Overview

Adobe Drive CC enables you to connect Creative Cloud™ and Creative Suite® 6 desktop applications to Adobe Experience Manager (AEM) Assets servers. A connected server appears in your computer as a mounted hard drive or mapped network drive. Once connected, you can access the server through the platform file browser (Windows Explorer or Mac OS Finder), where you can work with remote managed files as if they were local.

Adobe Drive CC is the name of the version 5 release. The product is referred to in the documentation and in the user interface as Adobe Drive 5.

Some desktop applications (Photoshop®, InDesign®, InCopy®, Illustrator®) and Adobe Bridge are integrated with Adobe Drive 5. For example, when you use Photoshop CS6 to open and edit a file stored on an AEM Assets server, the file is checked out automatically when you modify it. When you close the file, you can choose to check it in or simply save it. You can use Adobe Bridge to access AEM Assets servers and files, and to view, search for, and compare information about assets managed by AEM Assets.

Installing Adobe Drive 5

Adobe Drive 5 is used together with Adobe Creative Cloud desktop applications Photoshop, InDesign, InCopy, Illustrator, and Adobe Bridge. It is also compatible with the Creative Suite 6 versions of these applications. See the Creative Cloud system requirements at:

You must have installed one of these applications in order to install Adobe Drive 5.

Download the free, standalone installer for Adobe Drive 5 from:

http://www.adobe.com/products/adobedrive

IMPORTANT: If you have previously installed an earlier version of Adobe Drive, you must uninstall it before you can install Adobe Drive 5. This is because Adobe Drive 5 is installed, by default, in the same location as the previous release: <platform path>Adobe/Adobe Drive 4/.

To uninstall Adobe Drive 4.x:

- In Windows 7, go to Control Panels > Programs > Uninstall a Program, select Adobe Drive 4.x, and click Uninstall/Change.
- In Mac OS, go to Applications > Utilities > Adobe Installers, and double-click Uninstall Adobe Drive.
Adobe Drive 5 installation requires 500MB of available hard-disk space. You must have Administrator privilege to install on either platform.

- To install in Windows, unzip the installation package to the defined folder, then double click `Set-up.exe` to launch the install process.
- To install in Mac OS, double-click the downloaded DMG file; this mounts the `AdobeDrive5-mul` volume in Mac OS Finder. Go to this volume and double-click `Install.app` to launch the install process.

Restart the computer after the installation is completed.

**Updating your installation**

If you have previously installed an earlier version of Adobe Drive 5, you can update it to the latest release.

- You can click the Updates link from the Adobe Drive Connect UI
- You can use the Adobe Application Manager (AAM), which you access by choosing Help > Updates from a Creative Suite product such as Photoshop

**Uninstalling Adobe Drive 5**

- In Windows 7, go to Control Panels > Programs > Uninstall a Program, select Adobe Drive 5, and click Uninstall/Change.
- In Windows 8, go to Settings > Control Panels > Programs > Uninstall a Program, right-click Adobe Drive 5, and choose Uninstall.
- In Mac OS, go to Applications > Utilities > Adobe Installers, and double-click Uninstall Adobe Drive.

**Terminology**

**AEM ASSETS SERVER:** A server that manages digital assets.

**MANAGED ASSETS:** The files and folders managed by an AEM Assets server.

**INTEGRATED APPLICATIONS:** Creative Cloud and Creative Suite 6 desktop applications (Illustrator, InDesign/InCopy, Photoshop, and Adobe Bridge) that are integrated with Adobe Drive 5 and offer operations on managed assets through the application UI.

**Connecting to servers using Adobe Drive 5**

When you connect to an AEM Assets server using Adobe Drive 5, you can view the remote files on that server through your platform file browser (Windows Explorer or Mac OS Finder), and through integrated desktop applications. You also have access to the remote files in Open, Save As, and other file management dialogs.

To establish a connection:
1. Make sure that the AEM Assets server has been started.

2. Take one of these actions to invoke the Adobe Drive 5 interface:
   - Launch Adobe Drive 5 directly.
   - In Windows Explorer, right-click a folder, a file, or the desktop and choose Adobe Drive > Connect To from the context menu.
   - In Mac OS Finder, CTRL-click a folder or a file and choose Adobe Drive > Connect To from the context menu.
   - In Adobe Bridge, choose Tools > Adobe Drive > Connect To, or click the Connect To icon.

This brings up the Adobe Drive 5 Connect UI.
3. To connect to a server, click the Add Drive icon at the lower left. This gives you the opportunity to enter connection information:

4. Choose one of the available Connectors on the left, then enter or select the server URL on the right. If your configuration has preset servers for the chosen connector, these are available in a drop-down menu. When you select one, the URL for that server is filled in for you.

**NOTE:** The list of preset servers is configurable by the server administrator. For details, see the *Adobe Drive 5 Administrator’s Guide*.

5. Enter your login information, and choose configuration options:

   - **Remember me:** When selected, Adobe Drive 5 keeps your login information and automatically fills in the password for you on future connections to this server.

   - **Enable asset editing offline when server is not available:** When selected, you can continue editing a managed asset that has been saved locally if the connection goes down or the server goes offline. When you select this option, "Remember me" is automatically selected.

   - **Automatically connect to this server when computer starts:** When selected, Adobe Drive 5 keeps your login information and server preference, and connects to the server on startup, so you do not have to bring up the Adobe Drive 5 Connect UI unless you want to edit the connection or connect to a different server.

6. Enter a Display Name to identify this connection wherever it appears on screen. This string can contain only letters, numbers, and the underscore ("_"), hyphen ("-"), and dot ("." ) characters.

7. Click **Connect**.
8. Once a connection has been established, the window shows the Recent Connections. To change the viewing mode, click the tile-view or list-view icon in the upper right of the Recent Connections panel.

![Adobe Drive 5 Connect UI]

**Edit connections**

After you have successfully established the connection, you can close the Adobe Drive 5 Connect UI. You remain connected until you explicitly disconnect. If you want to change the configuration setting, or connect to a different server or service, open the Adobe Drive 5 Connect UI again.

For a selected server, you can:

- **Open in [Platform File Browser]**: Open the root folder of the mounted volume in Windows Explorer or Mac OS Finder.
- **Connect**: Establish a new connection to the selected AEM Assets server, if it is currently disconnected.
- **Disconnect Server**: Disconnect Adobe Drive 5 from the AEM Assets server, if it is currently connected.
- **Remove**: First disconnects the AEM Assets server if it is currently connected, removes all cache data from the local cache of Adobe Drive 5, and removes AEM Assets server from the Recent Connections panel.
Set system preferences

To set system preferences for Adobe Drive 5:

1. Open the Adobe Drive 5 window and click Settings.

2. Specify any of these options:
   
   **CACHING:** The cache stores information to improve performance when you're connected to an AEM Assets server. The cache takes up disk space; you can modify the configuration to optimize it for your system.
   
   ▶ After you have disconnected from all servers, you can click **Move Cache** to control where your cached files are stored.
   
   ▶ Specify a **Cache Size** to set the maximum total size of the cache. When the cache reaches this limit, the oldest cached files are automatically deleted.
   
   ▶ Click **Empty Cache** to delete all currently cached files.

   **LOGGING:** The log records information about the status of connections, and shows installation locations and configurations of connected servers. In case of warnings or errors, it contains a Java stack trace that you can send to your server administrator.
Specify the logging level as **info** (log informational, warning, and error messages), **warning** (log warning and error messages), or **error** (log only error messages).

- Click **Open Log File** to open the log file in the default text editor.

**Automatic Check-in:** You can choose to automatically check in new files that are added in a connected folder through the file system (Mac OS Finder or Windows Explorer). This preference does not affect new files added through Adobe Bridge (which has its own bulk check-in mechanism) or directly from an integrated application.

- Automatic check-in is enabled by default; you can deselect the checkbox to disable the feature.
- When the feature is enabled, files are automatically checked in when you create them in a connected folder, or when you copy new files into a connected folder using copy-and-paste or drag-and-drop. (Temporary files, such as ~*.tmp, are not checked in.)
- The comment that you enter is used as the check-in comment for files that are added through the file system.
- Check the log for information about files that may have failed to be automatically checked in for any reason. There are no error notification dialogs for automatic check-in.

3. If you have changed the configuration, click **Save**.

---

**Connecting your server to Windows Explorer**

In Windows, when you install Adobe Drive 5 as a "Local Administrator", it expects to map to the Z: drive. Before you install, therefore, you should make sure that any location you have previously mapped to the Z: drive is re-mapped to another drive.

1. Perform the installation as Administrator. To do this, unzip the downloaded installation archive, select and right-click the file **set-up.exe**. Choose the option "Run As Administrator" and provide "Local Administrator" credentials.
2. When the installation (and installation of all available updates) is complete, restart the computer and start Adobe Drive 5. You see a screen like this:

3. Click **Add Drive** and fill out the details of your AEM Assets server. For example:
4. Click **Connect**. In the new screen, select the new connection and click **Open In Explorer**.

   ![Adobe Drive](image_url)

   This opens a Windows Explorer window, where the drive letter Z:\ (if available) is mapped to the AEM Assets server.

5. To test the connection, drag and drop a file into a folder managed by your AEM Assets server.

   If automatic check-in is enabled, the file is automatically checked into the server with the default check-in comment.

6. If you have disabled automatic check-in, select the new file, right-click, and choose **Adobe Drive > Check In**.

   ![Context menu](image_url)
Provide a version comment, click **OK**.

The URL for the uploaded file follows this pattern:

```
http://<server_IP_addr>:<AEM_TCP_LISTEN_port>/assetdetails.html/content/dam/<upload_path>/<filename>
```

7. In Windows Explorer, select the file, right click, and choose **Adobe Drive > Open In DAM**.

8. In the resulting web page, check the Renditions tab on the right side. You should see different renditions (resolutions) of the uploaded image that are automatically created; for example, `cq5dam.thumbnail.319.319.png`, `cq5dam.web.1280.1280.jpeg`, and so on.
Connecting your server to Adobe Bridge

Once Adobe Drive is configured to connect to your AEM Assets server, you automatically have file browser access to AEM Assets content from within Adobe Bridge.

Working with remote files

When Adobe Drive 5 successfully connects to an AEM Assets server, a mounted hard drive or mapped network drive appears in the file browsers. You can use the contents of this drive the same way you use the local file system. When you save a file that is managed by an AEM Assets server, Adobe Drive 5 stores a temporary file locally. It creates a new version of the file on the server when you check the file in, or save it as a specific version.
This is what a remote file system might look like, for example, in Windows Explorer.

Inspecting a connected server in Adobe Bridge

This is what a mounted drive might look like in the Content panel in Adobe Bridge.

The Inspector panel in Adobe Bridge displays context-sensitive information about AEM Assets servers and managed assets. For example, if you select an AEM Assets server in the Content panel, the Inspector shows information about the server and asset properties in the top portion, and active links in the bottom portion that allow you to perform Adobe Drive 5 tasks, such as disconnecting from the server.

You can set preferences to customize the information that appears in the Inspector panel:

1. Choose **Edit > Preferences** (in Windows) or **Adobe Bridge CC > Preferences** (in Mac OS).
2. In the Preferences dialog, select the Inspector tab.
3. Select items to be displayed in the Inspector panel, and click OK. For example, select Adobe Drive Server Panel to display information and tasks related to a selected AEM Assets server.

You can copy information from the Inspector panel; for example, the text of a lengthy version comment. To do this, right-click (in Windows) or CTRL-click (in Mac OS) the information (such as a version comment) that you want to copy, and choose Copy [item name] from the context menu.

### Adding files or folders to the AEM Assets server

To save a version of a file, add the file to your AEM Assets server. You can add both Adobe and non-Adobe files. The procedure depends on whether you are using Adobe Bridge, a platform file browser, or an integrated Adobe application. In all cases, assume that you have already connected to the server using Adobe Drive 5.

#### Using Adobe Bridge

1. Click Adobe Drive in the Favorites panel, open the AEM Assets server in the Content panel, then double-click the folder to which you want to add files.

2. Do one of the following:
   - Drag files or folders from Windows Explorer or Mac OS Finder to the folder in Adobe Bridge.
   - You cannot drag an empty folder into Adobe Bridge, but you can create a new subfolder in Adobe Bridge, which is automatically checked in to the AEM Assets server.
   - Choose Tools > Adobe Drive > Add Files. In the Open dialog box, select one or more files and click Open.

3. Enter a version comment in the Check In dialog box and click OK.

#### Using the platform file browser

1. Open the AEM Assets server in Windows Explorer or Mac OS Finder.
   - The AEM Assets server appears in the same place as your mapped network drives and hard drives.

2. Open a folder, then do one of the following:
   - Drag the files you want to add into the folder.
   - Create a new subfolder in the platform browser; the created folder is automatically checked in to the AEM Assets server.

3. To check in a file so that it is available to others, invoke the context menu for the file with right-click (in Windows) or CTRL-click (in Mac OS) and choose Adobe Drive > Check In. Type a version comment and click OK.

4. If you check out a file, then drag a new version of the file into a folder that already contains an older version, you can check in the file to create another version.

   If you replace a file that is not checked out, Adobe Drive 5 checks it out automatically when you choose Replace in the conflict-resolution dialog. You must then check the file in to commit a new version.
Using an integrated Adobe application

If you save a file to a folder using one of the integrated Adobe applications—Photoshop, Illustrator, or InDesign/InCopy—you can check in a file to a connected AEM Assets server during the save process.

1. In the application, choose **File > Save, File > Save As**, or **File > Check In**.
2. Save the file to the remote folder.
3. Type a version comment and click **OK**. The file is saved and checked in.
4. If you edit the file, it is automatically checked out to you again. You can then check in another version by choosing **File > Check In**. You can also check in the edited file when you close it.

Opening a remote file

You can open a remote file directly in any application using **File > Open**, the same way you would open any other file.

- If you open a checked-in file and edit it in an integrated Adobe application, the file is checked out automatically and you can save versions of the file directly from the application UI.
- If you open a checked-in file in any other application, an error indicates that you are attempting to open a file for which you do not have write permission. You must check the file out in a platform file browser in order to open it, and explicitly check it in to commit any changes that you make.

To open a remote file from Adobe Bridge:

1. Select Adobe Drive in the Favorites panel.
2. Double-click the AEM Assets server in the Content panel.
3. Double-click the folder that contains the file you want to open.
4. Select the file, invoke the context menu, and choose **Checkout**.
5. Double-click the file to open it.

Adobe Bridge relies on the operating system to know which application to use when opening the file. If the file opens in the wrong application, open the file directly from within the desired application, or change the system settings to specify a different default application for the file type.

Changing remote file names and locations

You can use the move and copy commands of Adobe Bridge and the platform file browsers to move and copy remote files on a connected AEM Assets server. When you copy or move a file, the AEM Assets server copies or moves only the most current version.

Similarly, you can rename remote files and folders in the same way you rename local files. In Adobe Bridge, you can rename multiple files as a batch.

- To copy remote files:

  - In Adobe Bridge, invoke the context menu for the file with right-click in Windows, choose **Copy To**, and choose or browse to the target folder. In Mac OS, **CTRL-click** and choose **Copy**, navigate to the target folder, and choose **Paste**.
Select the file in a platform file browser, invoke the context menu and choose **Copy**, then go to the target folder and choose **Paste**.

In a platform file browser, CTRL-drag (in Windows) or OPTION-drag (in Mac OS) the file to the target location.

To move remote files:

In Adobe Bridge, invoke the context menu for the file with right-click in Windows, choose **Move To**, and choose or browse to the target folder. In Mac OS, there is no Move command; you can copy/paste, then delete the file from the original location.

In a platform file browser, drag the file to the target location.

You can only rename remote files if they are up-to-date. To rename remote files:

In a platform file browser, select the remote file, invoke the context menu and choose **Rename**.

In Adobe Bridge, invoke the context menu for the file with right-click (in Windows) or CTRL-click (in Mac OS), choose **Rename**, and enter the new name.

To perform a batch rename in Adobe Bridge, select the files, invoke the context menu and choose **Tools > Batch Rename**, set the desired options and click **Rename**.
Placing remote files in documents

While working with a document in an integrated Adobe application, you can use the Place command to place a remote file into the document, just as you would with a local file. You can also drag a remote file from Adobe Bridge to an open document.

Always add assets to the AEM Assets server before placing them in a managed document. When you place a file that is not managed by the AEM Assets server into a file that is managed, you cannot keep track of the placed asset’s versions or status.

View file status and versions in the Links panel

The Links panel in Illustrator or InDesign/InCopy displays additional information about placed files from the AEM Assets server, identifying whether a linked file is being edited and which user is doing the editing. You can also use the Links panel to determine whether the linked file needs to be updated to a newer version from the AEM Assets server.
The Links panel works the same way for remote files as it does for local files. For example, if a newer version of a linked file is on the AEM Assets server, the Modified Artwork icon appears. If a file is missing, the Missing Artwork icon appears. Update the linked file as you would for a local file.

In Illustrator, the Links panel identifies who is editing a linked file from a AEM Assets server, as well as a status icon that describes the current state of the file (see “File status in integrated applications and file browsers” on page 21). In Illustrator and InDesign/InCopy, the status bar displays the file status icon.

To view versions of a placed file, choose Versions (Illustrator) or Utilities > Versions (InDesign/InCopy) from the Links panel menu. In Illustrator, a tool tip displays the version of a placed file when the pointer hovers over the name of the file in the Links panel.

See application Help for more information about working with the Links panel and placed files.

Replace a placed file with a previous version

You may find yourself working with multiple versions of a document that includes a link to a file with multiple versions. If you decide to promote an earlier version of the document that includes a link to an earlier version of the file, Adobe Drive 5 automatically links to the current version of the file in the promoted document.

For example, suppose you create an InDesign/InCopy document, place a Photoshop file in the document, and create multiple versions of each file. If you then decide to promote an earlier version of the InDesign/InCopy document, the link to the placed Photoshop file points to the current version of the file—not the version of the file to which you originally linked in the promoted InDesign/InCopy document.

Illustrator or InDesign/InCopy may display a thumbnail of the version of the file to which you originally linked in the promoted document, but the link actually points to the most current version of the file. For example, when you package an InDesign/InCopy document that displays a thumbnail of the correct version, InDesign/InCopy replaces the thumbnail of the file with the most current (but incorrect) version.

To resolve these version issues, replace the linked file with a previous version:

1. In Illustrator or InDesign/InCopy, select the file in the Links panel.
2. Choose Versions (Illustrator) or Utilities > Versions (InDesign/InCopy) from the Links panel menu.
3. Select a version and click Promote To Current Version.
4. Enter a version comment if desired, and click Save.

Deleting remote files or folders

You can delete remote files or folders from the AEM Assets server using Adobe Bridge or the platform file browsers. Any user with appropriate privileges can delete files and folders, unless they are marked as Checked Out by Others. Delete remote assets the same way as local assets, by dragging them to Trash or Recycle Bin, or choosing Delete from a menu or toolbar.

Working with versions

Versions track changes to a file. Each version is a snapshot of the file at a particular point in time. When you edit a file from the AEM Assets server, you are editing the last version saved to the AEM Assets server. When
you are ready to save changes to the AEM Assets server, you check in a version. You do not have to check in a version every time you save your changes, just when you want to create a snapshot of the file.

- You can save comments with versions to help you track changes.
- You can promote a previous version to be the current version, letting you recover from unwanted changes.
- You can compare multiple versions of the same file, and delete versions as they become obsolete or to save disk space.

File status in integrated applications and file browsers

Files that are managed by Adobe Drive 5 are marked with a status icon that describes the state of the file on the AEM Assets server.

- Managed files in the platform file browser are marked with icons that show up-to-date, checked-out-by-me, or checked-out-by-someone-else status.
- When browsing managed files in Drive-integrated applications (InDesign/InCopy, Illustrator or Photoshop), you can see more information about a file's status in the status bar. A file can have more than one status at once.

Possible status value are as follows:

<table>
<thead>
<tr>
<th>Status</th>
<th>Icon in CS app</th>
<th>Icon in platform browser</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Open</td>
<td>![Icon]</td>
<td>![Icon]</td>
<td>The file is open on your computer.</td>
</tr>
<tr>
<td>Checked Out By Me</td>
<td>![Icon]</td>
<td>![Icon]</td>
<td>You are editing the file. Adobe Drive 5 assigns this status when you make an edit that changes the file's content. You can mark a file as checked out before you edit it to alert other users that you intend to change the content. (This shows the Photoshop icon; different icons are used in InDesign/InCopy and Illustrator.)</td>
</tr>
<tr>
<td>Checked Out By [user name]</td>
<td>![Icon]</td>
<td>![Icon]</td>
<td>Another user is editing the file and has not yet saved a new version.</td>
</tr>
<tr>
<td>Up-to-date</td>
<td>![Icon]</td>
<td>![Icon]</td>
<td>The latest known version of the file is checked in and available for editing.</td>
</tr>
<tr>
<td>Conflicting</td>
<td>![Icon]</td>
<td>![Icon]</td>
<td>There is a version conflict, or both you and another user are editing the file.</td>
</tr>
</tbody>
</table>
### Status | Icon in CS app | Icon in platform browser | Description
--- | --- | --- | ---
New File | ![New File Icon](image) | ![New File Icon](image) | The file appears in the mounted volume folder but has not been checked in to the AEM Assets server. This status can be applied, for example, if a file is saved in an existing folder for the first time while the AEM Assets server is offline. You can edit the file, but it is important to check in the file after you save your changes.

Newer Version On Server | ![Newer Version On Server Icon](image) | ![Newer Version On Server Icon](image) | A newer version of the file appears on the AEM Assets server. This icon appears if someone else checks in a version while you have the file open and up to date.

Server Not Accessible | ![Server Not Accessible Icon](image) | ![Server Not Accessible Icon](image) | The AEM Assets server is offline, or you are offline and not able to access the server.

Deleted | ![Deleted Icon](image) | ![Deleted Icon](image) | The file or folder has been deleted from the server.
Checking out files

**IN AN INTEGRATED ADOBE APPLICATION:** Open a managed file as you would any other file. The file is checked out automatically when you make your first edit.

**IN A PLATFORM FILE BROWSER:** Invoke the context menu for the file with right-click (in Windows) or CTRL-click (in Mac OS) and choose Adobe Drive > Check Out.

**IN ADOBE BRIDGE:** Select the file in the AEM Assets server, then choose Tools > Adobe Drive > Check Out, or click Check Out.

Checking in versions

To check in a new version of a file, use the Check In command, which saves your changes to the AEM Assets server and removes the Checked Out status from the file. When you check in a version, Adobe Drive 5 transfers and saves only the changes you have made to the file.

- In an integrated Adobe application, you can check in files directly from the application UI, by choosing File > Check In. (In Adobe Bridge, select the file in the AEM Assets server, then choose Tools > Adobe Drive > Check In, or click Check In.) Enter comments for the version in the Check In dialog, then click OK.

  In InDesign/InCopy or Illustrator, you can save versions of non-embedded graphics, images, and text files using the Edit Original command in the Links panel. After editing the file, save it in its native application. Then, in the Links panel, select the file and use the Check In Link command to check in a version in the AEM Assets server. For more information, see the application Help.

After you check in a file, editing the file checks it out again, allowing you to save another version. If you close an edited file without saving, you are prompted with these choices:

- **SAVE:** Saves the file but doesn’t check it in.
- **CHECK IN:** Saves and checks in the file.
- **DON’T SAVE:** Closes the file without saving the changes.
- **CANCEL:** Doesn’t save or close the file.

- For all other applications, use the context menu in the platform file browser to check in versions manually.

  Invoke the context menu for the file with right-click (in Windows) or CTRL-click (in Mac OS) and choose Adobe Drive > Check In. Enter comments for the version in the Check In dialog, then click OK.

  This method is especially useful when using non-Adobe files, such as Microsoft Word files.

- You can use Adobe Bridge to check in a file from an application that is not integrated with Adobe Drive 5 (assuming you have the file checked out):
  - Start Adobe Bridge.
  - Go to Bridge Preference > Startup Scripts and make sure that “Adobe Drive” is selected.
  - Open the file in its native application, make your changes, and save and close the file.
  - In Adobe Bridge, select the file and click Check In.
Enter comments for the version in the Check In dialog, then click **OK.**

**Editing files checked out by another user**

If someone is editing a managed file, Adobe Drive 5 changes the file's status to Checked Out. When you attempt to edit the file in an integrated application, Adobe Drive 5 informs you that the file is already checked out and gives you the option to continue working with a copy of the file.

You can save your copy as a new version. The AEM Assets server alerts all current users of the file about the presence of a new version on the server and gives them the option of downloading the latest version or continuing to edit their own copy.

To edit a file checked out by another user:

1. Open the file.
2. In the Checked Out By alert box, choose one of:
   - **CLOSE:** Closes the file without any alterations.
   - **CONTINUE:** Keeps the file open so that you can work on a new copy.
3. If you continue working with the document and change the content, Adobe Drive 5 alerts you to the possibility of conflicts. In this alert box, choose one of:
   - **DISCARD CHANGES:** Displays the most recent version of the file from the AEM Assets server.
   - **CONTINUE EDITING:** Allows you to edit your copy of the file, which may result in conflicts.
4. You can save a new version of your edits. Adobe Drive 5 displays an alert, warning you that conflicting edits will occur if you continue. Choose one of:
   - **CANCEL:** Returns to the open document without checking in a new version.
   - **CHECK IN:** Updates the master file in the AEM Assets server with the new version.
5. If you choose to check in the new version, Adobe Drive 5 displays an alert to the other user to note that a newer version of the file has been created.
6. At any point, you can choose to close the document and discard any changes you made.

**Updating a file to the most recent version**

If another user creates a version of a file that you have open or that is still marked as Checked Out, Adobe Drive 5 reminds you to update your document with the latest version. This prompt appears when you open the file, attempt to edit it, or when you bring the document window to the front.

When the prompt appears, choose one of:

- **DISCARD CHANGES:** Updates the document with the most recent version from the AEM Assets server. You can continue editing the file after it is updated. You lose any changes you made even if you have already used the Save command to save those changes to the local file.
- **CONTINUE EDITING:** Leaves the document as is. You can continue editing the file without overwriting the changes in the more recent version. Instead, you are prompted either to save a new version of the file when you close it or to discard your changes.
Viewing, promoting, and deleting versions

Versions are treated as separate files, which you can access through the Content panel in Adobe Bridge. The Versions dialog box and Adobe Bridge display thumbnails of all file versions (numbered sequentially) with comments, dates, and the login name of the user who created the version.

To view versions in Adobe Bridge:
1. Click Adobe Drive in the Favorites panel, and open the AEM Assets server in the Content panel.
2. Open the folder containing the file for which you want to view versions, and select the file.
3. Choose Tools > Adobe Drive > View Versions, or click View Versions in the Content panel.
   Versions appear in the Content panel.

To invoke the Versions dialog:

- In the platform file browser, invoke the context menu for the file with right-click (in Windows) or CTRL-click (in Mac OS), and choose Adobe Drive > View Versions.
- In an integrated Adobe application, choose Show Versions from the fly out menu in the status bar.

![Versions for "rfid.png"]

Current Version

- Version: 4 system
- Comment: Changed the color to yellow-orange

Past Versions

- Version: 3 system
  Comment: Made the circuit color metal grey.

- Version: 2 system
  Comment: Changed RFID circuit color to blue.
Viewing a previous version in its native application

If you want to compare versions in detail, you can choose to view each version in its native application.

If you view a previous version in its native application, changes you make are not reflected in the current version, unless you promote the previous version to be the current version (see “Promoting a version” on page 26). You can, however, save edits to a previous version as a new asset. Do this if you want both a previous version and the current version to be available for simultaneous use in the AEM Assets server.

To do this, open the Versions dialog, select the version that you want to open, and click Open Version. The selected version opens in its own document window. The version number appears in the file's title bar to remind you that it is not the current version. The file status is Never Saved, because the previous version is only a snapshot of a previous stage of the file.

Promoting a version

Promoting a previous version saves a copy of the previous version as the current version. This process keeps the previous version intact if you decide to return to it again in the future. Any changes made between its creation and promotion do not appear in the new current version.

To do this:

1. View the version you want to promote in Adobe Bridge or the Versions dialog.
2. To promote the version:
    In the Versions dialog, select the version you want to promote, and click Promote To Current Version.
    In Adobe Bridge, select the version you want to promote, and click the Promote icon.
3. Type a version comment in the Check In dialog and click OK.

Deleting a version

When you delete a version, the remaining versions are not renumbered. You cannot restore deleted versions. You cannot delete the head version.

 In the Versions dialog, select the version you want to delete and click Delete.
 In Adobe Bridge, select the version you want to delete, and click Delete in the Content panel.

Reverting to the last version

When you revert to the last version, you cancel any changes you’ve made since you last checked the file out.

 In the platform file browser, invoke the context menu for the file with right-click (in Windows) or CTRL-click (in Mac OS). Choose Adobe Drive > Cancel Check Out.

When prompted, click Revert To Last Version.

 In Adobe Bridge, select the file and choose Tools > Adobe Drive > Revert To Last Version, or click Revert.
Searching for managed files in Adobe Bridge

You can search for versions of managed files, as well as deleted files, using the Find dialog in Adobe Bridge.

To do this:

1. Launch Adobe Bridge and choose **Edit > Find**.

2. Choose the folder in which to search.

3. Choose search criteria by selecting options from the Criteria and Match menus. You can specify multiple criteria. Use the + and - buttons to add and remove criteria. See Adobe Bridge documentation for details of the search options.

4. Click **Find** to execute the search.

**NOTE:** The CMIS Connector and the AEM Assets Server Connector do not support the options to include all versions or deleted files in the search. If you select the options, they are ignored.
Offline editing

When you connect to an AEM Assets server using Adobe Drive 5, you can select the option "Enable asset editing offline when server is not available." Choosing this option enables offline editing mode. In this mode, you can continue to browse and edit assets after disconnecting from a server. When you select this option, the "Remember me" option is automatically selected.

When you connect with this option, you receive a warning if there is a change in the connection, for example network glitches or the server outages. You can choose to work offline to continue editing assets. If you click No, Adobe Drive 5 disconnects from the AEM Assets server, and the mounted drive is removed from your local file system.

If you click Yes, you enter offline editing mode. The status is reflected in the Adobe Drive 5 Connect UI. The server icon in the Adobe Drive Connection UI shows both the status of the connection and the current editing mode:

<table>
<thead>
<tr>
<th>Icon</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>![Icon]</td>
<td>Adobe Drive is disconnected</td>
</tr>
<tr>
<td>![Icon]</td>
<td>Server is available</td>
</tr>
<tr>
<td>![Icon]</td>
<td>Adobe Drive is disconnected</td>
</tr>
</tbody>
</table>
In offline editing mode, the mounted drive is still displayed on the local machine. You can see new files and files that you have checked out whose contents have been stored in local file system. Be aware, however, that files are not automatically stored locally just because you have checked them out. Files that you check out are only stored locally when you open them in an integrated Adobe product (Photoshop, Illustrator, or InDesign).

In offline editing mode:

- You cannot check files in or out, or view versions.

- You can continue to edit and save files that are cached locally. You cannot see or open files that are only on the server, even if you have them checked out.

- You can add new files.
While you are in offline editing mode, the application's document status bar shows “Server not accessible”.

You are notified when the connection is back online. When you click **OK**, Adobe Drive 5 automatically reconnects to the AEM Assets server using the remembered user name and password.

The server is now available. You can work online.

Because you can add new files in offline editing mode, Adobe Drive 5 synchronizes immediately upon reconnection. A progress bar displays the progress of the synchronization. If you click **Cancel** in the progress dialog, the synchronization stops and you are returned to the offline editing mode.
If there are file names in conflict with new files and the files on the server, you are prompted to rename or delete the local files.

![Renaming or deleting local files](image)

When synchronization completes, click **OK** in the progress dialog to return to online editing mode.

![Recent connections](image)

At this point, you can open any files that you have modified while offline, and check in the modified files to the server.
Troubleshooting

This section describes how to resolve common problems that might occur when attempting to connect to a server through the Adobe Drive 5 Connect UI.

Adobe Bridge does not show Adobe Drive features

The Adobe Drive 5 SDK includes startup scripts that configure the Adobe Bridge UI. If you start Adobe Bridge and do not see the Adobe Drive 5 commands in the Tools menu or Inspector panel, it is likely that the startup scripts have not run. You can use the Preferences dialog to select them:

1. Connect to a AEM Assets server using the Adobe Drive 5 Connect UI.
2. In Adobe Bridge, choose Edit > Preferences (in Windows) or Adobe Bridge > Preferences (in Mac OS), and select Startup Scripts.
3. Select both Adobe Drive and Adobe Drive SDK, then click OK.
4. Restart Adobe Bridge.

Adobe Bridge does not update its view of remote assets

Occasionally, infrequently-used commands do not automatically update the Adobe Drive 5 information displayed in Adobe Bridge (particularly if the Adobe Bridge window is in the background). If you do not see the results of an action you have completed, refresh the view by doing one of the following in Adobe Bridge:

► Choose View > Refresh or press “F5”.
► Change the focus by selecting another item.
► Change to a different folder and back.
► Resize the Adobe Bridge window, or bring it to the foreground.

Performance optimization and troubleshooting

This section provides some guidelines and advice that will help you get the best performance in your use of Adobe Drive 5, and avoid mistakes that could cause problems.

Log files

Adobe Drive 5 writes log files that track its operations. Logs are written to these locations:

► In Windows:

  Users\<username>\AppData\Roaming\Adobe\AD4ServiceManager\Logs

► In Mac OS:

  /Users/<username>/Library/Application Support/Adobe/AD4ServiceManager/logs

You can configure the logging level, and the resulting log files can help you troubleshoot your configuration and usage.
Automatic check-in or manual check-in

In Adobe Drive 5, the automatic check-in operation checks in multiple files to the server one by one, whereas manual check-in checks in all of the selected files simultaneously. For bulk check-ins, therefore, manual check-in offers much better performance than automatic.

Automatic check-in is recommended for ease of use when you don’t have to check in many files at the same time, or when you are working with a smaller numbers of files.

File caching

Adobe Drive 5 maintains a local file cache, in order to avoid excessive network access. Files that you access from the server are downloaded and stored in the local cache. New files that you create on the Adobe Drive 5 drive, or move from a local drive to your Adobe Drive 5 drive are also stored in the cache before you upload them to the server.

The size of the cache is not automatically increased when more files are added; instead, you set the maximum size, and when the cache reaches this limit, the oldest cached files are automatically deleted.

In general, the bigger your cache size is, the better your file-access performance is. To increase the cache size, use the Settings page:

1. Open the Adobe Drive 5 window and click Settings.

2. After you have disconnected from all servers, you can click Move Cache to control where your cached files are stored.

3. Specify a Cache Size to set the maximum total size of the cache.

4. Click Empty Cache to delete all currently cached files.

Environmental performance differences

AEM Assets servers and CMIS AEM Assets servers can differ significantly in file-access performance. Within these constraints, performance is also affected by whether an operation is initiated in Adobe Bridge or in a platform file browser.

- File check-in performance is often better from Adobe Bridge than from platform file browsers, because of additional background commands that the platform browsers perform, such as pre-reading and listing.

- File operations (such as deletion) of many large files are also significantly faster from Adobe Bridge. Adobe Bridge handles such bulk operations simultaneously, while platform browsers handle the operations individually and sequentially.
File read operations do not appear to differ significantly.

Avoiding mount point confusion

An InDesign document can contain a link to a managed asset. When you create the link, it includes the drive or volume specifier where you mounted Adobe Drive 5. For example, if you mount Adobe Drive 5 as drive “Z:”, the path includes that mount point.

When you unmount Adobe Drive 5, the next time you might mount it to a different drive, such “Y:”. When you open the InDesign document, InDesign should update the internal link. In Mac OS, however, the link may not be updated correctly, and can cause problems.

In order to avoid such problems, it is recommended that you always mount Adobe Drive 5 to the same drive letter (in Windows) or volume name (in Mac OS).

Sharing access with AEM Assets WebDAV

The Adobe Drive 5 AEM Assets Connector uses JCR lock to lock the asset on the AEM Assets server when you open the asset through Adobe Drive 5. However, the AEM Assets web client and WebDAV interface do not check the JCR lock.

In order to avoid conflicting changes, therefore, we recommend that when you are using Adobe Drive 5 to access managed files, you do not open these files using the AEM Assets WebDAV interface.
