to create the caption. For example, the caption style "Pill" uses bitmaps sized approximately 18 pixels (wide) x 16 pixels (high), so these bitmaps could not be resized to 15 x 12 pixels. However, any of the caption bitmaps can be made larger. If you need very small captions, consider creating custom captions.*

### Manually resize a text caption

To manually resize a text caption, select the text caption, and move the pointer over the selection handles. When the pointer becomes a resize handle, drag the mouse to resize the object.

### Automatically resize text captions

Adobe Captivate can automatically resize a text caption according to the amount of text in the text caption. If you edit the text, the caption is resized to accommodate the altered text. This is an easy way to keep your text captions looking balanced and proportional.

1. In an open project, select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Category panel, select Defaults from the Global menu.
3. Select Autosize Captions.

### Change text caption order using the Timeline

Adobe Captivate lets you add multiple captions to each slide. You can specify the order in which these captions appear using the Timeline. The Timeline enables you to precisely adjust the timing of all objects, including captions, on a slide.

1. In an open project, navigate to the slide containing the captions whose order you want to change.
2. In the Timeline (Window > Timeline), change the order and timing of captions as required.
  - For example, move the mouse over the left or right edge of a caption on the Timeline until the resize cursor appears. Then drag the edge left or right. This changes when the caption appears or disappears and how long it is shown.
  - Alternatively, suppose a caption and its slide appear concurrently, but you want a slight delay. To achieve this effect, move the mouse over the center of the caption on the Timeline until the hand cursor appears. Then drag the entire caption so the left edge aligns with 2s (a 2-second delay) or 4s (a 4-second delay) in the header.

3. If two captions overlap on the slide, select the caption you want to appear in front by setting the stacking order. To change the stacking order, moving captions to the back or front of the slide Stage. The key point to remember is that captions at the back of the Stage appear behind other captions. Use one of the following methods to set the stacking order:

- Right-click (Windows) or Control-click (Mac OS) a caption on the slide and select one of the caption order options. If necessary, right-click (Windows) or Control-click (Mac OS) other captions on the slide and adjust their order.
- Select a caption. On the Edit view toolbar (next to Slide Properties), click Bring selected objects to the front or Send selected objects behind.
- On the Timeline, move the mouse over a caption until the hand pointer appears. Drag the caption up or down to change its position in the stacking order. Moving a caption higher in the stacking order moves it to the front of the Stage. Moving a caption lower moves it to the back of the Stage.

[To the top](#)

## Captions in other languages

### Adding a language for text captions

You can add new languages to the list of existing languages in which text captions are recorded. The list of existing languages is available in the Recording dialog box. Text captions of events are stored as CaptureTextTemplates\_<language>.rdl files in the

- (On Windows) \\Program Files\Adobe\Adobe Captivate 6 directory. For example, the RDL file for Chinese-Simplified is CaptureTextTemplates\_Chinese-Simplified.rdl.
- (On Mac OS) \\Applications\Adobe Captivate 6.

You can use the existing RDL files to record text captions in a desired language.

### Record text captions in another language

1. Open Windows Explorer, and navigate to
  - (On Windows) \\Program Files\Adobe\Adobe Captivate 6 directory
  - (On Mac OS) /Applications/Adobe Captivate 6
2. Copy a file with an RDL extension.
3. Paste the file in the same location, and rename it according to the new language. For example, if you want to record in Polish, rename the file CaptureTextTemplates\_Polish.rdl.
4. Open the RDL file in any text editor.
5. In the Object Name and the Event Name tags, change the text for Default Template And Template Attributes to the specified language.
6. Save the file.
7. In the Preferences dialog box (Edit > Preferences (on Windows) or Adobe Captivate > Preferences (on Mac OS)), select Recording > Settings in Category.
8. In the Generate Captions In, select the added language.

When you record, the text captions are generated in the specified language.

### Type text in another language

#### For Windows

1. Open the Microsoft Windows Control Panel and double-click the Regional And Language Options icon. The Regional And Language Options dialog box appears.
2. Click the Languages tab.
3. Click the Details button.
4. In the Settings tab of the Text Services And Input Languages dialog box, click the Add button.
5. In the Add Input Language dialog box, select a language from the Input Language list.

6. Click OK. The selected language is included in the Installed Services list.
7. Select the desired language in the Default Input Language list.
8. Click Apply and click OK to save the settings and close the Text Services And Input Languages dialog box.
9. Click the Regional Options tab, and choose the language you selected in the Default Input Language list.
10. Click Apply and click OK to save the settings and close the Regional And Language Options dialog box. The Language bar or the Input Method Editor (IME) appears on the desktop of your computer.
11. Type content in the RDL file. The text appears in the selected language.  
If you change the language in the Default Input Language list and the Regional Options tab, the language selected in the Language bar is also updated automatically.

#### For Mac OS

1. In the System Preferences, select International > Input Menu tab.
2. Select from the list of languages.
3. In the Apple menu, select the language.
4. Open the RDL file using a text editor and start typing in the language of your preference.

#### Localizing text captions

If you are localizing a project that contains text captions, you can export text captions to make the process more efficient.

1. Create the initial ("source language") version of the project, including all necessary text captions.
2. Open the completed project.
3. Select File > Export > Project Captions and Closed Captions.  
By default, the Word (DOC) file is saved to your My Documents\My Adobe Captivate Projects folder (on Windows) and /Users/<username>/Documents/My Adobe Captivate Projects folder (on Mac OS). Change the location if you want. Also, the Word file is named [ProjectName] Captions.doc. You can change the name of the file, if necessary, by clicking directly in the File name text box and entering a new name. (Retain the.doc filename extension.)
4. Click Save.
5. The Word file is generated with the name you specified and saved to the location you selected. A dialog box appears asking if you want to view the document. Click Yes to view the document in Word.
6. The Word document contains the slide ID, item ID, original caption text, and the slide number. You can change the caption text in the Updated Text Caption Data column. Provide a copy of the Word document to the localizer/translator.
7. The localizer/translator should open the Word document and edit the caption text directly in the Updated Text Caption Data column in the document, replacing the source language text with the new text.
8. While the localizer/translator is translating the text, make a copy of the original Adobe Captivate project for the new language.  
**Note:** When you create a copy of the original project, be sure to keep the original text captions (in the source language) in the new project. The original text captions act as placeholders and are overwritten when you import the new (localized) text captions.
9. When the text captions are localized, open the copy of the project you created in step 8.
10. Select File > Import > Project Captions And Closed Captions.
11. Navigate to the localized text captions Word (DOC) file, select the file, and click Open.
12. The new, localized text captions are imported into the project, and all formatting is retained. A dialog box appears showing a successful import message. Click OK.
13. Test the new text captions by opening different slides in Edit view and reading the new caption text.

## Creating custom text caption styles

You can create custom text caption styles for your Adobe Captivate projects with a graphics program, such as Adobe® Fireworks® or Adobe® Photoshop®.

Custom text captions must be in BMP (bitmap) format. In general, each Adobe Captivate text caption has five associated bitmap images.

### Naming custom text caption styles

When creating custom text caption styles, be sure to follow the correct naming conventions. Each caption style has a unique name, and you must use this name at the beginning of each associated bitmap filename. For example, if you create a text caption style named "Brightblue," the five bitmap images that constitute the new style should be named as follows:

- Brightblue1.bmp, an image with no callouts
- Brightblue2.bmp, an image with a callout to the right or upper-right
- Brightblue3.bmp, an image with a callout to the left or upper-left
- Brightblue4.bmp, an image with a callout to the lower right
- Brightblue5.bmp, an image with a callout to the lower left

### Storing custom text caption styles

You must store all the bitmap images for a custom text caption style in the Adobe Captivate Captions folder located in C:\Program Files\Adobe\Adobe Captivate 4\Gallery\Captions (on Windows) and /Applications/Adobe Captivate 6/Gallery/Captions (on Mac OS). After you add the five new bitmaps to the captions folder, Adobe Captivate recognizes the bitmap files as a new text caption style. The next time you add a new text caption, your new custom style appears in the text caption style list.

### Create custom text for caption styles

You can create a custom style for the text that appears in the text captions. These preferences are applied only if you did not set a style for the text caption earlier.

1. Open the fonts.ini file, stored in the \\Program Files\Adobe\Adobe Captivate 6\Gallery\Captions folder (on Windows) or /Applications/Adobe Captivate 6/Gallery/Captions (on Mac OS), in a text editor.
2. Customize the style for the text caption using the procedure described in the file.
3. Save the file.
4. In an open Adobe Captivate project, select Insert > Standard Objects > Text Caption.
5. In Caption Type, select the caption that you have customized.  
The text in the text area changes to the specified style.
6. Edit the text in the text area.
7. Click OK.

### Change text alignment on custom text captions

Sometimes text in custom text captions can appear out of alignment. To solve this problem, set the left, right, top, and bottom margins.

Each of the five text caption styles requires different margin settings because text appears in slightly different places in each text caption.

The margin settings are stored in a text file with the extension.fcm. You can use Notepad or WordPad to create or edit FCM files.

1. Using Windows Explorer, navigate to C:\Program Files\Adobe\Adobe Captivate 6\Gallery\Captions (on Windows) or /Applications/Adobe Captivate 6/Gallery/Captions (on Mac OS). All the text caption BMP and corresponding FCM files are located in this folder.
2. Right-click (Windows) or Control-click (Mac OS) the FCM file you want to edit, and select Open With.
3. Select a text editor.
4. Edit the following values as necessary:
  - Left Margin is the number of pixels from the left side of the bitmap to the text.
  - Right Margin is the number of pixels from the right side of the bitmap to the text.

Top Margin is the number of pixels from the top of the bitmap to the text.

- Bottom Margin is the number of pixels from the bottom of the bitmap to the text.

5. (Optional) If necessary, you can edit the MarginX and MarginY settings. This can be important if you are adding captions automatically.

- MarginX is the number of pixels horizontally from the nearest corner to the tip of the caption callout.
- Margin Y is the number of pixels vertically from the nearest corner to the tip of the caption callout.

**Note:** The nearest corner is identified in the file open in a text editor under "Corner." For example, Corner=right, top.

6. From the File menu, select Save.

A dialog box may appear, asking whether you want to replace the original file. Click Yes.

7. Close the text editor.

## Design tips for custom text captions

**Colors** Don't use the transparent colors for captions. The upper-left pixel determines which color is transparent. For example, if the color in the upper-left pixel is yellow, everything that is the same yellow will be transparent in the text caption. Also, the text caption itself can have a gradient background, but the area around ("behind") the text caption, must be a solid color.

**Anti-alias** Do not anti-alias the edges of your text captions. Your text captions will appear on different screenshots, and the anti-alias can cause a jagged halo effect on some screenshots.

---

## Import and export text captions

[To the top](#) <sup>4</sup>

### Import text captions

You can import text captions from a DOC file. First, you export the text captions from your Adobe Captivate project. Adobe Captivate creates a DOC file that preserves all the formatting from the text captions. While the text captions are in DOC format, you can make text and formatting changes in a word-processing program. Then you can import the text captions back into the Adobe Captivate project using the following steps.

**Note:** If you export text captions to a DOC file, that DOC file can only be imported back into the original project.

Importing and exporting text captions to and from a DOC file can be useful in several situations. For example, if you have to edit many captions, it is easier and faster to work in DOC files instead of navigating from slide to slide.

1. In an open project that contains text captions, select File > Export > Project Captions And Closed Captions.
2. Make the necessary changes while the text captions are in DOC format (in the Updated Text Caption Data column), and save the DOC file.
3. Select File > Import > Project Captions And Closed Captions.
4. Select the DOC file that contains the exported text captions.
5. Click Open.
6. An Information dialog box appears, confirming that the import was successful. Click OK.

### Export text captions

You can export text captions from an existing Adobe Captivate project into a DOC file if you have Microsoft Word installed on your computer. All formatting done in Adobe Captivate is preserved when the text captions open as a DOC file. Make text and formatting changes to the text captions while they are in DOC format. Then import them back into the Adobe Captivate project.

**Note:** If you export text captions to a DOC file, that DOC file can only be imported back into the original project.

Exporting text captions can be useful in several situations:

- If you intend to record and voice-over narration and create a script, exported text captions can provide the foundation for the script.
- If you want to provide printed step-by-step instructions, you can export text captions and print the DOC file.
- If a project must be localized, you can export text captions into a DOC file and give it to a translator.

1. In an open project, select File > Export > Project Captions And Closed Captions.
2. In the Save As dialog box, enter a filename for the new DOC file.

Note the default directory where the file will be saved. If you want, navigate to a different location in which to save the file.

3. Click Save.
4. The text captions from the project are converted into DOC format. A dialog box appears, confirming that the text captions were exported to Word and asking if you would like to view the document. Click Yes.
5. A new DOC file that contains the caption text opens in Word. Make any necessary text changes in the Updated Text Caption Data column. The slide number is also included as a reference.
6. Save the document.

---

## Restore default settings for recording modes

[To the top](#)

If you changed the appearance of text captions, you can restore all text caption settings to their defaults. For example, you change the font for text captions to Times New Roman and the font color to green. Click Restore To Default to change the font back to the default font Arial and the color to the default blue.

1. In an open project, select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Category panel, select Modes under the Recording menu.
3. In the Recording menu, > Modes area, click Restore Defaults.

# Animations

---

## Properties of animation objects

### Add animations

#### Animated text

Adobe Captivate lets you add animation to Adobe Captivate SWF files. This introduces an element of motion that is effective and eye-catching for users. Add existing animation files to a slide or use the animated text feature in Adobe Captivate.

When you add an animation file to your project, it automatically gets added to the library to the Media folder.

- You can add SWF or GIF animation files directly to a slide. Slides containing an animation file can be edited just like other slides containing an object.

 *Adobe Captivate contains a gallery that has buttons, sounds, and animations (in SWF format) for you to use in your projects. By default, the gallery is stored in the following location when you install Adobe Captivate: C:\Program Files\Adobe\Adobe Captivate 6\Gallery (on Windows) or /Applications/Adobe Captivate 6/Gallery (on Mac OS).*

**Note:** *If you want to add a Flash animation file (FLA), you must first convert it to a SWF file. To do this conversion, you must have the latest Flash version installed on your computer.*

- To add animated text, select from a number of interesting effects included with Adobe Captivate. Experiment with different fonts, colors, and effects to achieve the right look. Slides containing animated text, with their combination of text, movement, and sound (if you choose to add audio) make great opening slides for projects.

**Note:** *Device fonts are not displayed in Adobe Captivate. If you import an animation file containing text created with device fonts, the animation appears in Adobe Captivate, but the text does not. For animations that will be imported into Adobe Captivate, try to use embedded fonts for text.*

---

## Properties of animation objects

[To the top](#) <sup>14</sup>

You can change the properties of animation objects using their Property Inspector (Window > Properties).

### Animation name

**Name** Enter a unique name for the object. You can use this name when defining the visibility conditions for the object.

**Visible** Deselect this option if you want the object to be invisible on the slide. The object can be made visible using the Show option. For more information, see Controlling the visibility of objects.

**Accessibility** Click to add accessible text to the object. For details, see Customize accessibility text for objects

### Animation

**Animation Info** Click the icon to see the key information about the animation file you selected including version, width, height, and the number of frames that compose the file. The total duration of the animation file is also shown.

**Linkage** Provides the link to the associated animation file.

**Update** Click to reflect the modifications to the source file (if edited externally).

**Source** Link to the source FLA file of the animation SWF file.

**Edit** Click to edit the FLA file using Adobe Flash from within Adobe Captivate. This option is available only in Adobe Captivate that is installed with the Adobe eLearning Suite.

**Alpha** The transparency of the animation file. A high Alpha value results in a bright version of the animation file and a lower value in a dimmer animation.

**Swap** lets you replace the animation file with another from the Media folder in the library using the Select Animation from the Library dialog box. If library does not have the required file, click Import in the dialog box to import the file to the Media folder.

### Timing

**Display For [Time]** The time the animation plays in the project.

**Rest Of Slide** The animation plays until the slide stops playing. The animation plays once, unless the Loop option is selected.

**Rest Of Project** The animation plays for the length of the project, even on other slides. The animation plays once, unless the Loop option is selected.

**Duration Of Animation** The animation plays for its entire length once.

**Specific Time** The animation plays for the specified time.

**Appear After [#] Seconds** Delay between the first appearance of the slide and the first appearance of the animation.

**Synchronize With Project** Synchronizes the speed at which the animation file plays with the Timeline speed. If you find that the animation file is not playing smoothly, test with this option selected and cleared to see which setting gives you better results.

**Loop** Select this option to have the animation file loop (replay continuously).

## Transition

**Effect** Specify a transition effect for the animation. You can make an animation fade in during its entry, and fade out during its exit.

**In [#] Seconds** Specifies the amount of time for the animation to fully fade into view.

**Out [#] Seconds** Specifies the amount of time for the animation to completely disappear from view.

## Shadow and reflection

**Shadow** Select the check box to apply shadow to the animation. Choose one of the presets. You can customize a preset by clicking Custom.

**Direction** Select the direction: inner or outer. The preview of the selected direction is displayed on stage.

**Color** click to select a color for the shadow. Specify the alpha for the color, in percentage, in the adjacent field.

**Blur** Specify a value, in pixels, for the blur of the shadow.

**Angle** Specify the angle for the shadow.

**Distance** specify the distance, in pixels, at which the shadow must be displayed.

**Reflection** Select the check box to add reflection to the animation. Choose one of the presets.

---

## Add animations

[To the top](#)

1. In an open project, select Insert > Animation.
2. Navigate to the animation file you want to add to the slide, select it, and click Open.
3. In the Property Inspector, set properties and options as required.

The animation is added to the slide.

**Note:** *Device fonts are not displayed in Adobe Captivate. If you import an animation file containing text created with device fonts, the animation appears in Adobe Captivate, but the text will not. For animations that will be imported into Adobe Captivate, try to use embedded fonts for text.*

---

## Animated text

[To the top](#)

Animated text is text that has applied special effects. Adobe Captivate offers a wide variety of text animation effects that you can experiment with. For example, on the opening slide of a project, you can have text fly-in or fade-in for an eye-catching start.

The Property Inspector (Window > Properties) provide a preview of the animated text that you insert.

## Text Animation

**Name** Enter a unique name for the object. You can use this name when defining the visibility conditions for the object.

**Visible** Deselect this option if you want the object to be invisible on the slide. The object can be made visible using the Show option. For more information, see Controlling the visibility of objects

### General

**Effect** The animation effect that is applied to the text.

**Transparency** Specifies a transparency level for the animated text. For a very dim animated text effect, select a high number such as 90. For darker text, select a low number such as 10.

**Properties** Click to display Text Animation Properties dialog box.

### Shadow and reflection

**Shadow** Select the check box to apply shadow to the animated text. Choose one of the presets. You can customize a preset by clicking Custom.

**Direction** Select the direction: inner or outer. The preview of the selected direction is displayed on stage.

**Color** click to select a color for the shadow. Specify the alpha for the color, in percentage, in the adjacent field.

**Blur** Specify a value, in pixels, for the blur of the shadow.

**Angle** Specify the angle for the shadow.

**Distance** specify the distance, in pixels, at which the shadow must be displayed.

**Reflection** Select the check box to add reflection to the animated text. Choose one of the presets.

### Timing

**Display For [Time]** Specifies the timing of the animated text. Click the pop-up menu and select an option. If you select the specific time option, you can enter the exact number of seconds for the animated text to appear.

**Appear After [#] Seconds** Displays the animated text after the slide has been displayed for the selected number of seconds.

### Transition

**Loop** Select this option to have the animation file continuously loop (play over and over again) as the project plays.

**Effect** Specify a transition effect for the animation. You can make an animation fade in during its entry, and fade out during its exit.

**In [#] Seconds** Specifies the amount of time for the animation to fully fade into view.

**Out [#] Seconds** Specifies the amount of time for the animation to completely disappear from view.

### Properties of animated text

Use the Text Animation Properties dialog box of the animated text to set its properties.

Set font, transparency, and delay options:

**Text** The text to which the animation is applied.

**Font** Specify the font name and then style, size, effects, and colors.

**Delay (Frames)** The time elapsed, in Flash frames, between the display of one animated letter and the next. If you set a low number (for example, 0 or 1), all the letters appear quickly, one after the other. If you set a higher number (for example, 30 or 40), each letter appears more distinctly. Try different numbers and watch the text in the Preview window to select an appropriate number.

**Note:** *The number you specify in Delay does not change the absolute amount of time the animated text feature appears. For example, suppose you specify, in the Options tab a total animation time of 8 seconds. The value of the Delay option, whether it is 1 or 30, does not change the absolute time of 8 seconds.*

**Loop** Select this option to have the animation file continuously loop (play over and over again) as the project plays.

### Add animated text

1. Select the slide to which you want to add animated text.
2. Select Insert > Text Animation.
3. In the Text Animation Properties dialog box, enter the text to animate.
4. Set the various options according to your requirements.
5. For properties with the  icon, select either
  - **Apply To All Items** To apply the effect to all objects that belong to the object type.
  - **Apply To All Items Of Same Style** To apply to all objects that use the same object style.
6. Click OK.

The text appears in the preview section of the Property Inspector.

More Help topics

# Fix size and position of noninteractive objects

---

To specify the exact size and position of the object, in the Property Inspector (Window > Properties), specify the values in the Transform area. Using these options instead of dragging the object helps you create consistent objects throughout your project.

**X** Specifies the position of the X coordinate of the object, in pixels.

**Y** Specifies the position of the Y coordinate of the object, in pixels.

**Width** Specifies the horizontal width of the object, in pixels.

**Height** Specifies the vertical height of the object, in pixels.

**Constrain Proportions** Maintains the height-to-width ratio of the object. If either the height or width of the object is changed, the other dimension is changed to maintain the relative proportion of the object.

**Angle** Angle of rotation of the objects.

# Highlight boxes

---

## Properties of highlight boxes

### Add highlight boxes

Use highlight boxes to spotlight areas within a slide. Highlight boxes focus the user's attention on the required areas of the slide.

---

## Properties of highlight boxes

[To the top](#) <sup>1</sup>

Use the Property Inspector (Window > Properties) of the highlight box to customize it.

### Highlight Box

**Name** Enter a unique name for the object. You can use this name when defining the visibility conditions for the object.

**Visible** Deselect this option if you want the object to be invisible on the slide. The object can be made visible using the Show option. For more information, see Controlling the visibility of objects.

**Style** Select a style for the highlight box. To define a new style, select Edit > Object Style Manager. For more information on object styles, see Object style

### Fill & Stroke

**Fill** Fill color for the highlight box. To decide the degree of transparency for the fill color, select a value for the option Alpha in the Color menu. The value of 90% is less transparent (more solid) than a value of 10%.

**Stroke** Stroke color for the highlight box.

**Fill Outer Area** Fills the area outside the boundaries of highlight box with the color selected in Fill Color. When you choose this option, the area within the highlight box is not colored.

**Note:** You can observe the fill color around the highlight box only when you preview or publish the project.

**Width** Thickness of the border of the highlight box.

### Shadow and reflection

**Shadow** Select the check box to apply shadow to the highlight box. Choose one of the presets. You can customize a preset by clicking Custom.

**Direction** Select the direction: inner or outer. The preview of the selected direction is displayed on stage.

**Color** click to select a color for the shadow. Specify the alpha for the color, in percentage, in the adjacent field.

**Blur** Specify a value, in pixels, for the blur of the shadow.

**Angle** Specify the angle for the shadow.

**Distance** specify the distance, in pixels, at which the shadow must be displayed.

**Reflection** Select the check box to add reflection to the highlight box. Choose one of the presets.

### Timing

**Display For [Time]** Specifies the duration for which the highlight box is displayed on the slide.

**Appear After [#] Seconds** The highlight box appears on the slide after the specified duration.

### Transition

**Effect** Transition effect for the highlight box. You can apply a fade in or fade out effect and set the time for the fading effects.

**In [#] Seconds** Time for the highlight box to fully fade into view.

**Out [#] Seconds** Time for the highlight box to completely disappear.

---

## Add highlight boxes

[To the top](#) <sup>1</sup>

1. Select Insert > Standard Objects > Highlight Box.
2. Use the Property Inspector (Window > Properties) to set the various options for the highlight box.

# Images and rollover images

---

## Properties of images and rollover images

### Add an image or rollover image

### Insert character images

### Working with Adobe Photoshop files

### Create watermark images

### Change JPEG quality

You can incorporate images into projects as logos, startup screens, pointers, backgrounds, buttons, and more. You can add images in the following formats: JPG, JPEG, GIF, PNG, BMP, ICO, EMF, POT, or WMF.

Rollover images consist of an image and a rollover area (the “hot” area). Rollover images appear when the end user moves the pointer over the rollover area at run time. They are useful for heavily detailed slides or for slides that contain buttons or toolbars that require explanation.

You can use the same type of graphics for rollover images that you use for traditional images. You can also customize the location, outline, and size of the rollover area for rollover images.

 *Adobe Captivate contains a gallery of buttons, sounds, and animations (in SWF format) for you to use in your projects. By default, the gallery is stored in the following location when you install Adobe Captivate: C:\Program Files\Adobe\Adobe Captivate 6\Gallery (on Windows) and /Applications/Adobe Captivate 6/Gallery (on Mac OS).*

---

## Properties of images and rollover images

[To the top](#) 

You can change the properties of an image using the Image Edit area of the Property Inspector (Window > Properties) after selecting the image on the slide.

### Image

**Name** Enter a unique name for the object. You can use this name when defining the visibility conditions for the object.

**Visible** Deselect this option if you want the object to be invisible on the slide. Use the Show option to make the object visible. For more information, see Controlling the visibility of objects.

**Accessibility** Click to add accessible text to the object. For details, see Customize accessibility text for objects

**Transparent Background** Select the color filler icon. All occurrences of one particular color in an image can be made transparent. For example, you can make all occurrences of red (#FF0000) transparent.

**Reset To Original Size** Restores the image to its original size.

**Select Image From Library** Click the folder icon. Select this option to reuse an image in your project file. Select the image and click OK.

The Select Image from Library dialog box appears with the following options:

**Import** Import an image stored on your computer or on a network location.

### Image Edit

**Brightness** The brightness of the image. When you increase the value for brightness, the selected image appears brighter.

**Sharpness** Sharpening enhances the definition of edges in an image. Whether your images come from a digital camera or a scanner, most images can benefit from sharpening. The degree of sharpening needed varies according to the quality of the digital camera or scanner. Keep in mind that sharpening cannot correct a severely blurred image.

**Contrast** The contrast between the light and dark areas of an image. When you increase the contrast of an image, the brighter areas appear brighter, and the darker areas appear darker.

**Alpha** The transparency of the image. At 100% Alpha, the image is opaque. At 0%, the image is completely transparent and becomes invisible.

**Hue** You can change the colors of an image by changing the values for its hue.

**Saturation** The intensity of colors in the image. When you increase the saturation value, you increase the intensity of the colors.

**Gray Scale** In a basic sense, you can convert a colored image to monochrome using this effect. Grayscale mode uses different shades of gray in an image. In 8-bit images, there can be up to 256 shades of gray. Every pixel of a grayscale image has a brightness value ranging from 0 (black) to 255 (white). In 16-bit and 32-bit images, the number of shades in an image is much greater than in 8-bit images.

**Invert Color** Inverts the colors in an image. When you invert an image, the brightness value of each pixel in the channels is converted to the inverse value on the 256-step color-values scale. For example, a pixel in a positive image with a value of 255 is changed to 0, and a pixel with a value of 5, to 250.

**Flip** Flipping an image produces its mirror image. You can flip an image vertically or horizontally.

**Rotate** Rotate an image either clockwise or counterclockwise 90 at a time.

**Crop** Click the crop icon. Crops the imagehandles of the rectangular box to select the area of the image that you want displayed.

**Fit to Stage** Resizes the image to fit the dimensions of the slide.

## Shadow and reflection

**Shadow** Select the check box to apply shadow to the image. Choose one of the presets. You can customize a preset by clicking Custom.

**Direction** Select the direction: inner or outer. The preview of the selected direction is displayed on stage.

**Color** click to select a color for the shadow. Specify the alpha for the color, in percentage, in the adjacent field.

**Blur** Specify a value, in pixels, for the blur of the shadow.

**Angle** Specify the angle for the shadow.

**Distance** specify the distance, in pixels, at which the shadow must be displayed.

**Reflection** Select the check box to add reflection to the image. Choose one of the presets.

## Timing

**Display For [Time]** Specifies how long the image is displayed on the slide.

**Appear After [#] Seconds** Delay between the first appearance of the slide and the first appearance of the image.

## Transition

**Effect** Transition effect for the image. You can have the image fade in and fade out of the slide during its entry and exit.

**In [#] Seconds** Specifies the amount of time for the image to fully fade into view.

**Out [#] Seconds** Specifies the amount of time for the image to completely disappear from view.

---

## Add an image or rollover image

[To the top](#)

1. Select the slide to which you want to add an image.
2. Select Insert > Image, or Insert > Standard Objects > Rollover Image.
3. Select an image from the list or browse to a new location for a different image. Click Open.
4. (If required) Resize the image on stage or using the Crop dialog box

(Crop option in Image Edit area of Property Inspector).

Set the following options in the Resize/Crop dialog box.

**Fit To Stage** Resizes the image to fit the dimensions of the slide.

**Crop** Displays a bounding box with dimensions corresponding to that of the project. Resize the handles of the box to select the area that you want displayed on the slide. If you have selected Constrain Proportions, the height- to-width ratio of the bounding box is maintained.

**Zoom** You can zoom in and zoom out of the image by moving the slider. Alternatively, you can choose from a list of standard zoom sizes from the menu.

**Constrain proportions** Maintains the height-to-width ratio of the bounding box used to crop the image. This option is enabled only when you choose to crop the image. When you disable this option, resize the bounding box, and enable the option again; the new dimensions are used thereafter to calculate the ratio.

5. Set properties and options as required.
6. To snap the rollover area to the edges of an object, press Alt and move the rollover area over that object.
7. For properties with the  icon, select either
  - **Apply To All Items** To apply the effect to all objects that belong to the object type.
  - **Apply To All Items Of Same Style** To apply to all objects that use the same object style.
8. Click OK.

The image is added to the slide. If you added a rollover image, the rollover area is also added. Drag the image to the desired location and adjust the rollover area as needed.

 *You can create a watermark image using a transparency trick. Insert an image and set the transparency to 50%. This setting works well with many company logos.*

---

## Insert character images

[To the top](#)

Click Insert > Characters, click one of the options from Category, and click an image.

---

## Working with Adobe Photoshop files

[To the top](#)

This release features Adobe Photoshop round-tripping with Adobe Captivate. The Photoshop (PSD) files that you import to Adobe Captivate are linked to the source. You can start Adobe Photoshop (to edit the files) from within Adobe Captivate.

Also, if you update the source file, Adobe Captivate lets you update the files in the library and the changes reflect in the slide.

**Note:** This feature is available only in Adobe Captivate that is installed as a part of Adobe eLearning Suite.

## Import Photoshop files

You can import a PSD file into your Adobe Captivate project, while preserving Photoshop features. You can select and import separate layers of the PSD file, or you can flatten selected layers and import them as a single image.

Each imported layer is treated as a separate image within the Adobe Captivate project. In the library, a folder with the PSD name is created and each imported layer is stored in it in PNG format.

You can resize the imported images to the size of your Adobe Captivate project. You can also apply all other available image-editing properties of Adobe Captivate.

When importing a PSD file, you can select and import layer comps. A layer comp is a Photoshop feature that allows you to create, manage, and view multiple versions of a layout in a single Photoshop file. See Photoshop Help for more information on this feature.

1. In an open project, select File > Import > Photoshop File.

**Note:** Alternatively, you can use Insert > Image or you can also drag-and-drop the PSD file to the slide.

2. In the Import dialog box, do one of the following:

- To select separate layers of the PSD file, select the Layers option and select each layer that you want to import. To merge the selected layers before importing, select Merge Layers.

**Note:** Importing each layer separately increases the size of your image file. To reduce the size of the image, you can merge the layers.

To import the layers that you have not imported before, repeat the above steps and choose the required layers. The layers get added to the corresponding PSD folder in the Library.

- To flatten the layers and then import them as a single image, select Flattened Image.

**Note:** When you flatten layers, you cannot edit each layer separately within Adobe Captivate. Use this option only if you are sure that layer editing is not required and the image is ready to use.

- To import any layer comps, click Multiple and select the layer comp from the drop-down list. The layers in the selected layer comps appear. Select the check boxes corresponding to the layer comps you want to import.

3. Select Scale According To Stage Size to automatically resize the image to the size of your Adobe Captivate project.

## Reusing PSD items in the Library

You can reuse PSD items, such as layers and layer comps, using one or all of the following ways:

- To reuse a PSD item in a slide, drag-and-drop the item from the Library onto the slide.
- To reuse a PSD item in a different project, open the target project. Then, drag-and-drop the item from the current project's Library into the target project. You can also copy and paste the item into the target project.

Alternatively, in the target project, select File > Import > External Library, and open the project from which you want to import the PSD items. When the Library panel of the selected project appears, select the item and drag-and-drop it into the current project.

If a PSD file by the same name exists in the target project, Adobe Captivate matches the modified date of the two files. If the dates are same, the layers get copied into the corresponding PSD file folder in the Library. If not, the layers are copied as normal images.

## Edit PSD files

❖ In the slide or PSD folder in the library, select the imported PSD file, right-click (Windows) or Control-click (Mac OS), and then select Edit PSD Source File.

You can also edit the file from image properties (Window > Properties).

## Update PSD files

If the files in the Adobe Captivate library and the original files are not in sync, the status column in the library changes from  to .

To update and bring the resource on slide in sync with the source,

- Select the PSD on stage, right-click (Windows) or Control-click (Mac OS), and then select Update from Source.
- Click Update in the Property Inspector (Window > Properties).
- Click the status icon  in the library.
- Select the PSD folder in the library, right-click (Windows) or Control-click (Mac OS), and then select Update from Source.

**Note:** The first two options update the PSD both on stage and in library. The last two options update the resource only in the library and the updated resources do not take effect on stage.

If you remove or relocate the PSD, then a question mark icon  appears in the status column. Click to relink. You can do this also from the Image Properties dialog box.

The procedure for linking to a new PSD file is same as importing a new PSD file.

---

## Create watermark images

[To the top](#) <sup>1</sup>

You can create a watermark image by setting the transparency of an image.

1. In an open project, select Insert > Image.
2. Select an image or browse to a new location for a different image. Click Open. The image gets inserted.
3. Set the image Alpha to 50% or lower in the Image Edit area of the Property Inspector. A low number results in a dim version of the image and a higher number displays a brighter image.
4. Position the image on the slide as required.

---

## Change JPEG quality

[To the top](#) <sup>1</sup>

Adobe Captivate automatically sets the quality of JPEG images in projects. However, you can adjust this setting depending upon the images used in your project. Using higher percentage values allow high-quality images but also increases file size.

1. In an open project, select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Category panel, select SWF Size And Quality from the Project menu.
3. Enter your preferred value in the JPEG Image Quality text box.

# Mouse

---

[Change mouse properties](#)

[Pointers](#)

[Change mouse movements](#)

[Mouse paths](#)

[Set mouse click effect](#)

[Change mouse click sounds on an individual slide](#)

[Enable the mouse wheel](#)

---

## Change mouse properties

[To the top](#) <sup>4</sup>

### Options

You can change the properties of the mouse object using its Property Inspector (Window > Properties).

**Available Mouse Pointers List**  Displays the available pointers. Click Browse to navigate to a custom file (CUR file format for Windows and PICT for Mac).

**Double Mouse Size** Doubles the size of the pointer.

**Straight Pointer Path** Select this option to have the pointer follow a straight path between its start and end points. By default, the pointer follows a curved path that gives the motion a more realistic look. You can change to a straight path if, for example, your project is a demonstration showing how to draw a line in a graphics program.

**Reduce Speed Before Click** Select this option to slow the mouse movement down before the click occurs. This option is useful for a long mouse path that moves quickly and stops suddenly.

**Mouse Click Sound** Select this option to play a sound when the pointer reaches its destination. Click the pop-up menu to select a sound (Single Click or Double Click). You can also select Browse and navigate to a sound file.

**Show Mouse Click** Adds a visual click effect to the mouse movement.

**Default** Displays a quick, small burst of color when the user clicks the slide. You can select a color for the color burst.

**Custom** Select this option to use a SWF file as a visual click effect. Adobe Captivate includes two effects you can use. Test them by clicking the pop-up menu, selecting one, and then clicking Play. View the effect in the small preview window on the right.

### Timing

**Display For** The time during which the pointer is displayed on the slide. If you select specific time, then specify the time.

**Appear After** Delay between the first appearance of the slide and the first appearance of the slide pointer.

---

## Pointers

[To the top](#) <sup>4</sup>

### Select a custom pointer

1. In an open project, select the slide and then select Insert > Mouse.
2. Click Browse in the Property Inspector (Window > Properties).
3. Select a custom pointer from the list.
4. Click Open.

### Change pointer size

You can double the size of the pointer. Large pointers emphasize mouse movement and are also helpful if you are creating accessible projects.

Pointer size is set on a slide-by-slide basis, so you choose exactly the slides that require the larger pointer.

1. In an open project, select the slide containing the pointer.
2. In the Property Inspector (Window > Properties), check Double Mouse Size.
3. The new double-sized mouse is displayed on the slide.

**Note:** To restore the original pointer size, follow the steps above and clear Double Mouse Size.

## Hide the pointer in an individual slide

❖ Select the slide and then select Slide > Mouse > Show Mouse.

## Hide the pointer for the entire project

1. In an open project, select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Category panel, expand Project, and select Publish Settings.
3. In the Publish Settings panel, clear the option Include Mouse.

---

## Change mouse movements

[To the top](#)

You can change mouse movements for an individual slide. For example, you may want to emphasize mouse movement in a screenshot so that it is more obvious to the viewer.

1. Using the mouse, move the pointer over the end of the mouse line on the slide until the pointer turns into a hand.
2. Drag the pointer to a new location on the slide.

If you change the pointer on a slide, the starting pointer location changes on the next slide. Preview your project to ensure that mouse movement flows smoothly from slide to slide.

You can't align mouse movement to a previous slide. Make sure that you manually change the starting point of the mouse on the first project slide containing mouse movements.

---

## Mouse paths

[To the top](#)

### Align mouse paths

You may need the pointer to be completely still during the playback of a slide and have it align properly with the previous or next slide. In this case, it is difficult to manually position the pointer correctly. Adobe Captivate can solve the problem by automatically aligning the pointer to the same position as the previous or next slide in the project.

1. Right-click (Windows) or Control-click (Mac OS) and select Align To Previous Slide or Align To Next Slide.
2. Preview your project to see how the pointer is aligned between slides.

**Note:** If you have mouse movement on the first slide of your project, you can manually change the start point of the mouse movement (because you cannot align to a previous slide).

### Change shape of mouse paths

By default, Adobe Captivate creates curved mouse paths on slides for a realistic, natural feel. However, a straight mouse path is sometimes preferable, for example, showing movement across a toolbar.

You can set the curved or straight mouse movement option for an individual slide.

❖ In the Property Inspector (Window > Properties) select Straight Pointer Path.

This option acts like a toggle. Select it again to restore curved paths.

---

## Set mouse click effect

[To the top](#)

You can set a mouse click color or effect. Use this option to add a quick burst of color or special effect around the pointer to emphasize mouse clicks during project playback.

1. In an open project, select a slide containing mouse movement.
2. In the Property Inspector (Window > Properties),
3. Select Show Mouse Click.
4. Do one of the following:
  - Select Default. Click the color box to open the Color dialog box. Select a color and click OK.
  - Select Custom. Select an option from the pop-up menu. To preview these options, select one and click Play. The SWF file plays in the small Preview window on the right. You can also select Browse in the pop-up menu and navigate to a SWF file.

To view the mouse click color, preview the project.

---

[To the top](#)

## Change mouse click sounds on an individual slide

You can change the default mouse click sound that plays whenever the mouse reaches the end of its movement path. For example, you can change from single clicks to double clicks to reflect the correct action in a workflow. You can also suppress all click sounds.

1. Select the mouse object and then in the Property Inspector (Window > Properties), select Show Mouse Click.
2. Select Show Mouse Click.
3. Do the following:
  - If you do not want a mouse click sound to play, deselect Mouse Click Sound.
  - For a single-click sound (the sound of a mouse button being pressed once), select Mouse Click Sound and then select Single Click from the menu.
  - For a double-click sound (the sound of a mouse button being pressed twice), select Mouse Click Sound and then select Double Click.
  - To browse to an alternative sound for a mouse click, select Mouse Click Sound and then click browse button. The Open dialog box appears, letting you browse to an mp3 file.

 To preview the selected mouse click sound, click the Play button.

---

## Enable the mouse wheel

[To the top](#) <sup>4</sup>

When recording, you can choose to enable mouse wheel movement to initiate full motion recording. The project starts recording in video mode when there is mouse wheel movement during recording.

1. In an open project, Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Category panel of Preferences, expand Recording, and select Settings.
3. In the Smoothen Movements For section, select Mouse Wheel Actions and then click OK.

[Legal Notices](#) | [Online Privacy Policy](#)

# Rollover captions

---

## [Add rollover captions](#)

## [Edit rollover area](#)

## [Convert tooltips to rollover captions](#)

Use rollover captions when you want to display the caption only when the user moves the mouse over a designated area on the slide. Rollover captions consist of a caption and a rectangle that marks the designated area, also called the rollover area. The caption appears when the user moves the mouse over the rollover area at run time.

---

## Add rollover captions

[To the top](#) <sup>4</sup>

1. Select the slide to which you want to add a rollover caption.
2. Select Insert > Standard Objects > Rollover Caption.
3. Set the various options for the caption in the Rollover Caption dialog box. See Text caption properties for more information.
4. Click OK. The text caption and the rollover area appear on the slide.
5. Select the rollover area and set the properties using the Property Inspector (Window > Properties).
6. Click Accessibility to add accessible text to the object. For details, see Customize accessibility text for objects
7. For properties with the  icon, select either
  - **Apply To All Items** To apply the effect to all objects that belong to the object type.
  - **Apply To All Items Of Same Style** To apply to all objects that use the same object style.
8. Click OK.

---

## Edit rollover area

[To the top](#) <sup>4</sup>

Rollover captions and rollover images consist of a caption or image and a rollover area (the “hot” area). The rollover area defines where the mouse must be for the caption or image to appear.

1. Open an Adobe Captivate project.
2. Select the slide containing the rollover caption or image.
  - To change the size of the rollover area, click one of the handles and drag.
  - To move the rollover area to another location, move the mouse over the rollover area until the hand cursor appears. Drag the box to the desired location.
  - To modify the rollover area attributes, select the rollover area make the required changes in the Property Inspector (Window > Properties).
  - Customize the following for the rollover area in the Property Inspector if required:

**Stroke** Stroke color for the rollover area.

**Fill** Fill color for the rollover area. To decide the degree of transparency for the fill color, select a value for the option Alpha in the Color menu. The value of 90% is less transparent (more solid) than a value of 10%.

**Width** Thickness of the border of the rollover area.

**Fill Outer Area** Select this option to fill the area outside the boundaries of the rollover area with the color selected in Fill Color. When you choose this option, the area within the rollover area is not colored.

**Note:** *You can observe the fill color around the rollover area only when you preview or publish the project.*

The other tabs in the Properties dialog box are similar to those for text captions. See Text captions for more information.

---

## Convert tooltips to rollover captions

[To the top](#) <sup>4</sup>

When you record a new project or record additional slides for an existing project, you can set a recording option that requires Adobe Captivate to convert tooltips to rollover captions. When this option is selected, Adobe Captivate creates a rollover caption for every tooltip that is selected

during the recording process.

Converting tooltips to rollover captions is an easy way to automatically create an appropriate and descriptive caption for action taking place in a project.

1. In an open project, select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select Modes in the Recording menu.
3. Select Convert Tooltips to Rollover Captions.
4. Click OK.
5. Click Record to begin recording a new project and automatically converting tooltips to rollover captions.

# Rollover slidelets

---

## Properties of slidelets

### Properties of rollover slidelets

#### Create a rollover slidelet

#### Insert objects within a slidelet

In Adobe Captivate, a rollover slidelet is a space on a slide that displays an associated slidelet (a slide within a slide) when the mouse is moved over the space. You can insert and display objects in the slidelet using the same procedure as that for the slides.

For example, you can create a rollover slidelet for a state on a map so that the demographics of the state are displayed when the mouse moves over it.

**Note:** You cannot create rollover slidelets on question slides or quiz review slides.

The following is further information about slidelets:

- A slidelet is always linked to a rollover slidelet and is created along with the rollover slidelet.
- You can insert most of the Adobe Captivate objects into a slidelet.
- You can place more than one type of object into a slidelet. The objects become visible when the mouse is moved over the rollover slidelet.
- You can drag audio and movie files from the Library into a slidelet.
- If a slidelet times out while an audio or movie file from the slide is running, the file stops running.
- When a slidelet or any of its objects is selected, the displayed Timeline and the corresponding menu options for the slide change to that for the slidelet.
- Objects within a slidelet can be hidden or locked, but not the slidelet itself. To hide or lock a slidelet, hide or lock the corresponding rollover slidelet from the slide Timeline.
- Slidelet objects cannot be dragged outside of the slidelet boundaries.
- When a slidelet is deleted, its associated objects are also deleted, and the Timeline reverts to the slide Timeline.
- Clicking an area outside the slidelet, or on the Filmstrip, reverts the Timeline to that for the corresponding slide.

---

## Properties of slidelets

[To the top](#) <sup>4</sup>

Select the slidelet and use the Property Inspector (Window > Properties) to set the following properties of a slidelet:

### Slidelet

**Name** Enter a unique name for the object. You can use this name when defining the visibility conditions for the object.

**Style** Select a style for the slidelet. To define a new style, select Edit > Object Style Manager. For more information on object styles, see Object style

**Accessibility** Click to add accessible text to the object. For details, see Customize accessibility text for objects

### Fill and Stroke

**Fill** Fill color of the slidelet. To decide the degree of transparency for the fill color, select a value for the option Alpha in the Color menu. The value of 90% is less transparent (more solid) than a value of 10%.

**Stroke** Stroke color of the slidelet.

**Width** The thickness of the slidelet border.

**Show Runtime Shadow** Select this option to display a shadow below the slidelet during run time. The shadow gives a three-dimensional feel to the slidelet.

**Image** Background image of the slidelet. Click the respective icon to remove or crop previously selected image.

### Shadow and reflection

**Shadow** Select the check box to apply shadow to the slidelet. Choose one of the presets. You can customize a preset by clicking Custom.

**Direction** Select the direction: inner or outer. The preview of the selected direction is displayed on stage.

**Color** click to select a color for the shadow. Specify the alpha for the color, in percentage, in the adjacent field.

**Blur** Specify a value, in pixels, for the blur of the shadow.

**Angle** Specify the angle for the shadow.

**Distance** specify the distance, in pixels, at which the shadow must be displayed.

**Reflection** Select the check box to add reflection to the slidelet. Choose one of the presets.

## Timing

**Display For** The duration for which the slidelet is displayed on the slide.

## Transition

**Effect** The transition effect for the slidelet when it appears and exits the slide.

**In and Out** The time (in seconds) for the fading effects.

---

## Properties of rollover slidelets

[To the top](#)

Select the rollover slidelet and use the Property Inspector (Window > Properties) to set the following properties for a rollover slidelet:

### Rollover Slidelet

**Name** Enter a unique name for the object. You can use this name when defining the visibility conditions for the object.

**Visible** Deselect this option if you want the object to be invisible on the slide. The object can be made visible using the Show option. For more information, see Controlling the visibility of objects.

**Style** Select a style for the rollover slidelet. To define a new style, select Edit > Object Style Manager. For more information on object styles, see Object style

### Fill and Stroke

**Fill** Fill color for the rollover slidelet. To decide the degree of transparency for the fill color, select a value for the option Alpha in the Color menu. The value of 90% is less transparent (more solid) than a value of 10%.

**Stroke** Fill color for the rollover slidelet.

**Show Border** Displays the border of the rollover slidelet. The border is not displayed if you disable this option.

### Action

**Stick Slidelet** The slidelet continues to be displayed even when you move the mouse away from the rollover slidelet area.

**On Click** Define the action to take when the user clicks the rollover slidelet by selecting one of the options in the menu.

**Shortcut** You can specify a keyboard shortcut for the mouse-click. Users can use the keyboard shortcut instead of using the mouse. For example, if you select Control+Shift+Enter as the keyboard shortcut for the mouse-click, the click is treated as correct (click within the box) when the users press this combination. If they press the wrong combination, it is treated as a click outside the box.

**Note:** *If your Adobe Captivate project is displayed in a browser, set keyboard shortcuts that do not conflict with common browser shortcuts. For example, F1 is frequently used as a keyboard shortcut to display Help on Windows. The Control, Alt, and Shift keys map to the Control, Option, and Shift keys on Macintosh® computers, respectively.*

### Shadow and reflection

**Shadow** Select the check box to apply shadow to the rollover slidelet. Choose one of the presets. You can customize a preset by clicking Custom.

**Direction** Select the direction: inner or outer. The preview of the selected direction is displayed on stage.

**Color** click to select a color for the shadow. Specify the alpha for the color, in percentage, in the adjacent field.

**Blur** Specify a value, in pixels, for the blur of the shadow.

**Angle** Specify the angle for the shadow.

**Distance** specify the distance, in pixels, at which the shadow must be displayed.

**Reflection** Select the check box to add reflection to the rollover slidelet. Choose one of the presets.

### Timing

**Display For** The duration for which the rollover slidelet is displayed.

**Appear After** Delay between the first appearance of the slide and the first appearance of the rollover slidelet.

**Hover Delay** The time delay before the appearance of the slidelet when the mouse moves over the rollover slidelet.

### Transition

**Effect** The transition effect for the slidelet when it appears and exits the slide.

**In and Out** The time (in seconds) for the fading effects.

**Show Runtime Border** When the mouse moves over the rollover slidelet, a border is displayed with the specified color.

---

## Create a rollover slidelet

[To the top](#)

1. Select Insert > Standard Objects > Rollover Slidelet.
2. In the Property Inspector (Window > Properties), set the options for the rollover slidelet as required.

**Note:** *Whenever a new rollover slidelet is inserted, the default timing is Rest Of Slide. If required, you can modify the properties later.*

## Insert objects within a slidelet

1. Select the slidelet by clicking it.
2. Select Insert and choose the object that you want to insert.
3. In the corresponding dialog box that opens, follow the procedure to insert the object.
4. Click OK.

**Note:** You cannot insert a rollover slidelet, mouse, text entry box, click box, or button within a slidelet.

 To select all objects in a slidelet, right-click (Windows) or Control-click (Mac OS) an object within a slidelet, and choose Select All from the pop-up menu.

# Set audio for noninteractive objects

---

You can add an audio file to noninteractive objects. The audio file is played when the object appears on the slide.

1. To add audio, go to the Audio area in the Property Inspector (Window > Properties) and then click Add Audio.

The Object Audio dialog box appears.

**Record Audio** Click to record. Recording audio requires some basic equipment.

**Stop Audio** Stops playing the audio file.

**Play Audio** Plays the audio file.

**Import** Displays the Import Audio dialog box. This dialog box lets you browse to an audio file and import it.

**Library** Opens the Library. The Library lists all audio files that are already part of the currently open Adobe Captivate project.

**Edit** This tab lets you edit the audio file in various ways, such as inserting silent periods and adjusting the volume.

**Settings** Opens the Audio Settings dialog box. You can change audio settings such as input source, quality level, and calibration. Click the Settings button to make your selections.

2. Specify the following in the Audio area:

**Stop Slide Audio When Slidelet Appears (for Rollover Slidelet)** Any audio associated with the slide stops playing when the slidelet appears in the movie.

**Fade In [#] Seconds** Specifies the time for the audio to fade in to full volume.

**Fade Out [#] Seconds** Specifies the time for the audio to fade out to silence.

# Zoom areas

---

## Properties of zoom destination areas

### Properties of zoom source areas

#### Add zoom areas

Zoom areas help you draw the learner's attention to important sections of a slide. For example, if you create a simulation that includes a step that might be easily overlooked, you can add a zoom area to highlight the step. After you add a zoom area, you can add timing, transition, and audio options to the zoom effect. Zoom areas consist of the following:

**Zoom source** The area of the slide that you want to magnify.

**Zoom destination area** The area in which the magnified portion of the slide is displayed.

[To the top](#)

## Properties of zoom destination areas

You can set the properties for a zoom destination area using the Property Inspector (Window > Properties).

**Fill** Color of the area within the Zoom Destination Area box. To decide the degree of transparency for the fill color, select a value for the option Alpha in the Color menu. The value of 90% is less transparent (more solid) than a value of 10%.

**Stroke** Stroke color for the Zoom Destination Area box.

**Width** Thickness of the border of the Zoom Destination Area box.

**Image** Image for the zoom destination area. Click the respective icon to add, crop, or delete image.

**Note:** You can also change the size and position of the zoom area or zoom destination area directly on the slide. Select the box you want to change. When the hand cursor is visible, you can adjust the position of the box. When the double-headed arrow cursor is visible, you can adjust the size.

[To the top](#)

## Properties of zoom source areas

You can set the properties for a zoom source area using the Property Inspector (Window > Properties).

### Zoom Source

**Name** Enter a unique name for the object. You can use this name when defining the visibility conditions for the object.

**Visible** Deselect this option if you want the object to be invisible on the slide. The object can be made visible using the Show option. For more information, see Controlling the visibility of objects

**Style** Select a style for the Zoom source. To define a new style, select Edit > Object Style Manager. For more information on object styles, see Object style

### Fill and Stroke

**Fill** Color of the area within the Zoom source.

To decide the degree of transparency for the fill color, select a value for the option Alpha in the Color menu. The value of 90% is less transparent (more solid) than a value of 10%.

**Stroke** Stroke color of the area within the Zoom source.

**Fill Outer Area** Select this option to fill the area outside the boundaries of the Zoom Area box with the color selected in Fill Color. When you choose this option, the area within the Zoom Area box is not colored.

**Note:** You can observe the fill color around the zoom area only when you preview or publish the project.

**Width** Thickness of the border of the Zoom Area box.

### Timing

**Display For [Time]** Specifies the duration for which the zoom area is displayed.

**Appear After [#] Seconds** Delay between the first appearance of the slide and the first appearance of the zoom area.

**Zoom For** The duration of the zoom, in tenths of a second.

### Transition

**Effect** The transition effect for the slidelet when it appears and exits the slide.

**In and Out** The time (in seconds) for the fading effects.

[To the top](#)

## Add zoom areas

1. In an open project, select the slide to which you want to add a zoom area.
2. Select Insert > Standard Objects > Zoom Area.
3. Set the options for the zoom area as required.
4. Select the zoom destination area and set its properties using the Property Inspector (Window > Properties).

## Interactive Objects

# Text entry boxes

---

## Add a text entry box

Text entry boxes are text fields into which users can enter text. Text entry boxes are a great way to test users' knowledge. After the user answers a question, Adobe Captivate matches the answer with the answers that you have set when creating the text entry box. You can even provide a hint to the user if you want to.

## Add a text entry box

[To the top](#)

1. Open the slide to which you want to add a text entry box.
2. Select Insert > Standard Objects > Text Entry Box. The text entry box appears on the slide.
3. Size and drag the text entry box as desired.
4. Double-click the Success, Failure, or Hint captions to edit the text.
5. To change the properties of the text entry box, click the box and change the properties in the Property inspector.

## Properties of text entry boxes

To view the properties of a text entry box, select it on the slide. The Property inspector displays the properties of the text entry box.

When you change the properties, the changes are instantly applied to the selected instance of the text entry box. Click the Apply to all icon to apply the changes to all the click boxes in the project or to those that use the same object style.

### Text Entry Box

**Name** Enter a unique name for the text entry box. You can use this name when defining the visibility conditions for the box.

**Visible** Clear this option if you want the text entry box to be invisible when the project is played. The object can be made visible when a specific event occurs such as the entry to a slide or exit from a slide. For more information, see [Controlling the visibility of objects](#).

**Style** Select a style for the text entry box. To define a new style, select Edit > Object Style Manager. For more information on object styles, see [Object style](#).

### General

**Default Text** Displays the default text that appears in the text entry box. The user can overwrite the displayed text to type the answer. For example, you can set a default text for the text entry box saying, "Enter the answer here."

**Retain Text** Allows users to view their previously entered answer if they return to this slide using the Back button.

**Show Text Box Frame** Enables or disables the visibility of the text entry box frame. If you do not select this option, only the Default Text is displayed to the user.

**Password Field** Displays asterisks in the text entry box to indicate that the box is a password field.

**Validate User Input** Validates the input provided by the users. The box behaves like a form field and accepts any user input.

**Success Caption** The caption displayed when the user provides the correct answer.

**Failure Caption** The caption displayed when the user provides an incorrect answer.

**More Options** Lets you specify the following options (available in the update for subscription and Adobe Software Assurance customers only):

**Maximum Length** Number of characters that you want to limit the input to.

**Auto Submit** This option is enabled if you have specified a limit on the number of characters. When you enable this option, the users' input is automatically submitted when the limit is reached without them having to click Submit.

**Numbers** Click if you want only numbers to be entered by users.

**Uppercase** Click if you want only uppercase characters to be entered into the text entry box. All characters that are typed into the box are automatically converted to uppercase even if users type them in lowercase.

**Lowercase** Click if you want only lowercase characters to be entered into the text entry box. All characters that are typed into the box are automatically converted to lowercase even if users type them in uppercase.

**None** Click to remove any restriction that you have set (numbers, uppercase, or lowercase).

**Var Associated** Indicates the name of the variable that stores the value entered in the text entry box by users. To specify a different variable name, click the 'X' icon, type the name of the variable, and click Ok.

**On Focus Lost** Select the action that should be performed when the user presses Enter or Tab.

## Character

**Family** Displays the font family associated with the text entered in the text entry box.

**Style** Displays the style for the characters entered in the text entry box.

**Size** Displays the size of the characters entered in the text entry box.

**Format** Displays the format (bold or italic) for the text entered in the text entry box.

**Color** Displays the color of the characters entered in the text entry box.

**Note:** When you change the properties in this section, the object style in the General section is prefixed with a '+' sign. This indicates that the style is now in a overridden state. For more information on object styles, see [Object style](#).

## Action

**On Success** Specifies the event that occurs when a user clicks the box. For the description of the available options, see [Project navigation using interactive objects](#).

**Attempts [#]** Specifies the number of times the user can attempt the question before the specified action takes place. By default, the number of attempts allowed is infinite. To specify a number, clear the Infinite check box and then click the numeral associated with the Attempts option.

**Infinite** Allows users an unlimited number of attempts.

**Last Attempt** Specifies the event that should take place after the last attempt. For the description of the available options, see [Project navigation using interactive objects](#).

- If you select Open URL Or File or Open Another Project, click the inverted arrow icon next to the URL or the Project field to select the window in which the URL, file, or project appears. Select from Current, New, Parent, and Top. If you choose New, Parent, or Top, you also have the option to continue playing the original project when the URL, file, or project opens.
- If you select Send E-mail To, you have the option to continue playing the project while the e-mail message is prepared and sent.

**Shortcut** You can specify a keyboard shortcut for the mouse-click. Users can use the keyboard shortcut instead of the mouse. For example, suppose you select Control+Shift+Enter as the keyboard shortcut for the mouse-click. The click is treated as correct (a click within the box) when users press this combination. If they press the wrong combination, it is treated as a click outside the box.

**Note:** If your Adobe Captivate project is displayed in a browser, set keyboard shortcuts that do not conflict with common browser shortcuts. For example, F1 is frequently used as a keyboard shortcut to display Help. The Control, Alt, and Shift keys map to the Control, Option, and Shift keys on Macintosh® computers, respectively.

## Options

**Success** select this check box to include a caption to be displayed when the user clicks inside the click box.

**Failure** select this check box to include a caption to be displayed when the user clicks outside the click box.

**Hint** select this check box to specify a hint to be displayed to users. The hint is displayed when the user moves the mouse over the click box.

**Pause For Success/Failure Captions** select this check box to pauses the project until all success and failure captions are displayed.

**Show Button** Adds a Submit button to the text entry box by default. Click the button to change its properties such as the label for the button and the formatting of the characters in the label.

**Show Scrollbar** Displays a scroll bar when the user exceeds the space available in the text entry box.

## Shadow & Reflection

**Shadow** Select the check box to apply shadow to the text entry box.

**Direction** Select the direction: inner or outer. The preview of the selected direction is displayed on stage.

**Presets** click one of the images in Presets to apply a shadow with standard angle, distance, blur, and color settings. You can customize these settings using the appropriate options in the Shadow accordion.

**Color** click to select a color for the shadow. Specify the alpha for the color, in percentage, in the adjacent field.

**Blur** Specify a value, in pixels, for the blur of the shadow.

**Angle** Specify the angle for the shadow.

**Distance** specify the distance, in pixels, at which the shadow must be displayed.

**Reflection** Select the check box to add reflection to the text caption. Choose one of the presets.

### Timing

**Display For** Specifies how long the text entry box is displayed on the slide.

**Appear After** Specifies the delay between the first appearance of the slide and the first appearance of the text entry box.

**Pause After** Specifies the point at which the project pauses so that the user can enter text in the text entry box. The project continues only after the user submits the correct answer.

### Transition

**Effect** Displays the transition effect for the text entry box. You can apply a fade in or fade out effect and set the time for the fading effects.

### Fill And Stroke

**Fill** indicates the background color of the text entry box. To change the color, click the Fill box and click a color in the color palette.

### Reporting tab

If you want to keep score for the text entry box or coordinate the score with a learning management system, use the Reporting tab.

**Include In Quiz** Considers the text entry box as a question in the current quiz. The points assigned to this box are added to the score results of the current quiz.

**Points** The score that you want to assign to the question. The maximum is 100 points, the minimum is 0. The points assigned to this text entry box are added to the score results of the current quiz.

**Add To Total** Includes the points for the correct click in the total score.

**Report Answers** Sends the quiz score to the learning management system (LMS).

**Interaction ID** Sends tracking information to your learning management system. Use the interaction ID specified by your learning management system.

### Audio tab

**Fade In [#] Seconds** Specifies the number of seconds until the audio fades in to full volume.

**Fade Out [#] Seconds** Specifies the number of seconds until the audio fade outs to silence.

**Add Audio** Allows you to associate an audio with the click box.

### Transform

Use this section to define the exact size or location of the text entry box in terms of pixels. You can also specify the rotation of a text entry box in this section.

**X** Position of the text entry box on the X-axis

**Y** Position of the text entry box on the Y-axis.

**W** Width of the text entry box.

**H** Height of the text entry box.

**Constrain Proportions** Maintains the height-to-width ratio of the text entry box when you resize it.

**Angle** Angle of rotation of the text entry box.

# Add JavaScript to boxes and buttons

---

You can add JavaScript to click boxes, text entry boxes, and buttons in Adobe Captivate projects. The JavaScript can run when a user clicks inside or outside the box or button. Using JavaScript gives you the opportunity to extend projects in numerous ways while adding interactivity.

1. Click the click box, text entry box, or the button.
  2. In the Action section of the Property inspector, select Execute JavaScript in the On Success or Last Attempt list as required.
  3. Click Script\_Window.
  4. Enter your JavaScript code in the text box and click OK. If you have the JavaScript in another location, copy it and paste it into the text box.
- 

# Add audio to boxes and buttons

---

## Import an audio file

### Import an audio file from the Library

You can import an audio file to use with buttons, highlight boxes, click boxes, or text entry boxes. You can use the audio files that are available in the Gallery or record your own audio to associate with these objects. The Gallery folder is in C:\Program Files\Adobe\Adobe Captivate 6.0 (on Windows) and /Applications/Adobe Captivate 6.0/Gallery/ (on Mac OS).

You can also use the Library to add an audio file that already exists in the project.

The audio file plays when the object appears. You can also associate Audio with Success, Failure, or Hint captions.

---

## Import an audio file

[To the top](#) <sup>4</sup>

1. Click the click box, text entry box, or the button.
2. In the Audio section of the Property inspector, click Add Audio.
3. In the Object Audio dialog box, click Import (F6).
4. Browse to the audio file you want to add, select the file, and click Open.
5. To listen to and test the audio file, click the Play icon.
6. To change the audio settings such as input devices, quality level, or calibration, click Settings.
7. Click the Edit tab to edit the audio file (change volume, add silence, and change length).
8. Click Save and then Close.

---

## Import an audio file from the Library

[To the top](#) <sup>4</sup>

1. Click the click box, text entry box, or the button.
2. In the Audio section of the Property inspector, click Add Audio.
3. In the Object Audio dialog box, click Library.  
**Note:** To use the Library option, the Adobe Captivate project must contain one or more audio files. If the project has no audio files, the Library option is unavailable.
4. In the Select Audio From The Library dialog box, select the audio file, and click OK. To use an audio file that does not exist in the library, click Import.
5. To listen to and test the audio file, click the Play icon.
6. To change the audio settings such as input devices, quality level, or calibration, click Settings.
7. Click the Edit tab to edit the audio file (change volume, add silence, and change length).
8. Click Save and then Close.

# Buttons

---

## Add a button

### Automatically resize buttons

### Modify buttons on question slides

You can increase the interactivity of your Adobe Captivate projects by adding buttons. To quickly add a button, use the default button style (a plain, white rectangle). You can also import custom button images. You can size and position buttons on a slide. You determine what happens after the user clicks the button.

[To the top](#) <sup>4</sup>

## Add a button

**Note:** *Resize any buttons before resizing the project. Resizing a project does not resize the buttons automatically.*

1. Open the slide to which you want to add a button.
2. Select Insert > Standard Objects > Button.

**Note:** *You can delete a button at any time by selecting it and pressing the Delete key. When you delete a button, all associated objects (such as success and failure captions) are also deleted.*

The button appears on the slide.

3. Size and drag the button as desired.
4. Double-click the Success, Failure, or Hint captions to edit the text.
5. To change the properties of the button, click the button and change the properties in the Property inspector.

## Properties of buttons

To view the properties of a button, select it on the slide. The Property inspector displays the properties of the button.

When you change the properties, the changes are instantly applied to the selected instance of the button. Click the Apply to all icon () to apply the changes to all the buttons in the project or to those that use the same object style.

### Button

**Name** Enter a unique name for the button. You can use this name when defining the visibility conditions for the button.

**Visible In Output** Clear this option if you want the button to be invisible when the project is played. The object can be made visible when a specific event occurs such as the entry to a slide or exit from a slide. For more information, see Controlling the visibility of objects.

**Style** Select a style for the button. To define a new style, select Edit > Object Style Manager. For more information on object styles, see Object style

### General

**OS Button** Button with text displayed on it. The look and feel of the button is different on different operating systems.

**Caption** Type text that you want displayed on the button.

**Make Button Transparent** Makes the button transparent. When a text button is transparent, only its text appears on the slide.

**Theme Button** Button that you can customize by modifying attributes such as fill color and corner radius. You can have text on theme buttons too.

**Caption** Type text that you want displayed on the button.

**Fill Color** Color of the button.

**Stroke** Color for the border of the button.

**Width** Thickness of the border around the button.

**Style** The style for the stroke line.

**Corner Radius** Radius for smoothing the corners of the button.

**Image Button** Use an image as a button. You can browse to an image available in the gallery or choose from the menu displayed.

**Make Transparent** Creates a button that is transparent.

### Character

**Family** Displays the font family associated with the text entered in the button.

**Style** Displays the style for the characters entered in the button.

**Size** Displays the size of the characters entered in the button.

**Format** Displays the format (bold or italic) for the text entered in the button.

**Color** Displays the color of the characters entered in the button.

**Note:** *When you change the properties in this section, the object style in the General section is prefixed with a '+' sign. This indicates that the style is now in a overridden state. For more information on object styles, see Object style*

### Action

**On Success** Specifies the event that occurs when a user clicks the button. For the description of the available options, see Project navigation using interactive objects.

**Attempts [#]** Specifies the number of times the user can attempt the question before the specified action takes place. By default, the number of attempts allowed is infinite. To specify a number, clear the Infinite check box and then click the numeral associated with the Attempts option.

**Infinite** Allows users an unlimited number of attempts.

**Last Attempt** Specifies the event that should take place after the last attempt. For the description of the available options, see Project navigation using interactive objects.

- If you select Open URL Or File or Open Another Project, click the inverted arrow icon next to the URL or the Project field to select the window in which the URL, file, or project appears. Select from Current, New, Parent, and Top. If you choose New, Parent, or Top, you also have the option to continue playing the original project when the URL, file, or project opens.
- If you select Send E-mail To, you have the option to continue playing the project while the e-mail message is prepared and sent.

**Shortcut** You can specify a keyboard shortcut for the mouse-click. Users can use the keyboard shortcut instead of the mouse. For example, suppose you select Control+Shift+Enter as the keyboard shortcut for the mouse-click. The click is treated as correct (a click within the box) when users press this combination. If they press the wrong combination, it is treated as a click outside the box.

**Note:** *If your Adobe Captivate project is displayed in a browser, set keyboard shortcuts that do not conflict with common browser shortcuts. For example, F1 is frequently used as a keyboard shortcut to display Help. The Control, Alt, and Shift keys map to the Control, Option, and Shift keys on Macintosh® computers, respectively.*

### Options

**Success** select this check box to include a caption to be displayed when the user clicks the button.

**Failure** select this check box to include a caption to be displayed when the user clicks outside the button.

**Hint** select this check box to specify a hint to be displayed to users. The hint is displayed when the user moves the mouse over the button.

**Pause For Success/Failure Captions** select this check box to pauses the project until all success and failure captions are displayed.

**Show Hand Cursor Over Hit Area** Select this check box to change the pointer to a pointing hand when the user moves the pointer over the button.

**Double Click** Select this check box if you want the users to double-click the button.

**Disable Click Sound** Select this check box to disable the click sound that is played when users click inside the button area.

### Shadow & Reflection

**Shadow** Select the check box to apply shadow to the button.

**Direction** Select the direction: inner or outer. The preview of the selected direction is displayed on stage.

**Presets** click one of the images in Presets to apply a shadow with standard angle, distance, blur, and color settings. You can customize these settings using the appropriate options in the Shadow accordion.

**Color** click to select a color for the shadow. Specify the alpha for the color, in percentage, in the adjacent field.

**Blur** Specify a value, in pixels, for the blur of the shadow.

**Angle** Specify the angle for the shadow.

**Distance** specify the distance, in pixels, at which the shadow must be displayed.

**Reflection** Select the check box to add reflection to the text caption. Choose one of the presets.

### Timing

**Display For** Specifies how long the button is displayed on the slide.

**Appear After** Specifies the delay between the first appearance of the slide and the first appearance of the button.

**Pause After** Specifies the point at which the project pauses so that the user can click the button. The project continues only after the user clicks the button.

### Reporting tab

If you want to keep score for the button or coordinate the score with a learning management system, use the Reporting tab.

**Include In Quiz** Considers the button as a question in the current quiz. The points assigned to this button are added to the score results of the current quiz.

**Points** The score that you want to assign to the question. The maximum is 100 points, the minimum is 0. The points assigned to this button are added to the score results of the current quiz.

**Add To Total** Includes the points for the correct click in the total score.

**Report Answers** Sends the quiz score to the learning management system (LMS).

**Interaction ID** Sends tracking information to your learning management system. Use the interaction ID specified by your learning management system.

## Audio tab

**Fade In [#]** Specifies the time for the audio to fade in to full volume.

**Fade Out [#]** Specifies the time for the audio to fade out to silence.

**Stop Slide Audio When Clicked** Stops playing the audio file associated with the slide when the users click button. This option stops only the slide audio, not the background audio. Also, using a keyboard shortcut does not stop the audio.

**Stop Slide Audio When Paused** Stops playing the audio file associated with the slide when the project is paused.

**Add Audio** Allows you to associate an audio with the button.

## Transform

Use this section to define the exact size or location of the buttons in terms of pixels. You can also specify the rotation of a button in this section.

**X** Position of the button on the X-axis

**Y** Position of the button on the Y-axis.

**W** Width of the button.

**H** Height of the button.

**Constrain Proportions** Maintains the height-to-width ratio of the button when you resize it.

**Angle** Angle of rotation of the button.

## Properties of review buttons

The Review button is present on the quiz results slide. When users click the Review button, they are presented with a slide that provides a report of the questions that were answered correctly and incorrectly. It also provides the correct answers to all the questions. The properties of review buttons are similar to those of normal buttons.

---

## Automatically resize buttons

[To the top](#)

You can configure Adobe Captivate to automatically resize a button or caption according to the amount of text in the button. If you edit the text, the button changes size to accommodate the new text.

1. In an open project, select Edit > Preferences (on Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select Defaults under the Global menu.
3. Select Autosize Buttons in the General panel on the right.

**Note:** *Best practice is to resize buttons before resizing the project. Resizing a project does not resize the buttons automatically.*

---

## Modify buttons on question slides

[To the top](#)

You can modify some properties of buttons on question slides. The standard buttons are Clear, Back, Submit, and Skip.

1. Select the question button that you want to modify.
2. In the Quiz Properties panel, set the values for the various options.

**Note:** *Resize any buttons before resizing the project. Resizing a project does not resize the buttons automatically.*

# Click boxes

---

## Properties of click boxes

### Add a click box

Click boxes are areas on the slide where the user must click before the next action can take place. You can use click boxes to demonstrate an application's functionality, for example, by placing them on menus or buttons where the user must click. You can determine what happens after the user performs a successful click. For example, the project can advance to the next slide, open a URL, or send an e-mail message.

You can insert the following types of click boxes in Adobe Captivate:

- Right-click box 
- Left-click box 
- Double-click box 

Unless specified as a double-click or right-click box in the properties, click boxes act as left-click boxes. You can recognize the different kinds of click boxes by their associated icons.

Right-click boxes are not supported in the following cases and act as left-click boxes after you publish the Adobe Captivate project:

- Publishing a project as a SWF file (HTML option enabled) unless you:
  - Disable accessibility (Edit > Preferences > Project > Publish Settings)
  - Publish SWF in a trusted path if you are planning to serve the content from a CD. If the javascript is enabled in the browser and the content is served from a webserver, this step is not required.
- Publishing a project with 508 compliance enabled.
- Publishing a project to a PDF file.
- Publishing a project as EXE files.

**Note:** Right-click boxes are not supported during the project preview (Project, From This Slide, and Next 'n' Slides preview options).

After you have added a click box to your project, you can view and edit its properties using Property inspector. To view the properties of a click box in relation with other interactive objects in the project, select Project > Advanced Interaction.

---

## Properties of click boxes

[To the top](#) 

To view the properties of a click box, select it on the slide. The Property inspector displays the properties of the click box.

When you change the properties, the changes are instantly applied to the selected instance of the click box. Click the Apply to all icon to apply the changes to all the click boxes in the project or to those that use the same object style.

### Click Box section

**Name** Enter a unique name for the object. You can use this name when defining the visibility conditions for the object.

**Visible** Deselect this option if you want the object to be invisible on the slide. The object can be made visible using the Show option. For more information, see Controlling the visibility of objects.

### Action section

**On Success** Specifies the event that occurs when a user clicks the box, for example, opening another project or a specific URL. For the description of the available options, see Project navigation using interactive objects.

**Attempts [#]** Specifies the number of times the user can attempt the question before the specified action takes place. By default, the number of attempts allowed is infinite. To specify a number, clear the Infinite check box and then click the numeral associated with the Attempts option.

**Infinite** Allows users an unlimited number of attempts.

**Last Attempt** Specifies the event that should take place after the last attempt. For the description of the available options, see Project navigation using interactive objects.

- If you select Open URL Or File or Open Another Project, click the inverted arrow icon next to the URL or the Project field to select the window in which the URL, file, or project appears. Select from Current, New, Parent, and Top. If you choose New, Parent, or Top, you also have the option to continue playing the original project when the URL, file, or project opens.
- If you select Send E-mail To, you have the option to continue playing the project while the e-mail message is prepared and sent.

**Shortcut** You can specify a keyboard shortcut for the mouse-click. Users can use the keyboard shortcut instead of the mouse. For example, suppose you select Control+Shift+Enter as the keyboard shortcut for the mouse-click. The click is treated as correct (a click within the box) when

users press this combination. If they press the wrong combination, it is treated as a click outside the box.

**Note:** If your Adobe Captivate project is displayed in a browser, set keyboard shortcuts that do not conflict with common browser shortcuts. For example, F1 is frequently used as a keyboard shortcut to display Help. The Control, Alt, and Shift keys map to the Control, Option, and Shift keys on Macintosh® computers, respectively.

## Options section

**Success** select this check box to include a caption to be displayed when the user clicks inside the click box.

**Failure** select this check box to include a caption to be displayed when the user clicks outside the click box.

**Hint** select this check box to specify a hint to be displayed to users. The hint is displayed when the user moves the mouse over the click box.

**Pause For Success/Failure Captions** select this check box to pauses the project until all success and failure captions are displayed.

**Show Hand Cursor Over Hit Area** Select this check box to change the pointer to a pointing hand when the user moves the pointer over the click box.

**Double Click** Select this check box if you want the users to double-click the click box.

**Disable Click Sound** Select this check box to disable the click sound that is played when users click inside the click box area.

**Pause Project Until User Clicks** Select this check box to pause the project till the users click the click box. The project resumes only after the user clicks the click box.

**Right Click** Select this check box if you want the users to right-click on the click box.

## Timing section

**Display For [Time]** Specifies the time for which the click box appears on the slide.

**Appear After [#] Seconds** Specifies the time after which the click box appears on the slide after the slide starts playing.

## Audio section

**Fade In [#]** Specifies the time for the audio to fade in to full volume.

**Fade Out [#]** Specifies the time for the audio to fade out to silence.

**Stop Slide Audio When Clicked** Stops playing the audio file associated with the slide when you click inside the click box area. This option stops only the slide audio, not the background audio. Also, using a keyboard shortcut does not stop the audio.

**Stop Slide Audio When Paused** Stops playing the audio file associated with the slide when the project is paused. For example, if you have enabled the Pause Project Until User Clicks option, the slide audio stops until the user clicks inside the click box area.

**Add Audio** Allows you to associate an audio with the click box.

## Reporting section

You can assign a score to every correct mouse-click and coordinate the score with a learning management system.

**Include In Quiz** Considers the click box as a question in the current quiz. The points assigned to this click box are added to the score results of the current quiz.

**Points** The score that you want to assign to the question. The maximum is 100 points, the minimum is 0. The points assigned to this click box are added to the score results of the current quiz.

**Add To Total** Includes the points for the correct click in the total score.

**Report Answers** Sends the quiz score to the learning management system (LMS).

**Interaction ID** Sends tracking information to your learning management system. Use the interaction ID specified by your learning management system.

## Transform section

Use this section to define the exact size or location of the click box in terms of pixels. You can also specify the rotation of a click box in this section.

**X** Position of the click box on the X-axis

**Y** Position of the click box on the Y-axis.

**W** Width of the click box.

**H** Height of the click box.

**Constrain Proportions** Maintains the height-to-width ratio of the click box when you resize it.

**Angle** Angle of rotation of the click box.

## Add a click box

[To the top](#)

1. Open the slide to which you want to add a click box.
2. Select Insert > Standard Objects > Click Box. A click box appears on the slide.
3. Size and drag the click box as desired.
4. Double-click the Success, Failure, or Hint captions to edit the text.
5. To change the properties of the click box, click the box and change the properties in the Property inspector.

[Legal Notices](#) | [Online Privacy Policy](#)

# Project navigation using interactive objects

You can define the navigation options using interactive objects according to the following:

- When the user performs the action as defined in the application
- When the user performs an action other than that defined in the application

The following list describes actions available in both the On Enter and On Exit menus in the Property inspector of a slide.

**Note:** The options *Go To Previous Slide*, *Go To Next Slide*, *Go To Last Visited Slide*, and *Jump To Slide* are available only in the *On Exit* menu.

**Continue** The movie moves to the next defined action.

**Go To The Previous Slide** The previous slide is displayed to the user.

**Go To The Next Slide** The movie moves to the next slide.

**Go To The Slide Last Visited** The movie moves to the previously viewed slide.

**Jump To Slide** The movie moves to the specified slide.

**Open URL Or File** A web browser opens with the specified web page if the user has internet connectivity. Alternatively, you could open a specified file for the user.

While specifying a URL, click the arrow adjacent to the URL box to open the URL in one of the following ways:

**Current** In the current browser window in which the Adobe Captivate movie is playing.

**New** In a new browser window.

**Parent** In cases where the Adobe Captivate project is a part of an HTML page, choose this option to display the URL in the region allotted for the project.

**Top** In cases where the Adobe Captivate project is a part of an HTML page, choose this option to display the URL in the 'top frame' of the page.

Options for opening URLs

**Open Another Project** Opens the specified Adobe Captivate project.

**Send E-mail To** A draft of the default e-mail editor opens with the e-mail address specified in the To field.

**Execute JavaScript** Adobe Captivate runs the specified JavaScript.

**Execute Advanced Actions** Adobe Captivate runs the script written in Adobe Captivate.

**Play Audio** Adobe Captivate plays the audio assigned to the interactive object. The audio plays until users click another interactive object, or navigate away from the slide. If users do not interact, the audio plays only for the duration of the specified audio file and does not loop. Before the audio ends, if users click another interactive object with audio, the second audio file begins to play.

**Note:** If you use multiple *Play Audio* actions in *Advanced Actions*, only the audio corresponding to the first *Play Audio* action is played.

**Stop Triggered Audio** Adobe Captivate stops the latest audio that was triggered by the *Play Audio* action.

**Show** When the user performs the required action, the specified hidden object is made visible

**Hide** When the user performs the required action, the specified object is hidden from the user.

**Enable** When the user performs the required action, it activates another object in the project.

**Disable** When the user performs the required action, it disables another object in the project.

**Assign** When the user performs the required action, the value of the specified variable is set inside the object.

**Increment** When the user performs the required action, the value of the specified variable is incremented accordingly.

**Decrement** When the user performs the required action, the value of the specified variable is decremented accordingly.

**Apply Effect** When the user performs the required action, the effect associated with the specified object is applied.

**No Action** Nothing happens when the user exits the slide.

Audio

# System audio (for subscription and Adobe Software Assurance customers only)

System audio refers to the audio from your computer's speakers. For example, audio associated with YouTube videos or the sound you hear when error messages pop-up in some applications. Adobe Captivate lets you capture or record system audio while recording a software simulation or a video demo. You can also add system audio to a slide after creating a project by recording or importing.

**Note:** Adobe Captivate does not support recording of system audio on Windows XP. On Mac, ensure that you have installed and configured Soundflower to record system audio for Adobe Captivate projects. For more information, see [this article](#).

You can add system audio only to a specific slide. This means, you can import or edit system audio using the following options in the Audio menu:

- Import To > Slide
- Record To > Slide
- Edit > Slide

When a slide contains both narration and system audio, the Timeline displays two different layers for both these audio waveforms.

Timeline showing narration and system audio

**A.** Narration **B.** System Audio

However, in a video demo project, the system audio does not exist on a separate layer in the Timeline. Narration and system audio are merged into a single audio waveform. The two types of audio are available as two different items in the Edit Audio dialog box and Adobe Captivate Library.

You cannot add closed captions to system audio.

## See also

- [Recording in sync](#)
- [Edit audio](#)
- [Insert audio](#)
- [Preview audio](#)
- [View audio details](#)
- [Export audio](#)

## View narration and system audio waveforms

[To the top](#)

The default view in the Slide Audio dialog box (Add/Replace or Edit tabs) displays all audio waveforms that are currently associated with the slide.

Slide Audio dialog box of a slide with only narration audio

Slide Audio dialog box of a slide with only system audio

Slide Audio dialog box with both narration and system audio

To view:

- Only narration, click the system audio icon (🔇).

- Only system audio, click the narration icon (.
- Both narration and system audio, click both narration and system audio icons.

**Note:** In a video demo project, narration and system audio waveforms are merged in the Timeline. However, the two types of audio are separately available for editing in the Edit Audio dialog box and Adobe Captivate Library.

---

## Delete system audio

[To the top](#) <sup>4</sup>

Right-click the audio waveform in the Timeline and select Remove.

**Note:** When you click Remove Audio in the Audio accordion of the Property Inspector, both narration and system audio associated with the slide are deleted.

# Recording in sync

---

[Recording equipment](#)

[Tips for recording audio](#)

[Set audio recording preferences](#)

[Calibrate microphone](#)

[Record audio to slides](#)

[Record audio while creating a project](#)

[Record audio for objects](#)

Add sync sound (synchronized sound recording) to your projects by narrating the movie into a microphone as you record it. The movie is recorded in the mono format.

---

## Recording equipment

[To the top](#)

Having the right audio equipment makes a big difference in the quality of recorded audio.

**Computer with sound card** The sound card installed with your computer acts as a digital recorder for audio.

**Microphone** If possible, avoid using the inexpensive microphone packaged with your computer. Also, use a proper microphone cable and a stand to hold the microphone while you are recording.

**Microphone preamplifier** A preamplifier boosts the signal of the microphone. The microphone input of your sound card probably includes a preamplifier, but it is most likely of poor quality. When purchasing a preamplifier, you can choose a small mixer or a stand-alone version. Mixers let you connect several microphones and devices to one location and adjust their volumes independently. Stand-alone preamplifiers are considered better than mixers at filtering out unwanted noises.

**Speakers** The speakers that came with your computer are probably good enough for recording purposes. You can change some of your speaker settings if required. However, if you are working on a laptop, use standard desktop computer speakers instead of the built-in laptop speakers.

**Headphones** Headphones are important because when the microphone is on, speakers can cause distracting feedback. Additionally, it is best to use closed-ear headphones that prevent leaking sound (which can be picked up by the microphone).

**Media players** Any software that can play audio files on your system.

**Recording software** A wide range of recording software is available. Important software features include editing functionality (to fix mistakes), music and sound effect options, and the capability to create the file format you require (such as mp3 or WAV).

**Recording area** After you have acquired the necessary audio equipment, the most important action you can take before recording is an obvious one: find a quiet place to record. Try closing doors, turning off any unnecessary computer equipment, turning off or lowering lights, turning off phone ringers, beepers, and pagers. Inform your coworkers that recording is in progress.

---

## Tips for recording audio

[To the top](#)

Follow these tips to ensure that you are recording the highest quality audio possible.

**Setup** After you have acquired the necessary audio recording equipment, ensure that it is set up properly. First, plug your microphone into your mixer or preamplifier, and then plug the output of that device into your computer sound card's "line in." Plug your headphones into your computer. Then, set the volume on your mixer or preamplifier. Begin speaking to test the volume levels, and carefully raise the volume until it shows just under zero.

**Sound card settings** Open the software application that controls the sound card. The sound settings are located in the Control Panel. Select the recording source (Line In) and adjust the volume to 100%.

You control the actual recording level with your mixer or preamplifier.

**Audio recording software settings** Start your audio recording software. Change the settings as necessary. Note that mixers and preamplifiers do not have sound-level controls, so you rely on the meters when recording. While recording, ensure that you do not exceed zero on the meters, or the sound will be distorted.

**Microphone placement** Positioning your microphone correctly can make a big difference in the finished audio file. First, get close to the microphone (within 4 to 6 inches), so any other nearby sounds have less chance of being recorded. Don't speak down to the microphone; instead, position it above your nose and pointed down at your mouth. Finally, position the microphone slightly to the side of your mouth, because this can

help soften the sound of the letters S and P.

**Microphone technique** Have a glass of water nearby so you can avoid “dry mouth.” Before recording, turn away from the microphone, take a deep breath, exhale, take another deep breath, open your mouth, turn back toward the microphone, and start speaking. This trick can eliminate breathing and lip-smacking sounds frequently recorded at the beginning of audio tracks. Speak slowly and carefully. You may feel that you are speaking artificially slowly, but you should be able to adjust the speed later by using your audio recording software. Finally, bear in mind that you don't have to get everything right the first time. You can listen and evaluate each recording and rerecord if required.

**Audio editing** Editing sound is similar to editing text. Listen carefully to your recording. Delete any extraneous sounds and then use the options available in your software to polish the track. Add any music or sound effects you require. Make sure you save your audio track in the correct format (mp3 or WAV files).

**Adding audio files to Adobe Captivate** When you are finished recording the audio file, add it to the Adobe Captivate project.

**Additional feedback** After you add the audio to the Adobe Captivate project, listen to it again. Play the project as users normally would. Finally, ask others to preview the Adobe Captivate SWF/audio file. If necessary, edit the audio file again.

---

## Set audio recording preferences

[To the top](#)

Audio files present the common challenge of balancing quality against size. The higher the sound quality, the larger the file size. The more you compress a sound and the lower the sampling rate, the smaller the size and lower the quality. Adobe Captivate lets you control the way sound is recorded and compressed based upon your input and output requirements.

Creating audio in Adobe Captivate is essentially a two-part process. You record audio in WAV format, and then Adobe Captivate converts the WAV file into an mp3 file. When files are in WAV format, they have a degree of flexibility. You can edit and adjust them “downward,” compressing them into mp3 files uniquely tailored to their playback scenario.

When working with audio, keep your users in mind. If a user is likely to access the Adobe Captivate project by using a dial-up modem, use a higher compression/lower sampling rate, such as 56 Kbps. However, if you are distributing the project on a CD-ROM, you can use a lower compression/higher sampling rate, such as 144 Kbps. In the best development case, experiment to find the optimal balance between sound quality and file size for your users.

Using Adobe Captivate, you can record an audio file for a single slide, group of slides, or for the entire project.

**Note:** *For slides with unique audio files, the Timeline of the slide is stretched to meet that of the audio file. However, audio files for a project are cut short if they exceed the project Timeline.*

1. In an open project, select Audio > Record to and select one of the options:

**Slide** Record the audio file for the selected slide.

**Slides** Record the audio file for a group of slides starting with the selected one. To finish defining the range of slides included in the group, enter a slide number in the To field of the Record Audio dialog box.

**Background** Creates background audio for your project. For details, see Create background audio.

**Object** Sets audio for a selected object on the slide.

2. In the Audio dialog box, configure the following according to your preferences:

### SWF Preview

The recording window displays a Preview panel where you can view the project as the audio gets recorded.

### Continuous Play

Select this option if you want the file to play until the end of all the selected slides or the end of the project.

### Captions and Slide Notes

Use these options when you want to record voice-over narration that matches the caption text or slide note text. Read aloud the text that you have added to these areas when recording audio.

### Record Audio

Click the icon to begin recording audio.

### Play Audio

Click the icon to play the audio file after you have completed the recording.

### Stop Audio

Click the icon to stop playing the audio file.

### Edit tab

Lets you make the following changes to the audio file:

- Select portions of the audio file and copy them.
- Delete portions of the audio file.
- Insert silence.

### Podcast

Export to podcast to save the file in WAV or mp3 format.

### Fade In and Fade Out

Set a time, in seconds, for the audio file to fade in and fade out at the beginning and end of the project.

### Lower Background Audio Volume On Slides With Additional Audio

Automatically reduces the background audio volume on slides that have individual audio files assigned, such as voice-over narration.

### Loop Audio

The background audio file replays continuously.

### Stop Audio At End Of Project

Stops the background audio when the project ends.

### Settings

Click to open the Audio Settings dialog box, which lets you set recording device and audio quality.

The Settings dialog box contains the following options:

**Audio Input Devices** Specifies the type of device you are using to create audio. The options available in your computer are listed in the menu.

**Bitrate** Select the bitrate at which audio encoding must be performed. Select one of the following options based on the audio encoding quality you require:

Constant Bitrate options:

**CD Bitrate (128 Kbps)** Specifies the amount of audio information (in Kbps) that will be stored per second of a recording, which is of CD quality.

**Near CD Bitrate (96 Kbps)** Specifies the amount of audio information (in Kbps) that will be stored per unit second of a recording, which is of a near-CD quality. By default, this option is selected.

**FM Bitrate (64 Kbps)** Specifies the amount of audio information (in Kbps) that will be stored per second of a recording, which is of FM radio quality.

**Custom Bitrate** Specifies the amount of audio information that will be stored per second of a recording, which is of a user-defined quality. You can drag the slider bar to set the required bitrate.

**Calibrate Audio Input** Click to display the Calibrate Audio Input dialog box. You are prompted to read a sentence into the recording device if you are using a microphone. Adobe Captivate uses the sample recording to detect optimal recording sensitivity levels. It is important to calibrate your recording device for optimal sound quality.

---

## Calibrate microphone

[To the top](#)

If you are recording audio for a project, you must set the microphone or recording device to the correct recording level. This process is called calibrating the recording device. Adobe Captivate can detect optimal microphone and recording sensitivity levels automatically.

**Note:** *Adobe Captivate must be able to detect a recording device before trying to calibrate. Check that a microphone or recording device using "line in" is connected to your computer properly and is turned on before calibrating.*

Calibration can be manual or automatic. See [www.adobe.com/go/learn\\_calibration\\_en](http://www.adobe.com/go/learn_calibration_en) for a comparison of manual and automatic calibration.

### Manual calibration

1. In an open project, select Audio > Settings.
2. Click Calibrate Input.
3. In the Calibrate Audio Input dialog box, specify a Pre-amplifier value between .1 and 100 and then click OK.

The volume gets multiplied by the value you specify. For example, if you specify 5, volume increases five times whereas the value .5 decreases the volume by half. Increase/reduce in multiples.

4. Use the Record and Play buttons to test the pre-amplifier value.

### Auto-calibration

1. In an open project, select Audio > Settings.
2. Click Calibrate Input.
3. In the Calibrate audio input dialog box, click Auto Calibrate.
4. To set the correct recording device level, read the following sentence into the microphone until the message Input level OK appears:  
"I am setting my microphone recording level for use with Adobe Captivate."
5. When you finish, click OK.

---

## Record audio to slides

[To the top](#) <sup>11</sup>

If you have a microphone connected to your computer, you can record audio to be included on a slide. You can use audio for many types of narration or instruction.

1. In an open project, select Audio > Record to from the main menu, and select one of the available options: Slide, Slides, or Background.
2. To set recording options, click Settings in the Slide Audio dialog box and then make the necessary changes.  
Depending on the type of recording (voice-over, music, and so on) and the desired playback (within an EXE file, over the Internet, and so on), you may need to adjust audio settings.
3. (Optional) If you have created text captions or slide notes that can be used as a script, click Captions & Slide Notes and then add them to the fields in the Captions and Slide Notes tabs.
4. You can choose to record narration, system audio, or both (in the patch for subscription and Adobe Software Assurance customers only)
  - To record narration, click the narration icon () , and proceed to step 5.
  - To record system audio, ensure that the required audio is running on your computer, and click the system audio icon ().
5. Click Record Audio icon to begin recording.
6. Speak into the microphone or recording device. Or, if you are using a line-in device (such as a CD) or a system file, run the file you want to record.
7. When you finish, click Stop Audio icon.  
The audio is converted to mp3 format.
8. Click Play Audio icon to listen to the recording.
9. (Optional) If you want to add silence or adjust the volume for the audio file, use the options in the Edit tab to change the settings.
10. When you finish, click Save.

---

## Record audio while creating a project

[To the top](#) <sup>11</sup>

Adobe Captivate lets you record an audio track at the same time you record a new Adobe Captivate project. This can be a very efficient way to create a full-featured project quickly.

The following procedure describes how to record audio while creating an Adobe Captivate project about an application.

1. Open the application you want to record. (You must do this before recording.)
2. Prepare your audio recording equipment.
3. Open Adobe Captivate.
4. Select File > Record New Project.

5. Do the following:

- In the Recording type section, select a recording mode
- Select the window you would like to record
- Customize the other available options.

6. In the recording window, select the type of recording, and choose the type of audio input from the Audio menu.

7. Select System Audio to record any audio originating from your computer speakers (in the patch for subscription and Adobe Software Assurance customers only).

After creating the project, you can edit, import, or remove system audio.

**Note:** This option is disabled on Windows XP as Adobe Captivate does not support recording of system audio on Windows XP.

8. Click Record.

If this is the first time you are recording audio, a dialog box appears asking if you would like to test audio levels. Click Auto Calibrate or set the pre-amplifier value to calibrate the recording device for optimal recording. Follow the instructions and when you finish, click OK.

9. As you record the project, speak into your microphone or recording device to create an audio sound track. For example, you can explain the actions you are taking or read the text on captions.

10. When you finish recording, press the End key (in Windows) or (Cmd + Enter) on Mac OS to stop recording.

The audio files you recorded are assigned to the correct slide and saved as individual mp3 files. You can view the files in the Library.

**Note:** If you need to pause the recording of narration, press the Pause/Break key. To restart project recording, press the Pause/Break key again on Windows or Cmd+ F2 on Mac OS.

---

## Record audio for objects

[To the top](#)

You can record an audio file to use with buttons, highlight boxes, click boxes, or text entry boxes. Recording audio requires some basic equipment.

You can also add existing audio to text entry boxes, captions, slides, slidelets, and so on.

1. Right-click (Windows) or Control-click (Mac OS) the object to which you want to add audio, and select Audio > Record to.
2. In the Object Audio dialog box, click the Record icon.
3. When you finish recording, click Stop Audio.
4. To listen to and test the audio file, click Play Audio.

---

 Twitter™ and Facebook posts are not covered under the terms of Creative Commons.

[Legal Notices](#) | [Online Privacy Policy](#)

# Insert audio

---

## Import audio

### Add audio from library

### Create background audio

### Use a custom keyboard tap sound

Adobe Captivate lets you add narration, music, step-by-step instructions, or almost any sound to your projects.

You can use audio in Adobe Captivate projects in a variety of ways. For example, you can do the following, all in the same project:

- Add a background track that plays for the duration of the project.
- Add sound to an individual slide.
- Add sound to a specific object, such as a caption, click box, highlight box, or button.

Adobe Captivate lets you record your own audio files (using some simple equipment) or import existing files. You can record audio files at the same time you record the project, or you can add an audio file later. Imported files can be in WAV or mp3 format. If you add a WAV file to a project, Adobe Captivate automatically converts the WAV file to mp3 format when you publish the project.

After you add audio to a project, you can adjust the timing of objects to fit the sound file precisely. Adobe Captivate also contains features for adding silence to audio files and for normalizing audio for all slides so the sound level is consistent.

Adobe Captivate contains a gallery that has buttons, sounds, and animations (in SWF format) for you to use in your projects. By default, the gallery is stored in the following location when you install Adobe Captivate:

C:\Program files\Adobe\Adobe Captivate 6\Gallery (on Windows)

or

/Applications/Adobe Captivate 6/Gallery/Captions (for Mac OS).

 You can attach an audio file to a button or click box and have the audio play when the user clicks the button or click box instead of when the button or click box is displayed. To do this, create the button or click box and select the Success Caption option. Make the Success Caption transparent and do not add any text. Add an audio file to the Success Caption.

---

## Import audio

[To the top](#) <sup>1</sup>

You can import an audio file to use with slides, buttons, highlight boxes, click boxes, or text entry boxes. You can also use the Library to add an audio file that is already in your current project.

1. Select the slide or object to which you want to add audio.
2. In the Property Inspector (Window > Properties), click Add Audio in the Audio area.
3. In the Slide Audio dialog box, click Import.

 Adobe Captivate contains a gallery that has buttons, sounds, and animations (in SWF format) for you to use in your projects. By default, the gallery is stored in the following location when you install Adobe Captivate: C:\Program Files\Adobe\Adobe Captivate 6\Gallery (on Windows) or /Applications/Adobe Captivate 6/Gallery/Captions (on Mac OS).

4. Browse to the audio file you want to add, select the file, and click Open.
5. (Optional) To listen to and test the audio file, click Play Audio.
6. Set other options as necessary.
  - To edit the audio file (for example, change volume, add silence, change length, and so on), click Edit Audio in Audio area.
  - If you want the audio to fade in or fade out, set the number of seconds using the options Fade In and Fade Out in the audio area.
7. When you finish, click Save.

---

## Add audio from library

[To the top](#) <sup>1</sup>

You can reuse existing audio files for any slide or object in a project.

1. In an open audio project, click the Library panel and then select the file from the Audio folder.
2. Drag and drop the audio object to the object or slide.

---

## Create background audio

[To the top](#) <sup>1</sup>

You can create background audio for your projects. The audio plays while the slides of your project are shown. Background audio can be music, sound effects, or almost any kind of sound you can import or record.

You can use background audio together with individual slide audio for a truly professional effect. Adobe Captivate provides an option to lower the volume of background audio when a slide with audio assigned plays. For example, you can import a music file and set it to loop continuously as background audio. In that same project, you can record voice-over narration for individual slides, and when the voice-over audio plays, the music volume is lowered.

1. In an open project, do one of the following:
  - Select Audio > Import to > Background to import an existing audio file by navigating to the file, selecting the file, and clicking Open.  
If you want to use an audio file that is already in your project, click Select Audio From Library.
  - Click Record to > Background and follow the instructions to record the background audio.
2. (Optional) Click Play Audio to listen to the audio file.
3. Select from the following options:

**Fade In and Fade Out** Lets you set a time, in seconds, for the audio file to fade in and fade out at the beginning and end of the project.

**Loop Audio** The background audio file replays continuously.

**Stop audio at end of project** Stops the background audio when the project ends.

**Adjust background audio volume on slides with audio** Use the slider to adjust the background audio volume on slides that have individual audio files assigned, such as voice-over narration.

---

## Use a custom keyboard tap sound

[To the top](#) <sup>1</sup>

Adobe Captivate includes a feature that records a keyboard tap sound whenever you press keys on the keyboard while recording a project. You can include or exclude the tap sounds. You can also create a custom keyboard tap sound to use.

1. Create a new sound for keystrokes, or use an existing mp3 file (for example, one of the Windows sound files.)
2. Name the new sound file KeyClick.mp3.
3. Save the file and note the location to which the file is saved.
4. Using Windows Explorer, browse to the Adobe Captivate sound effects folder. (The default location is \\Program Files\Adobe\Adobe Captivate 6\Gallery\SoundEffects (on Windows) or /Applications/Adobe Captivate 6/Gallery/SoundEffects (on Mac OS).
5. Locate the file named KeyClick.mp3. This is the Adobe Captivate default keystroke sound file.  
**Note:** Before overwriting the file, you may want to copy and place the original KeyClick.mp3 file in a backup folder so it can be used again if necessary.
6. Copy the new keyboard tap sound from the location in step 3 above, and paste it into the Adobe Captivate sound effects folder.
7. Select the option Hear Keyboard tap sounds (Preferences > Recording > Settings).

[Delete background audio](#)

[To the top](#)

## Edit audio files

You can edit the audio files in your Adobe Captivate project at any time. Using the Edit Audio dialog box, you can listen to an audio file, insert silence, adjust volume, and change numerous other options.

1. Select Audio > Edit and then choose Object, Slide, Slides, Project, or Background depending on your requirement.

**Note:** The Edit option is enabled if a question slide or a project slide contains an audio file. It is disabled for question pools and random question slides.

2. If you are editing slide audio and the slide contains both narration and system audio, then the Edit tab in the Slide Audio dialog box displays both the audio waveforms (in the patch for subscription and Adobe Software Assurance customers only).
  - To edit only narration audio, click the system audio icon (🔊). Only the narration audio waveform is displayed and you can continue editing the audio.
  - To edit only system audio, click the narration icon (🗣️). Only system audio waveform is displayed and you can continue editing the audio.
  - To perform editing operations simultaneously on both types of audio, click both narration and system audio icons. Both the audio waveforms are displayed. When you select a portion of one audio waveform, the portion of the other audio waveform corresponding to the selected time, also gets selected.

At any point in time, if you want to exclude an audio waveform from editing, click the Remove Selection icon (🗑️) corresponding to the waveform.

Simultaneous edit of narration and system audio

3. Make any necessary edits in the Slide Audio dialog box.

You can cut and paste sections of the audio file, insert periods of silence to lengthen the audio file, adjust volume, import a different audio file, and use more options.

**Cut Selection** Click to cut the selected portion of the audio file.

**Copy Selection** Click to copy the selected portion of the audio file.

**Paste Selection** Click to paste information from the clipboard. (For example, if you select a section of the audio file, and then click the Cut Selection or Copy Selection button, the selected audio is placed on the clipboard. You can then use the Paste Selection feature to place the audio located on the clipboard back into any location within the audio file.)

**Delete Selection** Click to remove the selected portion of the audio file.

**Undo** Click to undo the last action taken.

**Redo** Click to redo the last action taken.

**Insert Silence** Select the portion of the audio file where you want to insert silence, and click Insert Silence. Choose from one of the following options:

**Start Of Audio**

Adds silence to the beginning of the audio file.

**End Of Audio**

Adds silence to the end of the audio file.

**Playhead Position**

This option is available only when you have not selected a portion of the audio file. The silence is inserted at the playhead position. Use this option when you want to insert an extremely brief period of silence.

**Adjust Volume** Click to increase or decrease the sound level of the audio file. There is also an option to fine-tune quieter portions of the audio file.

**Normalize** Select this option to have Adobe Captivate adjust the sound volume automatically. Normalizing audio helps keep the sound level consistent between slides.

**Dynamics** Select this option to amplify quiet sections of the audio to help compensate for variations in audio volume.

**Ratio** Specifies the maximum amplification that will be used. The default setting of 2.0 sets the quietest sections of the audio to be amplified by a factor of 2. A higher setting can improve projects with large differences between quiet and loud sections, but can also amplify background noise.

**Threshold** Controls the amplification of background noise. Anything quieter than the noise threshold is not amplified. If background noise is amplified too much, setting a higher noise threshold may help solve the problem. Note that the Dynamics option does not work well with high noise levels.

**Zoom In and Zoom Out** Use the slider to enlarge or shrink the waveform.

**Settings** Click to set various options such as recording device, audio quality level, and recording device calibration.

**Podcast** Export the audio file as a WAV or mp3. You can later use these files for podcasting. Podcasting refers to distributing files over the Internet through web feeds to portable media players, and computers.

**Waveform** Displays the audio file graphically. The waveform is a visual representation of the audio file.

**Record Audio** Click to begin recording audio. (To record, you need a microphone.)

**Stop** Click to stop playing the audio file.

**Play** Click to play the audio file.

**Status** Displays the status of the audio file as playing, ready, and so on.

**Playhead** Displays the selected location, in seconds, within the audio file. For example, if you are working with an audio file that is 10 seconds long and you click in the middle of the file, this playhead area displays approximately 00.05.00, or 5 seconds.

**Duration** Displays the total amount of time it takes for the audio file to play.

**Selected** Displays the total amount of time selected. For example, suppose you have an audio file that is 20 seconds long. If you click at the beginning of the file and drag to the middle, you will have selected approximately a 10-second span of the file.

**Scale** Displays the scale at which the waveform is displayed. (To change the scale, use the Zoom slider).

**Library** Displays the Select Audio From Library dialog box, where you can browse to a new audio file and import it.

Click Select Audio From Library to import an audio file from the project's Library.

4. When you finish editing the audio file, click Save.

## Edit audio timing

Adobe Captivate lets you edit the timing of audio files after you record or import them. Having control over the timing of audio files gives you the ability to use audio files of different lengths and incorporate them smoothly into projects.

After you record or import an audio file, the file appears as a waveform in the Slide Audio dialog box. If your project contains multiple audio files, you can see which audio files are assigned to specific slides.

- Select Audio > Edit and then choose Slide, Slides, Project or Background (depending on your requirement) and then use the Edit tab.

**Note:** *Edit is enabled if a question slide or a project slide contains an audio file. It is disabled for question pools and random question slides.*

Audio files in the Adobe Captivate project are displayed as waveforms. Slide numbers are shown along the top of the waveform so you can see exactly how the audio files are currently distributed across the slides.

- To change how audio files are distributed across slides, click a slide divider and move it to the left or right. The waveform remains static, but you change where the audio file begins to play within the Adobe Captivate project. This option is particularly useful if you have a long audio file and need to experiment with assigning the file to one slide or having it play over multiple slides.
- To listen to audio, click a location within the waveform and then click Play Audio. The audio plays from the location you selected to the end of all the audio in the project. (You can stop the playback at any time by clicking Stop.)
- To zoom in on a particular area of the waveform, click in the waveform and then drag the zoom slider bar.
- To cut or copy and paste audio, select a section of an audio file directly in the waveform, click Cut Selection or Copy Selection, click in a different location on the waveform, and click Paste Selection.
- To delete audio, select a section of an audio file directly in the waveform and click Delete.
- You can insert a silent period within an audio file. If you want the silent period to begin in a specific location within an audio file, click the location directly in the waveform. Click Insert silence. Type in the length of the silent period you want to add and then select from the pop-up menu a location for the silent period: the location you clicked in the waveform, the beginning of audio, or the end of audio.
- To adjust the sound level of audio files, click Adjust Volume. Use the slider bar to increase or decrease the volume and select audio processing options.
- To set recording device and audio quality options, click Settings.
- To add a new audio file, click a location within the waveform, click Library, navigate to a file, and click Open. The audio file is imported directly into the Adobe Captivate project in the location you specified.

## Add silence to an audio file

You can add a period of silence to any audio file that is part of an Adobe Captivate project. This feature is particularly useful if you have imported an audio file and need to synchronize the audio with objects and slides. By adding silent periods, you can make the existing audio file work in an Adobe Captivate project without having to edit the audio extensively.

1. Select Audio > Edit and then choose Slide, Slides, Project or Background (depending on your requirement) and then go to the Edit tab.
2. (As per your requirement) Add silence to the beginning of the audio file, to the end, or to a specific location within the audio file.

If you want to add silence within the file, click the exact location directly on the waveform.

**Note:** *The Playhead and Selected information boxes near the bottom of the dialog box can help you choose a precise location in the audio file. For example, if you want to add a silent period four seconds into the audio file, click the waveform until the Playhead information box displays a number close to four seconds (that is, 00:04.00).*

3. Click Insert Silence.
4. Select the portion of the audio file where you want to insert silence, and click Insert Silence.

### Start Of Audio

Adds silence to the beginning of the audio file.

### End Of Audio

Adds silence to the end of the audio file.

### Playhead Position

This option is available only when you have not selected a portion of the audio file. The silence is inserted at the playhead position. Use this option when you want to insert an extremely brief period of silence.

**Note:** *When you select a part of an audio file, and then click Insert Silence, the selection is replaced with silence.*

5. Click Save.

The silent period is added to the audio file and you can see the silent period in the waveform. The audio file with added silence is saved under a new file name.

6. To test the audio file with the silent period added, click the audio icon.

 *If you find that you frequently want to add silence at the same position and of the same duration, press S to add it without using the Insert Silence dialog box.*

[To the top](#) <sup>4</sup>

## Edit audio using Adobe Audition

You can use Adobe Audition to edit audio when you want to go beyond the audio editing options available in Adobe Captivate. For example, to apply filters or remove noise, you need an advanced audio editor such as Adobe Audition. You can either edit the audio files from slides or batch process by opening multiple files in Adobe Audition using the Library panel.

The changes reflect in Adobe Captivate library and the associated slides where the audio files are being used. The saved files are reimported to Adobe Captivate with the slide associations intact.

**Note:** *This feature is available only in Adobe Captivate that is installed as a part of Adobe eLearning Suite.*

### Editing slide audio

Editing slide audio is helpful when you apply filters that do not affect audio timing.

**Note:** *The following steps are also applicable for editing background audio.*

1. Select the slides with the audio files (that you want to edit).
2. Select Audio and then slide, slides, or project depending on your requirement.  
The Slide Audio dialog box appears.
3. In the Edit tab, click Edit With Adobe Audition:
4. Read the instructions and then proceed.
5. Edit the slide audio in Adobe Audition and then save.
6. In the Adobe Captivate prompt, click OK.

**Note:** *If you have edited slide markers in Adobe Audition, the prompt displays a check box to let you import the marker changes as well.*

When you edit the slide audio file in Adobe Audition:

- If the audio file applies to multiple slides, ensure that you do not modify the audio duration.
- If the audio file applies only to a slide, you can increase the audio duration. If the audio duration exceeds the slide duration, on reimport, Adobe Captivate increases the slide duration to accommodate the audio. But if the audio is attached to an item, duration of item is not increased even if the reimported item audio has a longer duration. However, Adobe Captivate prompts you to increase the display time when you click OK or Apply for the item in the Properties dialog box.

When you edit audio using Adobe Audition, any change in the length of the audio clip, made by moving the slide markers, can be imported to Adobe Captivate. However, when you rename, delete, or change the order of slide markers, such changes cannot be imported back. For example, if you move the Slide3 marker before Slide2, you are prompted to ignore or cancel the edits, or reposition the markers.

### Editing audio files from library

1. In the Adobe Captivate library, select the audio files that you want to edit.
2. Right-click (Windows) or Control-click (Mac OS), and then click Edit With Adobe Audition.  
Adobe Audition launches. The files you selected are imported and are available for editing.  
**Note:** *If this option is not available, select Edit With and choose an appropriate program.*
3. Edit the files in Adobe Audition.
4. Select Save All.

While you edit the audio files in Adobe Audition, you can continue working on your Adobe Captivate project.

If you modify the exported audio files in Adobe Captivate, they are overridden by the files edited and reimported from Adobe Audition. But, if you

delete or break the audio files into clips in Adobe Captivate, then those files are not reimported.

[To the top](#)

## Add closed captions to an audio file

You can improve the accessibility of your project by adding closed captioning. Closed captioning lets you create transcripts for audio files associated with the slides in your project. When an audio file is played for a slide, the transcripts are displayed, thus aiding hearing-impaired users. The option that enables closed captioning is available in the Show Playback Control section of the Skin Editor. For more information, see Slides.

**Note:** You cannot add closed captions to system audio (available in the patch for subscription and upgrade plan only).

1. Select Audio > Audio Management.
2. Select the slide that contains an audio file to which you want to add a closed caption from the list and then click the Closed Caption button .

The following options are available in the Closed Captioning tab of the Slide Audio dialog box:

**Add Closed Caption** Click the '+' icon to add a caption. A new row appears in the caption window below. Type the closed caption text in the row.

**Delete Close Caption** Click the '-' icon to delete a selected caption row.

**Zoom In and Zoom Out** Use the slider to increase or decrease magnification of the waveform.

**Playbar** Use these controls to test the audio file.

**Caption & Slide Notes Window** Each slide note appears as a row in this window. Click any row to edit or delete the text. You can also add Captions to include for your reference.

3. If you want to test the audio file, click the Play button.
4. Click the specific spot in the waveform where you want to add a caption and click '+'.  
A new caption row appears with the start time you selected on the waveform.
5. Enter the caption you want to attach to the audio file.
6. To add another row to the caption for the audio file, click add. To remove a row from the caption for the audio file, click "-."

**Note:** For more precision, you can drag the end and start time markers of your caption if you want to manually adjust the timing of each caption.

7. When you have added all the rows you want, click Save.

 In the Closed Captioning dialog box, you can add closed captions while the audio is playing by clicking "+" or by pressing Alt+A.

**Note:** Multiple closed captions must be contiguous. If you do not want a closed caption for an intermediate duration, add a blank closed caption for that duration.

[To the top](#)

## Delete audio from a slide

- In an open project, do one of the following.
  - On Filmstrip (Window > Filmstrip), select a slide and click the audio symbol in the lower-right corner of the slide and then select Remove.
  - Select the slide that contains the audio and then click Remove Audio in the Audio area of the Property Inspector (Window > Properties).

**Note:** Deleting audio using the Property Inspector deletes both narration and system audio (available in the patch for subscription and Adobe Software Assurance customers only). To delete any one of the audio, right-click the audio waveform in the Timeline and select Remove.

[To the top](#)

## Delete background audio

- In an open project, select Audio > Remove > Background.

# Preview audio

---

[Test object audio](#)

[Test slide audio](#)

[Test background audio](#)

After you add an audio file, you can preview the audio to test it.

There are two methods for previewing audio. First, you can preview the entire Adobe Captivate project and listen to the audio associated with an object, a slide, or the background. This lets you see exactly where the audio begins and ends in the project and enables you to experience the audio as your users will.

Second, if you need to preview only the audio without hearing it in the context of the project, you can open an object, slide, or background audio and play the audio file.

---

## Test object audio

[To the top](#) <sup>+</sup>

1. On stage, select the object with associated audio.
2. In the Property Inspector (Window > Properties), click Edit Audio in the Audio area.
3. In the Object Audio dialog box, click the Play icon to listen to the audio file.

---

## Test slide audio

[To the top](#) <sup>+</sup>

1. Select the slide that contains audio.
2. Select Audio > Record.
3. In the Property Inspector (Window > Properties), click Edit Audio in the Audio area. In the Object Audio dialog box, click the Play icon to listen to the audio file.

---

## Test background audio

[To the top](#) <sup>+</sup>

1. In an open project, select Audio > Edit > Background Audio.
2. In the Background Audio dialog box, click the Play Audio icon to listen to the audio file.

# View audio details

---

## Audio details Slide settings

You can view all audio details (Audio > Audio Management) in one convenient location in Adobe Captivate. This is an easy way to see the playing time, size, and other attributes of all the audio files in a single project.

---

### Audio details

[To the top](#) <sup>1</sup>

**Slide/Object** The slide name.

**Sound** The presence (Yes or No) of a sound file.

**Duration** The length of the sound file, in seconds.

**Fade In** The presence (Yes or No) of a fade-in effect.

**Fade Out** The presence (Yes or No) of a fade-out effect.

**Size** The size of the sound file.

**Original Filename** The original name of the sound file.

**Display Name** The name of the file after you have renamed it in Adobe Captivate. If you have not renamed the file, the original name is displayed.

**Audio Sample Rate (kHz)** This rate is the number of times per second the original waveform is translated into digital form. A higher sample rate results in a more accurate digital representation of the sound. The sample rate for CD-quality audio is 44,100 samples per second.

**Bitrate (Kbps)** This rate is the number of bits a digital file uses in a specific time period, usually expressed as kilobits per second. The higher the bit rate at which an audio file is encoded, the higher the sound quality; 128 Kbps is a commonly used rate.

**Closed Caption** Indicates whether a transcript of the dialogue or sound effects has been included in the audio file.

---

### Slide settings

[To the top](#) <sup>1</sup>

**Play** click this icon to plays the audio for the selected slide.

**Stop** click this icon to stop the audio from playing.

**Remove** Click this icon to remove or delete the audio for the selected slide.

**Export** Click to opens a Browse For Folder dialog box and export the selected audio file to a folder.

**Update** Click to pull an updated version of the audio file.

**Closed Caption** Click this icon to enter a transcript of the dialogue or sound effects included in the audio file. Closed captioning improves the accessibility of your project for hearing-impaired users.

**Show object level audio** Select this check box to display any audio files associated with objects (click boxes, captions, buttons, highlight boxes, and so on) in the project.

**Include MP3 files in export** Select this check box to include mp3 files when you export audio.

**Include WAVE files in export** Select this check box to include WAV files when you export audio.

Video

# Differences between event and synchronized videos

---

The following scenarios can help you decide the option you must choose:

## Scenario: On-demand demonstration

You have to play a video (probably on user interaction) in a slide, for example an on-demand demonstration.

In this case, you can use the event video option.

## Scenario: Talking Heads

A presenter describes the contents on the slide. In such talking heads scenarios, multi-slide synchronized video is the effective option.

The following table shows the differences between the two so that you can decide which option to use:

Event video	Multi-slide synchronized video
May not be in sync with the slide	Plays in sync with the slide
Can be placed only on stage	Can be placed either on stage or TOC
Does not get added to the Library	Gets added to the library. You can preview the video on both slides and in the library. You can replace or update the file from the library.
Multiple videos can be added to a slide	Only one video can be added to multiple slides
Does not support closed captioning	Supports closed captioning
Users can play, pause, rewind, or forward the video using the playback controls in the skin.	Users cannot control the slide video. The video plays based on how you have synchronized it with the project.

# Event video

---

[Properties of event videos](#)

[Add a video file](#)

[Change video quality](#)

[To the top](#)

## Properties of event videos

Set the properties for event videos using its Property Inspector (Window > Properties).

### Video object

**Name** Enter a unique name for the object. You can use this name when defining the visibility conditions for the object.

**Visible** Deselect this option if you want the object to be invisible on the slide. The object can be made visible using the Show option. For more information, see Controlling the visibility of objects.

**Accessibility** Click to add accessible text to the object. For details, see Customize accessibility text for objects

### General

**Video Type** The type of video that you want to insert:

**Progressive Download Video** Choose this option if the video is hosted on any internal server, web server, or Adobe Media Server (AMS).

**Streaming Video** Choose this option if you want to use RTMP streaming. The video must be hosted on AMS.

**Flash Video Streaming Service** Choose this option if the video is hosted on AMS or any other web server and the service provider is one of the [Adobe partners](#). With this option, you can use either RTMP or HTTP streaming.

**Note:** *If your Adobe Captivate project contains video files, ensure that the files contain metadata for the video player to function correctly. Video files created with Flash Communication Server 1.5.2, FLV Exporter version 1.2, and Sorenson Squeeze® 4.0 automatically contain metadata. Sorenson Squeeze 4.0 is included with the Flash Video Kit. If you import an FLV file that does not have any metadata, the file will not play correctly in your project.*

**File Link (appears only when the selected video type is Progressive Download Video)** The absolute or relative path to the video file.

**Browse (appears only when the selected video type is Progressive Download Video)** Click to navigate to the video file.

**Server URI (appears only when the selected video type is Streaming Video)** The server name, application name, and instance name.

**Stream Name (appears only when the selected video type is Streaming Video)** The stream name.

**URL (appears only when the selected video type is Flash Video Streaming Services)** The direct file link provided by your Flash Video Streaming Service.

**Detect Size** Displays the existing size of the inserted video.

**Live Video Feed (appears only when the selected video type is Streaming Video)** Select this option to insert a live video feed.

**Auto Play** The video begins playing automatically as soon as it appears on the slide.

**Auto Rewind** The video automatically rewinds to the start position after it completes playing.

**Buffer Time (appears only when the selected video type is Streaming Video or Flash Video Streaming Service)** Enter the amount (time) of video that must be loaded before the video plays in the Adobe Captivate project. (The length of actual time it takes to stream video varies depending on the user's bandwidth.)

**Skin** The skin (playbar) for the inserted video. A preview of the skin you select appears directly below the Skin menu.

### Shadow and reflection

**Shadow** Select the check box to apply shadow to the video. Choose one of the presets. You can customize a preset by clicking Custom.

**Direction** Select the direction: inner or outer. The preview of the selected direction is displayed on stage.

**Color** click to select a color for the shadow. Specify the alpha for the color, in percentage, in the adjacent field.

**Blur** Specify a value, in pixels, for the blur of the shadow.

**Angle** Specify the angle for the shadow.

**Distance** specify the distance, in pixels, at which the shadow must be displayed.

**Reflection** Select the check box to add reflection to the video. Choose one of the presets.

### Timing

**Display For** Specifies the time for which the video file is displayed on the slide.

**Specific Time** Play the video file for a specified time interval.

**Rest Of Slide** Play the video file for the duration of the slide.

**Rest Of Project** Play the video file for the duration of the project.

**Duration Of File** Play the video file until its completion.

**Appear After** The time after which the video file appears on the slide after it starts playing.

**Loop (option disabled if you selected Rest Of Slide or Duration Of Video from the Display For menu)** Select this option if you want the video to play continuously.

**Pause Slide Till End Of Video (option enabled only if you selected Rest Of Slide from the Display For menu)** Select this option to pause the slide that contains the video until the video has finished playing. This option is enabled only when you select Rest Of Slide in the Display For menu.

### Transition

**Effect** Specify a transition effect for the video file. You can make the video file fade in during its entry, and fade out during its exit.

**In [#] Seconds** Specifies the amount of time for the video file to fully fade into view.

**Out [#] Seconds** Specifies the amount of time for the video file to completely disappear from view.

---

## Add a video file

[To the top](#)

**Note:** Only FLV/F4V files with metadata play in Adobe Captivate projects. If the inserted file does not have metadata, use third-party software like FLVMDI to add metadata to the file.

1. In an open project, select Video > Insert Video > Event Video.
2. In the Insert Video dialog box, specify the location of the video file and then click OK.

---

## Change video quality

[To the top](#)

In general, color is rendered correctly in Adobe Captivate projects. However, sometimes colors are rendered inaccurately, such as when the color scheme varies radically between slides.

You can fix most of these problems by changing the video quality of the slide. Adobe Captivate provides four levels of video quality, even though only the Low option is suggested for most uses.

1. In an open project, select the slide containing the colors you want to correct.
2. In the Property Inspector (Window > Properties), choose one of the following video options:

**Low** The default format for slides. Low is the most efficient choice for most screenshots because it uses 256 optimized colors.

**Optimized** This option gives you the highest JPEG quality possible.

**JPEG** This option is best used when the slide contains a photograph. You can change the quality of JPEG images on the Project Preferences dialog box.

**High** Compared to the Low format of 256 colors, this format uses 16 million colors for the slides. Use this option only if the Standard and Optimized options do not offer the correct color depth. This option increases file size substantially.

**Note:** Selecting the JPEG, High Quality, or Optimized format may increase the file size and the time it takes to download your project. Use a format other than Standard only when necessary and appropriate.

More Help topics

# Multi-slide synchronized video

---

[Insert synchronized videos](#)

[Edit video timing](#)

[Synchronizing objects with video](#)

[Changing the video proportion](#)

[Managing synchronized videos](#)

[Updating synchronized videos](#)

[Using audio](#)

[Setting timing](#)

[Setting transition](#)

[Setting the size and position of synchronized videos](#)

[Best practices to use synchronized videos effectively](#)

You can insert video files of all popular formats to the slides in your project. After importing a pre-recorded video, you can decide the part of the video that must be played on each slide in sync with the contents.

**Note:** You cannot add synchronized videos to locked slides, random slides, recording slide placeholder, quiz placeholder slides, slides with synchronized video, or slide video placeholder.

[To the top](#)

## Insert synchronized videos

1. Select Video > Insert Video > Multi-slide synchronized video.
2. Specify the file path or the URL of the video.
3. Click the type of the video in the Video Type list.

**Progressive Download Video** Choose this option if the video is hosted on any internal server, web server, or Adobe Media Server (AMS).

**Streaming** Choose this option if you want to use RTMP streaming. The video must be hosted on AMS.

**Flash Video Streaming Service** Choose this option if the video is hosted on AMS or any other web server and the service provider is one of the [Adobe partners](#). With this option, you can use either RTMP or HTTP streaming.

**Note:** If your Adobe Captivate project contains FLV/F4V files, ensure that the files contain metadata for the video player to function correctly. FLV/F4V files created with Flash Communication Server 1.5.2, FLV Exporter version 1.2, and Sorenson Squeeze® 4.0 automatically contain metadata. Sorenson Squeeze 4.0 is included with the Flash Video Kit. If you import an FLV file that does not have any metadata, the file will not play correctly in your project.

4. Click Stage or TOC in the Show Video On list based on where you require the video.
5. To insert the video on the slide selected in the Filmstrip, click Modify Slide Duration To Accomodate The Video.

To distribute the video among specific slides, click Distribute Across Slides and then specify the slide numbers.

You can insert the same video to another slide or a group of slides in the same project. When a synchronized video is imported into multiple slides, the association between the video and the slides (synchronized video group) is retained internally. Any edits that are made to the video timing are updated in all the slides of the synchronized video group.

**Note:** While placing videos from Adobe Bridge, use the options in the Windows > Progress Indicator panel to insert the video into the slide on Stage or the library.

## Inserting non-Flash video file formats

Adobe Captivate supports insertion of FLV/F4V files directly as synchronized videos. But to insert non-Flash video formats, you need Adobe Media Encoder (AME) to convert the files to FLV/F4V.

1. Select Video > Insert Video > Multi-slide Synchronized Video.
2. Select the file and then click OK.
3. In the Video dialog box, click Yes, and then choose a location to save the file in FLV format.

The status of the file conversion is indicated in the Windows > Progress Indicator panel.

4. After the files are converted, add them to the project by choosing one of the following options in the Progress Indicator panel, and clicking Go:
  - Import as synchronized video to add the video to the slide on Stage.

- Import to Library to add the video to the project's library and use it whenever required.

**Note:** You cannot place non-FLV or non-F4V files from Adobe Bridge. However, you can drag-and-drop the files from Adobe Bridge to the slide on Stage in Adobe Captivate.

---

## Edit video timing

[To the top](#)

The Edit Video dialog box (Video > Edit Video Timing) lets you edit the video timing:

- **Edit and preview:** Use the edit tab to edit the timing and preview the synchronized video while editing. You can decide the part of video that must play in each slide. When you edit the timing, it applies only to that particular synchronized video group.

Play the preview, pause at the point where you want to adjust the video, and then adjust the marker (drag left or right). Zooming the timeline makes the editing of the video easier. To help you synchronize the slide and the video, the slide and video duration are displayed below the timeline.

When you move the marker, a mismatch can occur between the video and the slide duration (for the slide with the reduced video duration). You can synchronize the duration using the Timeline. Unused video portions outside the start and end markers can be assigned to adjacent slides (if any in the project). To do this, use  and .

You can also preview the synchronized video from library and on stage (using the Edit Video Timing dialog box). On stage preview helps you decide the sequence of appearance of various objects as the video plays.

**Note:** On stage, you can preview only the slides that contain the synchronized video.

- **Add a beginning slide and an end slide:** For effective control over video distribution, you can, if necessary add slides before the first slide or after the last slide in your project. This is useful if unused video is present in the beginning or end. The synchronized video is distributed across these slides also.

To do this, use the  and .

- **Closed Captioning:** If your video has audio content, use the Closed Captioning tab to enter captions for hearing-impaired users. The text is displayed along with the audio when the slide is played.

---

## Synchronizing objects with video

[To the top](#)

Using the Timeline, play the video, pause it where you want the object to appear, and move the object to the playhead position or insert a new one.

**Note:** When you play a slide, an error can occur occasionally at the beginning or the end of the video. The video starts or ends slightly earlier or after the intended time. This behavior does not exist when the entire project is played.

---

## Changing the video proportion

[To the top](#)

You cannot change the proportion of the video, so that the quality is intact.

---

## Managing synchronized videos

[To the top](#)

The Video Management dialog box (Video > Video Management) provides the following details:

- the synchronized videos that you have inserted
- the slide and slide groups to which they belong
- the video type
- URL of the hosted video file
- the placement (if on TOC or stage)

Use this dialog box to:

- **Specify video type:** The type of video that you insert. For the description of the video types, see the General section in Properties of event videos.
- **Specify placement:** If TOC or Stage. Depending on the placement, an icon appears at the lower-right corner of the slide on Filmstrip and on the Timeline:
  -  if on TOC
  -  if on stage

You might place the video on TOC in talking heads scenarios where the focus is on objects in the slide (such as text or a Flash video). Placing video on TOC, helps you avoid the distraction that playing a synchronized video on stage can cause and viewers losing focus.

When you have the synchronized video play on TOC, ensure that you select Show TOC (Project > Table of Contents) so that the TOC also is visible while you play the project.

- **Launch Edit Video timing dialog box:** Click  to edit video timing. For more information on editing the video timing, see Edit video timing.
- **Delete:** Click  to delete synchronized video.

---

## Updating synchronized videos

To the top <sup>+</sup>

1. Modify the source file of the video as required.
2. Open the project in which you want to update the video.
3. In the Media > Video folder of the Library panel, right-click (Windows) or Control-click (Mac) the name of the video, and click Update.

The changes reflect on all slides that use the video.

---

## Using audio

To the top <sup>+</sup>

You cannot associate additional audio to a synchronized video. Therefore, Adobe recommends that you use audio in file and not audio as object ensure proper synchronization.

---

## Setting timing

To the top <sup>+</sup>

❖ In the Timing area of the Property Inspector (Window > Properties), specify the seconds after which the video must appear on the specific slide.

---

## Setting transition

To the top <sup>+</sup>

❖ In the Transition area of the Property Inspector (Window > Properties), specify the transition effects for the video.

**Note:** *Transition effects do not apply to synchronized videos that are used in the TOC.*

---

## Setting the size and position of synchronized videos

To the top <sup>+</sup>

1. In the Position & Size area of the Property Inspector (Window > Properties), specify the values for size and position.

**Note:** *Applying arbitrary sizes to video objects degrade the quality of the video on published project.*

2. Click  to apply the values to all the slides in the synchronized video group. Synchronized video group consists of slides into which you imported the synchronized video simultaneously.

**Note:** *Apply to all applies the size and position values only to the group of slides into which the synchronized video was imported. These values do not apply to other instances of the video in the project (other synchronized video groups).*

---

## Best practices to use synchronized videos effectively

To the top <sup>+</sup>

- Use synchronized videos when you want the video to play in synchronisation with the slide contents. For other purposes, use the FLV file or F4V object, where user gets to control the video (for example, play or pause the video).
- Ensure that the videos have sufficient keyframes. The recommended keyframe interval is at least one keyframe in every 2 secs.  
You can use Adobe Media Encoder (AME) to increase the keyframe interval if necessary. For a 30-fps video, configure the keyframe-distance to be 60 (frames) in AME (or any other tool of your preference).
- Ensure that the videos have optimal bit-rates so that viewers' experience is good. Else, many 'loading...' messages are displayed to the users.  
Decide the bit-rates based on the server's as well as your target users' bandwidth. For information on calculating bit-rates, see the article at [www.adobe.com/devnet/flash/apps/flv\\_bitrate\\_calculator](http://www.adobe.com/devnet/flash/apps/flv_bitrate_calculator) .
- Import video from your local machine rather than from a shared network location. Large videos imported directly from network locations cause excessive delays and occasional system instability.
- Ensure that the minimum duration for a portion of video on a slide (per synchronized video) is 3 seconds. This duration is necessary to ensure that at least a couple of keyframes are assigned per slide.
- Ensure that the maximum duration of a synchronized video is 999 seconds (maximum slide duration). If the video is longer than this duration, distribute it among multiple slides. Videos longer than 999 seconds can cause system instability.
- Video dimensions:

- Ensure that the video object dimension is the same as that of the original video for optimal quality.
- Do not change the aspect ratio of the video even if you cannot maintain equal dimensions for the video object and original video. Otherwise, the video loses quality.
- Keep the dimensions of a video that you want to include in the TOC as: Height 144 and Width 196.

### **Synchronizing video with the project**

1. Decide which of the slides in the project need synchronized videos. Set optimal duration for such slides so that synchronization is more effective.
2. Arrange the slides in the order in which they must appear in the video. Reordering the slides after importing the video is not recommended.
3. Import the video with distribution to span across slides.
4. Use the Edit Video Timing dialog box to specify which part of the video plays on which slide. For more information see Edit video timing.
5. Specify which object must appear at what part of the video clip. For more information, see Synchronizing objects with video.

### **Publishing projects with synchronized videos**

By default, the published SWF files with synchronized videos are optimized for progressive downloads of videos. You can host the publish folder with the SWF file on a web server without changing any settings.

To host the videos on a server other than the one on which the SWF file exists (for example, a video server) or if you want to use streaming or Flash Video Streaming Service (FVSS):

1. Upload the videos to the server.
2. In the Video Management dialog box (Video > Video Management), specify the path of the video on the server.

If streaming, specify the rtmp path. If you are using FVSS, specify the path given by the FVSS provider.

# Widgets

# Smart learning interactions

---

## From an expert: Previewing learning interactions

Learning interactions are static widgets that help you get started with standard user interactions, for example, interactions using accordions or tabs.

To insert learning interactions:

1. Click Insert > Interactions.
2. Click the type of interaction you want to insert in the Select Interaction dialog box, and then click Insert.
3. Choose a theme from the Themes list.
4. Click Custom to customize the selected theme.

**Note:** Buttons have three states: Up, Over, and Active. Up is the state when users have not clicked the button. Over is the state when users hover their mouse over the buttons. Active state is when users click the button.

5. Double-click the button text and the button content area to type your text. In addition to text, you can also insert pictures and audio files in the button content area.
6. Click the '+' icon to add more buttons.
7. Click OK.
8. Modify the required properties of the widget using the Property Inspector. For more information on widget properties, see [Properties of widgets](#).

To edit the theme or the content in the widget after inserting, double-click the widget on stage.

**Note:** Unlike other widgets, Adobe Captivate lets you resize the learning interaction widgets without loss in quality of the image on stage. To use this feature, click Refresh Widget in the Property Inspector whenever you resize the widget on stage.

Adobe Captivate update for subscription and Adobe Software Assurance customers provides dynamic updates to learning interactions by polling the Adobe interaction store at regular intervals. The collection of interactions installed on your machine is compared with the one in the interaction store to determine the new or updated interactions. When you open the Select Interaction dialog box, you find that some of the interactions are labelled as:

- **New:** New interactions that are available for you to use. The label disappears when you click the interaction.

Interaction tagged as New

- **Updated:** Interactions for which updates are available since you last viewed the Select Interaction dialog box. If you have the project open for a long period of time, you have to close and reopen the project to view the latest updates.

Interaction tagged as Updated

Updates to such interactions are dependent on the project data. So, irrespective of whether you have used the interaction in the project or not, you get to see the interactions that are tagged as Updated. If you have used the interaction in the project, you have to insert the updated one and

reenter your data.

- **Update:** Interactions that you can update retaining your data intact. You can quickly update the interaction by clicking the Update button under the interaction in the Select Interaction dialog box.

*Interaction that you can update instantly*

---

## Previewing learning interactions

[To the top](#) <sup>1</sup>

- To preview learning interactions on Internet Explorer 9 and Safari, click File > Preview > HTML Output On Web Browser.
- To preview the interactions on other web browsers or devices:
  1. Publish the project in HTML5 format.
  2. Host the output files on a web server (IIS, Apache, WAMP).
  3. Play the published output using the URL on the required browser.

[Legal Notices](#) | [Online Privacy Policy](#)

# Drag-and-drop interaction (for subscription and Adobe Software Assurance customers only)

Drag-and-drop interactions provide an interesting and engaging way of assessing your users' knowledge. This interaction lets users answer questions by dragging and dropping objects in the designated areas or objects.

A drag-and-drop interaction involves a drag source and a drop target. Users drag the drag sources and drop them onto drop targets.

Adobe Captivate also lets you group drag sources and drop targets into 'Types'. For example, you can create a type Stationery to include drag sources pen, pencil, and eraser. You can then map any item in Stationery to drop target 'Office' and all the items in the type get automatically mapped to the target.

---

## Create drag-and-drop interactions

[To the top](#) <sup>4</sup>

You can create a drag-and-drop interaction using a [wizard](#) or using the [Drag & Drop Interaction panel](#).

You can create a drag-and-drop interaction on any slide except:

- Master slides
- Question Pool slides
- Question Slides
- Placeholder Slides

You can convert any object on a slide into a drag source or a drop target except:

- Interactive objects (TEB, Clickbox, Button)
- Placeholders
- Smart shapes act as button
- Rollover Objects
- Slide Video
- FLV video
- Text animation
- Interactive Widgets
- Mouse
- Zoom Area
- Objects inserted in Rollover Slidelet
- All objects that have the timing set as 'Rest Of Project'

Object effects too are not supported in a drag-and-drop interaction.

## Using the Drag-and-Drop Interaction wizard

1. On the slide on which you want the interaction, insert the objects to be marked as drag sources and drop targets.
2. Click Insert > Drag and Drop Interaction Wizard.
3. Follow the instructions in the Wizard to choose the drag sources and drop targets, and then to specify the correct answers by mapping the sources and targets.  
Note: You can group the drag sources and drop targets into 'Types' using the wizard and then map them. For more information, see [Types](#).
4. After you click Finish in the Wizard, the Drag and Drop Interaction Property Inspector appears. You can use this Property Inspector to choose specific settings for drag sources and drop targets. For more information, see [Edit drag-and-drop interactions](#).

## Create drag-and-drop interaction using Property Inspector

1. On the slide on which you want the interaction, insert the objects to be marked as drag sources and drop targets.
2. Click Window > Drag Drop. The Drag and Drop Interaction Property Inspector appears.

3. Click the Create New Interaction icon (📄).
4. To specify the drag sources, click the objects on stage, and click Drag Source in the General accordion of the Drag and Drop Interaction Property Inspector. To select multiple objects, Ctrl + click (Windows).
5. To specify the drop targets, click the objects on stage, and click Drop Target in the General accordion of the Drag and Drop Interaction Property Inspector. To select multiple objects, Ctrl + click (Windows).
6. To group similar drag sources and drop targets into a 'Type', click '+' adjacent to Custom Type. If you have already created the types, click the required type from the Custom Type list.
7. To map the drag sources to correct drop targets, click the drag source. A '+' icon appears at the center of the drag source. Click and drag the '+' symbol and point the arrow to the correct drop target.
8. To assign an animation effect for the drag sources, click the required effect from the Effects list in the Drag Source accordion.
9. Edit different aspects of the drag-and-drop interaction, drag sources, and drop targets using the Drag & Drop Interaction panel. For more information, see [Edit drag-and-drop interactions](#).

## Best practices for creating drag-and-drop interactions

- Insert all objects that you want to include in the drag-and-drop interaction before invoking the 'Drag and Drop' Wizard.
- While adding the objects, rename the objects to meaningful names. Do not rename objects after creating the interaction.
- Make sure that the interaction name is not the same as that of any drag source, drop target, or Type.
- Ensure that the display time for drag source or drop target is greater than the interaction pause time.
- Ensure that none of the objects included in a drag-and-drop interaction have 'Appear After' timing set.
- If the output is targeted for iPad, try to create projects in iPad resolution rather than using the 'Scale HTML5 content' option as doing so may lead to drag issues on iPads.
- Specify at least one correct answer for a drag-and-drop interaction. Else, the project may hang on the interaction slide when users try to submit the answers.
- The configuration in Correct Answers may not work as expected if you make any changes to the interaction after configuring the Correct Answers. So, ensure that you identify and mark drag sources and drop targets, and assign it to appropriate types, before configuring the Correct Answers.
- If you make any changes to object names or Types, or delete them, ensure to revisit your Correct Answers configuration and change it appropriately.
- Sometimes the 'snap' area or padding of two drop targets may overlap each other. In such cases, Adobe Captivate executes the drop action based on:
  - First, the 'Accept' conditions. If the drag source is not configured to be accepted by one of the drop targets, the source is dropped onto the other drop target.
  - Second, Z-order. If both drop targets have the same 'Accept' condition, the drop action is executed based on the Z-order of the drop targets. The Z-order of drop targets is based on Timeline; the drop target that appears later in the interaction has the highest Z-order.
- Advise your users not to use the play bar or the rewind button to go back to the beginning of the interaction. When they do so, the drag sources appear to have returned to their original position even if they had been successfully dropped onto targets.

## Types

To the top <sup>4</sup>

Types in the context of drag and drop interactions are categories of drag sources or drop targets that have something similar.

By grouping drag sources and drop targets into 'Types', you not only can map them quickly by just mapping one item in a type but also can use different combinations for accept conditions and correct answers. For example, for a given drop target, you can specify that only 2 objects from a drag source type can be accepted.

Depending on how you are creating the drag and drop interaction, you can create Types in the Drag and Drop interaction Wizard or the panel (Property Inspector). The Types that you create using the Wizard are available for editing through the Property Inspector.

Type option in Drag and Drop Interaction Wizard

Type option in Drag and Drop Property Inspector

## Edit drag-and-drop interactions

### View mapping of drag sources and drop targets

After you complete creating the drag and drop interaction using the Wizard and exit, the mapping disappears on the stage. To view the mapping, click Show in the Drag and Drop Interaction panel.

The 'Show' option works as a toggle that you can use to view or hide the mapping as and when required.

Showing and hiding drag and drop mapping

### Add new drag sources and drop targets

Select the object on the slide and click Drag Source or Drop Target in the General accordion of the Drag and Drop Interaction panel.

To map them, click the drag source and drag the '+' symbol to point the arrow to the correct drop target.

### Specify multiple correct answers

**Scenario 1:** Multiple drag sources are correct answers for a drop target

Create a 'Type' and group them. Then, map the 'Type' to the drop target

**Scenario 2:** Multiple drop targets can accept one drag source

Create a 'Type' for the drop targets. Then, map the drag source to the 'Type'.

**Scenario 3:** Only some drag source types are correct for a given drop target

Click the drop target on stage, click Accept in the Drop Target accordion, and select the required drag source types.

**Scenario 4:** Only some objects in a drag source type are correct answers for a drop target

Click the drop target on stage, click Accept in the Drop Target accordion, and select the required drag source type. Uncheck the Accept All checkbox, and specify the limit on the number of objects as Count.

**Scenario 5:** Multiple combinations of drag source and drop target mappings are required in a single interaction

Click Correct Answers (Drag and Drop Property Inspector > Interaction Properties), and add additional rows to an existing answer set. Or, a new answer set and specify the mapping.

**Scenario 6:** Users need to drag and drop objects in a specific order.

In the Correct Answers dialog box, create the order by arranging the answers in the required way and select Sequence option under Type.

### Map multiple answer sets to drop targets

If a drag and drop interaction warrants multiple correct answer sets, you can specify those using the Correct Answers dialog box (Drag and Drop Property Inspector > Interaction Properties accordion > Correct Answers).

Further, for each answer set, you can also specify if the drop targets have to accept answers in any combination specified or if the answers have to be provided in the specified sequence only.

1. Open the Correct Answers dialog box (Drag and Drop panel > Interaction Properties accordion > Correct Answers).

The first answer set with the mapping that you specified while creating an interaction is already listed.

2. To specify more combinations of answers to the existing answer set:

- a. Click +. Then, click the row under Drop Target and click the target name from the drop-down list.
  - b. Specify the source for this target, by clicking the row under Drag Source and then clicking a source name from the drop-down list.
  - c. Count indicates the number of objects in the drag source type that can be correct answers. By default, this number is obtained from the mapping you specified while configuring the interaction. Click the Count row to specify a different number.
  - d. If you want users to map the drag sources and drop targets in the order you have specified, click Sequence from the Type list.
3. To add a new answer set, click Add New Answer and repeat the steps above.

### Specify the 'Accept' conditions

Accept dialog box

- A** List of all drag source types that the selected drop target can accept. To exclude a drag source type from a drop target, uncheck the check box corresponding to the drag source type.
- B** Use this check box to include or exclude all the listed drag source types.
- C** Select the Accept all check box to specify that the drop target can accept all objects in the selected drag source types. In scenarios where you want only some of the objects from a drag source type to be accepted, uncheck the Accept All check box and specify the number of objects that can be accepted.
- D and E** Use these options to specify the number of objects that can be accepted and what happens when users drag and drop objects more than the specified number.
- Replace** Previous object that is dragged and dropped is replaced with the new one.
- Go Back** The new object goes back to the location on the slide from where it was dragged.
- F** Standard actions that you can assign to drag sources in a specific type.

### Configure feedback messages

Click the drop target on stage and then select one of the following options in the Drop Target accordion of the Drag and Drop Interaction panel:

**On Accept** In the text caption that appears on stage, type the message to be displayed to users when users drag a correct source and drop on the target.

**On Reject** In the text caption that appears on stage, type the message to be displayed to users when they drag a wrong source and drop on the target.

**On Hint** In the text caption that appears on stage, type the message to be displayed to users when they hover their mouse over the drop target.

## Assign audio to the drag-and-drop action

When users drag and drop a source to a target, you may want to play audio to make the interaction more interesting.

- To play audio when drop targets accept an answer, click the drop target, and click an audio file in the Audio list of the Drop Target accordion. You can click Browse to use an audio clip saved on your computer.
- To play audio when drop targets reject an answer, select Play Audio in the Interaction Properties accordion. When you select this option, Adobe Captivate plays a default audio clip; you cannot select a custom audio for this scenario currently.

## Configuring drag source properties

To specify the behavior of drag sources during or after they are dropped onto drop targets, use the following options:

**Hit Area Padding** Refers to the padding around the selected drop target. The drag sources are considered to be dropped onto the target when users drop them anywhere within this padding area (that is not necessarily on the target).

**Position** Click one of the following options to specify how drag sources snap after dropping onto the selected target:

**Absolute** Drag sources remain at the same location where users drop them.

**Anchor** Drag sources snap to the selected anchor points. You can select from one of the nine anchor points you see under the Anchor option.

**Tile** Multiple drag sources are piled or placed in the selected order. Select a tiling option in the panel.

**Size** Edit the default value (100%) if you want to increase or decrease the size of the drag source after they are dropped onto the target. A value lesser than 100% decreases the size and a value higher than 100% increases the size.

**Opacity** Edit the default value (100%) to change the opacity of drag sources after they are dropped onto targets. A value of 0 makes the drag sources invisible after they are dropped.

**Depth** Select Front or Back to specify the z-order of the drag sources after they are dropped onto the target. The first source that is dropped is placed in front or back of the drop target. The subsequent objects that are dropped are placed in front or back of the previously dropped object.

## See also

- [Use effects for drag sources and drop targets](#)
- [Other options in the drag and drop interaction panel](#)
- [Assign audio to the drag-and-drop action](#)

## Use effects for drag sources and drop targets

- For drag sources, click the drag source on stage, and click an effect from the Effects list Drag Source accordion (in Drag & Drop Interaction panel).

The effects for drag sources are displayed when users click and drag these objects.

- For drop targets, click the drop target on stage, and click an effect from the Effects list in the Drop Target accordion (in Drag & Drop Interaction panel).

The effects for drop targets are displayed when users hover their mouse over these objects.

## Other options in the Drag and Drop Interaction panel

### Interaction properties

**Correct Answers** Use to specify the 'or' conditions for the correct answers. Mapping drag source types to drop targets help you establish an 'and' condition where objects x **and** y, both can be the correct answers. Correct Answers dialog box helps you specify x **or** y as the correct answers. For more details, see [Map multiple answer sets to drop targets](#).

**Use Hand Cursor** Hand cursor appears while users drag-and-drop objects.

**Send Drag Source to Original Position** When dragged sources are dropped outside the drop target, they are sent back to the location on the slide from where they were dragged.

If this option is not selected and users move drag sources on the slide, the Go Back option snaps the objects to their last position on the slide from where they were dragged. Incorrect answers are automatically sent back to the location from where they were dragged.

**Redrag the Dropped Source** Allows users to redrag a dropped drag source (incorrect or correct) to another drop target.

**Note:** *This feature may not work as expected in this release. Consider using Reset or suggest users to undo the changes.*

## Action

**Reset** If multiple attempts are allowed, this option helps you specify if the answers are to be reset when users click Submit.

**Note:** *If you have selected the Reset option as None, ensure that you select Include In Quiz in the Reporting accordion. If the slide is not included in quiz, the answers are reset each time when users navigate away and return to the slide.*

## Options

**Pause after n sec** The slide pauses at the specified time (n sec) to let users interact. The time is calculated after the slide that contains the drag-and-drop interaction starts playing.

**Auto Submit** Correct answers are immediately submitted without users having to click the Submit button. This option is useful in scenarios where an On Success action needs to be triggered immediately after users answer correctly.

**Undo** Inserts an undo button on the slide. Only the latest drag action by the user is undone.

**Reset** Inserts a reset button on the slide so that the user can reset the interaction at any point in time.

[Legal Notices](#) | [Online Privacy Policy](#)

# Create WDGT files

---

## Creating WDGT files for only SWF outputs

### Creating WDGT files for SWF and HTML5 outputs

The WDGT file is a file with .wdgt extension containing:

- SWF files with links to other SWF files or assets
- HTML version of the widget
- description.xml file that contains information about the linking

The HTML files are required for HTML5 outputs. If you want to generate only SWF output files of your Adobe Captivate projects, the WDGT file need not contain the HTML files.

---

## Creating WDGT files for only SWF outputs

[To the top](#) <sup>4</sup>

A WDGT file for SWF outputs must contain the following:

- swf (directory): Contains the SWF output file of the widget and other linked resources.
  - description.xml (file): Contains information on the SWF and HTML versions of the widget that Adobe Captivate can use to publish and display the widget to users.
1. Create a new directory and name it as required, for example, `mywidget`. Then create a subdirectory: `swf`.
  2. Publish the FLA as a SWF file in Flash. Place the SWF file in the `swf` directory.
  3. Create a `description.xml` file. If the main SWF file, `ABC.swf`, uses two linked files `PQR.swf` and `XYZ.swf`, the `description.xml` file is in the following format:

```
<?xml version="1.0" encoding="ISO-8859-1" ?>
<widget>
<Description>This is a ABC widget(static)</Description>
<Type>isStatic</Type>
<Name>ABC.swf</Name>
<linkedfiles>PQR.swf</linkedfiles>
<linkedfiles>XYZ.swf</linkedfiles>
</widget>
```

4. Place the `description.xml` file in the root directory, that is `mywidget` directory in this case.
5. Compress the root directory (`mywidget` directory) and change the extension of the file to `.wdgt`.
6. Place the `.wdgt` file in `<Adobe Captivate installation directory>/Gallery/Widgets`.

---

## Creating WDGT files for SWF and HTML5 outputs

[To the top](#) <sup>4</sup>

A WDGT file for SWF and HTML5 outputs must contain the following files and directories:

- swf (directory): Contains the SWF output file of the widget and other linked resources.
- html5 (directory): Contains the assets and scripts related to the widget created in HTML and javascript. The following is the typical directory structure:
  - images (directory)
  - scripts (directory)
  - xyz\_oam.xml (file)

The `html5` directory can contain other asset directories such as themes. You need to create the openAJAX metadata xml file (`xyz_oam.xml`)

to store all the widget information such as scripts and assets.

- `description.xml` (file): Contains information on the SWF and HTML versions of the widget that Adobe Captivate can use to publish and display the widget to users.
1. Create a new directory and name it as required, for example, `myhtmlwidget`. Then create the following subdirectories:
    - `swf`
    - `html5`
  2. Publish the FLA as a SWF file in Flash. Place the SWF file in the `swf` directory.
  3. Create the widget using HTML and Javascript.
  4. Place all the assets and scripts in the `html5` directory.
  5. Create an OpenAjax metadata XML file that stores all the relevant widget information such as the scripts and javascript libraries.

For information on the OpenAjax schema, see [this website](#).

Here is an example:

```
<?xml version="1.0" encoding="UTF-8"?>
<!--

    OpenAjax Alliance Widget Specification
-->
<widget name="Arrow" id="com.adobe.captivate.dev.sample.widgets.arrow"
  spec="0.1b" jsClass='Arrow' sandbox='true' width='300' height='300'
  xmlns="http://openajax.org/metadata">

  <requires>
    <libraries>
      <library name="dojo" version="1.7" copy="true" src="js/dojo-release-1.7.1"
includeRef="false">
        <preload>
          djConfig="{parseOnLoad:true}"
        </preload>
        <require type="javascript" src="dojo/dojo.js" copy="false" includeRef="true"/>
      </library>
      <library name="jQuery" version="1.6.1" copy="true" src="js/jquery1.7.1/jquery-1.7.1.min.js"
type="javascript"/>
      <library name="jQuery.svg" version="1.4.4" copy="false" src="js/jquery.svg"
includeRef="false">
        <require type="javascript" src="jquery.svg.js"/>
        <require type="css" src="jquery.svg.css"/>
      </library>
    </libraries>
    <require type="folder" src="assets/svg"/>
  </requires>
  <javascript src="js/arrow.js"/>
<!--

    Properties are currently ignored by captivate since we expect the widget to do all the work that
has to be done from widget xml
    or the widget JSON. Still we give it a stab to see if we can get in property replacement
-->
<properties>
  <property name="style" datatype="String" default="AeroArrow"/>
</properties>

<content type='fragment'>
<![CDATA[
  <H1>Hello Widget!!!</H1>
  <div ID="__WID__ArrowShape"/>
]]>
</content>
```

```
</widget>
```

6. Open the javascript that corresponds to the value specified for the `jsClass` attribute in the metadata XML file. For instance, if the `jsClass` value is `Arrow`, open `arrow.js` file from the `scripts` directory.
7. Ensure that the `arrow.js` file includes the `onLoad()` function that invokes the `getMovieProps()` function. Here is an example:

```
arrow1 = {
  onLoad: function()
  {
    if ( ! this.captivate ){
      return;
    }
    //Gives access to the the movie handle
    this.movieProps = this.captivate.CPMovieHandle;
    //Gives access to the widget params
    this.movieProps = this.captivate.CPMovieHandle.widgetParams();
    //Function to replace all instances
    //of a Captivate variable by their associated values
    this.movieProps = this.captivate.CPMovieHandle.replaceVariables(varString);
    //Access to the event dispatcher where addEventListener and
    //removeEventListener can be called. Also contains the constants
    //needed for registering for events such as
    //<Widget>.captivate.CPMovieHandle.getMovieProps().eventDispatcher
    //SLIDE_ENTER_EVENT
    this.movieProps = this.captivate.CPMovieHandle.getMovieProps().eventDispatcher;
    //Access to the variables handle
    this.movieProps = this.captivate.CPMovieHandle.getMovieProps().variablesHandle;
    //Access to the external resource loader
    this.movieProps = this.captivate.CPMovieHandle.getMovieProps().ExternalResourceLoader;
    if ( ! this.movieProps ){
      return;
    }
    this.varHandle = this.movieProps.variablesHandle;
    this.eventDisp = this.movieProps.eventDispatcher;
    // other code
  };
  //To unload your widget
  onUnload: function()
  {
    /*Unload your widget here*/
  };
}
// Ensure that there is a constructor function
// available for the JavaScript class identified by
// the 'jsClass' attribute. The constructor has no arguments.
arrow = function ()
{
  return arrow1;
}
```

Note:

- Do not directly register browser `onload` event handlers (for example, `window.addEventListener('load', myCallback, 0);`) to make the widget portable in many scenarios, including dynamic run-time scenarios where the widget can be added to the document after the browser's 'load' event has occurred.

Instead, widgets must rely on the `onLoad` callback defined in this specification for notifying that the widget has finished loading and is ready for rendering.

- Do not directly register browser `onunload` event handlers (for example, `window.addEventListener('unload', myCallback, 0);`) to make the widget portable in many scenarios, including dynamic run-time scenarios where the widget may be removed from the document much earlier than the page is unloaded.

Instead, widgets must rely on the `onUnload` callback defined in this specification for notifying that the widget is being removed from the page.

For information on `getMovieProps()` see, [Methods and properties](#).

8. Place the OpenAjax metadata XML file in the `html5` directory.

9. Create the `description.xml` file.

For information on the schema for the `description.xml` file, see [description.xml schema](#).

10. Place the `description.xml` file in the root directory (`myhtmlwidget` directory in this case).

11. Compress the root directory (`myhtmlwidget` directory) and change the extension of the file to `.wdgt`.

12. Place the `.wdgt` file in `<Adobe Captivate installation directory>/Gallery/Widgets`.

## Sample description.xml file

If the main SWF file is `ABC.swf`, and the openAJAX XML file that you created is `XYZ_oam.xml`, then the `description.xml` is:

```
<?xml version="1.0" encoding="ISO-8859-1" ?>
<!-- widget header
    spec - compulsorily required. if not present will be treated as spec 1 which doesnt support html5 etc
    version - widget version number
    type - widget type
-->
<widget spec="2" name="Certificate" description="This is a test for Process Tabs" uri="www.mycomapny.com"
version="1.0" type="static">
  <!-- Authors header - Can contain multiple authors
  -->
  <authors>
    <!-- Author header - author info
    about is to show off some skills like i am cool widget developer. contact me for custom widgets
    -->
    <author name="Dominique Skyler" email="dominique@mycomapny.com" organization="MyCompany"
uri="www.mycompany.com">
      <about>Widget Developer</about>
    </author>
  </authors>
  <!-- license info - author info
  -->
  <license name="CC" description="Creative Commons License" text="Feel free to use this"
uri="http://creativecommons.org/licenses/by/3.0/">

  <!-- different output formats supported
    each format has one directory in the wgt file
    paths can refer to other formats by using .. notation
  -->
  <formats>
    <!-- for the output format swf
    -->
    <format type="swf">
      <content source="ABC.swf"/>
    </format>
    <!-- for the html5 output -->
    <format type="html5">
      <!-- reference to the oam file -->
      <content source="XYZ.xml"/>
    </format>
  </formats>
</widget>
```

## description.xml schema

### widget

`<widget>` is the root element that defines a single widget and includes the following child elements:

- authors

- license
- formats

The <widget> element includes the following attributes:

Attribute	Description	Type	Compulsory	Value
spec	Indicates the specification on which the XML is based on. The default value '2' indicates that the XML file includes information on the HTML version of the widget.	Positive integer	Yes	2
name	Name of the widget.	String	No	NA
description	Description of the widget.	String	No	NA
uri	URL of the required website, for example, company's website.	String	No	NA
version	Version of the widget.	Positive integer.	No	NA
type	The type of the widget: static or interactive.	String	Yes	<ul style="list-style-type: none"> <li>• static</li> <li>• interactive</li> </ul>

#### authors

<authors> is the child element of the <widget> element and includes the following attributes:

Attribute	Description	Type	Required	Default
name	Name of the widget developer or author.	String	No	NA
email	Email ID of the widget developer or author.	String	No	NA
organization	Name of the organization of the widget developer or author.	String	No	NA
uri	URL of the organization's website or any other website the author wants to mention.	String	No	NA

**Note:** All these attributes are ignored in this version of Adobe Captivate.

#### license

<license> is the child element of the <widget> element and includes the following attributes:

Attribute	Description	Type	Required	Default
name	A short name for the widget license.	String	No	NA
description	Description of the widget license.	String	No	NA

text	The license text that you want to display with the widget.  You can also attribute licenses for any third-party software used in the widget.	String	No	NA
uri	Link to the website where widget users can find more information on the license.	String	No	NA

**Note:** All these attributes are ignored in this version of Adobe Captivate.

#### formats and format

<formats> includes the child element <format>, which includes the names of the SWF and HTML versions of the widget.

<format> element includes the following attribute:

Attribute	Description	Type	Required	Value
type	The type of the source: SWF or HTML.	String	Yes	<ul style="list-style-type: none"> <li>swf</li> <li>html5</li> </ul>

#### content

<content> is the child element of <format> and includes the following attribute:

Attribute	Description	Type	Required	Value
source	Refers to the SWF output or the HTML version of the widget.	String	Yes	Name of the SWF file or the metadata XML file of the HTML version of the widget.

# New widget APIs in Adobe Captivate6

---

## [CPWidgetInternalResourceLoader](#) [CPWidgetExternalResourceLoader](#)

Adobe Captivate 6 provides the following new classes for widget developers to manage external resources in their widget:

- [CPWidgetInternalResourceLoader](#)
- [CPWidgetExternalResourceLoader](#)

---

## CPWidgetInternalResourceLoader

[To the top](#) <sup>4</sup>

Use this class to use images in a widget. The resources are embedded into the SWF output file as PNG files. You need to use 'ByteArray' to use these resources.

You can use this class in Stage mode, Edit mode, or at run-time.

This class contains the following functions:

- [browseResource](#)
- [getResourceStream](#)

### **browseResource**

```
public function browseResource(): int
```

This functions works only in Edit mode. Adobe Captivate library is launched and you can select or browse for the resource.

This function returns an integer (resource number).

### **getResourceStream**

```
public function getResourceStream (resourceID:int) : ByteArray
```

This function works in Stage mode, Edit mode, and at run-time. You need to provide the resource number as the input parameter and the function returns the ByteArray for that resource.

---

## CPWidgetExternalResourceLoader

[To the top](#) <sup>4</sup>

Use this class to use music or video files in a widget. These resources are externalized and are not embedded into the Adobe Captivate SWF file. The resources are copied as separate files in the same directory as the SWF output file.

To use these resources, you need to get the file path of the resources.

This class contains the following functions:

- [browseResource](#)
- [getResourceStream](#)

### **getResourcePath**

```
public function getResourcePath (Resource ID:int) : String
```

This function works in Stage mode, Edit mode, and at run-time. You need to provide the resource number as the input parameter and the function returns the path of that resource.

# Create widgets

---

- [Create static widgets](#)
- [Create interactive widgets](#)
- [Create question widgets](#)

---

## Create static widgets

[To the top](#) <sup>1</sup>

1. In Adobe Captivate, select File > New > Widget in Flash.
2. In the Create New Widget dialog box, select Static in the Widget menu and then click OK.
3. In Flash, select Window > Actions.
4. The Actions panel appears with the template code for the static widget. Customize this code to create your widget.

---

## Create interactive widgets

[To the top](#) <sup>1</sup>

1. In an open project, select File > New > Widget In Flash.
2. In the Create New Widget dialog box, do the following:
  - a. In the Widget menu, select Interactive.
  - b. In the ActionScript Version menu, select the ActionScript version that you plan to use when writing the widget code in Flash.
  - c. Click OK.
3. In Flash, select Window > Actions.
4. The Actions panel appears with the template code for the interactive widget. Customize this code to create your widget.

---

## Create question widgets

[To the top](#) <sup>1</sup>

1. Select File > New > Widget In Flash.
2. In the Create New Widget dialog box, select Question and then click OK.
3. In Flash, right-click (Windows) or Control-click (Mac OS) the Actions layer in the Timeline, and select Actions.
4. The Actions panel appears with the template code for the question widget. Customize this code to create your widget.

**Note:** You can add question widgets to question pools. They are treated as any other question slide.

---

# Accessing Adobe Captivate movie properties

## MovieHandle

### Methods and properties

#### Guidelines for using movieHandle in widgets

[To the top](#)

## MovieHandle

Adobe Captivate passes a handle to the widget during runtime using the cpSetValue function. The widget has to implement something like the following inside its cpSetValue function.

```
function cpSetValue( variable:String , val )
{
    if(variable == 'movieHandle' ) {
        this.movieHandle = val;
    }
}
```

[To the top](#)

## Methods and properties

Using MovieHandle, the following properties can be accessed.

**widgetParams** The widget parameter provided by the widget during edit time. In AS3 it is a function, movieHandle.widgetParams(), and in AS2 it is a property, movieHandle.widgetParams.

**replaceVariables(var:String)** Any string with variable names enclosed in \$\$ is replaced with the value of the variable at runtime. For example, movieHandle.replaceVariables( \$\$JohnDoe\$\$ scored \$\$cpQuizInfoPointsscored\$\$ out of \$\$cpQuizInfoTotalQuizPoints\$\$) returns "JohnDoe scored 10 out of 100" assuming that JohnDoe scored 10 points out of the total 100 that was set in Adobe Captivate.

**getContainerProps()** Return the properties of the container.

**containerType** Returns one of the following: Slide, Slidelet, Zoom Destination Slide, Zoom Destination Slidelet, Movie (in case of rest of project widget)

**getSlideProps()** Returns the properties of the slide containing the widget. The returned object has the following members.

**slideType** Returns one of the following: Normal Slide, Question Slide, or Random Question Slide.

**slideHandle** Handle to the slide functions. slideHandle supports the following functions: AddNoSkipFrame, startFrame, and endFrame. AddNoSkipFrame(frameNum:Number): No frame is skipped at runtime. frameNum refers to the frame number with respect to the slide indexed from 1.

The Adobe Captivate SWF uses a functionality called “pacemaker” at runtime. When there are insufficient system resources, the pacemaker skips frames in a way that the user does not notice any glitch in the movie. However, it is possible that a frame containing actions might get skipped in the process. AddNoSkipFrame is used to ensure that pacemaker does not skip the specified frame.

startFrame returns the frame number at which the slide begins. The indexing begins with zero.

endFrame returns the frame number at which the slide ends. Indexing begins with 0.

**getMovieProps** Returns the properties of the Adobe Captivate movie that is closest to the hierarchy of the widget. The returned object has the following members:

**contentWidth** Width of the movie's content.

**contentHeight** Height of the movie's content.

**variablesHandle** Some Adobe Captivate System variables are accessed from here. For example, movieHandle.GetMovieProps().variablesHandle.myVar = 10;

**movieHandle <deprecated>** Handle to the main movie object(rdMovie) in captivate runtime. Only some Adobe Captivate system variables are available here.

**IsWidgetVisible** Returns if the widget is currently visible on stage.

**isWidgetEnabled** Returns whether the widget is enabled. A widget is considered as enabled when it is present on the slide or on the Timeline. All functions discussed work only if isWidgetEnabled() returns true.

[To the top](#)

## Guidelines for using movieHandle in widgets

The value of movieHandle must be updated by the widget whenever cpSetValue('movieHandle', val) is called. When it is called multiple times, the

value might not be the same every time. The variables must be updated for every call.

GetSlideProps and GetMovieProps consume a lot of memory resources. So, use these calls sparingly. Best practice is to cache the return value to a variable and use the variable. Refer to the following example.

```
var slideProps:Object;
var movieHandle:Object;
function cpSetValue( variable:String , val ) {
    if ( variable == 'movieHandle' ) {
        movieHandle = val;
    }
}
function onWidgetEnabled(){
    slideProps = movieHandle.GetSlideProps();
}
function myWidgetFunction (){
    if(slideProps.slideType == "Question Slide" ) {
        myLabel.Text = "" ;
    }
}
```

Ensure that operations are carried out during Adobe Captivate runtime only when the widget is enabled. Operations on movieHandle (particularly variablesHandle) when the widget is not enabled might lead to unexpected results.

# Add widgets

---

[Add a widget from the Widget panel](#)

[Add a widget from the Insert menu](#)

---

## Add a widget from the Widget panel

[To the top](#) <sup>↑</sup>

By default, the widgets available in the Widget gallery appear in the Widget panel. The Widget gallery is created in the \\Program files\Adobe\Adobe Captivate 6\Gallery\Widgets (on Windows) and /Applications/Adobe Captivate 6/Gallery/Widgets (on Mac OS) when you install the application. The Widget panel shows only those widgets created using the ActionScript version 3.0.

1. Select Window > Widget.
2. In the Widget panel, select a widget. A preview of the widget is displayed in the Widget panel.  
**Note:** You can sort the widgets in the Widget panel as *Static*, *Interactive*, or *Question* by selecting the corresponding option in the menu.
3. Do one of the following:
  - Click Insert.
  - Drag the widget to the slide.
4. In the Widget dialog box, specify the name of the course. For widget options, see Properties of widgets.

---

## Add a widget from the Insert menu

[To the top](#) <sup>↑</sup>

1. Select Insert > Widget.
2. In the Open dialog box, browse to the folder containing the widget, and open it.
3. In the Widget dialog box, specify the name of the course. For options for the widget, see Properties of widgets.

# Defining visibility mode for widgets

---

## Defining the preview movie

### Sample code for defining visibility for different modes

By defining the visibility of widgets, developers can make certain facets of the widget available to users for preview or customization.

The visibility status of a widget can be set for the following views:

- Widget tab in the property panel (Stage state): Developers can display a snapshot of the widget in this tab.
- Widget Parameters tab in the property panel (Edit state): The snapshot of the object is usually hidden in this mode, and only the parameters that can be customized are displayed.
- During run time: Developers can define the visibility of an object based on certain parameters.
- Widgets panel: To display the SWF file in preview mode, set `wm==preview` in the code.

The visibility state is undefined for widgets. Use the `movieHandle.widgetParams` property to set the visibility state.

Use the following tips when making visibility decisions:

- Decide whether the widget is visible in the following cases:
  - Edit area
  - Property Inspector
  - During run time
- Optimize the code for drawing. Excessive use of this code can slow down the player. The widget dialog box might not disappear even after the OK button is clicked.
  - Optimize the code in the `OnEnterFrame` function for the widget so that CPU use is kept to a minimum.
  - The drawing code is CPU intensive. Store states inside variables and use them to draw only when required.
- To test for Flash-related issues, you can simulate the way the widget appears on stage within Flash without launching Captivate. Hard-code `wm = 'Stage'` and `wm = 'Edit'` in the `OnEnterFrame` function. Similarly, to simulate the behavior of the widget at run time using Flash, hard-code `widgetParam`, and then test.
- Use the trace command to debug SWF files. Ensure that you delete the command during final testing as it degrades performance.
- Ensure that you publish to the following only:
  - Flash 8 and later
  - ActionScript 3.0.

---

## Defining the preview movie

[To the top](#)

You can provide a dummy SWF file that appears in the preview area when the user selects a widget in the Widget panel. The dummy SWF file gives users an idea of how the widget works.

Explore the `PieChart.fla` to get a better understanding of the procedure for defining a preview movie.

1. Open the `PieChart.FLA` file for the pie chart in Flash. This file is available on your computer in the `\\Program files\\Adobe\\Adobe Captivate <Version number>\\Gallery\\Widgets` directory.
2. In the Property Inspector, select the movie outside the Stage. The name of the movie `PieChart_prvw` is displayed in the Property Inspector.
3. Right-click (Windows) or Control-click (Mac OS) the frame containing the action, and select Actions.
4. Locate the following piece of code.

```
if (wm == 'Preview')
{
    PieChart_prvw._visible = true;
}
```

The code sets the movie to preview mode and displays the movie in the preview area when the user selects the widget. If you set the visibility to false, the widget is not displayed in the preview area.

## Sample code for defining visibility for different modes

```
function cpSetValue( variable:String , val )
{
    if(variable == 'movieHandle' ) {
        movieHandle = val;
        mainmov = movieHandle.getMovieProps().variablesHandle;
    }
    if (variable == 'widgetMode')
    {
        widgetMode = val;
    }
}
this.onEnterFrame = function()
{
var wm:String = widgetMode;//this variable will be provided by Captivate App or Captivate Movie
    if(wm == undefined)
    {
        wm = widgetMode;
    }
    if(wm == undefined)
        wm = 'Stage';

    if(wm == 'Edit')//Property inspection inside Captivate app
    {
        button1.visible=true;
    }
    else if (wm == 'Preview')
    {
        button1.visible=false;
    }
    else //this is the stage mode
    {
        button1.visible=true;
    }
}
```

# Properties of widgets

---

[Widgets](#)  
[Animation](#)  
[Timing](#)  
[Transition](#)  
[Action](#)  
[Options](#)  
[Audio](#)  
[Transform](#)  
[Reporting](#)  
[Set audio for widgets](#)

In addition to the parameters defined by the widget developer, Adobe Captivate allows you to set properties for widgets. You can modify the properties of a widget using its Property Inspector (Windows > Properties).

---

## Widgets [To the top](#)

**Name** Enter a unique name for the object. You can use this name when defining the visibility conditions for the object.

**Visible** Deselect this option if you want the object to be invisible on the slide by default. Use the Show action to make the widget visible. For more information, see Controlling the visibility of objects.

---

## Animation [To the top](#)

**Object Name** Name of the animation object.

**Linkage** Provides the link to the associated SWF file.

**Update** Click to reflect the modifications to the source file (if edited externally).

**Source** Link to the source FLA file of the animation SWF file.

**Edit** Click to edit the FLA file using Adobe Flash from within Adobe Captivate.

**Alpha** The transparency of the widget. At 0% transparency, the widget is opaque, and at 100%, transparency, it is invisible.

**Widget Properties** Click to display the Widget Properties dialog box that shows the parameters that you can use to customize the widget. These parameters are available only if the developer creating the widget has made provisions for customizing the widget. A snapshot of the widget may be displayed in this dialog box.

---

## Timing [To the top](#)

**Display For [Time]** Specifies how long the widget appears on the slide.

**Appear After [#] Seconds** Specifies the delay between the first appearance of the slide and the first appearance of the widget.

**Pause After [#] Seconds** Specifies the point at which the project pauses so that the user can follow the instructions in the widget.

**Note:** *This field applies only to interactive widgets.*

---

## Transition [To the top](#)

**Effect** Transition effect for the widget. You can apply a fade in or fade out effect, and set the time for the fading effects.

---

## Action [To the top](#)

**On Success** The options available if the user successfully fulfills the criteria specified in the widget. For more information, see Project navigation using interactive objects.

**Attempts** Define the number of attempts.

**Infinite** The user can attempt infinite number of times.

**Last Attempt** The options available if the user fails to fulfill the criteria specified in the widget in the defined number of attempts. For more information, see Project navigation using interactive objects.

---

## Options [To the top](#)

Select the appropriate options from the following:

**Success** The caption displayed when the user successfully completes the task assigned by the widget.

**Failure** The caption displayed when the user does not provide the input required by the widget.

**Hint** The caption providing a hint to the user. The hint is displayed when the user moves the pointer over the widget.

**Pause For Success/Failure Captions** Pauses the project until all success and failure captions are displayed.

---

[To the top](#)

## Audio

To add audio to the widget, go to the Audio area in the Property Inspector (Window > Properties) and then click Add Audio.

**Fade In [#] Seconds** Specifies the number of seconds until the audio fades in to full volume.

**Fade Out [#] Seconds** Specifies the number of seconds until the audio fades out to silence.

**Audio** Displays Object Audio dialog box. For details, see

Set audio for widgets.

---

[To the top](#)

## Transform

To define the exact size or location of the widget in terms of pixels, or to rotate the widget, click the Transform tab. Select from the following options:

**X** Position of the X coordinate of the object.

**Y** Position of the Y coordinate of the object.

**W** The width of the object.

**H** The height of the object.

**Constrain Proportions** Maintains the height-to-width ratio when the object is resized.

**Angle** Angle of rotation of the widget.

---

[To the top](#)

## Reporting

If you want to keep score for the widget or coordinate the score with a learning management system (LMS), use the Reporting tab.

**Include in Quiz** The points assigned to the widget are added to the score results for the current quiz.

**Points** Points assigned to a correct answer. The maximum is 100 points; minimum is 0.

**Add to Total** The score of the button is added to the quiz total.

**Report Answers** Sends the score to the learning management system (LMS).

**Interaction ID** Sends tracking information to the LMS based on the interaction ID specified by the LMS.

---

[To the top](#)

## Set audio for widgets

You can add an audio file to noninteractive objects. The audio file is played when the object appears on the slide.

1. To add audio, go to the Audio area in the Property Inspector (Window > Properties) and then click Add Audio.

The Object Audio dialog box appears.

2. In the Add/Replace tab, use the following options:

**Record Audio** Opens the Record Audio dialog box. (Recording audio requires some basic equipment.)

**Stop** Stops playing the audio file.

**Play** Plays the audio file.

3. In the Edit tab, to edit the audio file in various ways, such as inserting silent periods and adjusting the volume.
4. Click Settings to open the Audio Settings dialog box. You can change audio settings such as input source, quality level, and calibration. Click the Settings button to make your selections.
5. Click Import to display the Import Audio dialog box. This dialog box lets you browse to an audio file and import it.
6. Click Library to open the Library. The Library lists all audio files that are already part of the currently open Adobe Captivate project.

More Help topics

# Question widgets

Question widgets should implement the following functions in addition to the functions discussed in this topic.

**getWidgetQuestionState()** This method is called when the user clicks Submit on the question slide. The method provides the widget with an option to restore its state when the quiz is restored in an LMS. This function should return a non-empty string in a way that it can restore its state when the widget is reloaded.

**setWidgetQuestionState()** Restores the widget to its previous state. setWidgetQuestionState() is called when the widget is reloaded in the LMS.

```
function getWidgetQuestionState()
{
    trace("get Widget Question State");
    return "<var1>"+var1+"</var1><var2>"+var2+"</var2>"
//Should be a non- empty String.Should not contain _ and ;
}
function setWidgetQuestionState( val:String)
{
    trace("set Widget Question State()" + val );
}
```

For example, let us consider that the state of the variables is var1=10, var2="Captivate" when Submit is pressed and the function is called. Open the Adobe Captivate quiz in LMS, attempt the question, and press Submit. The getWidgetQuestionState function is called. Re-open the quiz in LMS. When the widget question is shown, function setWidgetQuestion is called with the same string: "<var1>10</var1><var2>Captivate</var2>"

**answers()** Displays the review feedback. The function returns an array of Objects() with the following properties.

**answerID** A unique ID for every answer.

**chosenAnswer** String representing the answer chosen by the learner.

**correctAnswer** String representing the correct answer.

For example,

```
function answers():Array {
var answers:Array = new Array();
var ans : Object = new Object();
var ans2 :Object = new Object();
ans.answerID = "10";
ans.chosenAnswer = "Hi..Hi...";
ans.correctAnswer = "Hello...Hello...";
answers["firstanswer"]= ans;
ans2.answerID = "12";
ans2.chosenAnswer = "Hi2..Hi2...";
ans2.correctAnswer = "Hello2...Hello2...";
answers["first2answer"]= ans2;
return answers; }
```

# Twitter widget

---

## Adding the Twitter widget to projects

### Collaboration workflow

### How is the 'context' of tweets determined?

### Asking questions

### Replying to questions

The Twitter widget facilitates in-context collaboration between you (the author) and your users (elearners). It helps you simulate a classroom environment in which elearners can ask questions to you and co-elearners in 'real-time'.

When you publish a project containing the Twitter widget, your users can ask questions from within the project without having to log on to Twitter. The questions appear to you and others at the appropriate context of the project in which they are asked.

While the questions can be asked only from a published project, the replies can be provided from any of the following:

- Twitter- accessed through a web browser or a mobile device.
- Within the published Adobe Captivate project using the Reply button that appears when the Twitter icon is clicked.

---

## Adding the Twitter widget to projects

To the top 

1. Download the Twitter widget from Adobe Exchange. The .zip file that you download contains the following files:
  - twitterwidget.swf — The Twitter widget that you can insert into your Adobe Captivate projects.
  - Twitteroauth.zip — The OAuth configuration file for authenticating Adobe Captivate when your users try to access the project with the Twitter widget.
2. Ensure that you have met the prerequisites for using the Twitter widget. See Prerequisites for more information.
3. Set up your project by providing a unique name in the Preferences. See Setting up the project for more information.
4. Insert the Twitter widget in your project. See Inserting the Twitter widget in projects for more information.

## Prerequisites

1. Install a Web server and PHP on a computer. You can opt for WAMP (for Windows) or MAMP (for Mac) that provides both.  
**Note:** *The computer can be the one on which you have installed Adobe Captivate or any other computer on your network.*  
Visit <http://www.wampserver.com/en/download.php> for downloading WAMP. For step-by-step instructions, see [http://www.ehow.com/how\\_5921076\\_set-up-localhost-computer.html](http://www.ehow.com/how_5921076_set-up-localhost-computer.html).  
**Note:** *Ignore the last step in these instructions that says continue according to the instructions on the WAMP web site.*  
Visit <http://www.mamp.info/en/index.html> for downloading MAMP. For step-by-step instructions, see <http://documentation.mamp.info/en/mamp/installation>.
2. On the Windows machine, configure PHP and the web server. See Configuring PHP and Configuring the web server for more information. This step is not required on Mac as the required parameters are enabled by default with MAMP.
3. Set up authentication for Adobe Captivate using OAuth. See Setting up authentication through OAuth

Your users (elearners) do not have to meet these prerequisites. They just need a valid Twitter account to access the projects with the Twitter widget.

## Configuring PHP

On Windows, enable the CURL library. To do so, click the WAMPSERVER icon in the system tray, select PHP > PHP extensions, and then click php\_curl.

To verify whether or not CURL is enabled, type <http://localhost> or <http://localhost:8080> in a web browser, and click phpinfo() in the Tools section. Search for CURL on the page. Check if the row cURL support contains the value enabled.

## Configuring the web server

On Windows, enable the rewrite module. To do so, click the WAMPSERVER icon in the system tray, select Apache > Apache modules, and then click rewrite\_module.

To verify whether or not the rewrite module is enabled, type <http://localhost> or <http://localhost:8080> in a web browser, and click phpinfo() in the Tools section. Search for rewrite on the page. Check if the mod\_rewrite is listed in the row Loaded Modules (apache2handler table).

## Setting up authentication through OAuth

1. Right-click (Windows) or Control-click (Mac) the file twitteroauth.zip and click Extract. The contents are extracted into the twitteroauth folder.  
**Note:** *twitteroauth.zip is available in the TwitterWidget.zip folder that you downloaded from Adobe Exchange.*
2. Place the twitteroauth folder into the root directory of your web server. To access the root directory:
  - (on Windows) Click the WAMPSEVER icon in the system tray and click www directory or navigate to `<WAMP_installation_folder>/wamp/www`.
  - (on Mac) Go to `/Applications/MAMP/htdocs`

## Setting up the project

1. Open the project in which you want to insert the Twitter widget.
2. Go to Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac).
3. In the Preferences dialog box, click Information under Project in the Category list.
4. In the Project Name field, specify a name for your project. Choose a unique name as this name will be used as the hash tag in Twitter for the course.

## Inserting the Twitter widget in projects

1. Open the Adobe Captivate project in which you want to insert the Twitter widget.
2. Click the first slide in the Filmstrip.
3. Click Insert > Widget. Browse to the location where you have downloaded the twitterwidget.swf, and click open. The Widget Properties dialog box appears.
4. In the Username field, type your Twitter account username. This account is considered to be the author's account.
5. In the PHP Location field, specify the location of the twitteroauth folder that you placed in the root directory as a URL in the following format:  
`http://<ipaddress_of_the_web_server>/<twitteroauth_folder_location>`  
For example, if you have placed the folder in `c:/wamp/www/Twitter/twitteroauth`, specify the PHP location as follows:  
`http://<ipaddress_of_the_web_server>/Twitter/twitteroauth`  
On Windows, if you are accessing the web server home page using the port number 8080, then specify the port number for PHP location too. For example,  
`http://<ipaddress_of_the_web_server>:8080/Twitter/twitteroauth`  
On Mac, specify the port number 8888. For example, `http://<ipaddress_of_the_web_server>:8888/Twitter/twitteroauth`
6. Click OK. The Twitter widget now appears on your slide. When you publish the output, the widget appears at the same position where it appears on the slide.
7. In the Timing panel of the widget's Property Inspector, click Rest Of Project in the Display For drop-down list.

Before you preview or publish your project, ensure that the status of the WAMP or MAMP server is 'Online'.

- On Windows, move your mouse on the WAMP server icon in the system tray. If the status indicates that the server is 'Offline', click the icon and then click Put Online.
- On Mac, launch MAMP. In the welcome screen, if you see a red button against Apache and PHP, click the adjacent buttons to put them online. The color of the buttons turn green.

## Accessing the project outputs with Twitter widget

When you or your users try to access the project published with the Twitter widget, a prompt for the OAuth PIN appears.

1. Click Generate to generate the PIN.  
If you have already logged into Twitter, click Allow to continue with the same account. To log in with a different account, click Sign-in.  
If you have not logged into Twitter yet, you will be prompted to provide your Twitter username and password.  
After you have logged in successfully, the PIN number appears in your default web browser.  
**Note:** *If the PIN number does not appear in the browser window, allow the pop-ups in the browser, and try refreshing the page.*
2. Copy the PIN number and paste it into the OAuth PIN number field in the prompt that appeared in the project.
3. Click Login.

## Searching for the project in Twitter

Use the name of the project to search for it in Twitter, TweetDeck, or search.twitter.com. All the tweets (questions and replies) that occurred in the project are listed. You can then tweet a reply or a question.

---

[To the top](#)

## Collaboration workflow

The questions and replies that were tweeted before you or an elearner started viewing the project are grouped into conversation threads. You (the author) get to see all the conversation threads on the current slide, irrespective of which frame you are viewing. However, other elearners can view only those conversations that have occurred until the frame that they are currently viewing.

To view the conversation threads, click the Twitter icon.

All the tweets that occur during the time when you or an elearner is viewing the project output are indicated instantly. You (the author) are notified about the tweets that occur on any slide in the project, irrespective of whether or not you have viewed that slide yet. However, for other elearners, the tweets are listed in the conversation list that they can view when they reach that slide (and frame).

When a new question or a reply is tweeted, a second Twitter icon appears on the slide. This icon disappears as soon as all the tweets are viewed.

**Note:** *The second Twitter icon differs from the first one in the color of its wing. In the first icon, the wing of the bird is blue while in the second the color is yellow.*

All the viewed tweets are added to the conversation lists on the slide.

The following steps outline the collaboration workflow between an author, Casey, and elearners, Alex and Jaden:

1. Casey creates and publishes an elearning course with a Twitter widget.
2. Alex starts viewing the course and right-clicks on a table on Slide 10 (frame 2), and asks a question.
3. Jaden is also viewing the course at the same time.
  - If Jaden too is on Slide 10, frame 2 or has already viewed the slide, an additional Twitter icon appears on Jaden's machine. Jaden can click the icon to view the question and click reply to provide an answer. As soon as Jaden views the question, the additional icon disappears and the tweets (question and answer) are added as a conversation thread.
  - If Jaden has not yet viewed Slide 10, frame 2, the question from Alex appears as a conversation thread. Jaden can click the original Twitter icon to view the question.
4. Casey is also viewing the course at the same time. Irrespective of which slide or frame Casey is viewing, an additional Twitter icon appears as soon as Alex or Jaden ask a question.
  - Casey can click the tweet to go to the context (slide 10, frame 2) and reply to the question.
  - Casey can access the older tweets by clicking the original Twitter icon.

---

[To the top](#)

## How is the 'context' of tweets determined?

The following factors determine the context of a question:

- Frame number
- The location on the slide where the elearner clicks to ask a question

If you or other elearners are viewing the published project, clicking the conversation headers or the new tweets takes you to the context (slide and frame).

When you or other elearners view the tweets in the project using Twitter, the context is provided as follows:

FrameNumber, X co-ordinate, Y co-ordinate

For example, 245; 400; 194.

---

[To the top](#)

## Asking questions

Only elearners (not the author) can ask a question in the project published with the Twitter widget.

1. Right-click (Windows) or Control-click (Mac), select Ask Question
2. Click inside the Ask A Question dialog box, and type the question
3. Click Send.

---

[To the top](#)

## Replying to questions

You (the author) and the elearners can reply to any question in the project using the Twitter icon.

1. Click the Twitter icon to view the questions.
  2. Click Reply to reply to a question or a conversation thread. To address your reply to a specific person, click the arrow mark adjacent to the name of the person.
  3. Type the reply and click Send.
-

# Types of widgets

---

- [Static widget](#)
- [Interactive widget](#)
- [Question widget](#)

---

## Static widget

[To the top](#) <sup>1</sup>

Static widgets are generic widgets that help you set up user interactions. Static widgets do not interact back with Adobe Captivate. This means, you cannot set up success and failure actions to these widgets.

---

## Interactive widget

[To the top](#) <sup>2</sup>

Interactive widgets change their appearance or function based on user input. You can assign success and failure actions to these widgets and make them interact back with Adobe Captivate when users interact with the widgets.

If you are a developer trying to create an interactive widget in Flash, you can explore the code for the button widget. The code gives you an idea of how to create interactive widgets. Look for the button widget, FlashButton.fla, on your computer in the \\Program Files\Adobe\Adobe Captivate <version number>\Gallery\ Widgets\FlashButton.wdgt (on Windows) and /Applications/Adobe Captivate 6/Gallery/Widgets/FlashButton.wdgt (on Mac OS).

The button widget glows when the user moves the pointer over it.

1. Insert a blank slide.
2. Insert the FlashButton.swf file from the Widget panel (Window > Widget).
3. Preview the slide. When you move the pointer over the button, the Button widget glows.

---

## Question widget

[To the top](#) <sup>3</sup>

You can use question widgets to add new question types in Adobe Captivate. The following procedure explains how to insert a widget for multiple choice questions:

1. Insert a blank slide.
2. Insert the widget MCQ\_AS3.swf from the Widget panel. Two slides, one with a placeholder for the question and the other for the scores are inserted.
3. Type the question and multiple choices as required.
4. To insert another question, insert a blank slide after the slide that contains the question and then insert the widget again.

**Note:** Use the Quiz Properties panel to edit properties such as the points scored per correct answer and the buttons to be displayed in the slides.

# Using ActionScript 3.0 in widgets

---

**Note:** Only ActionScript 3.0 is supported.

Changes in ActionScript from version 2 to version 3 warrant changes in how constructs access Adobe Captivate demos. Some of the changes are documented here.

- To declare onEnterFrame specify this.addEventListener("enterFrame",onEnterFrame);
- Use void instead of Void
- External interface takes only two parameters now. For example, ExternalInterface.addCallback("isStatic",isStatic);
- Use parent instead of \_parent
- Use the following code in the ActionScript file:

```
function cpSetValue(variable:String, val):void
{
if (variable == 'widgetMode')
{
widgetMode = val;
}
}
ExternalInterface.addCallback("cpSetValue", cpSetValue);
```

- The way to get widgetParam has changed in ActionScript 3.0 because of changes in the structure of Captivate demos:

```
var slide:Object = parent.parent.parent;
var slideXML:XMLList = XMLList(slide.slideXML);
var parname:String = parent.parent.name;
var ItemXML:XMLList = XMLList(slideXML.ItemList.Item.@name == parname));
widgetParam:String = ItemXML.widgetParams;
```

- Understand the new way of parsing XML.

**Note:** Ensure that the version of ActionScript for the widget matches the ActionScript version used for the Captivate demo. ActionScript 2.0 widgets do not work in movies published using ActionScript 3.0, and the other way around.

# Using XML in widgets

---

Widgets use XML to pass data from Flash to Captivate. The following examples illustrate widgets called by Adobe Captivate.

## Example 1: Creating objects inside Flash ActionScript

```
var _parameters: Object = new Object();
_parameters.country = txtCountry.text;
return _parameters;
```

This code segment creates an object named `_parameters` and assigns the field `country` to it. When the `_parameters` object returns, Adobe Captivate stores it in XML format for future use (for example, for publishing in a certain language).

## Example 2: Playing a movie containing a widget

```
if(movieHandle.widgetParams != undefined && movieHandle.widgetParams != '')//at runtime inside Captivate
movie
{
trace("widgetParams = "+movieHandle.widgetParams);
var x:XML = new XML(movieHandle.widgetParams);
var countryName = x.firstChild.firstChild.firstChild.firstChild.nodeValue;
ShowRandomizedCountryName(countryName);
initDone = true;
}
```

The visibility state is undefined for widgets. You set this state using the `movieHandle.widgetParams` property, which contains values derived from Adobe Captivate.

The `trace` command prints `widgetParams`, which is a string in XML format. You can access the nodes of the string using XML. Read the code to understand how your data is stored so that you can reach the node you need. To parse the string, use XML that is an ActionScript construct. For more information, see the ActionScript documentation in Flash.

# Using variables in widgets

---

To use an Adobe Captivate variable in widgets, specify the variable within \$\$\$. You can use both user-defined and system variables in widgets. The widget can get and set variables within the Captivate demo.

For example, the user-defined variable \$\$username\$\$ in a Certificate widget fetches the name of the user and displays it in the certificate.

---

# Widget panel

---

## [Sort widgets in the Widget panel](#)

## [Add new widgets to the Widget panel](#)

## [Change the default location of the Widget panel](#)

## [Download widgets from Adobe Captivate Exchange](#)

## [Linked widgets](#)

The Widget panel (Window > Widget) displays all the widgets that are present in the \\Program Files\Adobe\Adobe Captivate <version number>\Gallery\Widgets folder (on Windows) and /Applications/Adobe Captivate 6/Gallery/Widgets (on Mac OS). You can add widgets to a slide by dragging the widget from the panel to the slide. Alternatively, you can select a widget in the panel and click Insert. A preview of the widget is displayed in the Preview panel when you select a slide. Developers creating widgets can define the image that users see in the preview panel.

---

## Sort widgets in the Widget panel

[To the top](#)

You can sort widgets according to their type in the Widget panel.

- ❖ Use the menu at the bottom of the panel to select the type of widgets that you want displayed.

---

## Add new widgets to the Widget panel

[To the top](#)

1. Click the browse icon on the Widget panel.
2. In the Browse For Folder dialog box, navigate to the widget that you want to add to the panel.
3. Select the widget, and click Open.

---

## Change the default location of the Widget panel

[To the top](#)

The widgets in the Widget panel are picked up from the \\Program files\Adobe\Adobe Captivate 6\Gallery\Widgets folder (on Windows) and /Applications/Adobe Captivate 6/Gallery/Widgets folder (on Mac OS). You can change this default location by pointing the Widget panel to an alternative folder.

- Click the Change Path icon. In the Browse For Folder dialog box, select a folder from which to populate the Widget panel.

---

## Download widgets from Adobe Captivate Exchange

[To the top](#)

You can download widgets from Adobe Captivate Exchange to the Widget panel.

- Click the Adobe Captivate Exchange icon. Download the widget from the Adobe Captivate Exchange web site.

---

## Linked widgets

[To the top](#)

If you have a widget that references other widgets, do the following to display the widget in the Widget panel.

1. Save all the related widgets in a single folder.
2. Create a description.xml file that provides information about the linking of SWF files.

The description.xml file contains the following tags:

**Description** Description of the widget.

**Type** Type of the widget: Static, Interactive, or Question.

**Name** Name of the main SWF file that uses the linked SWF files.

**Linkedfiles** Name of the SWF files that are linked to the main SWF file. Use semicolons to separate the names.

3. Compress the folder and name the ZIP file, giving it a .wdgt extension.
  4. Place the ZIP file in the Widgets folder. The path to this folder is \\Program Files\Adobe\Adobe Captivate <version number>\Gallery\ (on Windows) and /Applications/Adobe Captivate 6/Gallery (on Mac OS).

## Variables and Advanced Actions

# Advanced actions

---

## [Advanced Actions model](#)

### [Create advanced actions](#)

### [Edit statements](#)

### [Edit/delete/duplicate advanced action](#)

### [Finding slides in which the script is used](#)

### [Apply advanced actions to slides](#)

### [Apply advanced actions to interactive objects](#)

You can use scripting in Adobe Captivate to do the following:

- Enhance the interactivity of Adobe Captivate projects by handling complex, and condition-based interaction scenarios.
- Control the movie.

---

## Advanced Actions model

[To the top](#) <sup>1</sup>

The scripting for the advanced actions model in Adobe Captivate is based on the Object-Event-Action model.

Events on an interactive object, such as mouse-clicks, trigger actions that are defined for that event. You can handle complex interaction scenarios by scripting your own actions and applying them to the various interactive objects. The scripting editor in Adobe Captivate helps you script custom actions for interactive objects.

You can use the following options to define actions for interactive objects in Adobe Captivate:

### Conditional Action

Provide if ... else conditions with and/or operators when scripting actions.

### Standard Action

Use a single script to run multiple actions in a sequence. Although the user interface provides a way to run multiple actions, it is restricted to the actions available in Adobe Captivate. During scripting, it is possible for you to combine actions defined during scripting with predefined actions in Adobe Captivate.

---

## Create advanced actions

[To the top](#) <sup>1</sup>

1. Select Project > Advanced Actions.
2. Select the action type:
  - Conditional Action** To create an if ... else condition for your script.
  - Standard Action** To customize one of the predefined actions in Adobe Captivate.
3. In the Action Name, specify a name for the action.
4. Click the add icon.
5. Complete writing the code with the supplied options. Any option that has not been assigned a value is indicated by the red icon. If you do not set these values, it results in an error when you try to save the script.
6. Click Save to save the script.

---

## Edit statements

[To the top](#) <sup>1</sup>

- When editing a script, use the appropriate icons to add, remove, copy, cut, paste, insert, or move a statement (a line of code).
- Use the drop-down menu to change the type from Variable to Literal, or the other way round.
- To remove a decision, select the decision and then click the delete icon.

## Edit/delete/duplicate advanced action

1. Select Project > Advanced Actions.
2. In the Existing Actions, select the action that you want to modify or delete.
3. Do one of the following:
  - Use the appropriate icon at the top-right corner to delete or duplicate the action
  - To update the advanced action, use the appropriate menu icons to update the statements and then click Update.

## Finding slides in which the script is used

1. Select Project > Advanced Actions.
2. In the Existing Actions, select the action.
3. Click Usage.

The slides in the project that use the selected script are displayed.

## Apply advanced actions to slides

1. In the Property Inspector (Window > Properties), go to Action.
2. Select Execute Advanced Actions.
3. In Script, select the script that you want to run from the Action menu.

## Apply advanced actions to interactive objects

1. In the Property Inspector (Window > Properties), go to Action.
2. In the action menu, select Execute Advanced Actions. Examples of actions are On Success, On Failure, and Lose Focus.
3. In Script, select the script that you want to run from the Action menu.

# Adobe Captivate SWF events

## Subscribe to SWF events

The following table lists the SWF events that are signaled by Adobe Captivate:

Event	Signaled when
CPMovieStartEvent	The movie starts playing
CPMovieStopEvent	After the movie finishes playing
CPMoviePauseEvent	The movie is paused
CPMovieResumeEvent	The movie resumes playing
CPSlideEnterEvent	While entering a slide
CPSlideExitEvent	While exiting a slide
CPQuestionSubmitEvent	A question is submitted and is evaluated.
CPAnswerSubmitEvent	An answer is submitted for the interactive object.
CPEndPlayerScrubbingEvent	Users stop scrubbing the playbar.
CPHideRolloverEvent	Users roll their mouse over a rollover object.
CPInteractiveItemSubmitEvent	Users click an interactive item.
CPQuestionEventData	Users submit an answer to a question.
CPQuestionSkipEvent	Users skip a question.
CPQuestionSubmitEvent	Users submit an answer to a question.
CPShowRolloverEvent	Users stop rolling the mouse over a rollover object.
CPStartPlaybarScrubbingEvent	Users start scrubbing the playbar.
CPVariableCreatedEvent	Users create a variable in Adobe Captivate.
CPVariableValueChangedEvent	Users change the value of a variable in Adobe Captivate.

## Subscribe to SWF events

[To the top](#)

Use the function `AddEventListener` to subscribe to SWF events.

### Example

```
eventHandle.addEventListener(CPMovieStartEvent.CPMOVIESTARTEVENT, CPEventHandler);
```

where

```
eventHandle = movieHandle.getMovieProps().eventDispatcher;
```

This example illustrates how to print a message when Adobe Captivate movie starts playing.

```
function CPEventHandler(e:Event):void
{
    switch(e.type)
```

```
{
    case CPMovieStartEvent.CPMOVIESTARTEVENT:
        var startEvt : CPMovieStartEvent;
        startEvt = e as CPMovieStartEvent;
        trace("movie started playing");
        break;
}
```

# Assign advanced actions to an event

---

You can define multiple actions that are performed sequentially after the occurrence of an event. You can assign multiple actions for the following:

**Interactive objects** You can define the sequence of actions after the user performs an action on an object.

**Slides** You can define the sequence of actions when the user enters or exits a slide.

**Question Slides** You can define the sequence of actions after the user completes answering a question.

For more information on the actions available in Adobe Captivate, see [Project navigation using interactive objects](#).

To assign advanced action,

1. In the Property Inspector (Window > Properties), select Execute Advanced Actions (in Action Area > On Enter).
2. Click the browse icon.
3. In the Advanced Actions dialog box, specify the details.
4. Click Close.

# Create a user-defined variable

1. Select Project > Variables.
2. In the Type menu, select User.
3. Click Add New, and enter the following information:

**Name** Specify a unique name for the variable. Ensure that the name is intuitive enough to help users guess its content. For example, a variable storing the version number of a product would have the name ProductVersion or VersionNumber.

**Value** Specify a value for the variable. The value that you specify occurs at all instances of occurrence of the variable in the document. You can also choose to set the value later by leaving this field blank. Variables with undefined values appear as blank spaces in the project.

**Description** Optionally, add a description for the variable. For example, you could add a note for the authors instructing them about when to use the variable.

4. Click Save.

**Note:** While assigning variables to text entry boxes, you can define the variable using the 'x' icon in the Property Inspector. For detailed instructions, see [this blog](#) by Lieve Weymeis.

Some of the variable names are reserved by ActionScript. Do not use the following variable names when creating your variable:

alpha	buttonMode	filters	mouseX	switch
currentframe	byte	final	mouseY	synchronized
droptarget	cacheAsBitmap	finally	name	tabChildren
focusrect	case	float	namespace	tabEnabled
ramesloaded	cast	focusEnabled	native	tabIndex
height	catch	focusRect	new	textSnapshot
highquality	char	for	null	this
lockroot	class	forceSmoothing	numChildren	throw
name	const	framesLoaded	opaqueBackground	throws
parent	constructor	function	override	to
quality	contextMenu	get	package	totalFrames
rotation	continue	goto	parent	trackAsMenu
soundbuftime	currentFrame	graphics	private	transform
target	currentLabel	height	protected	transient
totalframes	currentLabels	hitArea	prototype	true
url	currentScene	if	public	try
visible	debugger	implements	return	type
width	default	import	root	typeof
x	delete	in	rotation	use
xmouse	do	include	scale9Grid	useHandCursor
xscale	double	instanceof	scaleX	var
y	doubleClickEnabled	interface	scaleY	virtual
ymouse	dropTarget	internal	scenes	visible
yscale	dynamic	intrinsic	scrollRect	void
abstract	each	is	set	volatile
accessibilityProperties	else	loaderInfo	short	while
as	enabled	long	soundTransform	
blendMode	enum	mask	stage	
boolean	export	menu	static	

break	extends false	mouseChildren mouseEnabled	stop super	
-------	------------------	-------------------------------	---------------	--

[Legal Notices](#) | [Online Privacy Policy](#)

# Edit/delete a user-defined variable

---

1. Select Project > Variables.
2. In the list of variables, select the variable you want to edit.
3. Do one of the following:
  - To edit the variable, modify the value/description of the variable, and click Update.
  - To delete the variable from the list, click Remove.

**Note:** You cannot delete system variables or variables that are being used by text captions. Removing a variable referenced by an action resets the action to Continue.

---

# Tutorial on scripting

---

[Create variables for the project](#)

[Create objects for the slides](#)

[Create an advanced action for the login slide](#)

[Create an advanced action for the e-mail and welcome slide](#)

[Apply the advanced action to the login slide](#)

[Apply the advanced action to the next slide after login](#)

[More tutorials and examples](#)

The following tutorial helps you get started with using scripting in Adobe Captivate.

You have been asked to create a login slide with fields to enter the user name and password.

When the user enters the correct values, the following actions take place:

- The project moves to the next slide.
- A text caption in the next slide displays the message, "Welcome <user name>".
- The default e-mail editor opens with the e-mail ID of the person that must be informed of the login.

When the user enters incorrect information, a text caption is displayed asking the user to reenter information.

---

## Create variables for the project

[To the top](#)

1. Select Project > Variables.
2. Create a variable named varUserName, with the value user. For more information, see [Create a user-defined variable](#).
3. Create a variable named varPassword with the value password.

---

## Create objects for the slides

[To the top](#)

1. In an open project, insert two text entry boxes for the user name and password. The text entry boxes must be set to act as form fields.  
**Note:** To set a text entry box to act as a form field, select it and then deselect *Validate User Input* in the *Property Inspector*.
2. Delete the Submit button from the User Name field.
3. Set the following options for user name:
  - In Actions, go to On Success, and select No Action.
  - Deselect Infinite Attempts.  
**Note:** This option is disabled automatically when you disable *Validate User Input*.
  - In the Action area of the Property Inspector, select Continue in the Last Attempt field.
  - Associate the field with the variable varUserName in the Var Associated field (General area of the Property Inspector).
4. Double-click the text entry field for the password, and set the following options:
  - In the On Success field, select Continue.
  - Deselect Infinite Attempts.
  - In the After Last Attempt menu, select Continue.
  - In Variable Associated, select varPassword.
5. Insert a text caption and do the following:
  - Enter the following text on the caption: Invalid username/password. Please try again.
  - In Name, change the name of the caption to FailureCaption. Deselect the Visible option. Doing so hides the caption until the conditions in the script enable the caption.
6. Insert a blank slide.
7. Insert a text caption with the text Welcome and the variable varUserName in the format Welcome \$\$varUserName\$\$.
8. Save the project as variables.cp.

## Create an advanced action for the login slide

The advanced action for the login slide must do the following:

- Check whether the correct information has been entered in the login and password fields.
- Move to the next slide if the information is correct.
- Stay at the login slide if the information is incorrect and display a text caption requesting the user to reenter the login information.

1. Select Project > Advanced Actions.

2. In the script window, do the following:

a. Click Conditional Actions as the Action Type.

b. Specify the name of the script as 'validate'.

c. In the IF section, double-click the rows and select the appropriate options in the drop-down lists. See the following illustration for the options to select:

*IF condition in the 'validate' advanced action*

d. In the Actions section, double-click the first row and specify the action as Continue.

e. Click the Else header, double-click the rows, and specify the appropriate options as shown below.

*ELSE condition in the 'validate' advanced action*

Now look at individual lines of the code to understand what they do.

*Lines of code in the IF condition*

The code checks whether the user has used the user and password login credentials in the respective fields.

*Action performed when IF conditions are true*

This project moves to the next slide if the user name and password are entered correctly.

*Lines of code in the ELSE condition*

If the user information is incorrect, the project stays at the login slide. The text caption with the name FailureCaption is displayed.

## Create an advanced action for the e-mail and welcome slide

In the script window, do the following:

create a script named sequential action with the following code:

1. Click Standard Actions as the Action Type.
2. Specify the name of the script as 'sequentialaction'.
3. Double-click the rows and specify the options as shown below.

Lines of code in 'sequential action'

Now look at individual lines of the code to understand what they do.

First line of code in 'sequential action'

On successful login, the code opens up the default e-mail editor with the e-mail ID xyz@company.com displayed in the To field.

Second line of code in 'sequential action'

Displays the text caption containing the text, "Welcome <login name>".

## Apply the advanced action to the login slide

[To the top](#)

❖ Double-click the login slide, and set the following actions in the Property Inspector:

- On Enter: Select Continue.
- On Exit: Select Execute Advanced Actions, and in the Action menu, select Validate.

## Apply the advanced action to the next slide after login

[To the top](#)

❖ Double-click the display slide, and in the Property Inspector, set the following actions:

- On Enter: Select Execute Advanced Action, and choose sequential action in the Action menu.
- On Exit: select Go To Next Slide.

Run the project, and check whether the aims of the project have been achieved.

## Creating a Quiz

# Allow users to return to quiz

---

## Using Return To Quiz action

### Variable for quiz scope

The scope of a quiz begins from the first question slide and ends when a user:

- reaches the result slide; or
- the slide before the result slide if the result slide is hidden.

If users navigate to a content or a remedy slide while still in the scope of quiz, you can choose to allow users to return to the quiz. To do so, assign the Return To Quiz action to one of the following:

- Any interactive object on the slide. The interactive objects can be click box, button, or a text entry box.
- Slide Exit action.

**Note:** *This option is not applicable for question slides.*

You can assign the Return To Quiz action to existing or new interactive objects. When you assign the action to an existing object, Adobe Captivate associates the action only when users navigate to the slide from the quiz. Else, the Continue action is associated with the object.

For example, consider that you have a content slide that you want to use as a remedy slide for users who get a question wrong. When you change the action for the button on the content slide as Return To Quiz:

- The button behaves like a 'next' button when the users visit the slide for the first time. This behaviour helps you treat the slide like a regular content slide.
- The button takes the users back to the quiz.

---

## Using Return To Quiz action

[To the top](#) <sup>1</sup>

1. Configure your question slides to jump to the required remedy or content slides. To do so, click the Submit button and change the Action in the Property Inspector to Jump To Slide and choose the content slide.
2. Do one of the following actions:
  - On the content slide or the remedy slide, click any interactive object and click Return To Quiz in the Action list of the Property Inspector.
  - Click the slide and then click Return To Quiz from the On Exit list in the Action accordion of the Property Inspector.

When users click the interactive object associated with the Return To Quiz action, Adobe Captivate brings users back to:

- The last attempted question slide, if the answer provided by users earlier was incorrect or they skipped the question.
- The question after the last attempted question slide if it was answered correctly by users.
- Continues to the next slide if users had not attempted the quiz earlier.

---

## Variable for quiz scope

[To the top](#) <sup>1</sup>

cpInQuizScope is a read-only system variable that indicates whether users can return to the quiz from a slide. If the value of cpInQuizScope is:

- True, users return to the quiz when they exit the slide or click an interactive object that is assigned with the action Return To Quiz.
- False, users navigate to the next slide in the project.

# Insert pretests

## Reporting pretest performance

### Branching from pretests

### Variables for pretests

Pretests or preassessments are used to assess the knowledge of learners before they begin the course. Based on the points they score in the pretest, you can direct them to specific slides or modules in the course. This way the learners can make optimum use of their time by going through only that content that is relevant to them.

1. Click Quiz > Insert Question Slide.
2. Select the type of questions you want in the pretest and type the number of questions required.
3. In the drop-down list corresponding to each question type, click Pretest.

Differences between pretest and regular quiz questions:

Pretest	Regular quiz question
Cannot contain random question slides	Can contain random question slides
Edit Preset Action	No advanced action associated by default
No On Success action	On Success Action
Playbar is hidden always in the CPTX project (including regular quiz questions if any)	Playbar is available if it is enabled in Skin Editor. You can hide the playbar in regular quiz questions by selecting Hide Playbar In Quiz in Preferences.

## Reporting pretest performance

[To the top](#)

You can get the following details of pretests reported to an LMS, Acrobat.com, Adobe Connect, or to any server on your network:

- Slide views
- User interaction data

**Important:** You cannot report pretest scores using Adobe Captivate. However, you can get the pretest scores reported to an LMS using the Mult-SCO Packager in Adobe eLearning Suite. For more information, see [Adobe eLearning Suite documentation](#).

To enable reporting for pretests, do the following:

1. Click Edit > Preferences > Quiz > Reporting.
2. Select Enable Reporting For This Project, and choose an appropriate option. If you want the details to be reported to an LMS, click SCORM 1.2, SCORM 2004, or AICC based on the standard that your LMS supports.
3. Specify Success/Completion Criteria and Data To Report. For details, see [Success/Completion criteria](#) and [Data to report](#).

## Branching from pretests

[To the top](#)

1. Click one of the pretest question slides in the Filmstrip.
2. Click Edit Pretest Action in the Action accordion of the Quiz Properties panel.

The default action associated with pretests, CpPretestAction appears in the Advanced Actions dialog box.

3. Edit the advanced action by choosing appropriate values in the IF, Actions, and Else sections.
  - By default, the Edit Preset Action includes the variable, cpQuizInfoPretestScorePercentage in the IF section. If you have chosen points instead of percentage as the quiz score in the quiz settings, double-click the variable name and choose cpQuizInfoPretestPointScored.
  - If you have assigned partial or negative scores for the pretest scores, you can also use other variables, such as, cpQuizInfoQuestionPartialScoreOn.

Along with pretest, you can include regular quiz questions in individual modules in a course. In such cases, Review Quiz on the Result slide takes

users to the quiz in the module they viewed and not to the pretest.

[To the top](#)

---

## Variables for pretests

**cpQuizInfoPretestPointscored** Returns the score that users get in the pretest as points. For example, 20.

**cpQuizInfoPretestScorePercentage** Returns the score that users get in the pretest as percentage. For example, 50%.

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Insert question slides

## Default question slides

### Quiz results slide

Ensure that you have set up the quiz preferences before inserting question slides. For information on quiz preferences, see [Quiz preferences](#).

1. In an open project, select the slide after which you want to insert question slides.
2. Select Quiz > Question Slide.
3. Select the question types from the following and specify the number of questions slides of each type that must be inserted:  
**Multiple Choice** Users select one or more correct answers from a list.

**True/False** Users choose either True or False (or Yes or No).

**Fill-In-The-Blank** Users complete a blank in a sentence or phrase.

**Short Answer** Users supply a word or phrase.

**Matching** Users match entries in two lists.

**Hot Spot** Users move the pointer over areas on the slide.

**Sequence** Users arrange listed items in the correct sequence.

**Rating Scale (Likert)** Users indicate their level of agreement with statements.

**Random Question** Displays questions that are randomly selected from a question pool to which they are linked. After you select Random Question, select the appropriate question pool in Linked Question Pool. For details, see [Random question slides](#)

**Note:** *You can add a widget question slide only to question pools.*

4. Specify the number of questions.
5. Specify whether the question is a graded, survey, or a pretest question, and click OK.

**Graded Question** To evaluate the user using the score you assign for the question.

**Survey Question** To get user feedback.

**Note:** *Graded option is not applicable for Rating Scale (Likert) questions.*

**Pretest** To assess users' knowledge about the subject before they take the course.

New slide(s) with placeholder questions and answers appear in the Filmstrip. For a description of a typical default question slide, see [Default question slides](#).

In addition to the question slide that you have chosen, Adobe Captivate inserts a Quiz Results slide after the question slides. This slide summarizes the points that a user has scored across all the question slides. For more information on the quiz results slide, see [Quiz results slide](#).

After inserting a question slide, replace the placeholder question and answers with the required text. For more information on setting up the different types of slides, see [Set up question slides](#).

## Adobe recommends

 [Have a tutorial you would like to share?](#)

### Captivate 5 Quick Tip: Super-charged Quiz creation

Rick Zanotti

A video describing the general workflow of inserting question slides.

## Default question slides

[To the top](#) 

A typical default question slide contains placeholders for questions, answer choices, interactive buttons, and default captions.

A typical default question slide

A. Question type B. Quiz captions C. Quiz buttons D. Question placeholder E. Answer choices F. Review area G. Progress indicator

**Question type** Indicates the type of question, such as, multiple choice and true/false that you chose while inserting the slides.

**Question placeholder** Lets you type your question by editing the default text.

**Answer choices** Let you type the answer choices that you want to provide your users by editing the default text.

You can increase the number of answer choices using the Quiz Properties panel.

**Note:** The way you designate correct answers for your question varies based on the question type. See *Set up question slides for information*.

**Review area** Displays a preconfigured message to your users when they review the quiz using the Review Quiz button on the Quiz Results slide. You can configure the message in quiz preferences (Edit > Preferences > Quiz > Settings > Question Review Messages).

**Quiz buttons** Lets users reset their answers, skip the question, go back to a previous question, and submit their answers. You can choose to hide or show these buttons using the Quiz Properties panel.

**Quiz captions** Help you provide appropriate messages to the users when they answer the quiz. For more information, see Quiz properties.

**Progress indicator** Indicates the question numbers to users in a relative or absolute way. You can disable the progress indicator or change the type in project preferences. For information, see *Set progress indicator preferences*.

## Quiz results slide

[To the top](#)

The quiz results slide summarizes the performance of the user at the end of the quiz. You can hide or show the default parameters using the Quiz Properties panel.

Users can choose to continue with the course or review the quiz. When users review the quiz, the Review Area in the question slides displays a preconfigured message. The message indicates whether the user answered the question correctly, or skipped the question. You can customize the review messages in preferences (Edit > Preferences > Quiz > Settings > Quiz Review Messages).

By default, the quiz results slide is inserted after the question slides. You can click and drag the slide in the Filmstrip to any required location, for example, to the end of the course.

If you delete the slide, you can insert it again by clicking Show Score At The End Of The Quiz in project preferences (Edit > Preferences > Quiz > Settings).

# Quiz preferences

---

[Set general quiz preferences](#)

[Set pass or fail preferences](#)

[Specify messages and button labels](#)

[Set progress indicator preferences](#)

[To the top](#)

## Set general quiz preferences

1. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select Settings from the Quiz menu.
3. Enter information in the following fields:
4. **Name** Enter a name for your quiz. In a project with more than one quiz, naming helps identify a quiz easily.

**Required** Select one of the following options from the menu:

**Optional – The User Can Skip This Quiz** Allows users to skip the quiz and move on with the project.

**Required – The User Must Take The Quiz To Continue** The project moves to the next slide only after the user has moved through all the question slides.

**Pass Required – The User Must Pass This Quiz To Continue** The project moves to the next slide only after the user has scored the required points in the quiz.

**Answer All – The User Must Answer Every Question To Continue** The project moves to the next slide only after the user has answered all the question slides.

**Objective ID** The ID of the quiz to which the question slide belongs. In a master quiz containing multiple quizzes, an objective ID helps identify the quiz to which the question belongs.

**Interaction ID Prefix** Every action that the user performs on a question slide is assigned a unique interaction ID. For example, when the user attempts a question incorrectly the first time, and gets it right the next time round, Adobe Captivate generates two interaction IDs. Use this field if you want to customize the generated interaction IDs by prefixing them with the assigned characters.

**Shuffle Answers** For question slides with multiple answers, the answers are shuffled when the user attempts the same question slide the next time.

**Submit All** Enable this option to let users review and modify answered questions and submit all questions simultaneously. For more information, see Submitting all answers simultaneously.

**Branch Aware** Use this option to calculate the final score based only on the questions in the 'branch' that users have viewed. For example, consider that a project contains a quiz that branches into two modules that in turn contain a quiz each. If a user reaches the module with three questions and 10 points each, the total score is considered as 30 points.

If this option is not enabled, the scores are calculated on the total number of questions in the project and not the module that users actually viewed.

**Note:** *Pretests are branch-aware by default.*

**Show Progress** Select this option to show users which question number they are currently working on within the quiz. For more information, see Set progress indicator preferences.

**Allow Backward Movement** The user can visit the slides that were attempted previously.

**Show Score At End Of Quiz** Lets users view their score at the end of the quiz. You can customize the message that appears when the user passes or fails the quiz. Click Quiz Result Messages to customize the messages. You can also customize the options that you want displayed on the score slide.

**Pass Message** Customize the text that must be displayed when the user passes the quiz. Alternatively, you can disable this option if you do not want to display a message to the user.

**Fail Message** Customize the text that must be displayed when the user fails the quiz. Alternatively, you can disable this option if you do not want to display a message to the user.

**E-mail Button Text** Specifies the text for the E-mail button. Users can click the button to send an e-mail message to an address you specify.

**Display Score** Displays the user's score on the Results slide.

**Display Maximum Possible Score** The maximum score possible if all questions were answered correctly.

**Display Number of Correct Questions** The number of questions the user answered correctly.

**Display Total Number of Questions** The number of questions the user answered.

**Display Accuracy** The user's score as a percentage.

**Display Number Of Quiz Attempts** The number of user attempts.

**Allow User To Review Quiz** Users can review a quiz after they have completed attempting it and the score has been displayed. This option allows users to find out questions they answered incorrectly, and their correct answers. You can customize the messages provided in the feedback. Click Question Review Messages to customize the feedback messages:

**Incomplete** For incomplete answers.

**Correct** For correct answers.

**Partial Correct** For partially correct answers.

**Incorrect** The answer entered by the user, and the correct answer.

**Hide Playbar in Quiz** Select this option to hide the playbar on the question and result slides.

**Note:** *Playbar is never displayed for pretest questions.*

## Quiz reviews

When users review the quiz after attempting to answer it, Adobe Captivate provides feedback graphically through images.

Image/Message	Meaning	Displayed in Question Type...
	Question is answered incorrectly	All
	Question is answered correctly	All
	Answer to the question is partially correct	Multiple choice questions, if partial score is enabled. For example, if two choices are correct answers for the question and user selects one of them.
You did not answer this question completely (Default message specified in Preferences > Quiz > Settings > Question Review Messages)	Question is skipped	Any type of 'graded' question skipped by the user.
	Skipped answers	Matching question, Sequence question, Multiple choice questions, Fill in the blank questions with multiple answers For example, when a user does not select an option in the combo box of a matching question.
	Correct answer	All
	List of correct answers	Matching question, Sequence question, Fill in the blank questions For example, when users answer a sequence question incorrectly, the sticky icon provides the correct sequence of answers.
	Correct answer (in a hotspot question)	Hotspot question
	Incorrect answer	All
	Incorrect answer (in a hotspot question)	Hotspot question This icon is displayed on all the wrong clicks by the user in a hotspot question.

These images are in the <installation folder>/Gallery/Quiz/QuizReviewAssets folder. You can replace the images (PNG, FLA, and SWF files) with custom images. However, ensure that you maintain the same size as the default ones for best results.

[To the top](#)

## Set pass or fail preferences

You can set the minimum score required to pass a quiz. You can also define the action that should take place after the user passes or fails a test.

1. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select Pass or Fail from the Quiz menu.
3. In the Pass /Fail options, do one of the following:
  - Set the minimum percentage that the user must score to pass the quiz.
  - Set the minimum points that the user must score to pass the quiz.
4. To decide the course of the project after the user passes a quiz, select an action in the If Passing Grade section.

**Continue** The movie moves to the next defined action.

**Go To Previous Slide** The previous slide is displayed to the user.

**Go To Next Slide** The movie moves to the next slide.

**Go To Last Visited Slide** Similar to a back button. The movie moves to the previously viewed slide.

**Return To Quiz** Takes users back to

- The last attempted question slide if users answered it incorrectly or skipped the question.
- The question after the last attempted question slide if users answered the question correctly.

**Jump To Slide** The movie moves to the specified slide.

**Open URL Or File** A web browser opens with the specified web page if the user has internet connectivity. Alternatively, you could open a specified file for the user.

**Open Other Project** Opens the specified Adobe Captivate project.

**Send E-mail To** A draft of the default e-mail editor opens with the e-mail address specified in the To field.

**Execute JavaScript** Adobe Captivate runs the specified JavaScript.

**Execute Advanced Action** Adobe Captivate runs the script written using the application.

**Show** When the user performs the required action on the object, the specified hidden object is made visible

**Hide** When the user performs the required action on the object, the specified object is hidden from the user.

**Enable** When the user performs the required action on the object, it activates another object in the project.

**Disable** When the user performs the required action on the object, it disables another object in the project.

**Assign** When the user performs the required action on the object, the value of the specified variable is set inside the text caption.

**Increment** When the user performs the required action on the object, the value of the specified variable is incremented accordingly.

**Decrement** When the user performs the required action on the object, the value of the specified variable is decremented accordingly.

**Multiple Actions** When the user performs the required action on the object, multiple actions are performed in the order specified by the user.

**Apply Effect** When the user performs the required action, the effect associated is applied.

**No Action** Nothing happens when the user exits the slide.

5. To decide the course of the project after the user fails a quiz, select an action in the If Failing Grade section. The actions are similar to those in the If Passing Grade section.

[To the top](#)

## Specify messages and button labels

1. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select Default Labels from the Quiz menu.
3. Change the default labels and style for the Submit, Submit All, Clear, Skip, and Back buttons in the Default Question Button Labels section. The four buttons are displayed on any question slide unless you have disabled them in the Property Inspector of that slide.

To create a new style for the labels, click Create New Style. See Object style for more information.

4. Specify the text and the style to be used for the following:

**Correct Message** Appears when the user provides a correct answer.

**Incorrect Message** DEFINITION

**Retry Message** DEFINITION

**Incomplete Message** Appears when the user does not provide the complete answer to the question.

**Timeout Message** Appears when the user does not answer the question in the specified time. You can set the time using the Property Inspector of the question slide.

**Partial Correct Message** Appears when users select an answer that is partially correct in case of multiple choice questions.

[To the top](#) <sup>1</sup>

---

## Set progress indicator preferences

The progress bar displays the user's progress through the questions.

To set preferences for progress indicator,

1. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select Quiz > Settings.
3. In the Settings section, select Show Progress.
4. Specify a progress type. This decides how the progress bar displays the user's progress through the questions.
  - Relative Progress lists the current question and the total number of questions (for example, "Question 3 out of 10").
  - Absolute Progress lists just the question number (for example, "Question 3").

**Note:** In branched quizzes, the branching path can be indefinite. For example, if users click button A, then they go to branch 1 else branch 2. In such cases, Adobe Captivate omits the total number of questions even if Relative Progress is selected.

### Setting properties

Select the progress indicator on stage and then specify the properties in the Property Inspector.

**Style** Select a style for the progress indicator. To define a new style, select Edit > Object Style Manager. For more information on object styles, see Content reference to: Object style.

**Character** Specify the options to customize the appearance of the text for your progress bar.

More Help topics

# Random question slides

---

## Create question pools Create random question slides

Random question slides display questions that are randomly selected from a question pool to which they are linked. These slides help avoid quiz predictability. Random question slides do not have a Timeline of their own but use the timing of the question slide chosen at run time.

**Note:** *Random question slides cannot be exported into Flash 8 or Flash CS3.*

Create a question pool before creating a random question slide.

[To the top](#) <sup>4</sup>

## Create question pools

1. Select Quiz > Questions Pools Manager.
2. Click the add button (+) above the left panel to add a question pool.
3. In the text box that appears, type a name for the question pool.
4. Click the add button (+) above the right panel to add questions to the question pool.  
The Insert Questions dialog box appears.
5. Select the question types and specify the number of questions slides of each type that must be inserted.
6. (Optional) Click the remove button (–) in the right or left panel to remove questions from the question pools or question list.
7. Close the Insert Questions dialog box. The Question Pool panel appears.
8. Select the question slide in the Question pool panel and add the quiz content on stage. For more information, see Set up question slides.

**Note:** *Unlike the regular question slides, you cannot directly assign points or scores to the graded questions in question pools. You can assign the points to the random question slide using its Property Inspector.*

9. Repeat the procedure to add more question pools and questions to them.

Question pools cannot be exported as XML. However, in the Question Pool Manager, you can do the following using the right-click menu:

- Drag questions across question pools.
- Copy questions from one pool and paste them into other pools.
- Lock, unlock, hide, and show questions.

**Note:** *You can copy, duplicate, or delete the question slides using the Question Pool panel.*

## Move question slides to a question pool

You can move a question slide or a group of question slides to a question pool. The question slide is removed from the main project and placed in the question pool. Alternatively, you can move question slides from a question pool into the main project, or to other question pools.

Question pools do not support slide grouping, so all grouping information is lost when grouped slides are moved into pools. Consequently, when the question slides are moved back to the main project, they are not associated with any group.

To move question slides across multiple slide groups into a question pool, expand the group, select the question slides, and move them to the question pool.

**Note:** *You cannot undo the movement of question slides to question pools or to the main project.*

1. In the Filmstrip, select the question slide that has to be moved to the question pool.  
If required, you can select multiple slides.
2. Right-click (Windows) or Control-click (Mac OS) the slide, select Move Question To, and then select the pool to which you want to move the slide.

## Move a question from one question pool to another or to the main project

1. In the Question Pool panel, select the question slide that has to be moved to the question pool or main project.  
If required, you can select multiple slides.
2. Right-click (Windows) or Control-click (Mac OS) the slide, select Move Question To, and select either Main Project or Pool #.

## Import questions from question pools in other projects

1. Select File > Import > Question Pools.
2. Select the project to import, and click Open.

The question pools appear in the left panel of the Import Question Pools dialog box, and their corresponding questions appear in the right panel.

3. Select the questions to import into the current project, and click OK.

[To the top](#)

## Create random question slides

1. Click Quiz > Random Question Slide. A new slide appears in the Filmstrip that will be replaced at run-time with a question from the question pool that you select.
2. In the Quiz panel, do the following in the General area:
  - From the Question Pool menu, select the pool from which the questions are to be randomly selected. See Create question pools for detailed information.
  - Click Add Questions to add additional questions to the pool that you selected.
  - Select type as Survey or Graded.  
***Important:** If you select Survey, only survey questions from the question pool are randomly picked. Similarly, if you select Graded, only graded questions from the question pool are randomly picked.*  
If you select Survey and the question pool does not contain any survey questions, a blank slide is displayed to users.
3. In the Action area, do the following:

- For the options On Success and Last Attempt, use the menu to select one of the following actions:

**Continue** The movie moves to the next defined action.

**Go to the previous slide** The previous slide is displayed to the user.

**Go to the next slide** The movie moves to the next slide.

**Go to the slide last visited** Similar to a back button. The movie moves to the previously viewed slide.

**Jump to slide** The movie moves to the specified slide.

**Open URL Or file** A web browser opens with the specified web page if the user has internet connectivity. Alternatively, you could open a specified file for the user.

**Open another project** Opens the specified Adobe Captivate project.

**Send e-mail to** A draft of the default e-mail editor opens with the e-mail address specified in the To field.

**Execute JavaScript** Adobe Captivate runs the specified JavaScript.

**Execute Advanced Actions** Adobe Captivate runs the script written using the application.

**Assign** When the user performs the required action on the object, the value of the specified variable set inside the text caption.

**Increment** When the user performs the required action on the object, the value of the specified variable is incremented accordingly.

**Decrement** When the user performs the required action on the object, the value of the specified variable is decremented accordingly.

**Multiple Actions** When the user performs the required action on the object, multiple actions are performed in the order specified by the user.

**No Action** Nothing happens.

## Multiple-choice question slides

[To the top](#)

1. Insert the multiple choice question slide (Quiz > Question Slide > Multiple Choice).

The default multiple choice question contains a placeholder question and two answer choices: A and B.

2. Double-click the placeholder question on stage to edit it and type your question.
3. To add more answer choices, edit the number adjacent to Answers in the General accordion of the Quiz Properties panel (Window > Quiz Properties).

If the question has more than one correct answer, click Multiple Answers in the Quiz Properties panel.

**Note:** Select *Shuffle Answers* (Quiz Properties panel) if you want the choices to appear in a different order each time the user returns to this question.

4. To specify the correct answer (s), click the radio button or the check boxes that correspond to the correct answer choices on stage.
5. Select Partial Score to assign partial scores to answers. Then, select the answer item, and specify the points you want to award in the Advanced Answer Option in Property Inspector.

**Note:** You cannot set partial scores for multiple choice questions in question pools. For information on question pools, see *Random question slides*.

The variable, cpQuizInfoQuestionPartialScoreOn, indicates whether or not partial score is enabled for a question slide.

6. Specify other properties for the question slide in the Quiz Properties panel. For detailed information, see Quiz properties.

---

## True-or-false question slides

[To the top](#)

1. Insert the true/false question slide (Quiz > Question Slide > True/False).

The default true-or-false question slide contains a placeholder question and the answer choices: True and False.

2. Double-click the placeholder question to edit it and type your question.
3. To establish the correct answer, click the correct answer—True or False—on stage. You can replace True and False with Yes and No if required.
4. Specify other properties for the question slide in the Quiz Properties panel. For detailed information, see Quiz properties.

---

## Fill-in-the-blank question slides

[To the top](#)

1. Insert the fill-in-the-blank question slide (Quiz > Question Slide > Fill-In-The-Blank).
2. To specify the word or a phrase that users need to fill out, do one or all of the following:
  - Select a word or phrase, and click Mark Blank in the Quiz Properties panel.
  - Type your question in such a way that the answer (a word or a phrase) replaces the word 'blank'.
3. To provide multiple options that your users can choose from:

- a. Double click the word/phrase that is marked blank and then use the + button to add additional words/phrases that correctly fills in the blank.
- b. Select Dropdown list instead of User Input.
- c. Check the words/phrases that correctly fills in the blank.
- d. Select Shuffle Answ... if you want the choices to appear in a different order each time the user returns to this question.

[To the top](#)

## Short-answer question slides

1. Insert the fill-in-the-blank question slide (Quiz > Question Slide > Short Answer).
2. On stage, double-click the placeholder question to replace it with your question.
3. Double-click inside the answer box that is just below the question. The Correct Entries box appears.
4. Type the sentence or the phrases that constitute correct answers. Use the + button to add multiple entries.

[To the top](#)

## Matching question slides

1. Insert a matching question slide (Quiz > Question Slide > Matching).
2. In Column 1, click the placeholder text 'type the item here'. You see that a drop down list appears adjacent to the placeholder text. This list helps you specify the correct match for your questions. When your users answer the question, the answer is validated against the correct answer you specify in this list.
3. Double-click the placeholder text to replace it with the word or phrase to be matched.
4. In Column 2, double click 'type the answer here' to replace it with the answer choices. Do not specify the correct match in Column 2; use the drop-down list to specify the correct match.
5. To add more rows to the columns, specify the required number in the Column 1 and Column 2 fields in the General accordion of the Quiz Properties panel.
6. If you want the choices to appear in a different order each time the user returns to this question, click Shuffle Column 1 in the Quiz Properties panel.

[To the top](#)

## Hotspot question slides

Hotspot slides contain areas that the user must identify. For example, you can ask the user to identify company products from images displayed on the slide.

Answers to hotspot questions are correct if all the correct hotspots are clicked and none of the incorrect hotspots are clicked.

1. Insert a hotspot question slide (Quiz > Question Slide > Hot Spot).

The default hotspot slide contains placeholder text for the question and one hotspot area represented by a rectangle.
2. Double-click the placeholder question and replace it with your question.
3. Specify the number of hotspot areas you require in the Quiz Properties panel (the Answers field in the General accordion). You can add a maximum of 10 hotspot areas to a slide.
4. Add objects to the slide, for example, images, that you want to use as hotspots, and position the hotspot areas on these objects.
5. For each hotspot area, set the properties (such as, fill, stroke, correct answer) using the Property Inspector. For more information, see [Set hot spot properties](#).
6. Do the following in the Quiz Properties panel:
  - To disable mouse clicks on slide areas other than hotspots, click Allow Clicks Only On Hot Spots.
  - To customize the animation that appears when users click a hotspot, click Browse, and select the animation.

## Set hot spot properties

Click the hotspot area and do the following in the Property Inspector:

1. In the General accordion:

If clicking the hotspot is to be marked as a correct answer, (in the General area of Property Inspector).

  - Click Correct Answer if the hotspot is to be marked as a correct answer when users click it.
  - Click Show Hand Cursor Over Hit Area to make the hand icon appear when the mouse is moved over the hotspot.

2. In the Fill & Stroke accordion:

- To change the default border color, select the hotspot and then use the Stroke option.

**Note:** The border color isn't displayed if the frame width is set to zero.

- Enter a number or use the slider to set the thickness of the hotspot border.
- To change the default, use the Fill option.

**Note:** The fill color isn't displayed if the alpha is set to 0%. In the Color menu, specify a value for alpha. An alpha value of 0% creates an invisible (or transparent) fill; an alpha value of 100% creates an opaque fill.

3. To apply a shadow effect to hotspot area, click Enable in the Shadow & Reflection accordion.

4. In the Transform accordion, specify the exact size and position of the hotspot area.

5. Click , where available, to apply the properties to multiple hotspot areas on the slide and across the project.

---

## Sequence question slides

[To the top](#)

A sequence slide provides a list of items to be arranged in the correct order. For example, you can display a list of Polish kings and ask the user to arrange them chronologically.

1. Insert a sequence question slide ((Quiz > Question Slide > Sequence).
2. On stage, type the question replacing the dummy text.
3. Enter the list in the correct order. Adobe Captivate shuffles the answers in the list and displays them to users in random sequence.
4. In the Quiz Properties panel, specify the number of choices as Answers in the General accordion.
5. In the Answer Type list, specify the mode in which you want your users to arrange the answers in the list.

---

## Rating scale (Likert) question slides

[To the top](#)

A rating scale slide displays a statement to which users specify their level of agreement. For example, you can add the statement, "I learned valuable information from this presentation" and give the user a range of responses to choose from: disagree, somewhat disagree, am neutral, somewhat agree, or agree.

Rating scale questions are not graded and have no right or wrong answers. You can't assign a point value or create branching on the basis of correctness. You can, however, decide what happens after the user completes the rating scale, such as continuing to the next slide, opening another project, or displaying a URL

1. Insert a Rating Scale (Likert) question slide (Quiz > Question Slide > Rating Scale (Likert)).
2. On stage, rephrase the instruction by replacing the default text.
3. In the General accordion of the Quiz Properties panel (the Answers field), specify the number of rows of survey questions you require.
4. To edit the default agreement levels, double-click the text, and replace it with your text.  
  
You can edit the properties of the Likert Header that contains the agreement levels using the Property Inspector.
5. Complete the After Survey specification in the Action area of the Quiz Properties panel. The After Survey area is the same as the If Correct Answer area as described in the general workflow.

---

## Question widget slides

[To the top](#)

You can insert question widgets created as SWF files in Flash into Adobe Captivate. Developers creating the question widget in Flash must use a template code for efficient integration of the question widget into Adobe Captivate. For more information, see [Create question widgets](#).

1. Select Insert > Widget.
2. In the Open dialog box, select the question widget that you want to insert.
3. In the Widget Question dialog box, do the following:
  - a. In the Name field, enter a name for the widget.
  - b. In the Question field, enter the question.
  - c. Assign the points that should be awarded to the user who answers the question correctly.
4. Follow the instructions in the Widget Parameters section to create the question.

---

[To the top](#)

## Quiz properties

For each question slide, do the following in the Quiz Properties panel (Window > Quiz Properties):

1. In the General area:

- Toggle between Survey and Graded options using the Type list.
- (If type is Graded) Edit the number adjacent to Points (1 to 100) to specify the score a user gets by answering a question correctly.
- To award negative points to wrong answers, specify the required points as Penalty. Do not include the minus sign while specifying this value. The variable, cpQuizInfoNegativepointsOnCurrentQuestionSlide, helps you know if a question is configured for negative points.
- Specify the style for numbering the answer choices in the Numbering list.

2. In the Options area, specify the time limit and the captions to be included:

**Clear** Resets the slide to the initial view. It allows the user to start answering the questions on a slide by clearing the entered answers.

**Back** Takes the user to the previously attempted question slide.

**Skip** Allows the user to skip the question slide and move to the next slide.

**Correct** Displays a caption that lets users know that their answer is correct or incorrect.

**Incomplete** Displays a caption that lets users know that they did not complete the question when they click Skip.

**Partial Correct** Displays a caption to let users know that they have answered the question partially correct. This option appears only in multiple choice question slides for which partial score is enabled.

**Time Limit** Lets you specify a time limit by when the users have to answer the question. You can specify the time in seconds (maximum 1800 seconds). You can also click Timeout Caption to display a message to users that the time allotted for the question has expired.

3. In the Action area, specify the number of attempts, failure levels, and the action to be taken after the users visit the slide and the last attempt.

For more information, see On Success options and Last attempt options.

4. In the Reporting area, specify whether you want the answers to be reported along with other parameters chosen in quiz preferences (Edit > Preferences > Quiz > Reporting).

Also, specify an Interaction ID. For more information, see Reporting options.

## On Success options

In the Action area of Quiz Properties panel, select the action that should take place after the user provides the correct answer from the On Success menu:

**Continue** The movie moves to the next defined action.

**Go To Previous Slide** The previous slide is displayed to the user.

**Go To Next Slide** The movie moves to the next slide.

**Go To Last Visited Slide** Similar to a back button. The movie moves to the previously viewed slide.

**Jump To Slide** The movie moves to the specified slide.

**Open URL Or File** A web browser opens with the specified web page if the user has internet connectivity. Alternatively, you could open a specified file for the user.

**Open another project** Opens the specified Adobe Captivate project.

**Send e-mail to** A draft of the default e-mail editor opens with the e-mail address specified in the To field.

**Execute JavaScript** Adobe Captivate runs the specified JavaScript.

**Execute Advanced Action** Adobe Captivate runs the script written using the application.

**Play Audio** Adobe Captivate plays the specified audio when the users provide correct answers to the questions. The audio plays until users click another interactive object, or navigate away from the slide. If users do not interact, the audio plays only for the duration of the specified audio file and does not loop.

**Stop Triggered Audio** Adobe Captivate stops the latest audio that was triggered by the Play Audio action.

**Show** When the user performs the required action on the object, the specified hidden object is made visible

**Hide** When the user performs the required action on the object, the specified object is hidden from the user.

**Assign** When the user performs the required action on the object, the value of the specified variable set inside the text caption.

**Increment** When the user performs the required action on the object, the value of the specified variable is incremented accordingly.

**Decrement** When the user performs the required action on the object, the value of the specified variable is decremented accordingly.

**Multiple Actions** When the user performs the required action on the object, multiple actions are performed in the order specified by the user.

## Show Correct Message

On stage, select the Correct Caption and then replace the dummy text with a caption to display when the user supplies a correct answer.

In the Options area of the Quiz Properties, uncheck Correct (in the Captions section) to provide no feedback for a correct answer.

## Last attempt options

In the Action area of Quiz Properties panel, specify the following:

**Attempts** Select the number of times the user can attempt the question. After this number of attempts, the action you select from the Action pop-up menu occurs.

**Infinite** The user can attempt the question any number of times.

**Failure Levels** Specify the number of attempts for which the incorrect message is displayed. For example, if the level is set to 2, the error message is displayed for the first two attempts.

**Last Attempt** The options are the same as for the If Correct Answer area.

**Retry Message** Display a message when the user supplies an incorrect answer but there are remaining attempts available. This option is disabled if failure levels have been set.

In the Options area of Quiz Properties panel, specify the following:

**Show Incomplete Message** Select Incomplete to display a message (for example, "Please select an answer before continuing.") when the user doesn't supply an answer. This option is disabled if you have chosen the Drag Drop option. On stage, edit the dummy text to specify the appropriate message.

**Show Timeout Message** Select Timeout Caption to display a timeout message when the user fails to answer the question in the specified time. On stage, edit the dummy text to specify the appropriate message.

## Reporting options

Use the Reporting area of the Quiz panel to specify the reporting options.

**Report Answers** Keep a quiz score.

**Note:** *Interactive details like interaction ID, objective ID, and interaction type are not sent to the learning management system (LMS) if this option is not selected. However, details of the quiz, such as the total score, result, and quiz state, are still sent to the LMS.*

**Interaction ID** If you want the Adobe Captivate project (SWF file) to send tracking information to your LMS, enter the interaction ID specified by your LMS.

---

## Answer area properties

[To the top](#)

**Name** Enter a unique name for the answer area.

**Note:** *Although you can provide a name, the answer area is not available in Advanced Actions.*

**Style** Select a style for the answer area. To define a new style, select Edit > Object Style Manager. For more information on object styles, see Object style.

**Fill & Stroke** Use this accordion to specify the fill and stroke properties for the answer area.

**Fill** Click to fill the answer area with a color and type the transparency (in percentage) in the adjacent field. You can also choose a gradient fill or a texture fill. See [Apply gradient fills](#) and [Apply texture fills](#) for more information.

**Stroke** Click to fill the stroke with a color. Use the Width slider to specify the width of the stroke line. Choose a style for the Stroke line from the Style list.

**Corner Radius** Specify how much rounded you want the corners of the answer area to be.

**Transform** Use this section to define the exact size or location of the answer area in terms of pixels. You can also specify the rotation of the answer area in this section.

**X** Position of the text entry box on the X-axis

**Y** Position of the text entry box on the Y-axis.

**W** Width of the text entry box.

**H** Height of the text entry box.

**Constrain Proportions** Maintains the height-to-width ratio of the text entry box when you resize it.

More Help topics

# Submitting all answers simultaneously

---

To enable users to modify their choice for an answered question, you can use the Submit All button. To insert the button, click Submit All in Preferences (Edit > Preferences > Settings > Submit All).

The Submit button on every question slide in the quiz is replaced with the Submit All button. Although users can see this button on every slide, Adobe Captivate displays appropriate warnings if they click the button without attempting all the answers. These messages can be customized in the Quiz Preferences (Edit > Preferences > Settings > Submit All Messages). You can also change the look and feel of the message box using the Object Style Manager (Edit > Object Style Manager > Runtime Messages).

**Important:** *The answers are reported to LMS only after users click the Submit All button on the last question slide.*

After users click the Submit All button on the last question slide, they can click Return To Quiz to go back and change their answers.

---

# Advanced Editing and Project Reviews

# Projects and project preferences

---

[Edit project preferences](#)  
[Set project background color](#)  
[Recover damaged projects](#)

[To the top](#) <sup>1</sup>

## Edit project preferences

You can set project preferences that are applied to all the slides in the project. Some of these settings can overrule specific settings that you have set at the slide level. Use the Project menu in the Preferences dialog box to make the changes.

### Edit project information

Project properties are visible to users from the Information button that is included with all playback controls. It is important to set project properties if you are creating 508-compliant accessible projects.

Select Edit > Preferences > Project > Information (Windows) or Adobe Captivate > Preferences > Project > Information (Mac OS) and specify the following properties:

**Author** Name of the author or authors of the project.

**Company** Name of the company or organization responsible for the content in the document.

**E-mail** E-mail address for the company or, if appropriate, of your customer service department.

**Website** Website address of the company.

**Copyright** Copyright information for your project.

**Project Name** A distinctive and descriptive name for your project.

**Description** Short description of the contents of the project. For example, "This project is a brief overview of Product ZYX."

### Change project size and quality

Select Edit > Preferences > Project > SWF Size And Quality (Windows) or Adobe Captivate > Preferences > Project > SWF Size And Quality (Mac OS) and specify the following properties:

**Compress Full Motion Recording SWF File** Compresses the full motion recording SWF file to a smaller size. Choosing this option can increase the time taken to preview or publish the project.

**Settings** Indicates the quality of the published SWF file. You can select the quality of the SWF file by moving the slider bar to the corresponding option: High, Medium, Low, or Custom. When you choose High, Medium, or Low, Adobe Captivate uses its internal settings to set the quality of the file. Files of a higher quality are compressed to a lesser extent, and therefore might be of a greater file size. You can customize the options for quality when you move the slider to the Custom level.

**Retain Slide Quality Settings** Retains the slide quality settings defined in the Property inspector of the slide.

**BMP** Determines the image quality of bitmaps (screenshots) generated during recording. Reducing the image quality reduces the file size but can affect the quality of the color in the images. Any bitmap files that you have inserted in the project are also affected.

**JPEG** Determines the quality of JPEG files that you have inserted in the project. Reducing the image quality reduces the file size but can affect the quality of the color in the images. JPEG images are detailed and contain many colors, so greatly lowering their quality is not advised.

**Audio** Determines the quality of audio files used in the project. Audio files are converted to mp3 format before they are published. A file with higher quality does not affect the file size drastically but significantly improves the audio quality.

**Advanced Project Compression** Enables Adobe Captivate to take into account only the difference between two slides instead of publishing both the slides. The compression reduces the size of the published project. Choosing this option can increase the time taken to preview or publish the project. Compressed projects sometimes do not play as intended in Flash Player.

**Compress SWF File** Compresses the published SWF file. Compressed SWF files can be played only with Flash Player 9 or later. Choosing this option can increase the time taken to preview or publish the project.

### Define how a project starts and ends

Select Edit > Preferences > Project > Start And End (Windows) or Adobe Captivate > Preferences > Project > Start And End (Mac OS) and specify the following preferences:

**Auto Play** The movie starts playing as soon as it is downloaded. If you want the movie to play only after the user clicks the Play button, deselect this option. You can display an image until the user starts playing the movie. Click Browse (...) to select the image. If you do not select an image, the first slide of the movie is displayed.

**Preloader** You can add a loading screen to the beginning of your project. A loading screen is useful if the first slide of the project is large or contains audio and takes a few moments to appear.

Adobe Captivate includes predefined loading screen images that you can use. Also, you can create a custom image to use as a loading screen. You can also create a SWF file to use as a loading screen. In the Adobe Captivate Preloaders folder, there is a sample SWF file and FLA file named DefaultPreloader. You can use these files as templates to create your own SWF file. If you add a custom loading screen, Adobe Captivate calls the following functions if they exist on the main Timeline of the SWF file:

**Note:** The preloaders available in Adobe Captivate are located in the \\ProgramFiles\Adobe\Adobe Captivate <version number>\Gallery\Preloaders folder on Windows. They are available at /Applications/Adobe Captivate 6/Gallery/Preloaders directory on Mac OS.

```
function initialize(projectWidth:Number, projectHeight:Number) function  
onProgress(loadedBytes:Number, totalBytes:Number, preloadPercent:Number) function isDone():Boolean
```

**Preload%** The percentage of the SWF file that must be downloaded before the file starts playing. After the required portion of SWF file has been downloaded, the preloader disappears, and the SWF file starts playing.

**Password Protect Project** Password that users must enter before they can view the project. In the adjacent box, type the correct password to be used by users to successfully view the project. Click Options to specify the following:

**Message** The message that is displayed to users to explain what they must do when prompted to type a password.

**Retry Message** The message to be displayed when users enter an incorrect password.

**Button Text** The text that is displayed on the button that the users click in order to continue viewing the project.

**Project Expiry Date** Expiry date for the project. Click Calendar to choose a date. In the adjacent text box, specify the message to be displayed to users when the project expires.

When a project expires, it can no longer be viewed.

**Fade In On The First Slide** Provides a fade-in effect to the first slide of the project.

**Action** Click the menu and select an action to take place at the end of the project.

**Stop Project** Stops the project after it plays once.

**Loop Project** Continuously plays the project.

**Close Project** Closes the movie after it stops playing.

**Open URL Or File** Opens the specified website in a web browser after the movie stops playing.

To load a URL, type the full path to a website (for example, http://www.website.com). Click the inverted arrow icon next to the URL box to select the window in which to display the URL, then choose Current, New, Parent, or Top.

To load a file, click the browse icon, browse to the file, select the file, and click Open.

**Execute JavaScript** Runs the specified JavaScript after the movie stops playing. Click Script\_Window and type the javascript to execute. To reuse a script from a file, copy the script onto the clipboard and paste it into the JavaScript window. Click the inverted arrow icon next to the Script\_Window button to select the window in which to display the URL, then choose Current, New, Parent, or Top.

**Open Another Project** Opens another project after the movie stops playing. Click the browse icon, browse to the project file (with the extension .swf, .rd, or .cptx), select the file, and click Open. Click the inverted arrow icon to select the window in which to display the file, then choose Current, New, Parent, or Top.

**Send E-mail To** Sends an e-mail to the specified e-mail address after the movie stops playing. The default mail editor is used to send the message. Type the e-mail address in the adjacent box. Click the inverted arrow icon to select the window in which to display the file, then choose Current, New, Parent, or Top.

**Fade Out On The Last Slide** Select this option to have the last slide in the project fade out of view.

## Edit default preferences for slides and objects

The changes that you make in the Preferences dialog box are applied to all the slides in the project.

1. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select Defaults from the Global menu.

3. In the Slide Duration field, change the default time for which slides are displayed in the movie.
4. Set a background color for the slides in the project using the Background Color menu.
5. To change the number of slides displayed when the 'Preview next  $n$  slides' option is used, change the value of the Preview Next  $n$  Slides field. The default value is 5.
6. Select an object from the Select menu, and do the following according to your requirements.
  - Change the default time for which the selected object appears on the slide.
  - Change the default style for the selected object.
7. To resize a text caption according to the amount of text available in it, select Autosize Captions. The text caption resizes automatically to accommodate all the text. If you do not choose this option, the extra data is hidden. Manually resize the text caption to display the hidden data.
8. To resize a button according to the amount of text available in it, select Autosize Buttons. The button resizes automatically to accommodate the extra data. If you do not choose this option, the extra data is hidden. Manually resize the button to display the hidden data.
9. If you want to set the time of the caption automatically in accordance with the amount of data in it, select Calculate Caption Timing. Adobe Captivate calculates the time that the viewer requires to read the text and applies it to the text caption.

## Export and import project preferences

By exporting project preferences you can reuse your set of preferences across projects. Preferences can be saved and exported as CPR files. When the CPR file is imported into a project, the preferences mentioned in the CPR file are set in the Preferences dialog box.

1. Select File > Export > Preferences.
2. In the Save As dialog box, save your preferences as a CPR file.
3. Click Save.

When you want to import preferences into another project, select File > Import > Import Preferences. Open the file from the location where you saved the CPR file.

---

## Set project background color

[To the top](#) <sup>1</sup>

You can set the background color for the project. Whether the background color appears on all slides depends on the type of slide and how a screenshot is captured.

1. In an open project, select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Category panel, select Defaults from the Global menu.
3. Click the box adjacent to the Background Color option, and do the following:
  - To fill the background with a color, click a color.
  - To apply a gradient fill, click the gradient icon, and then choose the gradient options. For more information on gradient fills, see Apply gradient fills.
4. Click OK.

---

## Recover damaged projects

[To the top](#) <sup>1</sup>

Use one or all of the following options to recover damaged or corrupted projects:

- Using the project backup file
- Clearing the project cache

## Clear the project cache

Project cache in Adobe Captivate 6 helps you save and open projects faster. When you create a project in Adobe Captivate 6, a corresponding project cache folder is automatically created. This folder is saved in the project cache root folder specified in the project Preferences.

Over time, these cache folders may use up your system resources and you may want to delete the folders to optimize the resources. You can delete the folders using the 'Clear Cache' option in the project Preferences (Edit (Win)/Adobe Captivate (Mac) > Preferences > General Settings >

Project Cache).

### Clear Cache option in Preferences

To delete multiple project cache folders, use the Clear Cache application. This application lists all the Adobe Captivate project cache folders on the system along with the corresponding project name, size, status of the project (opened or closed), date modified, and cache size. Using this information, you can decide which cache folders you want to delete and quickly delete multiple cache folders with a single click.

To install and use this utility, perform the following steps:

1. Download [dcache.zip](#) and unzip the contents.
2. Double-click the file dcache.zip and follow the on-screen instructions to install the utility.
3. After the installation, the Clear Cache Application opens and lists all the project cache folders in the default cache location.
  - To view the cache folders in a different location on your system, click Browse, and navigate to the location of the folder.
  - To delete a cache folder, select the check box that corresponds to the folder and click Clear. To delete all the folders, click Select All, and then click Clear. Please note that currently opened projects cannot be selected for deletion.

# Spelling and search

---

[Check spelling](#)  
[Search slides and replace content](#)

[To the top](#) <sup>↑</sup>

## Check spelling

You can check spelling in most places where text occurs in your projects, including captions, slide notes, slide names, text animations, and quizzes.

 *Before checking spelling, set the options for spelling checking.*

1. Open an Adobe Captivate project.
2. Select Project > Check Spelling. Alternatively, you can press F7.
3. When Adobe Captivate encounters an unrecognized word, the word appears in the Not In Dictionary text box. Select the appropriate options based on how you want the discrepancy handled:

**Ignore Once** Ignores this instance of the unrecognized word.

**Ignore All** Ignores all instances of the unrecognized word.

**Add To Dictionary** Adds the unrecognized word to your personal dictionary. The personal dictionary added.txt can be found on your computer at the following locations:

- On Windows: \\Documents and Settings\\Local Settings\Application Data\Adobe\Linguistics\Dictionaries\Adobe Custom Dictionary\- On Mac: <boot>\Users\

You can add words or remove them from the personal dictionary by opening the added.txt file in Notepad, making the changes, and saving the file. Words added in this file are not marked incorrect during a spell check by Adobe Captivate.

**Delete** Removes the unrecognized word.

**Change** Replaces this instance of the unrecognized word with text that you type in the Not In Dictionary text box or with the text that is selected in the Suggestions list.

**Change All** Replaces all instances of the unrecognized word in the same manner.

4. (Optional) The default dictionary used to check spelling is English. To change the language, click the pop-up menu in Main Dictionary Language and select a new language.
5. (Optional) If you want to change how spelling is checked, click Options.
6. When you finish, click Close.

## Set spelling check options

Adobe Captivate lets you check spelling in most places where text occurs in your projects, including captions, slide notes, slide names, text animations, and quizzes. Before using the spelling checking feature, review the spelling check options and change them if necessary.

1. Open the project and select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select General Settings from the Global menu.
3. Click Spelling Preferences.
4. In the Spelling Options dialog box, set the following options:

**Ignore Capitalized Words** Omits any words from the spelling check that begin with a capital letter such as “Adobe.” Consider this option if

your text contains many proper nouns.

**Ignore All-Caps Words** Omits any words from the spelling check composed of all uppercase letters such as “MIDI.” Consider this option if your text contains many acronyms.

**Ignore Words With Numbers** Omits any words from the spelling check that contain digits such as Q2. Consider this option if your text contains many symbols or code with numbers.

**Ignore Mixed Case Words** Omits any words from the spelling check composed of uppercase and lowercase letters such as “ActionScript.”

**Ignore Domain Names** Omits any words from the spelling check that appear to be Internet domain names such as www.adobe.com.

**Report Doubled Words** Notifies you during the spelling check of any words that appear twice in a row such as “the the.”

**Case Sensitive** Analyzes capitalized and lowercase versions of words separately. For example, “chicago” and “Chicago” would each be checked and the lowercase spelling would be identified as a misspelled word.

**Suggest Split Words** Provides two-word suggestions for any misspelled word that appears to be two joined words such as suggesting “press the” for “pressthe.”

**Main Dictionary Language** Specifies the dictionary language used during the spelling check. The default dictionary is English. To change the language, select the new language from the list.

5. When you finish, click OK.

## Change dictionary

By default, the spelling checker uses the English (United States) dictionary. You can change to any dictionary installed on your computer at any time.

1. Open the project and select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Category Panel, select Global.
3. Click Spelling Preferences.
4. In the Spelling Options dialog box, select the dictionary you want to use in the Main Dictionary Language list. All dictionaries installed on your computer are listed.
5. Click OK.

---

## Search slides and replace content

[To the top](#)

You can use the numerous options available in the Adobe Captivate Find feature to search for information on your slides. Besides text, you can locate different kinds of objects, such as text animation or a rollover image.

1. Select Edit > Find And Replace.  
The Find And Replace panel appears.
2. Select the object to be searched from the Search In list. The type selection determines which fields are enabled on the panel.
3. To narrow down the search, select the style associated with the object in the Style list.
4. In the Find field, enter the text or object to search for.

**Note:** The Find field is enabled for All Controls, Text Entry, Button, and Text Animation searches only. In the Adobe Captivate update for subscription and Adobe Software Assurance customers, this field is enabled for Slide Notes / Closed Caption / Text-To-Speech search too.

5. (Optional) In the Replace field, enter the text that replaces the search string.

**Note:** The Replace option is enabled for All Controls, Text Entry, Button, and Text Animation searches only. In the Adobe Captivate update for subscription and Adobe Software Assurance customers, this field is enabled for Slide Notes / Closed Caption / Text-To-Speech search too.

6. Select any of the following options:

**Whole Word** Skip variations of the text. For example, find special, but not specialist.

**Match Case** For example, find Chair, but not chair.

**Quiz Slides** Include quiz slides in the search.

**Hidden Items** Include hidden slides or controls in the search.

**Locked Items** Include locked slides or controls in the search.

7. Click any of the following buttons:

**Find Next** The focus moves to the next occurrence of the text or object.

**Find All** The search result lists all instances of the text or object.

**Replace** The selected found text is replaced with the text in the Replace field.

**Replace All** All instances of the text in the Find field are replaced with the text in the Replace field.

**Note:** Use *Replace All* only when you are sure that the other words in the project are not affected adversely. For example, if you choose to replace all instances of "to" with "too," the word "together," after the replace operation, is converted to "together."

# Using the AIR Review application

---

- [Creating reviews for Adobe Captivate projects](#)
- [Sending projects for reviews](#)
- [Reviewing Adobe Captivate projects](#)

---

## Creating reviews for Adobe Captivate projects

[To the top](#) <sup>1</sup>

After creating and editing an Adobe Captivate project, the author can publish the project for review on one of the following:

- An internal server
- Acrobat.com

The project is published as a CREV file, a custom SWF file that is used for review.

Reviewers can review the CREV file by opening it in Adobe Captivate Reviewer, an AIR application. The installer for the application, AdobeCaptivateReviewer.air, is present in the location where you installed Adobe Captivate. You can also download it from the Adobe website: [www.adobe.com/go/cp5\\_reviewerapp](http://www.adobe.com/go/cp5_reviewerapp).

If you choose an internal server for the review process, you can send the AIR application along with the e-mail notification for review. If you choose Acrobat.com for the review process, the reviewers have to install the AIR application from the URL included in the default e-mail message.

**Note:** Reviewers can install Adobe Captivate Reviewer without installing Adobe Captivate on their computers. However, they need to install Adobe AIR before installing the application. Adobe AIR can be downloaded for free from the Adobe website <http://get.adobe.com/air/>. Installing the AIR application is a one-time effort.

In a shared review where the author and the reviewers are on a common network, each of them can view comments posted by the other. The author, in addition, can accept, reject, or ask for feedback for the comments posted by the reviewers.

Reviewers who are not a part of the shared network can export their comments to an XML file and send it to the author. The author can import the XML file into the project, and view comments in the timeline of the slides where the reviewers posted them.

During the review cycle, the author and reviewers can view the latest comments posted by refreshing the contents of the application.

---

## Sending projects for reviews

[To the top](#) <sup>1</sup>

### Sharing projects for review on an internal server

1. Select File > Collaborate > Send for Shared Review.
2. In the Send for Shared Review dialog box, type a name for the review file (CREV file) and then select Automatically Collect Comments From My Own Internal Server.
3. Click Next.
4. Use the following options to create the CREV file:

#### **Publish Folder**

The location where the CREV file is published. Click Browse if you want to specify a different location for the generated files.

#### **Project Comments Folder**

Select this option and choose a shared folder, either on your computer or on the network, for storing the comments. Ensure that you provide write permissions to the folder. The path to the shared location must begin with a double backslash (\\) on Windows. On Mac, prefix the path with smb://.

If reviewers do not have access to a shared folder, you can choose not to specify a location for the comments. In this case, you can ask the reviewers to export their comments to an XML file and send the file to you.

When there is no shared network, you can choose not to specify a location. The reviewer must export the comments and send them to you. When you import the contents of the XML file, the comments are embedded in your project.

5. Select Send Mail, and do the following:

Select Attach Review (.CREV) File if you want to send the CREV file as an attachment along with the mail. Use this option when the size of the CREV file is small enough to be sent by e-mail. E-mail filters are usually configured to block e-mails that are larger than a specified size.

- Select Attach Adobe Captivate Reviewer if you want to send the AIR installer as an attachment. Use this option the first time you send a CREV file to a reviewer.

6. Click Email. A draft of the e-mail appears.
7. Customize the body of the draft if you want to provide additional instructions to reviewers.
8. Enter e-mail addresses of reviewers in the To and Cc fields, and click Send.

**Note:** Best practice is not to edit the Adobe Captivate project during the review. If the project changes during the review, the posted comments might not appear at the intended locations. If you must edit the project, ask the reviewers to stop their work. Then start a fresh review after editing the project.

## Share the project on Acrobat.com for review

1. Open the project that you want to share for review.
2. Select File > Collaborate > Send For Shared Review.
3. In the Send for Shared Review dialog box, type a name for the review file (CREV file) and then select Automatically Download and Track Comments From Acrobat.com.
4. Click Next.
5. Provide your Adobe ID and password. If you do not have an Adobe ID, create it using the link provided at the top of the dialog box.
6. Click Sign In. A draft of the e-mail notifications to be sent to the reviewers appears.
7. Customize the body of the draft if you want to provide additional instructions to reviewers.
8. Enter e-mail addresses of reviewers in the To and Cc fields, and click Send.

## Set default project comments folder

You can set your preference for the Project Comments Folder in the Preferences dialog box. When you create new projects, this location is used when you publish a project for review on an internal server.

1. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. Select General Settings from the Global menu.
3. Specify a location for the project comments folder in the Comments At field.

---

## Reviewing Adobe Captivate projects

[To the top](#) <sup>4</sup>

Ensure that you complete the following procedures before you review a project using the CREV file:

- Install Adobe AIR on your computer. Adobe AIR can be downloaded for free from the Adobe website <http://get.adobe.com/air/>.
- Install the Adobe Captivate Reviewer application on your computer. The installer is provided to you by the author of the Adobe Captivate project. If you have Adobe Captivate installed on your computer, you can locate the installer, AdobeCaptivateReviewer.air, at the location where you installed Adobe Captivate.

## Install Adobe Captivate Reviewer

1. Double-click the AdobeCaptivateReviewer.air installer .
2. Click Install.
3. (Optional) Customize your installation preferences, and specify a location on your computer where to install the Adobe Captivate Reviewer.

## Open the CREV file using Adobe Captivate Reviewer

1. Download the CREV file onto your computer. Based on the review mode chosen by the author, the CREV file is made available on the internal server or on Acrobat.com. Typically, in both these cases, you receive an automated email indicating the availability of the file for

review.

2. Do one of the following:

- Double-click the CREV file .
- Open Adobe Captivate Reviewer.

3. Based on how the CREV file is shared by the author, the following prompts appear:

- Adobe ID and password, if the CREV file is shared on Acrobat.com.
- User details, if the CREV file is shared on an internal server. Provide your name and email address. These details are used in your comments and helps authors to associate your name with your comments.

4. Click Load Captivate Movie, and open the CREV file from your computer.

If the author has not specified a location for storing comments, a dialog box appears indicating that the comments have to be exported manually. Click OK.

### Add comments to the SWF file

1. Click Play . The seek slider starts moving through the movie.

2. Click Add Comment  at the point where you want to add your comment.

3. Add your comment in the Add Comment window.

4. Click Add to add the comment. A marker, indicated by a white dot, is added at this location in the commenting bar and the movie continues to play.

5. Repeat steps 2, 3, and 4 to add more comments.

6. Click Save Comments .

- If the CREV file is hosted on Acrobat.com, the comments are automatically published to Acrobat.com. your comments.
- If the CREV file is hosted on an internal server with a shared network folder, the comments are automatically published to this folder. If a folder is not shared on the network, export the comments into an XML file and send it to the author. For more information on exporting comments, see [Export comments to an XML file](#).

### Edit comments in the SWF file

Comments added to the project are indicated as markers (white dots) at the specific location in the seek bar. To locate the comment that you want to edit, move your pointer over the markers. The comment added at a location is displayed when the pointer moves over it.

1. Click the marker on the seek bar whose comment you want to edit or delete. The comment is displayed in a pop-up window.

Comment marker on seek bar

2. Edit the comment.

**Note:** If others have replied to a comment, only the latest comment in the comment thread can be edited.

### Import comments from an XML file

Authors and reviewers can import comments from XML files sent to them. Comments imported from XML files appear at the same location in the Timeline if the author has not edited the file during the review process.

1. Click Import Comments .

2. Browse to the location of the XML file.

3. Click Open.

Authors can alternatively import comments from XML files using the Comments panel in Adobe Captivate.

### Export comments to an XML file

Reviewers can export comments to an XML file and send it to the author. The author can import the XML file, provide feedback, export the file, and send it to the reviewers.

1. Click Export Comments.
2. In the Browse For Folder dialog box, select the folder where you want to save the XML file, and click OK.

Authors can alternatively export comments to XML files using the Comments panel in Adobe Captivate.

### View or sort comments in the AIR application

The author and reviewers can view and sort comments using the AIR application.

Do one of the following:

- To view all comments added to the file, click Show All Comments.
- To sort comments by reviewer name, click Filter Comments. In the Reviewers pop-up menu, select names of the reviewers to view comments posted by those reviewers.

### View or sort comments in the Adobe Captivate project

Authors can view and sort comments in the Adobe Captivate project as well as the AIR application. Some of the options available for sorting are available only when the author uses Adobe Captivate to review the project.

1. To view comments added to the file, select Window > Comments. The Comments panel appears. Comments posted by reviewers are displayed in the panel.
2. In the View By menu, select one of the following options:
  - a. Select Creation Time to sort comments chronologically.
  - b. Select Reviewer to sort comments by the reviewers' name.
  - c. Select Status to sort comments according to their status (New, Accepted, or Rejected.)

### View the latest comments

- To view the latest comments posted by reviewers, click Refresh Comments.

### Provide feedback on comments by reviewers

The author can accept, reject, or reply to comments posted by reviewers. Reviewers can view feedback posted by the author when they refresh the contents of their application. In the Filmstrip, a comment icon appears below the slides that contain comments.

Comments are also visible on the timeline of individual slides. Authors can use Preview > Play This Slide to view the exact location of comments.

1. Open the project sent for review in Adobe Captivate.
2. Select Window > Comments. The Comments panel appears. Comments posted by reviewers are displayed in the panel.
3. Select one or more comments for which you want to provide feedback, and do one of the following:
  - Click the reject comments icon to ignore the comment. Optionally, enter a reason for ignoring the comment in the pop-up window, and click Submit.
  - Click the accept reviewer comments icon to accept the comment. Optionally, enter your feedback in the pop-up window, and click Submit.

***note:** After you accept or reject a comment, the corresponding icon is displayed for the comment in the review application, along with any comments.*
  - Click the Reply To Reviewers Comments icon to request clarification on the comment.

### End reviews

In the Windows > Comments panel, click the End Review icon.

# Combining multiple SWF files with aggregator

---

## [Create an aggregator project](#) [Publish the aggregator project](#)

You can combine multiple projects published as SWF files using the Aggregator. You can publish the combined files in the Aggregator as SWF output, executable files (Windows and Mac), PDF, HTML, or Zip files. The Aggregator creates a table of contents (TOC) using the names of the separate modules (SWF files). TOCs of individual modules are displayed under their module name.

The Aggregator currently supports SWF files that are published using Adobe Captivate and that use the same ActionScript version.

**Note:** *You cannot add SWF files created in Flash to an Aggregator project.*

To ensure uniformity of TOC settings across a movie, you can set a SWF file as the master movie. The TOC settings of the master movie are applied to all the other movies in the Aggregator. Any changes made to the TOC settings by individual content creators can be undone using a master movie.

---

## Create an aggregator project

[To the top](#) <sup>1</sup>

1. Select File > New > Aggregator Project.
2. In the Aggregator dialog box, click Add Module.
3. In the Open dialog box, select the SWF file that you want to add to the Aggregator.
4. Repeat steps 2 and 3 to add more SWF files to the project.
  - To set a SWF file as the master movie, select Set As Master Movie. The TOC settings of the SWF file are applied to the other files in the Aggregator. The project information of the master movie is applied to the Aggregator file.
  - If you do not want to display the name of the SWF file in the movie, deselect Include Module Title.
  - To change the position of a SWF file in the menu, select the name of the file. Use the Up and Down Arrow keys to relocate the movie to the desired location in the menu.
  - To delete a movie from the list, select the movie, and click Remove .
  - To override the project information set in the TOC of the master movie, click Info. In the TOC Info dialog box, select Override TOC Info, and change the settings. The TOC information is displayed above the TOC menu of the Aggregator in the published file. For more information, see Display project information in the TOC panel.
  - To add a preloader screen to the project, click the browse icon in the Select Preloader area. Navigate to the image you want to use and click Open.
5. Click Save, and save the file as a .aggr file.

---

## Publish the aggregator project

[To the top](#) <sup>1</sup>

1. Open the aggregator project.
2. Click the publish icon.
3. In the Aggregator Publish dialog box, do the following:
  - a. In the Format section, select SWF, Win Executable, or Mac Executable based on your requirements.
  - b. In the Title field, specify a unique name for the published file.
  - c. In the Folder field, enter the path to which the files are published. Alternatively, click Browse to specify the path. Select Publish Files To Folder if you want Adobe Captivate to create a default folder into which the files are published.
4. In the Publish Options section, select one or more options based on the publishing format you have chosen.
  - Select Zip Files if you want to publish the files as a single ZIP file. This option is especially useful when you want to create a single ZIP file that can be uploaded to a learning management system (LMS) directly.
  - Select Export HTML if you want to insert the SWF into an HTML file and publish it.
  - Select Export PDF if you want to insert the SWF file into a PDF file and publish it.
  - Full Screen if you want the movie to be displayed in full screen of the users' monitors.

5. If you have chosen Win Executable as the publish format, click the browse icon in the Custom Icon field to assign an icon to the published EXE file.

6. Click Publish.

# Creating accessible projects

---

[Accessibility and Adobe Captivate](#)  
[Creating accessible content](#)  
[Testing accessible content](#)

[To the top](#) <sup>1</sup>

## Accessibility and Adobe Captivate

You can create output that is compliant with Section 508 for users who have visual or hearing impairments, mobility impairments, or other types of disabilities. You can also take steps at the design level to remove obstacles for people with disabilities viewing your Adobe Captivate projects.

These solutions support government agencies in meeting their users' needs through Section 508 compliance, as well as companies who are committed to improving accessibility.

### Worldwide accessibility standards

Many countries, including the United States, Australia, Canada, Japan, and countries in the European Union, have adopted accessibility standards based on those developed by the World Wide Web Consortium (W3C). W3C publishes the Web Content Accessibility Guidelines, a document that prioritizes actions designers should take to make web content accessible. For information about the Web Accessibility Initiative, see the W3C website at [www.w3.org/WAI](http://www.w3.org/WAI).

In the United States, the law that governs accessibility is commonly known as Section 508, which is an amendment to the U.S. Rehabilitation Act. Section 508 prohibits federal agencies from buying, developing, maintaining, or using electronic technology that is not accessible to those with disabilities. In addition to mandating standards, Section 508 allows government employees and the public to sue agencies in federal court for noncompliance.

For additional information about Section 508, see the following websites:

### What is Section 508- compliance?

Section 508 is part of the Rehabilitation Act of 1973 requiring that federal agencies develop, maintain, acquire, or use electronic and information technology to make the systems accessible to people with disabilities. The most recent (1998) version of Section 508 establishes enforceable, government-wide standards.

### What does accessible mean?

In general, an information technology system is accessible for people with disabilities if it can be used in various ways that do not depend on a single sense or ability. For example, users should be able to navigate with a keyboard, in addition to a mouse (not with a mouse only). Also, the visual and auditory elements of a user interface must accommodate both hearing-impaired and visually impaired users.

### What other types of assistive software do end users need?

Screen readers or text-to-speech utilities (which read the contents of the active window, menu options, or text you have typed) and screen review aids translate onscreen text to speech or to a dynamic, refreshable, Braille display. This assistive technology can provide keyboard assistance or shortcuts, captions for speech and sound, and visual warnings such as flashing toolbars. Tools available include Windows Eye and JAWS.

### What does Adobe Captivate do to be Section 508 compliant?

Selecting the 508 Compliance option makes certain elements in Adobe Captivate projects accessible or open to accessibility technology. For example, if you select the 508 Compliance and you have filled in the project name and project description text boxes in Project preferences, a screen reader will read the name and description when the Adobe Captivate SWF file is played.

The following Adobe Captivate elements are accessible when the 508 Compliance option is selected:

- Project name (derived from Project Properties)
- Project description (derived from Project Properties)
- Slide accessibility text
- Slide label (derived from Slide Properties)
- Buttons
- Playback controls (The function of each button is read by screen readers)
- Password protection (If an Adobe Captivate SWF file is password protected, the prompt for a password is read by screen readers)

- Question slides (Title, question, answers, button text, and scoring report are read by screen readers)

Output generated with the Section 508 option is displayed by all supported browsers. However, your output may not be Section 508-compliant unless it is viewed with Internet Explorer. Internet Explorer is the only browser with support for MSA (Microsoft Active Accessibility).

To access Flash files using a screen reader, users must have Flash Player 9 or later installed.

The Access Board is an independent federal agency committed to accessibility for people with disabilities. For more information about making your output compliant, see the Access Board website ([www.access-board.gov/508.htm](http://www.access-board.gov/508.htm)).

## Adobe Captivate accessibility web page

For the latest information on creating and viewing accessible Adobe Captivate content, visit the Adobe Captivate Accessibility Overview page on the Adobe website at [www.adobe.com/go/learn\\_cp\\_accessibility\\_en](http://www.adobe.com/go/learn_cp_accessibility_en).

---

## Creating accessible content

To the top 

### Create 508-compliant projects

Create an Adobe Captivate project using the Section 508 option to view and test the output. Generating the Adobe Captivate project updates source files containing information about your project and creates output files that you can publish for users. Read the tips for authoring and use the following procedure.

1. In an open project that you want to publish as 508-compliant, select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Category panel, expand Project, and select Publish Settings.
3. Select Enable Accessibility in the Project panel.

### Tips for creating 508-compliant Adobe Captivate SWF files

While Adobe Captivate Section 508 output is compliant for navigation, make sure that other elements are also compliant in your project. Assistive software must be able to “read” elements on the screen to visually impaired users. Use these tips to design accessible projects.

- In the Project preferences, write a meaningful name and description for your Adobe Captivate projects.
- For users with hearing impairment, add text equivalents for audio elements. For example, when delivering narrative audio, it is important to provide captions at the same time. One option is to place a transparent caption in a fixed location on slides, then synchronize the text with the audio using the Timeline.
- If your project contains visual multimedia, provide information about the multimedia for users with visual impairment. If a name and description are given for visual elements, Adobe Captivate can send the information to the user through the screen reader. Make sure that audio in your Adobe Captivate projects does not prevent users from hearing the screen reader.
- Supply text for individual slides that screen readers can read.
- Ensure that color is not the only means of conveying information. For example, if you use blue to indicate active links, also use bold, italics, underlining, or some other visual clue. In addition, make sure that foreground and background contrast sufficiently to make text readable by people with low vision or color blindness.
- For users with either visual or mobility impairment, ensure that controls are device independent or accessible by keyboard.
- Users with cognitive impairments often respond best to uncluttered design that is easily navigable.
- If mouse movement is critical in your Adobe Captivate project, consider making the pointer twice its normal size for easier viewing.
- Document methods of accessibility for users.
- Avoid looping objects. When a screen reader encounters content meant for Flash Player, the screen reader notifies the user with audio, such as “Loading...load done.” As content in a project changes, Flash Player sends an event to the screen reader notifying it of a change. In response, the screen reader returns to the top of the page and begins reading again. Therefore, a looping text animation on a slide, for example, can cause the screen reader to continually return to the top of the page.
- If you are creating click boxes, you can make them more accessible by adding sound. The sound can play when users tab to the click box or hover over it. To add this accessibility feature, attach a sound file to the hint caption. (If you do not want the hint caption to appear on the slide, you can make the caption transparent and add no text.)
- Accessibility in Adobe Captivate demos works better when all the slides have interactive content. If you are using JAWS 6.1 or later, be aware that JAWS sometimes does not clear the Microsoft Active Accessibility (MSAA) tree. As a result, the content of previous slides can replay when slides are continuous. This problem does not occur in JAWS 4.5.

### Add accessibility text to slides

A screen reader can read aloud text that appears on the computer screen. Screen readers are useful for people with visual impairment. In Adobe

Captivate, you can write text describing each slide for screen readers to read aloud.

1. Open the slide to which you want to add accessible text.
2. In the Property Inspector, click Accessibility.
3. Type the text that you want the screen reader to read aloud.
4. To use the slide notes (Text-to-speech and closed captioning included), click Import Slide Notes.

### Customize accessibility text for objects

You can add accessible text to individual objects on a slide. When the object appears in the movie, the screen reader reads that text aloud. If you do not specify accessible text for an object, the screen reader reads the default text. For example, if the object is an image, it reads *Graphics Image*. This default text is generally not sufficiently descriptive to help a visually impaired user. Also, objects other than text captions and text entry boxes do not contain any text. Accessible text for such objects can help users understand their purpose in the movie.

1. Select the object whose accessibility text you want to customize.
2. In the Property Inspector, click Accessibility.
3. Deselect Auto Label. When Auto Label is selected, the text in the object is read aloud by the screen reader.
4. In the Item Accessibility dialog box, do the following:

**Accessibility Name** Enter the accessibility name. For a text caption, you can enter “This text is in a caption,” for example.

**Accessibility Description** Add a description to clarify information for the person using the screen reader. For example, consider the text caption “Select File > Edit Image.” You can change the text to “From the File menu, select the Edit Image command. This command is available only when an image is selected on the slide.”

---

## Testing accessible content

To the top <sup>1</sup>

### Tips for testing

If you are designing your Adobe Captivate project to work with screen readers, download several screen readers. Then test your project by playing it in a browser with the screen reader enabled. Make sure that the screen reader is not attempting to “talk over” places in your project where you have inserted separate audio. Several screen reader applications provide a demonstration version of the software as a free download. Try as many as you can to ensure compatibility across screen readers.

If you are creating interactive content, test it and verify that users can navigate your content effectively using only the keyboard. This requirement can be especially challenging, because different screen readers work in different ways when processing input from the keyboard. For this reason, your Adobe Captivate content might not receive keystrokes as you intended. Make sure to test all keyboard shortcuts.

### About screen reader technology

Screen readers are programs designed to navigate through a website and read the web content aloud. Visually impaired users often rely on this technology.

JAWS®, or Job Access with Speech, from Freedom Scientific, is one example of a screen reader. You can access the JAWS page of the Freedom Scientific website at [www.hj.com/fs\\_products/software\\_jaws.asp](http://www.hj.com/fs_products/software_jaws.asp). Another commonly used screen reader is Window-Eyes®, from GW Micro®. To access the latest information on Window-Eyes, visit the GW Micro website at [www.gwmicro.com](http://www.gwmicro.com). For Windows users, Microsoft provides a free, downloadable product called Microsoft Reader that contains a text-to-speech component. For more information, visit the Microsoft website at [www.microsoft.com](http://www.microsoft.com).

Because different screen readers use varying methods to translate information into speech, the way your content is presented to users can vary. As you design accessible projects, keep in mind that you have no control over how a screen reader behaves. You have control only over the content, not the screen readers. You cannot force screen readers to read specific text at specific times or control the manner in which that content is read. It is important to test your projects with various screen readers to ensure that they perform as you expect.

# Import, export, and delete content

---

- [Export project content to XML](#)
- [Import project content to XML](#)
- [Import and export project preferences](#)
- [Delete projects or templates](#)

---

## Export project content to XML

[To the top](#) <sup>1</sup>

An Adobe Captivate project file can have the following types of content:

**Static content** Examples include images (bitmaps, buttons, backgrounds), audio, FLV files, and videos (SWF files). To customize static content for different languages, create new files with translated content.

**Dynamic content or localizable content** Examples include text captions, button text, and slide notes, which can be localized in different languages.

When you export the dynamic content of an Adobe Captivate project to an XML file, you can edit and translate content in the objects using the XML file. You can edit and translate many objects, including project properties, the Menu Manager slides and slide information, and so on. You can export audio items only for closed captions.

After exporting project content to XML, you can import it into any other Adobe Captivate project.

1. Open an Adobe Captivate project and save it with a new filename for a new language.
2. Select File > Export > To XML.
3. In the Save As dialog box, enter a filename for the new XML file.
4. Make a note of the default directory where you save the file. You can navigate to a different location if desired.
5. Click Save.

Relevant objects in the project are converted into XML format. A dialog box appears, confirming that the XML export was successful. Choose whether you want to view the XML file. If you click Yes, the XML file opens in your default XML viewer.

6. Open the XML file, and translate all terms specified in the <source> </source> tags inside the <trans-unit> </trans-unit> tags.

For RTF data (such as text captions), the actual translatable text is present within <g> </g> tags. To change the text to a different language, change the font-family field in css-style attribute, and add the corresponding character set.

Instead of exporting a project to XML, you can publish the project you want to edit and localize. You can then send the content in the XML format to an e-mail address. The XML file is sent as an attachment to the e-mail address. You can also compress the XML file and send it by e-mail.

Ensure that the Adobe Captivate project file is edited before exporting the XML file.

**Note:** *The Info, Blabber, and Skin tool tips are not exported to XML because such information is stored in Flash Authoring Files. After localization, separately create Info, Playbars, and Skin tool tips for the relevant localized version of the Adobe Captivate project.*

---

## Import project content to XML

[To the top](#) <sup>1</sup>

**Note:** *After translating the content of the XML file to the required language, import the updated XML file into Adobe Captivate. The project content then appears in the required localized language.*

If you want to rerecord the project, ensure that you do so before importing the XML file.

1. In an open project, select File > Import > From XML.
2. In the Open box, enter the filename of the XML file or navigate to the XML file.
3. Click Open.

The XML content is imported into the Adobe Captivate project. A dialog box appears, confirming that the XML import was successful.

4. Click OK.

**Note:** *If the XML file was sent to you by e-mail, open the e-mail message and save the XML file in the required directory. Translate its contents to the required language.*

---

[To the top](#) <sup>1</sup>

## Import and export project preferences

You can export preferences set in one Adobe Captivate project and import them into other Adobe Captivate projects. Preferences are exported as an XML file with a .cpr extension. When this file is imported into another Adobe Captivate project, the preferences defined in the file are set.

**Note:** All preferences in your current project are modified according to those set in the preferences file.

### Export project preferences

1. Select File > Export > Preferences.
2. In the File Name field, type a name for the CPR file.
3. Click Save.

### Import project preferences

1. Select File > Import > Preferences.
2. Select the CPR file that contains the preferences you want to import.
3. Click Open.

---

## Delete projects or templates

[To the top](#) <sup>↑</sup>

You can delete Adobe Captivate projects (CPTX files) or templates (CPTL) at any time. When you create Adobe Captivate projects and templates, they are saved, by default, to the following locations:

- Projects are saved in \My Documents\My Adobe Captivate Projects. If you are using Windows® Vista®, the path is \Users\- Templates are saved in \My Documents\My Adobe Captivate Projects\Templates. If you are using Windows Vista, the path is \Users\

To delete projects or templates, perform the following steps.

1. Open Windows Explorer.
2. Navigate to the location of the Adobe Captivate project or template (see the default locations listed previously).
3. Right-click (Windows) or Control-click (Mac OS) the project or template and select Delete.

# Link Adobe Captivate projects

---

## [Link Adobe Captivate projects to other projects](#)

## [Link Adobe Captivate projects using question slides](#)

You can interlink Adobe Captivate projects or link them to other files when using the following features:

- Interactive objects: text entry boxes, click boxes, and buttons
- Question slides
- Slide navigation
- Project action

Make sure all the linked projects or files are in the same folder before you use the procedure to link them.

---

## Link Adobe Captivate projects to other projects

[To the top](#) <sup>1</sup>

1. Open the project that must be linked with another project.
2. Determine the trigger for opening the other project. For example, the project is to be opened when slide 14 begins. Or, the project is to be opened when user clicks the button on slide 24.
  - If the trigger is based on events related to a slide, click the slide in the Filmstrip and deselect all the objects on the slide.
  - If the trigger is based on objects, select the object.
3. In the Property Inspector, select one of the following options in On Success, Last Attempt, On Enter, or On Exit lists based on the option you chose in step 2:
  - Open URL Or File
  - Open Other Project
4. Click the browse icon, and use the Open dialog box to link to the file or project.
5. Delete the system path, if any, to make sure that only the filename is displayed in the URL or Project field.

---

## Link Adobe Captivate projects using question slides

[To the top](#) <sup>1</sup>

1. Open the project to be linked and select Quiz > Question Slide.
2. In the Property Inspector, select Graded as the Type in the General area.
3. In the Action area, select one of the following options in the On Success or Last Attempt fields based on your requirement:
  - Open URL Or File
  - Open Other Project
4. Click the browse icon, and use the Open dialog box to link to the file or project.
5. Delete the system path, if any, to make sure that only the filename is displayed in the URL or Project field.

# Localizing Adobe Captivate projects

---

## Using Adobe Captivate with a localized user interface

### Localize text captions

Localization is the process of adapting information for use in a specific country. The term localization is often used as a synonym for translation. However, localization also entails editing information for a particular cultural context.

---

## Using Adobe Captivate with a localized user interface

[To the top](#) <sup>4</sup>

If you are creating Adobe Captivate projects that show a website or application that has been created in several languages, you can create localized projects for each language.

### To create localized Adobe Captivate projects:

1. Create an Adobe Captivate project in your source language using a source language version of the website or application. For example, if you created your application in English, you can produce an English-language Adobe Captivate project that shows the English application.
2. Export any captions in the project and translate the caption text into the languages you require. Continuing the example from step 1, you can take the English-language captions in the English project, export them, and give the text to localizers so they can translate it into other languages such as German and Japanese.
3. Open the website or application in the localized forms and record the same steps that were recorded in the source language version of the project. When you record the projects, do not automatically include objects. In this example, you record Adobe Captivate projects (using the same steps in the English project) of the application after the localizers have translated the application user interface into German and Japanese.
4. Import all objects from the source language version of the project. In this example, you import all objects from the English version of the project into the German and Japanese projects.
5. Import the localized captions created by translators in step 2. In this example, you open the German and Japanese projects and import the Microsoft Word file of the captions that have been translated.
6. Test the localized versions of the project. In this example, open the German and Japanese projects and ensure that the correct user interface is shown, that captions are properly translated and appear on the correct slide, and that timing is accurate. If necessary, adjust the timing or resize the captions so that Adobe Captivate displays all the translated text correctly.

---

## Localize text captions

[To the top](#) <sup>4</sup>

If you are localizing a project that contains text captions and closed captions, you can export text captions to make the process more efficient.

1. Create the initial ("source language") version of the project, including all necessary text captions.
2. Open the completed project.
3. Select File > Export > Project Captions And Closed Captions.
4. By default, the Word (DOC) file is saved to your My Documents\My Adobe Captivate Projects folder. You can change the location if you want. If the project file was saved, the location of the default Word file, named [ProjectName] Captions.doc, is in the same directory as the one in which the project has been saved. You can change the name of the file, if necessary, by clicking directly in the File Name text box and entering a new name. (Retain the.doc filename extension.) Click Save.
5. The Word file is generated with the name you specified and saved to the location you selected. A dialog box appears, asking if you want to view the document. Click Yes to view the document in Word.
6. The Word document contains the slide ID, item ID, original caption text, and slide number. There is also a column named "Updated Text Caption Data" where you can change the caption text. Provide a copy of the Word document to the localizer/translator.
7. The localizer/translator opens the Word document and edits the caption text directly in the "Updated Text Caption Data" column, replacing the source language text.
8. While the localizer/translator is translating the text, make a copy of the original Adobe Captivate project for the new language.

**Note:** When you create a copy of the original project, keep the original text captions and closed captions (in the source language) in the new project. The original captions act as placeholders and are overwritten when you import the new (localized) text captions and closed captions.

9. When the text captions are localized, open the copy of the project you created.

10. Select File > Import > Project Captions And Closed Captions.

**Note:** *The Import Project Captions And Closed Captions option is enabled only after you export the captions. You can import only those edited caption files that you originally exported from the same project.*

11. Navigate to the localized text captions Word (DOC) file, select the file, and click Open.

12. The localized text captions and closed captions are imported into the project and all formatting is retained. A dialog box appears showing a successful import message. Click OK.

Test the new text captions by opening different slides in Edit view and reading the new caption text.

# Preview projects

---

Previewing a project before and during the editing of a project helps you notice the changes that are required. This way, you can be sure of the final output before you publish it.

1. Open the Adobe Captivate project that you want to preview.
2. In the main toolbar, click the preview icon, and select one of the following options:

**Play This Slide** Plays only the current slide.

**Project** Plays the entire project.

**From This Slide** Plays the project from the currently displayed slide to the end.

**Next 5 Slides** Plays five slides starting with the current slide.

**Note:** *You can change the number from 5 to your desired number of slides using the Preferences dialog box.*

**In Web Browser** Opens and plays the project in your default web browser.

**Device Central** Opens the project within the display of a mobile phone of a mobile phone simulation software.

# Resize projects

---

## Resize a project

### View project dimensions

You can resize Adobe Captivate projects, even after you have recorded them. Resizing can save you from having to rerecord an entire project. For example, suppose you record your project at a width of 640 and height of 480, but then decided you need a slightly smaller or larger size.

Resizing a project cannot be “undone” with a toolbar button or key combination such as Control+Z.

Resizing a project numerous times can result in quality deterioration. As far as possible, try to resize a project only once.

---

## Resize a project

[To the top](#) <sup>1</sup>

1. In an open project, select Modify > Rescale Project.
2. Under Size, enter an exact custom size in pixels in the Width and Height text boxes (minimum size 100 x 100). Alternatively, enter a percentage for width and height, with the current size being 100%. (For example, to make the project slightly bigger, enter 110%; to make the project much smaller, enter 50%.) You can also select the Preset Size option and choose a commonly used size, such as 640 x 480, from the pop-up menu.

If you want, select the Maintain Aspect Ratio option, which maintains the height and width proportions when the image is resized. This option ensures that the image is displayed accurately and is not distorted.

3. If you want to choose from a standard set of sizes, select Preset Size, and choose from the options.
4. You have different options depending on whether the new size you specified is larger or smaller than the original size.

**Rescale Project To Fit New Size** This option resizes the entire project to the new larger size you specified. To also rescale any objects in the project, select the Rescale Captions, Highlight Boxes, And Other Objects option.

**Keep Project The Same Size And Fill Background With Color** This option keeps the project the same size, but creates a project background at the size that you specified earlier. For example, if your original project is 550 x 400 pixels and you set the new size to 640 x 480, this option keeps the project at 550 x 400 and creates extra space around the project of 90 x 80. You can select any background color and choose a position for the project on the background, such as center or upper right.

**Rescale Project To Fit New Size** This option resizes and resamples the project to provide a good quality project. To also rescale any objects in the project, select the Rescale Captions, Highlight Boxes, And Other Objects option.

**Rescale Captions, Highlight Boxes, And Other Objects** Select this option to have Adobe Captivate automatically rescale all objects in your project such as captions, highlight boxes, click boxes, and text entry boxes to the new, smaller size.

**Crop** Crops the project to the new size. If you select the Crop option, click Next to open the Crop Area dialog box where you can define a crop area. To define the crop area, hold down the left mouse button and drag the Crop window (area with green border).

**Arrows** Move backward or forward one slide at a time through the project.

**Slide** Lists all the slides in the project. Click the drop-down arrow to select an individual slide.

**Apply To All Slides** Applies the crop area you defined to all slides in the project.

5. Click Finish.

**Note:** *Resize buttons before resizing the project. Resizing a project does not resize the buttons automatically.*

---

## View project dimensions

[To the top](#) <sup>1</sup>

❖ In an open project, select Modify > Rescale Project. The dimensions of the project are mentioned in the Original Project Size section of the Rescale dialog box.

# Skins

---

- [Playback controls](#)
- [Project border](#)
- [Custom Flash playback controls](#)
- [Flash button-naming conventions](#)
- [Previewing skins](#)
- [Save a customized skin](#)

Adobe Captivate is shipped with a default set of skins. You can create a customized skin by changing the various options in the Skin Editor and saving the changes as a theme. Skins in Adobe Captivate include the following elements: playback controls, border, and table of contents.

---

## Playback controls

[To the top](#)

The playback controls, consisting of a playbar and a progress bar, allow users to control the movie when it is played. The playbar displays buttons that control the movement of a movie. The progress bar tracks progress through the movie, showing the location of the current slide.

You can change the appearance of playback controls using the Skin Editor (Project > Skin Editor). You can customize the following options for playback controls:

**Show Playback Control** Allows you to enable or disable the display of playback control options for users when the movie is played.

**Hide playbar in quiz** Allows you to hide the playbar on question slides.

**Note:** *Playbar is always hidden on pretest question slides.*

**Playbar Overlay** Allows you to place the playbar on top of the content. The playbar does not occupy any extra space. This option is useful if you want to keep the size of the movie as desired by the author.

**Position** The position of the playbar with respect to the movie. You can place the playbar at any of the four sides of the movie.

**Layout** The alignment of the toolbar with respect to the movie. You can center the playbar controls, align them to left or right, or stretch them across the width of the movie.

**Play/Pause** Allows your users to pause and resume the project.

**Rewind** Replays the movie starting from the first slide.

**Forward** Moves the playhead to the next slide.

**Closed Captioning** Displays closed captions in your project. Use the Closed Captioning Settings dialog box to change the appearance of text in the closed captions.

**Back** Enables users to go back to the previous slide.

**Close** Allows users to exit the project. This button is important for full-screen projects because it allows the user to close the window quickly.

**Mute** Allows users to turn off the audio.

**Progress bar** Allows users to see their progress as they move through the project. They can also move back and forth in the project by dragging the playhead on the progress bar.

**Fast Forward** Helps users to play the movie at twice or four times the normal speed.

**Alpha** Indicates the transparency of the background color of the playbar.

**No Tooltips At Runtime** Allows you to disable tool-tips if you think they do not fit the style of your presentation.

## Theme

By default, the values of the settings in the Theme section are inherited from the theme currently applied to the project.

**Playbar** Consists of buttons that control the movie when it is played. The Playbar menu lists the available skins for playbars in Adobe Captivate.

**Playbar Two Rows** Displays the progress bar and playback controls in separate rows.

**Playback Colors** Indicates the colors used for various parts of the playbar. Click the boxes to change the colors.

**Note:** *When you save the theme of the project (Themes > Save Theme), changes to the theme settings in the Skin Editor too are saved.*

---

## Project border

[To the top](#)

You can specify the style, size, texture, and width of the border around your project using the Skin Editor dialog box.

**Show Borders** Allows you to enable or disable the borders for the movie. The buttons represent the sides of the project window to which you want to add borders. You can have borders on any combination of sides.

**Style** Determines the shape of the border edges. You can choose to have a border with sharp or rounded edges.

**Texture** Allows you to choosing an image for the texture of the borders. when you choose a texture, the color settings for the borders are overridden. To choose a specific color for your border, select None from the Texture list.

**Width** Displays the thickness of the project border.

**Color** Displays the color of the project border. You can use the color palette or use the eyedropper to select and copy a color on your screen.  
**HTML Background Color** Displays the color for the background area around the project.

[To the top](#)

## Custom Flash playback controls

You can create custom Flash playback controls for your project.

When creating custom SWF playback controls, follow these guidelines:

- Store the source FLA file of the skin in the following location: C:\Program Files\Adobe\Adobe Captivate 6\Templates\PlaybackFLA.
- Do not change the control names or symbols.
- The playbar must be present on the Stage with the instance name pbcBar\_mc.
- The playbar must have the cpPlaybar identifier in the Library.
- The Export For ActionScript option must be selected for cpPlaybar in the Library.
- The actions at the action layer must not be changed.
- Store All Buttons must be stored at the Library root.
- Do not change the registration points. The registration point for every symbol is at the center (important for editing), except for the following symbols:
  - - icoProgress (upper-left)
  - - icoThumb (top-center)
  - - icoThumbBase (upper-left)
- Store the published SWF file of the skin in the following location:  
<Installation Directory> \Gallery\Widgets\Playbars; /Applications/Adobe Captivate 6/Gallery/Widgets/Playbars (on Mac OS). The Skin Editor picks the file from this location.

[To the top](#)

## Flash button-naming conventions

Each SWF button contains three layers: a button, an icon, and an action layer.

The SWF filename consists of the following elements:

- Acronym for playback control (“pbc”)
- Playback element identifier (“Btn” for button, “Bar” for bar, and so on)
- Name of the button (“play”).

[To the top](#)

## Previewing skins

You can preview the changes you’ve made to your project skin from the Skin Editor dialog box. Whenever you set the button colors, add or remove menus, or configure the positions of playbars, the preview reflects the changes immediately.

The skin preview displays the first slide of the project. It displays the background image (if present) or the slide color. No objects on the first slide are visible in the skin preview.

 *The skin preview is slow if it has a large background image. To overcome this performance issue, when configuring the skins, you can insert a blank slide and set it as the first slide. Then, open the Skin Editor dialog box and configure the skin changes. After making these changes, you can hide the first slide. The next slide that has the background image appears in the skin preview for final viewing.*

[To the top](#)

## Save a customized skin

After you have customized the options in the Skin Editor, you can save your customized set of options as a theme. The theme is added to the Skin menu in the Skin Editor. The next time you want to use your customized skin for a project, select it from the menu.

1. Select Project > Skin Editor.
2. Customize the settings in the dialog box according to your preferences.
3. Click the save icon, and enter a name for your theme in the Save As dialog box. Click OK.

The new skin you saved is listed in the Skin list.

# Table of contents (TOC)

---

## Create a table of contents (TOC)

### Organize a table of contents (TOC)

### Customize the table of contents (TOC)

You can generate a table of contents (TOC) automatically for your Adobe Captivate project. The hierarchy of slides in the project is preserved in the TOC. Grouped slides are displayed as subentries under the group name. The name of the slides and the group are automatically added as in the project.

You can specify the position of the TOC with respect to the main slide during editing. At run time, clicking the various headings in the TOC displays the corresponding slides in the main panel.

You can configure the appearance of the TOC using the various available options. You can then save the TOC as a theme along with the other skin items like playback controls and borders.

The TOC entry corresponding to the slide displayed is highlighted in the TOC panel as the movie runs through the slides.

A check mark in the Status panel indicates the slides that the user has completed viewing. You can choose to configure the project for self-paced learners so that they can start viewing slides from where they left off earlier.

---

## Create a table of contents (TOC)

[To the top](#)

1. Select Project > Table Of Contents.
2. Select Show TOC if you want to generate the TOC and display it in the project. The slide groups and slides are displayed in the same order as they appear in your project, along with their titles.

---

## Organize a table of contents (TOC)

[To the top](#)

Grouped slides are classified according to their hierarchy in the project. The slides of a group appear under the group name in the TOC in the same order.

You can change the hierarchy and classification of the slides in the TOC. The reorganization affects only the TOC and not the order of the slides in the project. You can also choose to hide certain slide entries in the TOC. These entries are not displayed in the TOC when the project is played.

Depending on your preferences, you can reorganize the TOC using one or more of the following procedures:

- To move a slide to the next sublevel in the hierarchy, click Move TOC Entry Right.
- To move a slide to a previous level in the hierarchy, click Move TOC Entry Left.
- To move the slide entries up and down, click Move TOC Entry Up or Move TOC Entry Down.

**Note:** You can also move the TOC entries by dragging them to another location.

- To create a group within the TOC, click Create Folder Rename the topic in the TOC, and organize slides under it. You can create up to five sublevels in the TOC menu.

**Note:** Grouping slides in the TOC does not group them in the project.

- To remove a TOC entry, select the entry in the TOC, and click Delete TOC Entry (🗑️).

**Note:** Hiding a TOC entry does not delete the slide from the project.

- To hide the TOC entry for a slide when the project is played, deselect the option for that slide under the eye icon. The slide is not removed from the project.
- To discard your changes to the TOC, and display the default entries, click Reset TOC.

When you reorganize a project after creating the TOC, the changes are not automatically reflected. Reset the TOC to view the changes. Any new slide added after creating the TOC is displayed as a hidden entry after you reset the TOC. Enable the TOC entry by selecting the check box under the eye icon.

**Note:** If you do not want to preview changes to the skin when you change an option, click Settings, and in the TOC Settings dialog box, deselect the Auto Preview option.

---

## Customize the table of contents (TOC)

[To the top](#)

You can customize the following for the TOC:

- Appearance of the TOC.
- Position of the table of contents with relation to the main panel playing the movie. You can also choose to overlay the TOC on the main panel playing the movie or display the TOC as a separate panel during run time.
- Display the project information such as the details of the company or the person creating the project in the TOC panel.
- Display the status of the slides for users during run time. When the Status option is turned on, a check mark appears next to slides that the users have completed viewing.
- Allow users to start viewing the project from the slide at which they left off previously when they run the project again.

1. Select Project > Table Of Contents.

2. Click Settings. The TOC Settings dialog box appears.

3. Set the options for the following:

**Style** Select Overlay to overlay the TOC panel on the main movie panel. Ensure that the contents of the movie are not hidden when you choose this option. You can use background transparency to achieve optimum results for slides with overlay.

Select Separate to display the TOC panel separately from the main movie panel.

**Position** Left or right position for the TOC panel.

**Background** Background color of the TOC panel.

**Default** Background color of the TOC menu.

**Active** Background color of the active TOC entry during run time. During run time, the TOC entry corresponding to the slide displayed is highlighted in the TOC panel. This entry is called the active TOC entry.

**Rollover** Background color of the TOC entry when the user moves the pointer over the entry at run time.

**Gradient** Color gradient for rollover.

**Heading** Background color of the header and footer.

**Outline** Border color of the TOC menu.

**Alpha** Transparency of the background of the TOC menu.

 Use the Transparency option to create visually striking TOC panels. You can define an optimum level of transparency for the background color of the TOC panel and menu.

**Width** The width of the TOC pane in pixels.

4. Modify the settings in the Theme section to configure a different look- and- feel for the TOC. By default, the values for these settings are derived from the theme that is currently applied to the project.

**Color** Click the boxes to modify the colors for various elements of the TOC.

**Font Settings** The TOC entry level for which you want to specify the font style.

**Font** The font family and style for the level selected in the Font Settings list.

**Note:** When you save the theme of the project (Themes > Save Theme), changes to the theme settings in the TOC too are saved.

## Display project information in the TOC panel

1. Select Project > Table of Contents.

2. Click Info. The TOC Information dialog box appears.

3. Enter the details of the author or company in the respective fields.

4. Click Project Information to use the information that you set in the Project Information menu of the Preferences dialog box. The information from the Preferences dialog box is added to the corresponding fields.

5. Click Clear Information to clear information that you have entered in the different fields.

6. Select Auto Preview to have the preview panel reflect a change as soon as you complete that change in a dialog box.

7. In the Photo section, click the browse icon to select an image to display on the panel. This image can be the logo of your organization, or a snapshot of a prominent slide in the project.

8. To change the character format for the project information fields: Click Font Settings to specify the font style for the project information.

a. Select the field from the Font Settings list.

b. Select a font family in the Font list and click on a style: regular, italics, or underlined.

c. Specify the size and the color for the characters.

## Display the duration and status of the slides during run time

1. Select Project > Table Of Contents.
2. Click Settings. The TOC Settings dialog box appears.
3. In Runtime Options, select Show Duration to display the duration of the slides when the movie plays.
4. Select Status Flag to flag slides that have been viewed with a check mark.

When the Status option is selected, a check mark appears next to slides that the users have completed viewing.

5. Select Clear Button to display the Clear Button to the user during run time. Clicking the Clear button removes all the status flags from the movie.

## Enable search in the TOC

Adobe Captivate searches for content both within the slides and their labels. Question slides are searched only if you enable the option in the settings panel.

1. Select Project > Table Of Contents.
2. Click Settings. The TOC Settings dialog box appears.
3. Select Show Search to provide users with a search field in the TOC.
4. Select Search Quiz to allow users to search content in question slides.

## Enable or disable navigation

When you disable navigation, users can't navigate on their own using the TOC.

1. Select Project > Table Of Contents.
2. Click Settings in the TOC panel.
3. Use the Enable Navigation toggle.

## Enable or disable preview

The Preview panel shows how the TOC looks every time you make edits in the TOC Settings or the TOC Information dialog boxes. Previewing helps you explore various options before you arrive at one that best suits your requirements. If you have already decided on the settings for the TOC, you can disable this option in the corresponding dialog box.

1. Select Project > Table Of Contents.
2. Click Settings. The TOC Settings dialog box appears.
3. Deselect Auto Preview.

## Allow users to resume sessions

In a self-paced learning scenario, you can set an option to allow users to resume viewing a project from where they left off earlier. The status flag is not reset after the project is closed. When the user plays the movie again, the project resumes playing from the first slide that is not flagged.

1. Select Project > Table Of Contents.
2. Click Settings in the TOC panel.
3. Select Self-Paced Learning.

## Save the TOC settings as a part of the theme

Changes to the TOC settings, along with other skin settings such as playback controls and borders can be saved as a theme. The save themes then can be reused in other projects.

1. After you change the TOC panel and other options in the Skin dialog box, click the save icon.
2. Enter a unique name for the theme and click OK.

More Help topics

## Publishing Projects

# Publish projects as HTML5 files

---

**From an expert:**

[Unsupported objects in HTML5 output](#)

[Hosting HTML5 output on web servers for iPad/iPhones](#)

[Accessing HTML5 output from iPads/iPhones](#)

[Best practices for creating Adobe Captivate projects for iPads](#)

**From an expert:**

You can publish Adobe Captivate projects for devices that support HTML5 such as iPad or iPhone.

1. Open the project and then click File > Publish.
2. In the Publish dialog box, click HTML5 in the Output Format.
3. After publishing, do the following:
  - If your project contains links to external files (Open URL Or File action), copy the files to the output folder
  - If your project contains a link to another Adobe Captivate project (CPTX), copy the project to the Calleees folder in the output folder.

**Note:** You can view the Interactions in the project only when you view the HTML5 output hosted on a web server. Interactions are not visible when you view the published output locally on your computer.

You can also publish HTML5 output of projects to Adobe Connect. For more information, see Publish projects to Adobe Connect (available only in the update for subscription and Adobe Software Assurance customers).

---

## Unsupported objects in HTML5 output

[To the top](#)

Objects in the project that are not supported in the HTML5 output get dynamically listed in the HTML5 Tracker. To view the tracker, click Window > HTML5 Tracker. When you delete or modify such objects in the project, the tracker too is updated.

The following objects and slides are not published in the HTML5 output:

- Text and SWF animations (only the first frame is visible).
- Mouse click animations (only one default click effect is supported).
- Question pools, Likert question slides, and random question slides.
- Slide transitions.
- Slide background if a SWF file is used.
- Audio attached to invisible objects.
- Mouse right-click and double-click.
- Borders.

**Note:** FLV files that are created using On2VP6 codec only are supported in the HTML5 output.

Video streaming using RTMP is not supported in HTML5 output.

Not all object effects are supported in HTML5 format; only the following object effects are supported:

- Entrance
  - Fly-in
  - Ease-in
- Exit
  - Fly-out
  - Ease-out
- Motion path
  - Left to Right

- Left to Right Ease
- Pentagon
- Rectangle
- Right to Left Ease
- Right To Left
- Triangle
- Zig Zag

Reporting to internal server and Acrobat.com is also not supported.

---

## Hosting HTML5 output on web servers for iPad/iPhones

[To the top](#) <sup>11</sup>

HTML5 output can be accessed on iPads/iPhones only through web browsers. Upload the entire HTML5 output folder to a web server root folder and make the URL available to your users. Your users can access the URL from their iPad/iPhone and view the content that plays within the web browser.

Webserver root for IIS: `C:\Inetpub\wwwroot\`

Webserver root for Apache: `<Apache install folder>\htdocs\`

---

## Accessing HTML5 output from iPads/iPhones

[To the top](#) <sup>11</sup>

HTML5 output is supported only on iPads with OS version 5 or later.

HTML5 output is supported only on the following browsers:

- Internet Explorer 9 or later
- Safari 5.1 or later
- Google Chrome 17 or later

Type the following URL in one of the above web browsers:

`http://<webserver_hostname>:<port>/<HTML5_outputfolder>/`

For example, if the HTML5 output folder is MyCpProject, the URL will be:

`http://localhost:80/MyCpProject/`

---

## Best practices for creating Adobe Captivate projects for iPads

[To the top](#) <sup>11</sup>

- Use the recommended project resolutions (presets) for iPad.
- Avoid overlapping audio in the project. If at all you need overlapping audio, read the article [Adobe Captivate audio for iPad](#).
- Disable button click sound as it may lead to unexpected behavior on iPad occasionally.

### Adobe Captivate audio for iPad

Avoid using overlapping audio in your projects if they are to be used extensively on iPads.

If you use overlapping audio, the preferences to different types of audio are as follows:

#### Scenario 1: Different types of audio triggered at the same time

The sequence in this case is:

Object audio > Slide audio > Background audio

Object audio is played first, followed by slide and background audio.

On iOS 6, however, multiple audio clips can be played simultaneously.

#### Scenario 2: Two or more objects are assigned with audio and appear simultaneously in the Timeline

Audio of the object lower in the z-order of the timeline is played first.

- Case 1: Object 1 has audio for 0-4 seconds and Object 2 has audio for 0-8 seconds. Object 2 is lower in the z-order of the Timeline.  
Audio of Object 2 is played for 8 seconds and then Adobe Captivate checks if there is any other audio at that point (8th second) in the

Timeline. In this case, there is no audio to be played at the 8th second. Therefore, audio of Object 1 is not played.

- Case 2: Object 1 is lower in the z-order.

Audio of object 1 is played for 4 seconds. A check at 4th second indicates that the audio of object is for 4 more seconds. So, the audio of second object is played from the beginning. After 8th second when the second object's audio is played, a check on the Timeline indicates that there is no more audio to be played.

### Scenario 3: Object audio, slide audio, and background audio on a single slide

- Case 1: Object Audio is present from 0-4 seconds and Slide Audio is present at the same time. (no background audio)  
Object Audio is played first for 4 seconds and then the whole Slide audio will be played.
- Case 2: Object Audio is present from 2-6 seconds and slide audio is present at the same time. (no background audio)  
First Slide Audio will be played for 2 seconds, then Object Audio for 4 seconds and then Slide Audio again.
- Case 3: Object Audio is present 0-4 seconds, Slide Audio 0-8 seconds and Background Audio is present. (slide duration let say is 14 seconds)  
Object Audio is played for 4 seconds, then slide audio for 8 seconds, then the remaining slide duration background audio is played.

### Adobe Captivate video on iPads

Avoid using overlapping video if your project is to be extensively used on iPads.

#### Scenario 1: Two or more videos on the same slide with different durations

Videos are played one after the other based on their order in the Timeline.

For example, consider that two videos are present on a single slide with the following durations on the timeline:

- Slide\_Video1 from 0-8 seconds Event\_Video2 from 4-10 seconds

Slide Video will be played for 8 seconds and then Event Video

#### Scenario 2: When two videos start at the same time

Video that is lower in the z-order is played first. For example, consider that Video1 is present on a slide from 0-8 seconds and Video2 is also present on the same slide from 0-12 seconds.

- When Video 2 is present lower in the z-order, Video 2 is played for 12 seconds and the Video1 is never played.
- When Video1 is present lower in the z-order, Video1 is played for 8 seconds and then Video2 is played until the slide duration.

# Change the default location of published files

---

The Adobe Captivate projects are published to the \\Documents and Settings\<>user name>\My Documents\My Adobe Captivate Projects folder (on Windows) or /Users/<username>/Documents/My Adobe Captivate Projects folder (on Mac OS) if you have not made any changes to the settings when publishing the project. You can change this default location in the Preferences dialog box.

1. In Adobe Captivate, select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select General Settings from the Global menu.
3. Click the Browse button corresponding to the Publish At field.
4. In the Browse For Folder dialog box, select the folder in which you want the Adobe Captivate projects to be published.

[Legal Notices](#) | [Online Privacy Policy](#)

# Collaboration with Acrobat.com

---

## Uploading and sharing files

You can upload Adobe Captivate project files to Acrobat.com and share with users and reviewers instead of sending the files by e-mail.

When you choose to upload or share a project, Adobe Captivate automatically publishes the file to a temporary location in one or all of the following formats:

- Adobe Captivate project published as SWF file
- Adobe Captivate project published with output option ZIP
- Adobe Captivate project published with output option PDF

**Note:** If you choose only CPTX for upload/share, only that file is uploaded and automatic publishing does not occur.

---

## Uploading and sharing files

[To the top](#) <sup>4</sup>

1. Select File > Collaborate.
2. Select either of the options:
  - Upload files
  - Upload and share files

### Upload Files to Acrobat.com

1. If you have signed up for Acrobat.com, specify the username and password in the Publish to Acrobat.com dialog box.  
If you are new to Acrobat.com or you lost your password, click the respective links to Acrobat.com website. Follow the instructions to register or retrieve your password.
2. After you submit the Acrobat.com credentials, click Sign In.
3. Specify a publish title and check the file types for upload. If files with the same publish title reside on Acrobat.com, you are prompted to overwrite. If you do not want to overwrite, but want to upload files, provide a unique publish title.
4. Click Upload.

### Share Files on Acrobat.com

1. Follow step 1 to step 3 in the section Upload Files to Acrobat.com.
2. Click Next and then enter e-mail addresses of people you want to share the files with, e-mail subject, and message.
3. Set one of the following access levels:

**Limited access: Only my specific recipients can access and download the file:** The recipients must log in with their e-mail addresses to access the files. The e-mail addresses using which you shared the files and the e-mail addresses using which the recipients have signed up for Acrobat.com account must match.

**Open access: Anyone who knows the URL can access and download the file:** People who know the link can access and download the file without signing in to Acrobat.com.

# Publish projects as MP4 files

## Video settings

### Upload projects to YouTube directly from Adobe Captivate

Adobe Captivate lets you publish your projects as MP4 files by choosing any of the following presets:

- Smart devices, such as, Apple iPad and iPhone.
- YouTube formats, such as, YouTube Widescreen HD, and YouTube Widescreen SD.
- Any custom settings.

**Note:** *F4V publishing is replaced with MP4 publishing in Adobe Captivate 5.5 and later.*

When you select a smart device or a YouTube format, Adobe Captivate automatically sets the optimum video settings for the chosen option.

If you have used a device or a YouTube preset while creating the project, an appropriate option is displayed automatically in the Publish dialog box.

1. Click File > Publish, and click Media.
2. In the Select Type list, click MP4 Video (\*.mp4).
3. Specify a title for the project.
4. Specify a folder in which the project must be published. By default, the project is published in the folder specified in the project preferences.
5. Click one of the options in the Select Preset list.

Adobe Captivate automatically sets the video settings based on the option you select. If necessary, you can customize the settings by selecting the Customize Video Settings check box. For the description of the settings, see Video settings.

**Note:** *It is recommended that you retain the default settings for optimized outputs.*

6. Click Publish.

### Adobe Captivate 5.5 -- New Publishing Outputs

Jason Nichols  
A video on the new publishing formats in Adobe Captivate 5.5

### Publishing projects as MP4 files

A video tutorial on how to publish projects as MP4 files.

After publishing a project as an MP4 file, you can do the following:

- Upload it to the device stores or to YouTube.
- Distribute the file to your users as a stand-alone video over email or host it on your web server.
- Stream or embed the MP4 file using Flash.

## Video settings

[To the top](#) 

**Profile** The profile of the H.264 encoder/decoder.

**Baseline** For mobile and video conferencing applications

**Main** For standard-definition digital TV broadcasts

**High** For applications and devices dealing with high definition

The higher the profile, the higher is the complexity involved to encode or decode.

**Level** The degree of the required decoder for the selected profile. The higher the level, higher is the degree of complexity associated with the decoder.

**Bitrate Encoding** The type of bit rate you want to use.

**CBR** Constant Bit Rate. For every second of the video, the number of bits used is constant and is equal to the Target Bit Rate.

**VBR, 1 Pass** Variable Bit Rate. Some frames require higher bits than others. If you select this option, the encoder decides how many bits

to use in such cases. So, the actual bit rate of the video is between the target and maximum bit rate.

**Target Bitrate** Number of bits per second to be used by the encoder.

**Max Bitrate** The maximum bit rate to be used by the encoder. This option available only when you choose variable bit rate.

After specifying the video settings, click Test Settings to verify whether the custom settings are valid.

Some best practices while customizing the video settings:

- The higher the profile or level, the greater is the chance of reducing the file size.
- Constant bit rate provides a file with lower size compared to variable bit rate.

When you specify a variable bitrate, the encoder decides when to use more bits to maintain good quality. The file size increases when more bits are used. You may encounter issues while streaming such files as more number of bits can be downloaded to show specific sections of a movie.

---

## Upload projects to YouTube directly from Adobe Captivate

[To the top](#)

1. Click File > Publish to YouTube.

Adobe Captivate converts your project to an MP4 file at the back end. After the conversion is completed, the Adobe Captivate Video Publisher dialog box, and the YouTube Login window appears.

2. Specify your YouTube login credentials and select the I've Read Adobe Privacy Policy check box.
3. Click Login.
4. In the Adobe Captivate Video Publisher dialog box, specify the title for the project, and type in a description.
5. In the Tags field, type the tags for the project to optimize your users' search for the project. Use commas or semicolons to separate multiple tags.

Generally, the tags are the search terms that your users use to search for your project on YouTube. Some examples are the subject of your project, or the key terms in the project, or the title.

6. In the Category list, click a category to which your project belongs.
7. Click one of the following options:
  - Public: To make your project available for everyone who accesses YouTube.
  - Private: To make your project available to only specific set of users. After uploading the file, log on to YouTube, and provide permissions for such users. For more information, see [this website](#).
8. Click Terms and Conditions, review them, and click Back.
9. Select the I have read the terms and conditions check box, and click Upload.

The Adobe Captivate Video Publisher displays a message indicating that the video is uploaded successfully.

10. Click Send An email to send the YouTube URL to the required people over mail. to the to the required people. The default email application configured on your machine is loaded, and the URL of the project appears in the default text of the email.
11. To post the video on Facebook, do the following:
  - a. Select the Facebook check box and log in to Facebook.

If you are accessing Facebook through Adobe Captivate Video Publisher for the first time, you will be prompted to go to the Adobe Captivate Social Share app and provide permissions.
  - b. Click Go To App and then click Allow.
  - c. In Adobe Captivate Video Publisher, click Post.
12. To post the video on Twitter, do the following:
  - a. Select the Twitter check box and log on to Twitter.
  - b. Twitter generates a PIN automatically.
  - c. Copy the PIN and paste it in the Enter PIN Here box at the bottom of the dialog box, and then click Set PIN.
  - d. In Adobe Captivate Video Publisher, click Post.

# Publish projects as SWF files

## Reduce the size of a SWF file

You can publish Adobe Captivate projects as SWF files in one of the following formats:

- Flash 9 or Flash 10
- Flash Lite 4.0

**Note:** To run projects that you have published using Flash, you must have the same or later version of Flash Player.

1. In an open project, select File > Publish.
2. In the Publish dialog box, select Flash (SWF), and configure the following options:

**Project Title** Enter the desired name without the filename extension (.swf).

**Folder** Enter the full path for the folder in which to save the file or click Browse to locate the folder. A folder is created with the same name as the title, and all published files are moved inside it. If you do not want to create a separate folder and want to place the published SWF file in the same folder as the source file, clear the option Publish Files To A Folder.

For example, if you have chosen to publish your project variables.swf to the desktop, a folder named variables is created on the desktop, and the files are published into this folder. When this option is not chosen, all the published files are published directly to the desktop.

**Zip Files** Creates a ZIP file containing the Flash content (SWF file) and other associated files such as the HTML file required to display the SWF file, and a JavaScript for loading the SWF file into the HTML file. When you have enabled AICC/SCORM, other supporting files are created. This option is especially useful when you want to create a single file for uploading to a learning management system (LMS). For more information, see Configuring the project to report to LMS.

**Full Screen** Opens the file in full screen mode. (You can't apply this option if you select AICC or SCORM options for the project.)

**Note:** If you select the full screen option, Adobe Captivate generates two HTML files to accommodate the Windows XP Service Pack 2 release. Use both HTML files with the SWF file so that when you publish your project users do not receive a Service Pack 2 warning message. Link to the HTML file with "fs" added, for example, "myproject\_fs.htm." The HTML file with "fs" automatically links to the second HTML file, which, in turn, plays your project.

**Generate Autorun For CD** Runs the output file automatically when the CD is inserted into the computer.

**Export HTML** Creates a standard JavaScript file that helps embed the SWF file into the generated HTML file.

**Export PDF** The generated SWF file is inserted into a PDF file and published. This option is useful to share content over email or any other means where the learner doesn't have access to the content through the Flash Player in a browser.

**Note:** You must have Adobe Acrobat® or Adobe Reader® version 9.0 or later installed on your computer to view the output.

**Flash Player Version** Adobe Captivate generates the SWF file in the Flash version that you choose.

The Project Information area displays useful statistics about the project including the size (resolution), number of slides, audio information, e-learning details, accessibility compliance, and the playback control assigned to the project. To change any of the options listed in this area, click the blue text.

To change preferences, click Preferences.

After publishing your project as a SWF file, you can use these SWF files independently or include them in web pages.

## Adobe recommends

 [Have a tutorial you would like to share?](#)

### Publishing projects as SWF files

A video tutorial on how to publish projects as SWF files.

## Reduce the size of a SWF file

[To the top](#) <sup>↑</sup>

You can reduce the size of the published Flash (SWF) file during the publishing process. However, the quality of the published file is compromised.

1. In an open project, select File > Publish.

2. In the left panel, select Flash (SWF).
3. In Flash (SWF) Size And Quality under Project Information in the right panel, click Custom.
4. In the Settings area, use the slider bar to customize the quality of the file and the file size. For more information, see [Change project size and quality](#).  
**Note:** *The quality of the file increases as you move to the top of the slider, with a corresponding increase in file size.*
5. To use the changed setting whenever the file is published, click Retain Slide Quality Settings.
6. Click OK.

[Legal Notices](#) | [Online Privacy Policy](#)

# Publish projects as executable files

You can create stand-alone, executable files of your Adobe Captivate projects. This publishing option enables you to create a Windows executable file (EXE) or MAC executable file (APP).

1. Select File > Publish.
2. In the Publish dialog box, select Media, and configure the following options:

**Select Type** From the menu, select Windows Executable (\*.exe) or MAC Executable (\*.app).

**Project Title** Enter a name for the executable file without adding the extension (.exe/.app).

**Folder** Enter the full path to the folder in which to save the file, or click Browse to locate the folder.

**Custom Icon** You can customize the icon that is displayed for the executable file. Click Browse (...) to add a custom icon for your file. Ensure that the icon file has a .ico extension (on Windows)/.icns (for Mac).

(Applies only for Windows) You can create a custom icon file using any software meant for that purpose. Ensure that the file you create contains seven images of the following dimensions:

- 256x256 32-bit color image
- 48x48 32-bit color image
- 48x48 8-bit color image
- 32x32 32-bit color image
- 32x32 8-bit color image
- 16x16 32-bit color image
- 16x16 8-bit color image

3. (Applies only to EXE) Select from the following output options:

**Zip Files** Creates a ZIP file containing the EXE file.

**Full Screen** Runs the executable file in full screen mode.

**Note:** *If you select AICC or SCORM options for the project, you can't apply the full screen publishing option.*

**Generate Autorun For CD** An autorun.inf file is generated in the publish directory. The file starts playing as soon as the CD is inserted into the computer.

**Flash Player Version** Adobe Captivate generates the SWF file in the Flash version that you choose.

The Project Information area displays useful statistics about the project including the size (resolution), number of slides, audio information, e-learning details, accessibility compliance, and playback control assigned to the project. To change any of the options listed in this area, click the blue text.

To change preferences, click Preferences.

# Publish projects to the web using FTP

You can publish your Adobe Captivate projects directly to a website through FTP.

1. In an open project, select File > Publish.
2. In the Publish dialog box, select FTP and set the following options.

**Project Title** Enter the desired name.

**Server** Select the name of the server that hosts the FTP site on which you want to publish your project. To add an FTP server to the list, click the browse (<<+>>) button, and add or delete servers using the options in the FTP Servers dialog box.

**Note:** You will not have to create a separate FTP server list for every project because Adobe Captivate saves changes made to the FTP list automatically. These changes are also captured when you import and export preferences.

**Directory** Enter the specific directory on the server to which to upload the files.

**User name** Enter a user name with permissions to publish files to the server.

**Password** Enter a valid password for the user name.

**Port** Enter the correct port number to which you should upload your files. (Port number 21 is commonly used.)

3. Select a file type.

**SWF File** Select this option to create a Flash SWF file to FTP.

**Project Files** Select this option to create Adobe Captivate project files (CPTX) to FTP. This is useful if you want to share the project with someone who needs to open and edit the project.

4. (Optional) Click Test Settings to test the settings you entered for the server. You will receive either a confirmation message stating that the connection succeeded or an error message explaining why the connection cannot be made.

5. Select from the following output options:

**Zip Files** Creates a ZIP file. (A program like WinZip can be used to open the files.)

**Full Screen** Opens the file in full screen mode.

**Export HTML** Creates a standard JavaScript file that helps embed the SWF file into the HTML file.

**Flash Player Version** Adobe Captivate generates the SWF file in the Flash version that you choose.

6. The Project Information area displays useful statistics about the project including the size (resolution), number of slides, audio information, e-learning details, accessibility compliance, and the playback control assigned to the project. To change any of the options listed in this area, click the blue text.

To change preferences, click Preferences.

7. Click Publish.

You are notified when the process is complete.

**Note:** After the files are uploaded, you can view the project from your web browser by entering the web address

<http://www.yourwebaddress.com/filename.htm> where *www.yourwebaddress.com* is the URL and *filename.htm* is the filename you entered in step 2.

# Report to Acrobat.com or internal server

---

## Reporting workflow

### Setting the reporting preferences

### Submitting the results

### Viewing the results

### Adobe Captivate Quiz Results Analyzer and Offline reporting

If you do not want to use a Learning Management System (LMS) for tracking the quiz scores, Adobe Captivate provides you with alternate reporting options. You can now choose Acrobat.com or an internal web server as your reporting servers.

After the user submits the quiz result, Adobe Captivate Quiz Results Analyzer, an AIR-based desktop application, lets you analyze the assessment report in online and offline modes.

---

## Reporting workflow

[To the top](#)

1. You create a quiz and set either Acrobat.com or Internal Server as the reporting server preference.
2. User completes the quiz, and submits the result to the reporting server.
3. You access the report from the server, view, generate, and publish using Adobe Captivate Quiz Results Analyzer.
4. You save the report locally so that it can be analyzed in offline mode.

After you set the reporting preference, the process happens in the background and usually requires no user intervention.

---

## Setting the reporting preferences

[To the top](#)

1. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac).
2. Select Reporting from the Quiz menu in the Preferences dialog box.
3. Check Enable reporting for this project.
4. Select Acrobat.com or Internal Server and then click Configure.
5. In the Alternate Reporting dialog box, provide the server settings:

- **For Acrobat.com:** If you have signed up, specify the username and password.

If you are new to Acrobat.com or if you lost your password, click the respective links which take you to Acrobat.com website where you can register or retrieve your password.

- **For Internal Server:** Specify the path to the web server as provided in the following example:

`http:\\<ip address>\internalServerReporting.php`

The internal server can be a web server of your preference.

internalServerReporting.php is the sample PHP that is available in the Adobe Captivate installation folder. You can either use it or create your own server-side file, for example a PHP or ASP to write files to the server. Ensure that the server allows writing to files.

6. Enter the details of the institution that conducts the assessment, department, and course.

---

## Submitting the results

[To the top](#)

1. After the users complete the quiz, they reach the results slide and then click Post Result.
2. At prompt, the users specify the names and e-mail addresses, and then click Send.  
**Note:** *Then name and e-mail address are not verified.*
3. Depending on the reporting preference that the author has set, the results are sent to Acrobat.com or internal server.

---

## Viewing the results

[To the top](#)

Use Adobe Captivate Quiz Results Analyzer for viewing and downloading the results.

Though the user submits the quiz result to Acrobat.com, you cannot directly view the results. If you are using an internal web server, manually retrieve the report. Adobe Captivate Quiz Results Analyzer lets you overcome these constraints.

## Adobe Captivate Quiz Results Analyzer and Offline reporting

Adobe Captivate Quiz Results Analyzer is an AIR-based desktop application that allows you to analyze quiz results that are posted on Acrobat.com or internal server.

Use this tool to:

- View results and generate reports
- Save results to a local folder so that they can be viewed in offline mode
- Customize your reports to display or hide the report columns
- Print reports
- Generate dynamic charts that visually present the results as line charts and bar charts making results easy to compare. You can also export the reports as CSV.

**Note:** To use Adobe Captivate Quiz Results Analyzer, you do not require Adobe Captivate installed on your machine.

### Installing Adobe Captivate Quiz Results Analyzer

Download the Quiz Results Analyzer.air from Adobe website ([www.adobe.com/go/cp5\\_quizanalyzer](http://www.adobe.com/go/cp5_quizanalyzer)) or run it from the location where Adobe Captivate is installed.

Ensure that you have AIR installed because Adobe Captivate Quiz Results Analyzer requires the AIR platform to run.

You can download AIR from: <http://get.adobe.com/air/>.

### Using the Adobe Captivate Quiz Results Analyzer

Launch the Analyzer and specify the source. The source can be *Acrobat.com*, *Internal server*, or (if you have downloaded the results) *From this computer*.

The internal server option appears only if you have added the servers in the preferences of the AIR application. To do this, click Options > Preferences and then click Add.

**Note:** On the internal server, the results are stored in the folder *CaptivateResults-<internalservename>*.

To download the results to the local computer, click the Download To Disk icon. The results are stored in the folder *CaptivateResults-<yourAdobeAcrobatID>*.

# Set publishing preferences

---

1. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select Publish Settings from the Project menu.
3. Set the various options according to your requirements.

**Frames Per Second** This option sets the number of Flash frames that appear per second. The default setting is 30 frames per second and is appropriate in most cases. For example, with the default setting, a caption that appears for 1 second requires 30 Flash frames. Dividing the number of frames in a project by 30 gives you the length of the project in seconds. You may need to change the rate if you are embedding your Adobe Captivate SWF file in another SWF file that has a frame rate other than 30.

**Publish Adobe Acrobat Connect Pro Metadata** Adds information to your Adobe Captivate project file (SWF) that makes it easier to integrate the project into Adobe Acrobat Connect Pro. The embedded data links the Adobe Captivate CPTX file to the SWF file when you publish the project to Connect Server and makes it easier for the Adobe Captivate output file to be found during searches done in Adobe Acrobat Connect Pro.

For more information see [Adobe Connect](#) .

**Note:** *Selecting this option increases the size of the project. If you will not use the project with Adobe Acrobat Connect Pro, you can clear the option and decrease the size of the finished project file (SWF). However, if there is the possibility that the output file (SWF) may be used in Adobe Acrobat Connect Pro, it is a good idea to select the Publish Adobe Acrobat Connect Pro Metadata option.*

**Include Mouse** Includes any recorded mouse movement in the project.

**Include Audio** Includes any audio files that have been added to the project.

**Publish Audio as Mono** Converts stereo sounds to mono.

**Play Tap Audio For Recorded Typing** This option plays tapping sounds in the final project to represent recorded keystrokes. (For example, if you recorded an e-mail message being sent, you most likely typed an address to which the e-mail should be sent. The sound of the keys being pressed to enter the address was recorded, and using this option, a tapping sound can be played for each of the keystrokes.)

**Enable Accessibility** Enable this option to make your project accessible to visually impaired users. The text in your project is read aloud when users accept the help of a screen reader when viewing the project. In addition, any other accessibility options that you have configured in the project are also enabled.

**Externalize Resources** When you publish a project as a SWF file, a single SWF file is produced. To reduce the size of the SWF file, you can choose to externalize some of its objects (skin, widgets, FMR SWF file, and animations). After publishing, the externalized resources reside outside the SWF file, and are referenced by it.

## Using Adobe Captivate with Other Applications

# Learning management system (LMS)

---

## [Configuring the project to report to LMS](#)

### [Publish the project for an LMS](#)

### [Accessing Adobe Captivate courses in cross-domain environments](#)

You can use a learning management system (LMS) to distribute a computer-based tutorial created using Adobe Captivate over the Internet. A learning management system is used to provide, track, and manage web-based training.

The project that you upload to the LMS must be compliant with the SCORM/AICC standards.

**SCORM** Shareable Content Object Reference Model (SCORM) is a set of specifications used to produce reusable e-learning objects. It defines communication between a client (such as Adobe Captivate) and a host (usually an LMS).

SCORM is distributed by Advanced Distributed Learning, an organization under the US Department of Defense.

**AICC** Aviation Industry CBT [Computer-Based Training] Committee standards define how content for e-learning is developed, delivered, and evaluated.

Adobe Captivate provides you options to make your projects SCORM/AICC-compliant and also creates the necessary files required for compliance to these standards. You can directly upload the published package to an LMS.

The following workflow is usually used for creating an LMS-ready package using Adobe Captivate and uploading it to an LMS:

1. Create an Adobe Captivate project with at least one slide containing an interactive object, and for which reporting has been enabled.
2. Configure the project to report to LMS by setting the SCORM/AICC options in Preferences. See [Configuring the project to report to LMS](#) for more information.
3. Publish the project as a SWF file after enabling the Export HTML option. Best practice is also to select compression in a ZIP file. This way, you can upload the package as a single file to the LMS.
4. Do one of the following:
  - Upload the published project files or the ZIP file directly to the LMS.
  - If you are using an AICC-based LMS, publish the Adobe Captivate project and upload it to an HTTP location (your content server). Then, upload the URL of the HTM file to LMS.

---

## Configuring the project to report to LMS

[To the top](#) <sup>↑</sup>

1. In an open project, select Quiz > Quiz Preferences. The Preferences dialog box appears.
2. In the Category list, select Reporting from the Quiz menu.
3. Select Enable Reporting For This Project and then click one of the options in the drop-down list.

**SCORM 1.2** Select if you are using a SCORM 1.2-based LMS. Click Configure to specify the manifest file details. See [Configure manifest details](#) for more information.

**SCORM 2004** Select if you are using a SCORM 2004-based LMS. Click Configure to specify the manifest file details. See [Configure manifest details](#) for more information.

**AICC** Select if you are using an AICC-based LMS.

4. Specify how you want the status of the course to be reported to LMS. See [Status Representation](#) for more information.

**Note:** *Status Representation option is available for SCORM 1.2 only. However, not all SCORM 1.2-based LMSs display the status.*
5. Specify the success and completion criteria for your course. The status of the course is decided based on whether or not the users met these criteria. See [Success/Completion criteria](#) for more information.

**Note:** *Unlike SCORM 1.2, you can specify separate success and completion criteria for SCORM 2004.*
6. Specify how the data is to be reported to LMS. See [Data to report](#) for more information.

7. In the LMS Initialization Text field, type the text that you want to display to users while the course loads in the web browser.

8. Click Advanced to specify the following advanced settings:

**Never Send Resume Data** The project notifies the LMS when users resume a session after taking a break. Users see the page at which they left off earlier. If this option is enabled, users see the first page when they resume the project.

**Set exit to normal after completion** Restarts the course from the first slide when users launch it again after successfully completing it once. If you select this option, the `cmi.exit` value is set to 'Normal' when the status changes to 'Completed'.

*note: This behavior is consistent in SCORM 2004-based LMSs. On SCORM 1.2-based LMSs, the behavior may vary. For such cases, check with your LMS administrator for assistance.*

**Escape Version and Session ID** Converts the version and session ID to its URL encoded values.

**Don't Escape Characters** Supports the escape version and session ID option. Type the characters that should not be included in the escape version and session ID.

The manifest file is generated. To see the manifest file, publish your Adobe Captivate project and create a SWF file. If you used the default save location, you see the SWF file and `imsmanifest.xml` file in your My Documents\My Adobe Captivate 6 Projects folder (on Windows) /Users/<username>/Documents/My Adobe Captivate Projects folder (on Mac OS).

When you enable reporting for the project by setting the SCORM options, Adobe Captivate creates the following files when the project is published:

#### **Manifest File**

This file is used to import the Adobe Captivate project into the LMS. The manifest file, `imsmanifest.xml`, contains the metadata of the project and its course structure.

#### **HTML File**

Launches the Adobe Captivate project from the LMS.

#### **JavaScript File**

Acts as a link between the SWF file and the LMS. Adobe Captivate sends tracking data to the LMS using the JavaScript APIs.

#### **SWF File**

The contents of the published project are stored in the SWF file.

#### **Other supporting Files (.xsd Files)**

Contain other information required by the LMS.

### **Configure manifest details**

Course area:

**Identifier** (Required field) The identifier used by the LMS to identify different manifests. A default identifier based on the name of your Adobe Captivate project is automatically added to this field. You can change the identifier at any time by selecting the text and typing in new text.

**Title** (Required field) The title of your project that is displayed to the user viewing the project using an LMS. A default title based on the name of your Adobe Captivate project is automatically added to this field. You can change the title at any time by selecting the text and typing in new text.

**Description** (Required field) The text that the LMS displays to describe your project. A default description based on the name of your Adobe Captivate project is automatically added to this field. You can edit the description at any time.

**Version** (Required field) The version specifies a number that can be used to differentiate manifests with the same identifier. For example, if you are uploading the same project after modifying it, use a different version number.

**Duration** (Optional field) The time required for learners to complete the project. Adobe Captivate prepopulates this field with an approximate value. However, if your project is 'heavy', for example, if it contains videos or animations, you can revise this value.

SCO area:

#### **Identifier**

(Required field) The LMS uses the identifier to identify different shareable content objects (SCOs). In the Adobe Captivate context, SCO refers to the Adobe Captivate project. A default identifier based on the name of your Adobe Captivate project is automatically added to this field. You can change the identifier at any time by selecting the text and typing in new text.

*note: A course can contain more than one project. Each project is treated as a distinct SCO. However, Adobe Captivate does not support more than one project in a course.*

#### **Title**

(Required field) A default title based on the name of your Adobe Captivate project is automatically added to this field. You can change the title at any time by selecting the text and typing in new text.

## Status Representation

**Incomplete -- > Complete** The status of the course is reported as Incomplete in LMS when users launch the course. The status changes to Complete when the completion criteria is satisfied.

**Incomplete -- > Passed/Failed** The status of the course is reported as Incomplete when users launch the course. The status changes to Passed/Failed when the completion criteria is satisfied.

**Note:** Status Representation fields are available only when you choose AICC or SCORM 1.2.

## Success/Completion criteria

**User Access** The users are considered to have successfully completed the course if they launch the course from LMS.

**Slide Views** The course is considered to be complete or successful if users view the specified number or percentage of slides.

**Tip:** For branched quizzes, specify the criterion as percentage of slides.

**Quiz** The course is considered to be complete or successful based on the users' performance in quiz. You can choose one of the following criteria:

- Users attempt the quiz: In this case, the status is reported as Complete if users attempt the quiz irrespective of whether they pass or fail the quiz.
- Users pass the quiz: In this case, the status is reported as Complete only if users pass the quiz.
- Users pass or the attempt limit is reached: In this case, the status is reported as Complete if users pass the quiz or have taken all the attempts. For example, if the number of attempts set in the course is 2, and:
  - Users take the first attempt and pass, then the status is reported as Complete and Passed.
  - Users take the first attempt and fail, then the status is reported as Incomplete and Failed as the attempt limit is still not reached.
  - If users retake the quiz and fail, the status is reported as Complete and Failed.
  - If users attempt the quiz again and pass, the status is reported as Complete and Passed.

**Note:** SCORM 2004 supports two types of status: Success and Completion status. You can configure Adobe Captivate to send these two statuses to a SCORM 2004-based LMS separately. For example, criteria for Completion status can be 'slide views 100%' while Success criteria can be 'quiz is passed'.

## Data to report

**Quiz Score** Report the quiz score as percentage or as points.

**Interaction Data** Report user interaction data, for example, the question attempted by users, and the answer provided them.

---

## Publish the project for an LMS

[To the top](#) <sup>11</sup>

After you set the SCORM/AICC options, you must publish the project as an SWF file.

When you choose to zip the published files, the entire set of published files is compressed into a single ZIP file. The ZIP file containing the manifest file is also called a PIF (Package Interchange File). SCORM guidelines recommend, but do not require, the use of a PIF for transporting content packages between systems. However, some LMSs require you to upload the project as a PIF. In any case, it is always simpler to upload a single file to the LMS rather than many files.

1. Open an Adobe Captivate project.
2. Select File > Publish.
3. On the left of the Publish dialog box, select Flash (SWF).
4. In Project Title, enter the name without the filename extension (.swf).
5. In the Folder text box, enter the full path to the folder in which to save the file or click Browse to locate the folder.

By default, Zip Files is selected as the output option. Adobe Captivate packages the course into a PIF by creating a ZIP file containing the Flash (SWF) file and the HTML file.

6. Click Publish.

After publishing the project, upload the ZIP file to your LMS, and distribute the URL provided by the LMS to your users.

---

## Accessing Adobe Captivate courses in cross-domain environments

[To the top](#) 

If the web server on which you have hosted your Adobe Captivate HTML5 course and your LMS are in different domains, perform the following steps to set up the course:

1. Publish your AICC-based Adobe Captivate course as an HTML5 course.
2. Go to the publish folder and open the index.html file in Wordpad or Notepad.
3. Search for the comment “Uncomment below line to run across domain for HTML5” and uncomment the lines that follow this comment.
4. Save the changes in the file and upload your course onto the web server.

**Note:** *This feature is available only in the Adobe Captivate 6 update exclusively for subscription and Adobe Software Assurance customers.*

## PowerPoint tips

[Import PowerPoint presentations into Adobe Captivate](#)

[Create Adobe Captivate projects from PowerPoint presentations](#)

[Insert Adobe Captivate projects into PowerPoint presentations](#)

[Edit imported PowerPoint slides within Adobe Captivate](#)

[Update PowerPoint presentation changes made outside Adobe Captivate](#)

[Change link type after importing the presentation](#)

[Change the link to the presentation after importing](#)

[Reduce file size of projects with embedded slides](#)

[Using Adobe Captivate with Microsoft PowerPoint on Mac OS](#)

You can import and edit Microsoft PowerPoint presentations in Adobe Captivate. Imported slides can be edited in a Microsoft PowerPoint environment from within Adobe Captivate. You can choose to link to the source PowerPoint presentation to keep it in sync with the Adobe Captivate project.

When a PowerPoint presentation is linked to an Adobe Captivate project, Adobe Captivate creates a reference to the source presentation. When the linked presentation is opened in Adobe Captivate for editing, the source presentation is loaded into Adobe Captivate. Because the source presentation is referenced, and not embedded into the project, linking to presentations does not affect the file size of the Adobe Captivate project.

When you import a presentation into Adobe Captivate without linking to it, the entire source presentation is embedded into the project. Editing an embedded presentation does not affect its source file. However, embedding increases the file size of the Adobe Captivate project. You can embed the presentation when the location of the Microsoft PowerPoint presentation is not fixed. Embedding is also useful when the Adobe Captivate project must be opened on a computer that doesn't have access to the Microsoft PowerPoint presentation.

Adobe Captivate supports PowerPoint presentations with the extensions .ppt, .pps, .pptx, and .ppsx. You can import PPT and PPS slides even if you do not have PowerPoint installed on your computer. However, you can't edit them after import. To import PPTX and PPSX slides, you must have Microsoft PowerPoint installed on your system. Adobe Captivate converts PPTX files to PPT files during import. The information loss that occurs during such conversion is documented on the Microsoft website <http://office.microsoft.com/en-us/powerpoint/HA101023491033.aspx>.

Scenario	PowerPoint version required
Import PPT file	Need not install Microsoft PowerPoint if you are importing slides from a PPT file.
Import PPTX file	(For Windows) Microsoft PowerPoint 2007 or 2010 or Microsoft PowerPoint 2003 with Office Service Pack 3 (or later) and Office compatibility pack. (For Mac) Microsoft PowerPoint 2008 or 2011 or Microsoft PowerPoint 2004 with Office 2004 update (11.5 or later) and Open XML converter (compatibility pack for Office 2008)
Edit PPT file	(For Windows) Microsoft PowerPoint 2003 or Microsoft PowerPoint 2007 (For Mac) Microsoft PowerPoint 2004 or Microsoft PowerPoint 2008 or 2011
Edit PPTX file	(For Windows) Microsoft PowerPoint 2003 with Office Service Pack 3 (or newer) and Office Compatibility Pack (both available as freeware on the Microsoft website) or MicrosoftPowerPoint 2007 (For Mac) Microsoft PowerPoint 2008 or 2011 or Microsoft PowerPoint 2004 with Office 2004 update (11.5 or later) and Open XML converter (compatibility pack for Office 2008)

---

Open, edit, and save the PowerPoint file in Microsoft PowerPoint before importing it into Adobe Captivate. Performing this procedure ensures that the PowerPoint version installed on your computer is stable.

---

## PowerPoint tips

[To the top](#) <sup>1</sup>

Follow these guidelines when you work with Adobe Captivate and PowerPoint:

- Do not close or use PowerPoint launched by Adobe Captivate during import or round-tripping.
- Launch both Adobe Captivate and PowerPoint in the same mode, that is either both in Administrator mode or both in non-Administrator mode. It is recommended that you launch both in Administrator mode.
- Avoid doing any copy/paste action (even in other applications such as Notepad, or file copy), when Adobe Captivate is using PowerPoint.
- Avoid parallel edits. For example, suppose you edit a linked PowerPoint file within Adobe Captivate and the source file in Microsoft PowerPoint simultaneously. In such cases, the results are unpredictable.
- Avoid editing PPTX and PPSX files with older Microsoft PowerPoint versions. If you want to edit an embedded PPTX or PPSX file outside of Adobe Captivate, export the file from the resource Library and then edit the file. The edited file can then be updated in Adobe Captivate.
- If you have installed any interactive PowerPoint plug-ins, ensure that you launch Microsoft PowerPoint before you open the presentation in Adobe Captivate for editing.
- Avoid linking to PowerPoint files over the network on a shared network drive. The results are unpredictable if you lose connectivity while working with the shared file.

---

## Import PowerPoint presentations into Adobe Captivate

[To the top](#) <sup>1</sup>

1. In an open project, Select File > Import > PowerPoint Slides.
2. Navigate to and select the PowerPoint presentation file format that you want to import.
3. Click Open.
4. Decide where to place the imported PowerPoint slides in the Adobe Captivate project. Add the slides to the end of the project, or click a slide in the list and add the PowerPoint slides after that slide.
5. Click OK.
6. In the Convert PowerPoint Presentations dialog box, do the following:
  - a. Select the PowerPoint slides to convert to Adobe Captivate project slides.
  - b. Set navigation preferences for the selected slides.
  - c. If you want to link to the PowerPoint presentation, select Linked. If you want to embed the PowerPoint presentation, deselect Linked.
7. Click OK.

The PowerPoint slides are imported into the Adobe Captivate project and they appear in the designated location. If necessary, you can change the order of the slides.

Narration in a PowerPoint presentation slide is imported as a sound object and appears as a separate object on the Timeline. Even in the linked mode, changes made to the audio file in Adobe Captivate after import are not reflected in the respective Microsoft PowerPoint presentation. Similarly, changes made to the audio file in Microsoft PowerPoint are not reflected in the Adobe Captivate project. Object sounds are retained in the SWF file that is created from slides containing such objects.

Slide labels and notes are imported only during the first import. Any subsequent changes to the labels and notes in PowerPoint are not reflected in Adobe Captivate.

---

## Create Adobe Captivate projects from PowerPoint presentations

[To the top](#) <sup>1</sup>

1. In an open project, Select File > New > Project From MS PowerPoint.
2. Navigate to and select the PowerPoint presentation file format that you want to import.

3. In the Convert PowerPoint Presentations dialog box, do the following:
  - a. Enter the name of the project.
  - b. Select a size for the new Adobe Captivate project. The size displayed is the actual size of the slide in PowerPoint. Best practice is not to change the size.
  - c. Select the PowerPoint slides to convert to Adobe Captivate project slides.
  - d. Set navigation preferences for the selected slides.
  - e. If you want to link to the PowerPoint presentation, select Linked. If you want to embed the PowerPoint presentation, deselect Linked.
4. Click OK.

---

## Insert Adobe Captivate projects into PowerPoint presentations

[To the top](#) <sup>4</sup>

You can insert Adobe Captivate projects into Microsoft PowerPoint presentations in a few simple steps. Publish an Adobe Captivate project as a SWF file. Then open a PowerPoint presentation and insert the published SWF file into a slide.

**note:** For information on inserting Adobe Captivate projects into Microsoft PowerPoint 2007, see the topic on PowerPoint 2007 on the [Microsoft website](#).

1. Create and edit the project in Adobe Captivate.
2. Publish the project as a SWF file.
3. Note the location of the saved SWF file.
4. Open the PowerPoint presentation to which you want to add the Adobe Captivate project.
5. In the Developer menu, select More Controls from the Control Toolbox.
6. Select More Controls.
7. From the list of objects, select Shockwave Flash Object.
8. Drag diagonally to create a box for the project.
  -  You can resize the box in which the project appears. Return to the slide that contains the project in PowerPoint, and drag the resizing handles.
9. Right-click (Windows) or Control-click (Mac OS) the box and select Properties.
10. In the Properties dialog box, click once on the top line, Custom.
11. Click once on the Ellipsis button.

The Property Pages dialog box appears.
12. In Movie URL, enter the location of the SWF file to add. Type the full path, including the filename (for example, C:\My Documents\MyFile.swf) or URL to the SWF file that you want to play.
13. Click OK.
14. In the PowerPoint Properties dialog box (opened in step 9), set the following properties:
  - Set the Playing property to True to play the file automatically when the slide is displayed. If the SWF file has a Start/Rewind control built in to it, you can set the Playing property to False.
  - If you don't want the animation to play repeatedly, set the Loop property to False. (Click the cell to display a down arrow; then click the arrow and select False.)
  - Set Embed Movie to True to ensure that the Adobe Captivate project is always included with the PowerPoint presentation.
15. When you finish setting options, close the Properties dialog box.
16. Test the project.

## Edit imported PowerPoint slides within Adobe Captivate

You can edit an individual slide or the entire set of slides imported from a PowerPoint presentation within Adobe Captivate without launching PowerPoint. If you want to edit only a few slides, edit each slide individually. It is faster than editing the entire presentation.

**Note:** *Single-slide edit mode is not supported on Mac.*

When you send an Adobe Captivate project with linked slides for editing, send the PowerPoint presentation along with the project. Sometimes the recipient has to relink the presentation before editing it.

1. Import the PowerPoint presentation into your project.
2. Open the slides and then navigate to a slide imported from PowerPoint.
3. Right-click (Windows) or Control-click (Mac OS) the slide generated from Microsoft PowerPoint, select Edit with Microsoft PowerPoint and then select one of the following options:

**Edit Slide** Edit the selected slide

**Edit Presentation** Edit the entire presentation.

**Find Presentation In Library** Locate the presentation in the library. When you select this option, the presentation is highlighted in the library.

**Export Animation** Convert the selected slide to a SWF file. After conversion, Adobe Captivate prompts you to save the SWF file.

4. When you select Edit Slide or Edit Presentation, the PowerPoint editing environment opens within the Adobe Captivate window (if you are using Adobe Captivate on Windows. You can edit the slides in Microsoft PowerPoint.

If you are using Adobe Captivate on Mac OS, see [Using Adobe Captivate with Microsoft PowerPoint on Mac OS](#).

5. After you complete editing, click Save PPT.
6. The Adobe Captivate editing environment appears.
7. Save the project.

## Update PowerPoint presentation changes made outside Adobe Captivate

Updating is necessary when the PowerPoint file is linked and the changes are made directly in Microsoft PowerPoint.

1. Open the Adobe Captivate project and then navigate to a slide that was imported from the PowerPoint presentation.
2. Right-click (Windows) or Control-click (Mac OS) the slide generated from Microsoft PowerPoint, and then select Edit with Microsoft PowerPoint > Find Presentation In Library. When you select this option, the PowerPoint presentation containing the slide is highlighted in the library.
3. Right-click (Windows) or Control-click (Mac OS) the presentation in the Presentation folder.
4. Select Update.

**Note:** *If the file in the Adobe Captivate library and the original Microsoft PowerPoint file are not in sync, the color of the dot in the status column in the library changes from green to orange. If you remove or relocate the source Microsoft PowerPoint file, then a question mark appears in the status column. Click to relink.*

## Change link type after importing the presentation

1. Open the Adobe Captivate project and then navigate to a slide that was imported from the PowerPoint presentation.
2. Right-click (Windows) or Control-click (Mac OS) the slide generated from Microsoft PowerPoint, and then select Edit with Microsoft PowerPoint > Find Presentation in the Library. When you select this option, the PowerPoint presentation containing the slide is highlighted in the library.
3. In the Library panel, right-click (Windows) or Control-click (Mac OS) the presentation in the Presentation folder.
4. Do one of the following:

- a. Select Change To Linked if you have not linked to (embedded) the presentation during import. Specify a location for the linked file on your computer.
- b. Select Change To Embedded to embed the linked file into your project.

---

## Change the link to the presentation after importing

[To the top](#)

When you send an Adobe Captivate project for editing, the recipient sometimes has to relink the presentation to the project.

1. Open the Adobe Captivate project and navigate to a slide that was imported from the PowerPoint presentation.
2. Right-click (Windows) or Control-click (Mac OS) the slide generated from Microsoft PowerPoint, and then select Edit with Microsoft PowerPoint > Find Presentation in the Library.

When you select this option, the PowerPoint presentation containing the slide is highlighted in the library.

3. Right-click (Windows) or Control-click (Mac OS) the presentation.
4. In the Property Inspector, click Update, select the new path, and then click OK.

---

## Reduce file size of projects with embedded slides

[To the top](#)

You can import a presentation into an Adobe Captivate project without linking (embedded mode). The entire presentation is embedded into the Adobe Captivate project. Slides that are not selected during import are also imported into the Adobe Captivate project, but they are not visible in the project. When you choose to reduce the file size, Adobe Captivate deletes such slides permanently from the project. This process is irreversible.

1. Open the Adobe Captivate project and navigate to a slide that was imported from the PowerPoint presentation.
2. Right-click (Windows) or Control-click (Mac OS) the slide generated from Microsoft PowerPoint, and then select Edit with Microsoft PowerPoint > Find Presentation in the Library.

When you select this option, the PowerPoint presentation containing the slide is highlighted in the library.

3. In the Library panel, right-click (Windows) or Control-click (Mac OS) the presentation in the Presentation folder.
4. Select Compact.

**note:** *The Compact option is disabled for linked presentations.*

---

## Using Adobe Captivate with Microsoft PowerPoint on Mac OS

[To the top](#)

The following list describes the changes in behavior when you use Adobe Captivate with Microsoft PowerPoint on Mac OS:

- When you select to edit a presentation (added as Adobe Captivate project), the presentation opens in Microsoft PowerPoint and not in Adobe Captivate. On Microsoft Windows, you can edit the presentation from within Adobe Captivate.

When you edit the presentation in Microsoft PowerPoint, you can continue to work in Adobe Captivate.

**note:** *Do not edit the presentation when Adobe Captivate updates the project, else the changes are lost. Let Adobe Captivate update the project and then modify the presentation.*

- You cannot edit and compact PPSX files on Mac with Microsoft PowerPoint 2004 installation (even if you have installed the converter pack).

# Adobe Connect

---

- [Using Adobe Connect for learning management](#)
- [Add an Adobe Captivate demo to an Adobe Connect meeting](#)
- [Add Adobe Connect tracking](#)
- [Enable Adobe Connect search features](#)

Use Adobe® Connect™ to host online meetings, presentations, and training over the Internet. The integration between Adobe Connect and Adobe Captivate allows you to include interactive software simulations and demonstrations in Connect meetings.

The key integration features include the following:

**Adobe® Connect™ Training** Increase meeting and training effectiveness by adding Adobe Captivate demonstrations and interactive simulations. Presenters can use the Sync button to make their actions visible to all participants. If the presenter turns off the Sync option, participants can fully interact with the Adobe Captivate demonstration or simulation on their individual computers.

**Deliver and publish with ease** Deliver Adobe Captivate simulations and demonstrations through standard web browsers. Adobe Connect users can publish Adobe Captivate projects directly to Adobe Connect, making them accessible to others.

**Use options for integrating Adobe Captivate and Adobe Connect** In Adobe Captivate, you can select two options that help Adobe Captivate and Adobe Connect work together smoothly. The Include Adobe Acrobat Connect Metadata option adds Connect information to the Adobe Captivate project files. When this option is set, users can search the Adobe Captivate project and its contents from Adobe Connect. You can also select Adobe Connect as your quiz reporting output option. Use this option in Adobe Connect to track how users work with quizzes and interactive objects in Adobe Captivate projects. You can also place the project into a ZIP file for easier uploading. With Adobe Connect integration, you can also update video files easily.

---

## Using Adobe Connect for learning management

[To the top](#)

Adobe Connect lets you easily deliver elearning content through live virtual classrooms and self-paced courses, manage participants, and track learner progress. For more information on the Adobe Connect's learning management system integration solutions, see [www.adobe.com/go/learn\\_adobeconnectlms\\_en](http://www.adobe.com/go/learn_adobeconnectlms_en).

You can leverage the learning management features of Adobe Connect for your Adobe Captivate projects. Do the following to upload an Adobe Captivate project to an Adobe Connect server:

- Specify Adobe Connect as the LMS in the Preferences dialog box.
- Publish the project to the Adobe Connect server.

### Specify Adobe Connect as the LMS

1. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Preferences dialog box, select Reporting from the Quiz menu.
3. Select Adobe Connect.
4. Click OK.

### Publish projects to Adobe Connect

Apart from the SWF file, you can choose to upload source files and any external FLV files to the server. You can also choose to upload the project as a single zip file.

1. Select File > Publish.
2. Select Adobe Connect.
3. Click Change Server to add the name and URL of the Acrobat Connect Server.
4. In the Adobe Connect Server dialog box, click Add.
5. Enter the name and URL of the Acrobat Connect Server to which you want to load the project.

6. In the Publish dialog box, select the options as required.

**Publish Project Files (\*.cp)**

The source file is uploaded to the server.

**Zip Project File**

All the published files are uploaded to the server as a single zip file.

**Publish Video Files (\*.flv)**

Publishes any video files that you have imported into the Adobe Captivate project.

**SWF**

Publish the project as a SWF file.

**HTML5 (for subscription and Adobe Software Assurance customers only)**

Publish the project as an HTML5 output.

7. Click Publish.

8. In the Adobe Connect window, enter your login credentials.

9. Click New Folder, and create a folder where you want to upload the project file. Alternatively, you can select any existing folder from the list.

10. Click Publish To This Folder.

11. In the Adobe Connect Server window, do the following:

- a. Enter a name for your project in the Title field.
- b. If you want to customize the URL for the project, enter a name in the Custom URL field. The URL prefix `http://<servername>/` is added.
- c. Enter a description for your project.
- d. Select the language in which your project has been created.
- e. Click Finish.

After you have uploaded the content to Adobe Connect, you can make it a part of an existing course or a new course.

---

## Add an Adobe Captivate demo to an Adobe Connect meeting

[To the top](#)

You can bring an Adobe Captivate project into an Adobe Connect meeting using two different methods:

- Publish the Adobe Captivate project directly to Adobe Connect. Add the project from the Connect Content library to an Adobe Connect meeting. (Adobe recommends using this option. Adding the Adobe Captivate project from the Content library ensures that all Adobe Captivate features work properly within Adobe Connect)
- Publish the Adobe Captivate project to create a ZIP file stored on your computer and then add the ZIP file to an Adobe Connect meeting. Presenters can use the Sync button so that all participants can view their actions. As the presenter moves the mouse or interacts with the demonstration, all meeting participants see the actions on their computers. Presenters can also turn off the Sync option so participants can fully interact with the Adobe Captivate demonstration or simulation on their individual computers. Presenters can turn the Sync feature off and on as many times as necessary.

**Note:** *The Sync button in Adobe Connect is not displayed if the Adobe Captivate project contains the `_skin` file.*

If you want to include multiple files in an Adobe Connect, ensure that you do the following:

1. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
2. In the Category panel, expand Project, and select Publish Settings.
3. Select Publish Adobe Connect Metadata in the Project panel.
4. Click OK.
5. Select File > Publish.
6. Select Flash (SWF).
7. In Output Options, select ZIP Files.

Upload the ZIP file to an Adobe Connect meeting.

### **Add an Adobe Captivate project from the Connect Content library to a meeting**

1. In Adobe Captivate, create a project.
2. Publish the project to Adobe Connect.
3. Open an existing meeting or create a meeting.
4. Send the meeting URL to the people you want to invite.
5. Enter the meeting room.
6. Select Pods > Share > Select From Content Library.
7. Select the Adobe Captivate project, and click Open.
8. (Optional) Click the Sync button as necessary so participants either see actions taken by the presenter or they have control on their individual computers.
9. Click Stop Sharing to return to the Adobe Connect meeting room.

### **Add an Adobe Captivate project from your desktop to a meeting**

1. In Adobe Captivate, create a project.
2. Publish the project to Flash to create a SWF file.
3. Note the location of the SWF file.
4. Log in to Adobe Connect.
5. Open an existing meeting or create a meeting.
6. Send the meeting URL to the people you want to invite.
7. Enter the meeting room.
8. Select Pods > Share > Select From My Computer.
9. Navigate to the Adobe Captivate SWF file, select the file, and click Open.
10. The upload message appears. When the SWF file has been uploaded, click the Play button on the Adobe Captivate playbar to start the project.
11. (Optional) Click the Sync button as necessary so participants either see actions taken by the presenter or they have control on their individual computers.
12. Click Stop Sharing to return to the Adobe Connect meeting room.

---

### **Add Adobe Connect tracking**

[To the top](#) 

You can track how users interact with an Adobe Captivate simulation added to an Adobe Connect meeting. To simplify tracking, specify Adobe Connect as the project output option. Access this option from the Quiz settings in the Preferences dialog box.

1. Open an Adobe Captivate project.
2. Select Quiz > Quiz Preferences.
3. From the Quiz menu, select Reporting.
4. Select Enable reporting for this project.
5. Select Adobe Connect.

6. Click OK.

## Enable Adobe Connect search features

If you enable search, users can search for the Adobe Captivate project from Adobe Connect.

1. Open an Adobe Captivate project.
2. Select Edit > Preferences (Windows) or Adobe Captivate > Preferences (Mac OS).
3. In the Category panel, expand Project and select Publish Settings.
4. Select Publish Adobe Connect Metadata.
5. Click OK.

**Note:** *The Include Adobe Connect Metadata option is selected by default. This option increases the size of the project. If you are not going to use the project with Adobe Connect, deselect this option.*

# Adobe Flash

---

- [Export from Adobe Captivate to Flash](#)
- [Modifying Adobe Captivate projects in Flash](#)
- [Navigating through projects in Flash](#)
- [Record application in Adobe Flash](#)
- [Adobe Flash round-tripping](#)

If you are a Flash developer, use Adobe Captivate to record a SWF file. Then use the features of Flash to edit the file. Adobe Captivate 6 supports Flash Professional CS6.

---

## Export from Adobe Captivate to Flash

[To the top](#) <sup>↑</sup>

You can export a project from Adobe Captivate to Flash. You can enhance it or integrate it into a larger project.

**Note:** *You need not have Adobe Flash installed to perform this task.*

When you export an Adobe Captivate project into Adobe Flash, the project is imported directly to the Stage. The imported project contains layers for each type of object. Appropriate Flash methods are used to enable any Adobe Captivate special effects (for example, tweens to move the mouse pointer). The Flash Library panel shows all objects created for the Adobe Captivate project, organized logically into folders.

Import of the following slide elements are supported: highlight box, captions, animation, click box, text entry box, and rollover caption.

Most elements in your projects are converted so they look and operate the same in Flash as in Adobe Captivate, but here are a few exceptions:

- Question slides
- Imported mouse paths are linear, and not curved like in Adobe Captivate.
- Advanced compression
- Playback controller
- 508 compliance
- Drawing objects
- Interactive objects are not completely supported.
- Slide transitions (fade between slides)

1. In an open project, select File > Export > To Flash CS5.
2. In the Export To Flash Options dialog box, specify the location and select the elements to export. These options are self-explanatory, but note that Hints are a Flash feature, not an Adobe Captivate element that is imported into Flash. Hints are not included in the project SWF file.
3. Click Export. If you have installed Flash Professional CS5, the exported file opens in Flash Professional CS5.

---

## Modifying Adobe Captivate projects in Flash

[To the top](#) <sup>↑</sup>

Use the Flash Library and movie clip objects to create reusable elements from the original project.

When you become familiar with the structure of the project in Flash, you can easily change your entire project or place Adobe Captivate elements in it. All the Adobe Captivate project elements are stored in the Flash Library and organized into folders. Navigate through these folders to select elements for editing.

The following layers are seen in the Timeline when you open an Adobe Captivate project in Flash.

**Preloader** This is the file that plays until the movie is downloaded to the user's computer. For example, you could have a GIF file that informs the player that the movie is being downloaded until the download is complete.

**Actions** The global actions defined in a movie. You can define global variables and declarations using the Actions layer in the Timeline.

**Slides** Contains the imported slides in the order in which they appear in the movie.

When you double-click the slide, the Timeline in the next view contains objects corresponding to that slide. Use the Timeline to edit the various objects on the slide. Keep double-clicking an object to edit its different parts. The Timeline changes to reflect the various parts of the object.

---

## Navigating through projects in Flash

[To the top](#) <sup>↑</sup>

Remember these points when you navigate:

- In the Library panel, a folder named Adobe Captivate Objects contains all slides and objects in the project. (You can ignore the objects listed with the prefix “xrd”; these objects are images and sounds that are used in other objects.) To edit your project, double-click a library item and edit it. The “xrd” files are shown in a folder in the library.
- Another way to navigate is to double-click elements on the Stage (in Flash). For example, to edit a movie, double-click the movie on the Stage. To navigate to an element on a slide, click in the Timeline. Position the playhead to show an object on the slide (such as a caption or highlight box). Then double-click the object to edit it. This method has the advantage of showing each element and object in the context in which it is used.
- Unlike Adobe Captivate, Flash does not show all objects at one time; Flash uses the Timeline to represent when different objects are shown. Click in the Timeline or drag the playhead to preview the project.
- The Library panel organizes your project and all of the elements it contains, such as slides, captions, and sounds, into a hierarchy of folders.

---

## Record application in Adobe Flash

[To the top](#)

You can now record applications in all Adobe Captivate recording modes from within the Adobe Flash workspace (without launching Adobe Captivate).

1. In Adobe Flash Professional CS6, select Command > Record Application.
2. Click the recording icon  and then start recording.

**Note:** This feature is available only in Adobe Captivate that is installed as a part of Adobe eLearning Suite.

---

## Adobe Flash round-tripping

[To the top](#)

You can instantly update the SWF files in Adobe Captivate by editing the source FLA files in Adobe Flash. You can launch Adobe Flash from within Adobe Captivate.

**Note:** This feature is available only in Adobe Captivate that is installed as a part of Adobe eLearning Suite.

### Using Adobe Flash to edit animation objects and widgets

1. Right-click (Windows) or Control-click (Mac OS) the animation or the widget and then select Edit With Flash. The FLA file that is associated with the SWF file is opened for editing in Adobe Flash.
2. Edit the FLA file, generate a SWF file output, and then save the file in the same location where the original SWF file was saved. Also, use the same name for the new SWF file.

All instances of the SWF file used in the Adobe Captivate project get automatically updated.

You can also open Adobe Flash manually and edit the FLA file associated with the SWF file. However, you can manually synchronize the files by selecting Update in the right-click menu.  at the corner of the object or widget indicates that the SWF file is not synchronized with its source.  indicates that the SWF file is up-to-date and  indicates that the SWF file is not available.

### Replacing animation SWF files

Do one of the following in the Properties panel:

- Click the hyperlinked SWF file, browse to the location where the replacement SWF file is located, and click Open.
- Click Swap. In the Select Animation From the Library dialog box, select the replacement SWF file in the project’s library. Using this dialog box, you can also import SWF files saved in other locations and then select the file to replace the current one.

# Microsoft Word

---

[Publish projects as handouts](#)

[Publish projects as lessons](#)

[Publish projects as step-by-step guides](#)

[Publish projects as storyboards](#)

If you have Microsoft® Word® installed on the same computer as Adobe Captivate, you can publish Adobe Captivate projects in Microsoft Word. Your output can be published in various formats: handout, lesson, step-by-step, and storyboard.

---

## Publish projects as handouts

[To the top](#) <sup>4</sup>

You can publish Adobe Captivate projects as handouts in Microsoft Word format. An Adobe Captivate project is published into a Word document showing all the slides as they would appear with the options you choose.

1. Open an Adobe Captivate project.
2. Select File > Publish.
3. In the Publish dialog box, select Print.
4. In Project Title, enter the desired name without the filename extension (.doc).
5. In Folder, enter the full path for the folder in which to save the file or click Browse to locate the folder.
6. Select an Export range. The export range is made up of the slides that you want to export to Word. You can select all slides, the current slide, a selection, or a range of slides.
7. In Type, select Handouts.
8. Select from the following Handout Layout options:

**Use tables in the output** Specify the number of slides printed on each page.

**Slides per page** Specify the number of slides printed on each page of the Word document. A small thumbnail image to the right shows a preview of the page layout selected.

**Caption Text** Print the text of captions underneath the slides on which they appear.

**Add blank line for notes** Print blank lines with each slide of your project in the Word document. The lines appear under the slide if you select Use Tables in the output. If you deselect that option, the blank lines appear to the right of the slide.

**Slide notes** Include slide notes in your Word document. (Users who view your project don't see these notes.)

**Include hidden slides** Include slides marked as hidden. (Hidden slides do not appear when the project is viewed.)

**Include mouse path** Include mouse paths that appear on slides.

**Include objects and questions** Include captions, images, click boxes, highlight boxes, and other objects on slides.

**Include question pool slides** Includes question slides from the question pool.

9. When you finish, click Publish.

Microsoft Word opens with the new project document. Modify the file as desired and save it.

**Note:** The DOC file is created using a Microsoft Word template named AdobeCaptivate.dot. This template contains a header with the date and a footer with page numbers. If you want to change or remove the information in the header or footer, you can edit the DOT file by opening it in Word. When you install Adobe Captivate, the AdobeCaptivate.dot template is automatically placed in the program folder: \\Program Files\Adobe\Adobe Captivate 6\Gallery\PrintOutput (on Windows) or /Applications/Adobe Captivate 6/Gallery/PrintOutput (on Mac OS).

---

## Publish projects as lessons

[To the top](#) <sup>4</sup>

You can publish Adobe Captivate projects as lessons in Microsoft Word format. An Adobe Captivate project is published in a Word document as a lesson, complete with your questions and an answer key.

1. In an open project, select File > Publish.
2. In the Publish dialog box, select Print.

3. In Project Title, enter the desired name without the filename extension (.doc).
4. In Folder, enter the full path for the folder in which to save the file or click Browse to locate the folder.
5. Select an export range. The export range is made up of the slides that you want to export to Word. You can select all slides, only the current slide, only the current selection, or a range of slides.
6. In Type, select Lesson.
7. Select from the following Template options:

**Header text** Enter text that you want to appear in the header of the project.

**Footer text** Enter text that you want to appear in the footer of the project.

**Include hidden slides** Select this option if you want hidden slides to appear in the published project.

**Include quiz question slides** Select this option if you want to include quiz question slides in the published project.

**Include question pool slides** Select this option if you want the published project to include question slides from the question pool.

8. When you finish, click Publish.

Microsoft Word opens with the new project document. Modify the file as desired and save it.

**Note:** *The Lesson, Storyboard, and Step By Step templates are stored in the Gallery (C:\Program Files\Adobe\Adobe Captivate 6\Gallery\PrintOutput (on Windows) or /Applications/Adobe Captivate 6/Gallery/PrintOutput (on Mac OS)). When Adobe Captivate is first launched, these templates are copied to the user profile (for example, C:\Documents and Settings\<User>\My Documents\My Adobe Captivate Projects\Templates\PrintOutput).*

[To the top](#)

## Publish projects as step-by-step guides

You can publish Adobe Captivate projects as a step-by-step guide in Microsoft Word format. An Adobe Captivate project is published in a Word document that lists a summary of the steps taken in the project. For example, if the project teaches a user how to navigate to a website, the step-by-step guide lists the steps taken to get there. The step-by-step guide does not include images of the project slides, but does include images of objects (buttons, links, and so on).

1. Open an Adobe Captivate project.
2. Select File > Publish.
3. In the Publish dialog box, select Print.
4. In Project Title, enter the desired name without the filename extension (.doc).
5. In Folder, enter the full path for the folder in which to save the file or click Browse to locate the folder.
6. Select an export range. The export range is made up of the slides that you want to export to Word. You can select all slides, only the current slide, only the current selection, or a range of slides.
7. In Type, select Step By Step.
8. Select from the following Template options:

**Header text** Enter text that you want to appear in the header of the project.

**Footer text** Enter text that you want to appear in the footer of the project.

**Include hidden slides** Select this option if you want hidden slides to appear in the published project.

9. When you finish, click Publish.

Microsoft Word opens with the new project document. Modify the file as desired and save it.

**Note:** *The Lesson, Storyboard, and Step By Step templates are stored in the Gallery (C:\Program Files\Adobe\Adobe Captivate 4\Gallery\PrintOutput on Windows or /Applications/Adobe Captivate 6/Gallery/PrintOutput on Mac OS). When Adobe Captivate is first launched, these templates are copied to the user profile (for example, C:\Documents and Settings\<User>\My Documents\My Adobe Captivate Projects\Templates\PrintOutput).*

[To the top](#)

## Publish projects as storyboards

You can publish Adobe Captivate projects as storyboards in Microsoft Word format. The project is published as a Word document that includes a summary of project properties and a detailed view of each slide. Project properties include the number of slides used, score setting details, length of the slides, and so on. The detailed view of each slide has a summary of slide properties.

If the project has a quiz and you choose Storyboard output, the answers are shown next to the question. There is no answer key.

1. Open an Adobe Captivate project.

2. Select File > Publish.
3. In the Publish dialog box, select Print.
4. In Project Title, enter the desired name without the filename extension (.doc).
5. In Folder, enter the full path for the folder in which to save the file or click Browse to locate the folder.
6. Select an export range. The export range is made up of the slides that you want to export to Word. You can select all slides, only the current slide, only the current selection, or a range of slides.
7. In Type, select Storyboard.
8. Select from the following Template options:

**Header text** Enter text that you want to appear in the header of the project.

**Footer text** Enter text that you want to appear in the footer of the project.

**Include hidden slides** Select this option if you want the published project to include hidden slides.

**Include quiz question slides** Select this option if you want the published project to include quiz question slides.

**Include question pool slides** Select this option if you want the project to include question slides from the question pool.

9. When you are done, click Publish.

Microsoft Word opens with the new project document. Modify the file as desired and save it.

**Note:** *The Lesson, Storyboard, and Step By Step templates are stored in the Gallery (C:\Program Files\Adobe\Adobe Captivate 6\Gallery\PrintOutPut on Windows or /Applications/Adobe Captivate 6/Gallery/PrintOutput on Mac OS). When Adobe Captivate is first launched, these templates are copied to the user profile (for example, C:\Documents and Settings\<User>\My Documents\My Adobe Captivate Projects\Templates\PrintOutput).*

More Help topics

---

[Legal Notices](#) | [Online Privacy Policy](#)

# RoboHelp

---

## [Add an Adobe Captivate project to a RoboHelp HTML online Help system](#) [Determining how the Adobe Captivate project appears](#)

To add an Adobe Captivate project to a RoboHelp project, create the Adobe Captivate project, add it to the RoboHelp project, and select among several display options. Adobe Captivate 6 is supported by RoboHelp 10.

---

### Add an Adobe Captivate project to a RoboHelp HTML online Help system

[To the top](#) <sup>4</sup>

1. Create an Adobe Captivate project.
2. Publish the project as a Flash SWF file. Select the Export HTML option during the export process and note the folder location where the SWF file is stored.
3. In RoboHelp, open the Help project to which you want to add the Adobe Captivate project.
4. In the Project Manager, double-click the Project Files folder.
5. From the File menu, select Import > HTML/XHTML File.
6. Navigate to the HTML file of your Adobe Captivate project (created in step 2) and select it.
7. Click Open.

The HTML file and the FLA file (SWF file) are imported into your RoboHelp project. The SWF file is added to the Project Files folder, and a new topic (with the title of the project) is created.

**Note:** *The HTML file (with the title of the project) that is added to your RoboHelp project is important. If you delete the topic, the related SWF file is also deleted from the project. You can, however, leave the topic in your Help project as a “hidden” topic. Hidden topics can’t be linked to and don’t appear in the table of contents. Their index markers don’t appear in the index.*

---

### Determining how the Adobe Captivate project appears

[To the top](#) <sup>4</sup>

After you add the FLA file (SWF file) to your RoboHelp project, specify how to display the project. You can place an Adobe Captivate project in a new RoboHelp topic and then link to that topic from any other topic in Help.

#### Display the project within an existing topic

1. In RoboHelp, open the topic you want to use to start the project.
2. Click in the topic. From the Insert menu, select Adobe Captivate Demo.
3. Browse to the location of your Adobe Captivate file, select it, and click OK.
4. Preview the topic to see what the project looks like, or generate and view your Help system to see how the project looks.

#### Display the project in a window or panel

1. In RoboHelp, create a topic.
2. Add the Adobe Captivate project to the topic. From the Insert menu, select Adobe Captivate Demo.
3. Browse to the location of your Adobe Captivate file, select it, and click OK.
4. Save the topic.
5. Open the topic you want to use to start the project.
6. Select the text or image to use as a hypertext link. From the Insert menu, select Hyperlink/Popup.
7. In the Select Destination (File or URL) list, select the topic containing the Adobe Captivate project.
8. In Hyperlink Properties, specify how to display the project:

**Display In Auto-Sizing Pop-Up** Displays the project in a window that adjusts to accommodate the height and width of the project.

**Display In Custom-Sized Pop-Up** Select a width and height by using the arrows or typing a number.

**Display In Frame** You have the choice of displaying in a new window or in the same slide as the link from the topic. From the pop-up menu

next to Display In Frame, select either New Window or Same Slide. If you choose New Window, the project appears in the user's default browser. If you choose Same Slide, your topic replaces the topic the user is currently viewing.

9. Click OK.

10. Preview the topic to see what the project looks like, or generate Help.

**Note:** *You can edit the SWF file you have inserted into RoboHelp only if you have the associated Adobe Captivate project saved on your computer.*

[Legal Notices](#) | [Online Privacy Policy](#)

# Troubleshooting

# Adobe Captivate output

---

Adobe Captivate was built with low bandwidth in mind. A typical project with sound (some narration) and a modest screen size of 512 x 384 streams at approximately 2–3 kilobytes per second. Your viewers can play this project using a 56 Kbps (or slower) dial-up modem without waiting more than a few seconds for the project to start. Additionally, there are no pauses during playback.

A project that streams well might have the following characteristics:

- File size: 777 KB
- Length: 6 minutes, 12 seconds
- Audio: 286 KB
- Video: 491 KB
- Screen size: 608 x 460

**Note:** *File size depends on several factors. Larger files contain elements such as photos, images, sound tracks, large screen sizes, rapid screen transitions, and higher quality video and audio settings.*

There are a number of ways to improve the file size of Adobe Captivate output:

- One important factor is the kilobytes per second ratio. Check the bandwidth analysis to find this factor. Don't despair if your project is large; it is possible for a large project to stream well over the Internet. For example, a 400 KB file might seem large, but if it plays for 5 minutes, it streams easily over a 28.8 Kbps modem. The first slide in a project always has a longer kilobytes per second ratio, because it is the first slide to load and additional project information must load with it.
- Consider your color settings and the images included in your project. Two quick tips for reducing file size are to avoid color gradients and to avoid photo images.
- If you are not going to upload your SWF files to Adobe® Connect™ Enterprise, you can turn off the Include Adobe Connect Metadata option in the project preferences. This option is on by default, and it adds data to your project that allows for better integration with Adobe Acrobat Connect Professional. If you do not use Acrobat Connect Professional, turn this option off to reduce project size.

# Animation timing

---

If you notice when previewing a project that an animation file you added as an object is displayed for a longer or shorter period of time than the duration of the animation file, you can synchronize the animation with the Adobe Captivate Timeline to give you greater control over the timing.

1. Select the animation.
2. In the Property Inspector (Window > Properties), select Synchronize With Project in the Timing area.

**Note:** *If the animation file was originally recorded with an audio track, you may find that the audio track is choppy after selecting the Synchronize With Project option. The best solution is to separate the animation file and audio so they can be used as two distinct objects in the project.*

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Application distortion when recording

---

**Note:** Applies only if you are using Adobe Captivate on Microsoft Windows.

Application distortion can occur with certain combinations of Microsoft Windows and video cards. The problem can be solved by setting the hardware acceleration on your computer to None. You can change this setting in the following location: Start Menu > Settings > Control Panel > Display > Settings > Advanced > Troubleshoot.

**Note:** This issue occurs only when you use Adobe Captivate on Microsoft Windows.

**Important:** Turning off the hardware acceleration may turn off the display in some computers.

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Capture of elevated applications in Windows Vista/Windows 7

---

You will have to set administrator permissions for the AdobeCaptivate.exe file to record or capture applications running in elevated or administrator mode.

To set administrator permissions for AdobeCaptivate.exe:

1. Locate AdobeCaptivate.exe in your installation directory. If you have not changed any settings during installation, you can locate this in the \\Program Files\Adobe\Adobe Captivate 6 folder.
2. Right-click the file, and select Run As Administrator. The User Account Control (UAC) dialog box appears.
3. Click Allow.

[Legal Notices](#) | [Online Privacy Policy](#)

# Capturing while recording a web application

---

When you capture a web-based application or a website from a browser, sometimes the slide does not have the correct image.

Whenever you capture a screen, you must listen for the shutter sound. The shutter sound occurs when Adobe Captivate has successfully taken the screenshot. When you are capturing from a website or a web-based application and you have to click several links, you will hear the shutter sound on every click. After you click a link and a new page is loaded, wait for the page to load completely. After the page is fully loaded, you will hear the shutter sound of Adobe Captivate. In case you do not hear the shutter sound when the page is fully loaded, press the Print Screen key, which will take the screenshot manually. It is recommended that you use Internet Explorer as the browser when capturing a website or a web-based application. Following these simple guidelines will enable you to achieve the best results.

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Choppy full motion recording

---

**Note:** *Applies only if you are using Adobe Captivate on Microsoft Windows.*

You can create a smoother full motion project, particularly better mouse movement, by disabling hardware acceleration. When hardware acceleration is enabled, it can use a great deal of system resources and result in “choppy” full motion recording. Disabling hardware acceleration results in better full motion recording quality.

To disable hardware acceleration, change this setting in the following location: Start Menu > Settings > Control Panel > Display > Settings > Advanced > Troubleshoot.

If you disable hardware acceleration, your computer screen will briefly flicker when you begin and end full motion recording. This screen flicker does not harm your computer and does not appear in the final project.

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Correcting colors in slides

---

In general, color should appear correctly in Adobe Captivate projects. However, there are cases in which colors may appear inaccurately, such as when the color scheme varies radically between slides. So if Slide A uses color palette ABC, and Slide B uses color palette XYZ, and the two palettes are radically different, Slide B might resort to using palette ABC.

Most of these problems can be fixed by changing the video quality of the slide. Adobe Captivate provides four levels of video quality, even though only the Standard option is suggested for most uses.

To change video quality in a slide:

1. In an open project, double-click the slide containing the colors you want to correct.
2. From the Slide menu, select Video Quality and one of the video options:

**Standard** The default format for slides. Standard is the most efficient choice for the majority of screenshots because it uses 256 optimized colors. Standard slides also compress well, which results in smaller file sizes.

**Optimized** This option gives you the highest JPEG quality possible.

**JPEG** This option is best used when the slide contains a photograph. You can change the quality and compression ratio for JPEG images on the Project Preferences dialog box.

**High Quality** Compared to the Standard format of 256 colors, this format uses 16 million colors for the slides. This option should be used only if the Standard and Optimized options do not offer the correct color depth. The file size increases dramatically using this option.

**Note:** *Selecting the JPEG or High Quality format may increase the file size and the time it takes to download your project. You should use a format other than Standard only when necessary and appropriate.*

# JavaScript that does not appear

---

JavaScript does not appear while you preview Adobe Captivate output.

If the Execute JavaScript option is selected as action in the Project End options of the Project Preferences dialog box (Edit > Preferences > Project > Start and End (Windows) or Adobe Captivate > Preferences > Project > Start and End (Mac OS)), Adobe Captivate may not display an error message when the JavaScript is previewed. This is because the Show Borders option as set to On (enabled), by default. When this option is on, Adobe Captivate creates multiple SWF files—skin SWF files and content SWF files.

To preview JavaScript, set the value of the Show Borders option to Off (disable it) in the Borders tab of the Skin Editor.

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Publishing projects

---

Adobe Captivate appears to stop responding for a few moments while publishing a project containing a large size full motion recording. When a large full motion recording is captured in an Adobe Captivate project, the preview and publish operations take a long time.

If you frequently want to preview the project that contains a large full motion recording, set the value of the Compress SWF File option to Off (disabled) in the Preferences tab of the Project Preferences dialog box. This will reduce the time taken to preview the output. After previewing the output, you can change the value of the Compress SWF File option to On (enabled), and then publish your project.

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Quizzing errors

---

The user should not be able to navigate to the result slides without answering the quiz in the question slides.

When designing an Adobe Captivate project containing result slides, make sure that you do not allow the user to navigate or jump to the result slides directly without working through the question slides, or the slides containing interactive objects, and that you enable the Reporting option (set to On). It's important to design the project to help the user complete the quiz before navigating to the result slide.

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Recording Applications on Mac

---

Before you record applications on Mac, ensure that you set the following preference:

1. In the System Preferences, select Universal Access.
2. Select Enable Access for Assistive devices.

When you select File > Record new project and then select Application in Adobe Captivate on Mac, the menu lists the applications (for recording) only if you have this option selected.

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Recording audio produces recording(Clip).wav file

---

The CLIP file appears when a single audio file is distributed over several slides. The CLIP file is generated under the following circumstances

- Recording narration for several slides / projects in continuous play mode
- Inserting audio on a slide and then distributing it over several slides.
- Inserting audio, retaining current slide timing, and distributing remaining audio over several slides.

To identify, which recording(Clip).wav is being used on which particular slide, use the Audio Management dialog (Audio > Audio management). The column "Display name" displays the audio file linked to the particular slide.

---

[Legal Notices](#) | [Online Privacy Policy](#)

# Security warning with Flash Player 9 or later

---

A security warning appears when you launch an external file from a SWF file created in Adobe Captivate. The same security warning appears when you launch Flash Help created in either RoboHelp HTML or RoboHelp for Word. This is because Flash Player 9 (or later) includes the new Settings Manager, which allows you to manage global privacy settings, storage settings, security settings, and automatic notification settings.

To permanently change the settings:

1. Click Settings.
  2. Select Edit Locations.
  3. Select Add Location.
  4. Under Trust This Location, enter the location of the folder that contains your published project.
  5. Click Confirm.
- 

[Legal Notices](#) | [Online Privacy Policy](#)

# Text viewed in a browser

---

If text in a project is not displaying properly in a browser, the problem could be that a link is calling the Adobe Captivate project SWF file instead of the HTM file that corresponds to the SWF file. If you are adding your project to a web page, do not link directly to the SWF file. If you link directly to the SWF file, the browser does not know the size at which it should display the SWF file, so it simply shows the SWF file at the same size as the browser window. This can result in distortions, especially text distortion that causes text to become unreadable.

To display the SWF file in a browser properly, use the HTM file that can be generated with the SWF file. The HTM file contains code that tells the browser the correct size for the project.

When you publish your project as a SWF file, select the Export HTML option. The HTM file will be saved in the same location you specified for the SWF file. The HTM file will have the same name as the SWF file but will have the .htm extension.

If you have installed Adobe® Flash® Player 8 or later, previewing an Adobe Captivate project using a browser causes a security settings warning to be displayed. This is because of the security settings configured in Flash Player 8 or later.

# The Skin Editor

---

The Skin Editor shows the skin preview of the first slide of the project. The preview contains the background color of the slide (if any) or the background image. You may experience performance issues when the skin preview shows the background image because every setting in the Skin Editor dialog box is applied to the preview immediately. To avoid this delay of preview update while editing a skin in the Skin Editor dialog box, you can insert a blank slide as the first slide. Then open the Skin Editor dialog box and define all your skin configurations like playbar controls, positions menu, and borders. After finalizing the skin configuration, you can hide the first slide (the blank slide inserted) and open the Skin Editor dialog box again to preview the final changes. The skin preview will always show the first project slide that is not hidden.

# Uninstalling Adobe Captivate

---

It is relatively simple to uninstall Adobe Captivate. When you uninstall Adobe Captivate, all of the files you have saved in your My Documents\My Adobe Captivate Projects folder are retained.

To uninstall Adobe Captivate on Windows:

1. Click Start > Control Panel.
2. Double-click Add Or Remove Programs.
3. Click the Install/Uninstall tab (if your version of Windows contains this tab).
4. From the list of programs you can remove, select Adobe Captivate x.x.
5. Click Add/Remove.
6. In the Uninstall Options screen, select Remove Preferences and click Uninstall.

The uninstall program removes program files, folders, and registry entries. When the files are removed, the uninstall program indicates that the process is complete.

7. Click Done.

To uninstall Adobe Captivate on Mac:

1. Go to Applications\Adobe\Adobe Captivate 6.
2. Click Uninstall Adobe Captivate 6.
3. In the Uninstall Options screen, select Remove Preferences and click Uninstall.

The uninstall program removes program files, folders, and registry entries. When the files are removed, the uninstall program indicates that the process is complete.

4. Click Done.

# Video errors

---

Adobe Captivate output does not play if it is published over the network with Flash video (FLV) files in it.

Also, FLV files do not play when the Adobe Captivate project containing progressive FLV is published to a network share and viewed by clicking the View Output button. You can play the FLV file in the Adobe Captivate output by mapping the network drive in Microsoft Windows Explorer.

The FLV file must contain metadata for the video player to function correctly. FLV files created with Flash Communication Server 1.5.2, FLV Exporter version 1.2, and Sorenson Squeeze 4.0 automatically contain metadata. Sorenson Squeeze 4.0 is included with the Flash Video Kit.

FLV files will not play when an Adobe Captivate project is hosted on a Windows 2003 web server.
