# Contents

## Chapter 1: Introduction

About Adobe ColdFusion 9 documentation .....	1
--	---

## Chapter 2: Reserved Words and Variables

Reserved words .....	2
Scope-specific built-in variables .....	4
Custom tag variables .....	5
ColdFusion tag-specific variables .....	6
CGI environment (CGI Scope) variables .....	11

## Chapter 3: ColdFusion Tags

New tags in ColdFusion 9 .....	15
Tag summary .....	15
Tags by function .....	21
Tag changes since ColdFusion 5 .....	23
Tags a-b .....	33
Tags c .....	54
Tags d-e .....	102
Tags f .....	183
Tags g-h .....	263
Tags i .....	304
Tags j-l .....	362
Tags m-o .....	398
Tags p-q .....	450
Tags r-s .....	551
Tags t .....	622
Tags u-z .....	663

## Chapter 4: ColdFusion Functions

New Functions in ColdFusion 9 and ColdFusion 9.0.1 .....	688
Functions by category .....	689
Function changes since ColdFusion 5 .....	696
Functions a-b .....	702
Functions c-d .....	748
Functions e-g .....	830
Functions h-im .....	923
Functions in-k .....	999
Functions l .....	1050
Functions m-r .....	1107
Functions s .....	1167
Functions t-z .....	1265

**Chapter 5: Ajax JavaScript Functions**

Function summary .....	1316
ColdFusion.Ajax.submitForm .....	1318
ColdFusion.FileUpload.cancelUpload .....	1319
ColdFusion.FileUpload.clearAllFiles .....	1320
ColdFusion.FileUpload.startUpload .....	1321
ColdFusion.getElementValue .....	1322
ColdFusion.Grid.getGridObject .....	1323
ColdFusion.Grid.refresh .....	1324
ColdFusion.Grid.sort .....	1325
ColdFusion.JSON.decode .....	1326
ColdFusion.JSON.encode .....	1327
ColdFusion.Layout.collapseAccordion .....	1328
ColdFusion.Layout.collapseArea .....	1329
ColdFusion.Layout.createAccordionPanel .....	1330
ColdFusion.Layout.createTab .....	1332
ColdFusion.Layout.disableTab .....	1334
ColdFusion.Layout.enableTab .....	1335
ColdFusion.Layout.expandAccordion .....	1336
ColdFusion.Layout.expandArea .....	1337
ColdFusion.Layout.getAccordionLayout .....	1337
ColdFusion.Layout.getBorderLayout .....	1338
ColdFusion.Layout.getTabLayout .....	1339
ColdFusion.Layout.hideAccordion .....	1339
ColdFusion.Layout.hideArea .....	1340
ColdFusion.Layout.hideTab .....	1341
ColdFusion.Layout.selectAccordion .....	1342
ColdFusion.Layout.selectTab .....	1343

# Chapter 1: Introduction

The *CFML Reference* is your primary ColdFusion Markup Language (CFML) reference. Use this manual to learn about CFML tags and functions, ColdFusion expressions, and using JavaScript objects for WDDX in Adobe® ColdFusion® 9. It also provides detailed references for Java™ and C++ CFX interfaces.

## About Adobe ColdFusion 9 documentation

The ColdFusion documentation is designed to provide support for the complete spectrum of participants.

### Documentation set

The ColdFusion documentation set includes the following titles:

Manual	Description
<i>Installing Adobe® ColdFusion® 9</i>	Describes system installation and basic configuration for Windows®, Macintosh®, Solaris™, Linux®, and AIX®.
<i>Configuring and Administering Adobe® ColdFusion® 9</i>	Describes how to perform ColdFusion administration tasks such as managing server settings, configuring datasources, managing security, deploying ColdFusion applications, caching, setting up CFX tags, monitoring server activity using the ColdFusion Server Monitor, and configuring web servers.
<i>Developing Adobe® ColdFusion® 9 Applications</i>	Describes how to develop your dynamic web applications.  This book provides detailed information about using the CFML programming language and ColdFusion features, such as ColdFusion Web Services, ColdFusion Portlets, ColdFusion ORM, AJAX support, Flex and AIR integration, and integration with other products and technologies such as Microsoft Office, OpenOffice, and SharePoint.
<i>Adobe® ColdFusion® 9 CFML Reference</i>	Provides descriptions, syntax, usage, and code examples for all ColdFusion tags, functions, and variables.

### Viewing online documentation

All ColdFusion documentation is available online in HTML and Adobe PDF files. Go to the ColdFusion Help and Support page at [www.adobe.com/go/learn\\_cfu\\_support\\_en](http://www.adobe.com/go/learn_cfu_support_en) to view the online documentation. In addition to viewing the online documentation, you can also add and view comments to the documentation.

# Chapter 2: Reserved Words and Variables

Adobe ColdFusion language includes reserved words and scope variables.

## Reserved words

The following list indicates words you must not use for ColdFusion variables, user-defined function names, or custom tag names. Although you can safely use some of these words in some situations, you can prevent errors by avoiding them entirely.

- Any name starting with cf. However, when you call a CFML custom tag directly, you prefix the custom tag page name with cf\_.
- Built-in function names, such as Now or Hash
- Scope names, such as Form or Session
- Operators, such as NE or IS
- The names of any built-in data structures, such as Error or File
- The names of any built-in variables, such as RecordCount or CGI variable names
- The following CFScript language element names:
  - for
  - default
  - continue
  - import
  - finally
  - local (inside function declaration)
  - interface
  - pageencoding

Remember that ColdFusion is not case sensitive. For example, all of the following are reserved words: IS, Is, iS, and is.

**Note:** Keywords in the newly added statements, such as *abort*, *rethrow*, *param*, and so on are not reserved.

## Reserved words in forms

Do not create form field names that end in any of the following, except to specify a form field validation rule by using a hidden form field name.

- \_integer
- \_float
- \_range
- \_date
- \_time

- `_eurodate`

## Reserved words in queries

The following table lists SQL keywords that are reserved in ColdFusion queries of queries. This list includes all reserved words in the SQL standard. Avoid them in variables used in all queries. Do not use these keywords as variable names in any queries.

**Note:** Many database management systems have additional reserved words that you cannot use as variable names in queries to their databases. For a detailed list, see your DBMS documentation.

ABSOLUTE	ACTION	ADD	ALL	ALLOCATE
ALTER	AND	ANY	ARE	AS
ASC	ASSERTION	AT	AUTHORIZATION	AVG
BEGIN	BETWEEN	BIT	BIT_LENGTH	BOTH
BY	CASCADE	CASCADEDE	CASE	CAST
CATALOG	CHAR	CHARACTER	CHARACTER_LENGTH	CHAR_LENGTH
CHECK	CLOSE	COALESCE	COLLATE	COLLATION
COLUMN	COMMIT	CONNECT	CONNECTION	CONSTRAINT
CONSTRAINTS	CONTINUE	CONVERT	CORRESPONDING	COUNT
CREATE	CROSS	CURRENT	CURRENT_DATE	CURRENT_TIME
CURRENT_TIMESTAMP	CURRENT_USER	CURSOR	DATE	DAY
DEALLOCATE	DEC	DECIMAL	DECLARE	DEFAULT
DEFERRABLE	DEFERRED	DELETE	DESC	DESCRIBE
DESCRIPTOR	DIAGNOSTICS	DISCONNECT	DISTINCT	DOMAIN
DOUBLE	DROP	ELSE	END	END-EXEC
ESCAPE	EXCEPT	EXCEPTION	EXEC	EXECUTE
EXISTS	EXTERNAL	EXTRACT	FALSE	FETCH
FIRST	FLOAT	FOR	FOREIGN	FOUND
FROM	FULL	GET	GLOBAL	GO
GOTO	GRANT	GROUP	HAVING	HOURL
IDENTITY	IMMEDIATE	IN	INDICATOR	INITIALLY
INNER	INPUT	INSENSITIVE	INSERT	INT
INTEGER	INTERSECT	INTERVAL	INTO	IS
ISOLATION	JOIN	KEY	LANGUAGE	LAST
LEADING	LEFT	LEVEL	LIKE	LOCAL
LOWER	MATCH	MAX	MIN	MINUTE
MODULE	MONTH	NAMES	NATIONAL	NATURAL
NCHAR	NEXT	NO	NOT	NULL

NULLIF	NUMERIC	OCTET_LENGTH	OF	ON
ONLY	OPEN	OPTION	OR	ORDER
OUTER	OUTPUT	OVERLAPS	PAD	PARTIAL
POSITION	PRECISION	PREPARE	PRESERVE	PRIMARY
PRIOR	PRIVILEGES	PROCEDURE	PUBLIC	READ
REAL	REFERENCES	RELATIVE	RESTRICT	REVOKE
RIGHT	ROLLBACK	ROWS	SCHEMA	SCROLL
SECOND	SECTION	SELECT	SESSION	SESSION_USER
SET	SIZE	SMALLINT	SOME	SPACE
SQL	SQLCODE	SQLERROR	SQLSTATE	SUBSTRING
SUM	SYSTEM_USER	TABLE	TEMPORARY	THEN
TIME	TIMESTAMP	TIMEZONE_HOUR	TIMEZONE_MINUTE	TO
TRAILING	TRANSACTION	TRANSLATE	TRANSLATION	TRIM
TRUE	UNION	UNIQUE	UNKNOWN	UPDATE
UPPER	USAGE	USER	USING	VALUE
VALUES	VARCHAR	VARYING	VIEW	WHEN
WHenever	WHERE	WITH	WORK	WRITE
YEAR	ZONE			

## Scope-specific built-in variables

ColdFusion returns variables, such as those returned in a `cfdirectory` or `cfhttp` operation. A variable is usually referenced by *scoping* it according to its type: naming it according to the code context in which it is available; for example, `Session.varname`, or `Application.varname`. For more information on ColdFusion scopes, see [Using ColdFusion Variables](#) in the *Developing ColdFusion Applications*.

You use the `cflock` tag to limit the scope of CFML constructs that modify shared data structures, files, and CFXs, to ensure that modifications occur sequentially. For more information, see [“cflock”](#) on page 379, and [Using Persistent Data and Locking](#) in the *Developing ColdFusion Applications*.

### Variable scope

ColdFusion supports the Variables scope. Unscoped variables created with the `cfset` tag acquire the Variables scope by default. For example, the variable created by the statement `<CFSET linguist = Chomsky>` can be referenced as `#Variables.linguist#`.

### Caller scope

#### History

ColdFusion MX: The Caller scope is accessible as a structure. (In earlier releases, it was not.)

## CGI variables

see “[CGI environment \(CGI Scope\) variables](#)” on page 11

## Client variables

The following client variables are reserved:

```
Client.CFID  
Client.CFToken  
Client.HitCount  
Client.LastVisit  
Client.TimeCreated  
Client.URLToken
```

## Server variables

Use the Server prefix to reference server variables, as follows:

```
Server.ColdFusion.ProductName  
Server.ColdFusion.ProductVersion  
Server.ColdFusion.ProductLevel  
Server.ColdFusion.SerialNumber  
Server.ColdFusion.SupportedLocales  
Server.ColdFusion.AppServer  
Server.ColdFusion.Expiration  
Server.ColdFusion.RootDir  
Server.OS.Name  
Server.OS.AdditionalInformation  
Server.OS.Version  
Server.OS.BuildNumber
```

## Application and session variables

To enable application and session variables, use the `cfapplication` tag or `Application.cfc`. Reference them as follows:

```
Application.myvariable  
Session.myvariable
```

To ensure that modifications to shared data occur in the intended sequence, use the `cflock` tag. For more information, see “[cflock](#)” on page 379.

ColdFusion provides the following predefined application and session variables:

```
Application.ApplicationName  
Session.CFID  
Session.CFToken  
Session.URLToken
```

## Custom tag variables

A ColdFusion custom tag returns the following variables:

```
ThisTag.ExecutionMode  
ThisTag.HasEndTag  
ThisTag.GeneratedContent  
ThisTag.AssocAttrs[index]
```

A custom tag can set a Caller variable to provide information to the caller. Set the Caller variable as follows:

```
<cfset Caller.variable_name = "value">
```

The calling page can access the variable with the `cfoutput` tag, as follows:

```
<cfoutput>#variable_name#</cfoutput>
```

## Request variable

Request variables store data about the processing of one page request. Request variables store data in a structure that can be passed to nested tags, such as custom tags, and processed once.

To provide information to nested tags, set a Request variable, as follows:

```
<CFSET Request.field_name1 = "value">  
<CFSET Request.field_name2 = "value">  
<CFSET Request.field_name3 = "value">  
...
```

Each nested tag can access the variable with the `cfoutput` tag, as follows:

```
<CFOUTPUT>#Request.field_name1#</CFOUTPUT>
```

## Form variable

ColdFusion supports the Form variable `FieldNames`. `FieldNames` returns the names of the fields on a form. You use it on the action page associated with a form, as follows:

```
Form.FieldNames
```

# ColdFusion tag-specific variables

Some ColdFusion tags return data as variables. For example, the `cffile` tag returns file size information in the `FileSize` variable, referenced as `CFFILE.FileSize`.

The following tags return data that you can reference in variables:

```
cfcatch  
cfdirectory  
cferror  
cffile  
cfftp  
cfhttp  
cfindex  
cfldap  
cfpop  
cfquery  
cfregistry  
cfsearch  
cfstoredproc
```

## ColdFusion query variables

A ColdFusion tag that returns a query object supports the following variables, where *queryname* is the value of the name attribute:

```
queryname.CurrentRow  
queryname.RecordCount  
queryname.ColumnList
```

## CFCATCH variables

Within a `cfcatch` block, the active exception properties can be accessed as the following variables:

```
CFCATCH.Type  
CFCATCH.Message  
CFCATCH.Detail  
CFCATCH.ErrNumber  
CFCATCH.NativeErrorCode  
CFCATCH.SQLState  
CFCATCH.LockName  
CFCATCH.LockOperation  
CFCATCH.MissingFileName  
CFCATCH.TagContext  
CFCATCH.ErrorCode  
CFCATCH.ExtendedInfo
```

Within a `cfcatch` block, database exception properties can be accessed as the following variables:

```
CFCATCH.QueryError  
CFCATCH.SQL  
CFCATCH.Where  
CFCATCH.Datasource
```

Within a `cfcatch` block, undefined variable exception properties can be accessed as the following variable:

```
CFCATCH.Name
```

Within a `cfcatch` block, syntax and parsing exception properties can be accessed as the following variables:

```
CFCATCH.TokenText  
CFCATCH.Snippet  
CFCATCH.Column  
CFCATCH.KnownColumn  
CFCATCH.Line  
CFCATCH.KnownLine
```

## CFDIRECTORY variables

The `cfdirectory` tag, with `action=list`, returns a query object as follows, where *queryname* is the name attribute value:

```
queryname.Name  
queryname.Size  
queryname.Type  
queryname.DateLastModified  
queryname.Attributes  
queryname.Mode
```

## CFERROR variables

When `cferror` generates an error page, the following error variables are available if `type="request"` or `"exception"`.

```
Error.Diagnostics  
Error.MailTo  
Error.DateTime  
Error.Browser  
Error.GeneratedContent  
Error.RemoteAddress  
Error.HTTPReferer  
Error.Template  
Error.QueryString
```

The following error variables are available if `type="validation"`.

```
Error.ValidationHeader  
Error.InvalidFields  
Error.ValidationFooter
```

Any `cfcatch` variable that applies to exception type can be accessed within the Error scope, as follows:

```
Error.Type  
Error.Message  
Error.Detail  
Error.ErrNumber  
Error.NativeErrorCode  
Error.SQLState  
Error.LockName  
Error.LockOperation  
Error.MissingFileName  
Error.TagContext  
Error.ErrorCode  
Error.ExtendedInfo
```

**Note:** You can substitute the prefix `CFERROR` for `Error`, if `type = "Exception"`; for example, `CFERROR.Diagnostics`, `CFERROR.Mailto`, or `CFERROR.DateTime`.

## CFFILE ACTION=Upload variables

File variables are read-only. Use the `CFFILE` prefix to reference file variables, for example, `CFFILE.ClientDirectory`. The `File` prefix is deprecated in favor of the `CFFILE` prefix.

```
CFFILE.AttemptedServerFile  
CFFILE.ClientDirectory  
CFFILE.ClientFile  
CFFILE.ClientFileExt  
CFFILE.ClientFileName  
CFFILE.ContentSubType  
CFFILE.ContentType  
CFFILE.DateLastAccessed  
CFFILE.FileExisted  
CFFILE.FileSize  
CFFILE.FileWasAppended  
CFFILE.FileWasOverwritten  
CFFILE.FileWasRenamed  
CFFILE.FileWasSaved  
CFFILE.OldFileSize  
CFFILE.ServerDirectory  
CFFILE.ServerFile  
CFFILE.ServerFileExt  
CFFILE.ServerFileName  
CFFILE.TimeCreated  
CFFILE.TimeLastModified
```

## CFFTP error variables

When you use the `cfftp stoponerror` attribute, the following variables are populated:

```
CFFTP.Succeeded  
CFFTP.ErrorCode  
CFFTP.ErrorText
```

## CFFTP ReturnValue variable

Some `cfftp` file and directory operations provide a return value, in the variable `CFFTP.ReturnValue`. Its value is determined by the results of the `action` attribute. When you specify any of the following actions, `cfftp` returns a value:

```
GetCurrentDir  
GetCurrentURL  
ExistsDir  
ExistsFile  
Exists
```

## CFFTP query object columns

When you use the `cfftp` tag with the `listdir` action, `cfftp` returns a query object, where *queryname* is the name attribute value, and *row* is the row number of each file or directory entry:

```
queryname.Name[row]  
queryname.Path[row]  
queryname.URL[row]  
queryname.Length[row]  
queryname.LastModified[row]  
queryname.Attributes  
queryname.IsDirectory  
queryname.Mode
```

## CFHTTP variables

A `cfhttp get` operation can return text and binary files. Files are downloaded and the contents stored in a variable or file, depending on the MIME type, as follows:

```
CFHTTP.FileContent  
CFHTTP.MimeType  
CFHTTP.Header  
CFHTTP.ResponseHeader[http_hd_key]  
CFHTTP.StatusCode
```

## CFLDAP variables

The `cfldapaction=query` tag returns information about the LDAP query, as follows:

```
queryname.CurrentRow  
queryname.RecordCount  
queryname.ColumnList
```

## CFPOP variables

The `cfpop` tag returns the following result columns, depending on the `action` attribute value and the use of other attributes, such as `attachmentpath`, where *queryname* is the `name` attribute value:

```
queryname.Date  
queryname.From  
queryname.Body  
queryname.Header  
queryname.MessageNumber  
queryname.ReplyTo  
queryname.Subject  
queryname.CC  
queryname.To  
queryname.CurrentRow  
queryname.RecordCount  
queryname.ColumnList  
queryname.Attachments  
queryname.AttachmentFiles
```

## CFQUERY and CFSTOREDPROC variables

The `cfquery` tag returns information about the query in this variable:

```
CFQUERY.ExecutionTime
```

The `cfquery` tag uses the query name to scope the following data about the query:

```
queryname.CurrentRow  
queryname.RecordCount  
queryname.ColumnList
```

The `cfstoredproc` tag returns the following variables:

```
CFSTOREDPROC.ExecutionTime  
CFSTOREDPROC.StatusCode
```

## CFREGISTRY variables

The `cfregistry` tag returns a query record set that you can reference after executing the `GetAll` action, as follows, where *queryname* is the name attribute value:

```
queryname.Entry  
queryname.Type  
queryname.Value
```

## CFSEARCH variables

A `cfsearch` operation returns the following variables, where *searchname* is the name attribute value:

```
searchname.URL  
searchname.Key  
searchname.Title  
searchname.Score  
searchname.Custom1 and Custom2  
searchname.Summary  
searchname.RecordCount  
searchname.CurrentRow  
searchname.RecordsSearched  
searchname.ColumnList
```

## CGI environment (CGI Scope) variables

When a browser makes a request to a server, the web server and the browser create environment variables. In ColdFusion, these variables are referred to as *CGI environment variables*. CGI Environment variables contain data about the transaction between the browser and the server, such as the IP Address, browser type, and authenticated username. The available CGI variables depend on the browser and server software.

The CGI variables are available to ColdFusion pages in the CGI scope. They take the CGI prefix regardless of whether the server uses a server API or CGI to communicate with the ColdFusion server. You can reference CGI environment variables for a given page request anywhere in the page. CGI variables are read-only.

By default, when you use the `cfdump` tag to display the CGI scope, or when you request debug output of the CGI scope, ColdFusion attempts to display a fixed list of standard CGI environment variables. Because the available variables depend on the server, browser, and the types of interactions between the two, not all variables are normally available. They are represented by empty strings in the debug output. You can request any CGI variable in your application code, including variables that are not in the list variables displayed by dump and debug output.

ColdFusion checks for the following variables for the `cfdump` tag and debug output:

AUTH\_PASSWORD  
AUTH\_TYPE  
AUTH\_USER  
CERT\_COOKIE  
CERT\_FLAGS  
CERT\_ISSUER  
CERT\_KEYSIZE  
CERT\_SECRETKEYSIZE  
CERT\_SERIALNUMBER  
CERT\_SERVER\_ISSUER  
CERT\_SERVER\_SUBJECT  
CERT\_SUBJECT  
CF\_TEMPLATE\_PATH  
CONTENT\_LENGTH  
CONTENT\_TYPE  
CONTEXT\_PATH  
GATEWAY\_INTERFACE  
HTTPS  
HTTPS\_KEYSIZE  
HTTPS\_SECRETKEYSIZE  
HTTPS\_SERVER\_ISSUER  
HTTPS\_SERVER\_SUBJECT  
HTTP\_ACCEPT  
HTTP\_ACCEPT\_ENCODING  
HTTP\_ACCEPT\_LANGUAGE  
HTTP\_CONNECTION  
HTTP\_COOKIE  
HTTP\_HOST  
HTTP\_REFERER  
HTTP\_USER\_AGENT  
QUERY\_STRING  
REMOTE\_ADDR  
REMOTE\_HOST  
REMOTE\_USER  
REQUEST\_METHOD  
SCRIPT\_NAME  
SERVER\_NAME  
SERVER\_PORT  
SERVER\_PORT\_SECURE  
SERVER\_PROTOCOL  
SERVER\_SOFTWARE  
WEB\_SERVER\_API (This value is always blank; retained for compatibility.)

The following sections describe how to test for CGI environment variables and provide information on some of the more commonly used CGI environment variables

## Testing for CGI variables

Because some browsers do not support some CGI variables, ColdFusion always returns `true` when it tests for the existence of a CGI variable, regardless of whether the browser supports the variable. To determine if the CGI variable is available, test for an empty string, as the following example shows:

```
<cfif CGI.varname IS NOT "">
    CGI variable exists
<cfelse>
    CGI variable does not exist
</cfif>
```

## CGI server variables

The following table describes common CGI environment variables that the server creates (some variables are not available with some servers):

CGI server variable	Description
SERVER_SOFTWARE	Name and version of the information server software answering the request (and running the gateway). Format: name/version.
SERVER_NAME	Server's hostname, DNS alias, or IP address as it appears in self-referencing URLs.
GATEWAY_INTERFACE	CGI specification revision with which this server complies. Format: CGI/revision.
SERVER_PROTOCOL	Name and revision of the information protocol this request came in with. Format: protocol/revision.
SERVER_PORT	Port number to which the request was sent.
REQUEST_METHOD	Method with which the request was made. For HTTP, this is Get, Head, Post, and so on.
PATH_INFO	Extra path information, as given by the client. Scripts can be accessed by their virtual pathname, followed by extra information at the end of this path. The extra information is sent as PATH_INFO.
PATH_TRANSLATED	Translated version of PATH_INFO after any virtual-to-physical mapping.
SCRIPT_NAME	Virtual path to the script that is executing; used for self-referencing URLs.
QUERY_STRING	Query information that follows the ? in the URL that referenced this script.
REMOTE_HOST	Hostname making the request. If the server does not have this information, it sets REMOTE_ADDR and does not set REMOTE_HOST.
REMOTE_ADDR	IP address of the remote host making the request.
AUTH_TYPE	If the server supports user authentication, and the script is protected, the protocol-specific authentication method used to validate the user.
REMOTE_USER AUTH_USER	If the server supports user authentication, and the script is protected, the username the user has authenticated as. (Also available as AUTH_USER.)
REMOTE_IDENT	If the HTTP server supports RFC 931 identification, this variable is set to the remote username retrieved from the server. Use this variable for logging only.
CONTENT_TYPE	For queries that have attached information, such as HTTP POST and PUT, this is the content type of the data.
CONTENT_LENGTH	Length of the content as given by the client.

## CGI client variables

The following table describes common CGI environment variables the browser creates and passes in the request header:

CGI client variable	Description
HTTP_REFERER	The referring document that linked to or submitted form data.
HTTP_USER_AGENT	The browser that the client is currently using to send the request. Format: software/version library/version.
HTTP_IF_MODIFIED_SINCE	The last time the page was modified. The browser determines whether to set this variable, usually in response to the server having sent the <code>LAST_MODIFIED</code> HTTP header. It can be used to take advantage of browser-side caching.

## CGI client certificate variables

ColdFusion makes available the following client certificate data. These variables are available when running Microsoft IIS 4.0 or Netscape Enterprise under SSL if your web server is configured to accept client certificates.

CGI client certificate variable	Description
CERT_SUBJECT	Client-specific information provided by the web server. This data typically includes the client's name, e-mail address, and so on, for example:  O = "VeriSign, Inc.", OU = VeriSign Trust Network, OU = "www.verisign.com/repository/RPA Incorp. by Ref., LIAB.LTD(c)98", OU = Persona Not Validated, OU = Digital ID Class 1 - Microsoft, CN = Matthew Lund, E = mlund@.com
CERT_ISSUER	Information about the authority that provided the client certificate, for example:  O = "VeriSign, Inc.", OU = VeriSign Trust Network, OU = "www.verisign.com/repository/RPA Incorp. By Ref., LIAB.LTD(c)98", CN = VeriSign Class 1 CA Individual Subscriber-Persona Not Validated

# Chapter 3: ColdFusion Tags

ColdFusion Markup Language (CFML) includes a set of tags that you use in ColdFusion pages to interact with data sources, manipulate data, and display output. CFML tag syntax is similar to HTML element syntax.

The following categorized and alphabetical lists of the tags are followed by the detailed tag descriptions.

## New tags in ColdFusion 9

The following table briefly describes CFML tags added in ColdFusion 9:

CFML tag	Category	Description
<a href="#">cfcontinue</a>	<a href="#">Flow-control tags</a>	Returns processing to the top of a loop; used within a <a href="#">cfloop</a> tag.
<a href="#">cffileupload</a>	<a href="#">File management tags</a> , <a href="#">Forms tags</a>	Displays a dialog for uploading multiple files from the user's system.
<a href="#">cffinally</a>	<a href="#">Exception handling tags</a>	Used inside a <a href="#">cftry</a> tag
<a href="#">cfimap</a>	<a href="#">Communications tags</a> , <a href="#">Internet protocol tags</a>	Retrieves and manages e-mails and folders in IMAP servers
<a href="#">cfmap</a>	<a href="#">Other tags</a>	Embeds a Google map within a ColdFusion web page
<a href="#">cfmapitem</a>	<a href="#">Other tags</a>	Creates markers on the map; a child tag of the <a href="#">cfmap</a> tag
<a href="#">cfmediaplayer</a>	<a href="#">Other tags</a>	Creates an in-built media player that can play FLV files
<a href="#">cfmessagebox</a>	<a href="#">Application framework tags</a>	Defines a control for displaying pop-up messages
<a href="#">cfprogressbar</a>	<a href="#">Other tags</a>	Defines a progress bar to indicate the progress of an activity
<a href="#">cfsharepoint</a>	<a href="#">Extensibility tags</a>	Invokes a SharePoint action from ColdFusion
<a href="#">cfspreadsheet</a>	<a href="#">Extensibility tags</a>	Manages Excel spreadsheet files

## Tag summary

The following table briefly describes CFML tags:

CFML tag	Category	Description
<a href="#">cfabort</a>	<a href="#">Flow-control tags</a>	Stops the processing of a ColdFusion page at the tag location
<a href="#">cfajaximport</a>	<a href="#">Internet protocol tags</a>	Controls importation of JavaScript files used for ColdFusion AJAX-based features
<a href="#">cfajaxproxy</a>	<a href="#">Internet protocol tags</a>	Generates an AJAX proxy class on the client page for a ColdFusion component
<a href="#">cfapplet</a>	<a href="#">Forms tags</a>	Embeds Java applets in a <a href="#">cform</a> tag
<a href="#">cfapplication</a>	<a href="#">Application framework tags</a>	Defines an application name; activates client variables; specifies client variable storage mechanism

CFML tag	Category	Description
<a href="#">cfargument</a>	<a href="#">Extensibility tags</a>	Creates a parameter definition within a component definition; defines a function argument
<a href="#">cfassociate</a>	<a href="#">Application framework tags</a>	Enables subtag data to be saved with a base tag
<a href="#">cfbreak</a>	<a href="#">Flow-control tags</a>	Breaks out of a CFML looping construct
<a href="#">cfcache</a>	<a href="#">Page processing tags</a>	Caches ColdFusion pages
<a href="#">cfcalendar</a>	<a href="#">Forms tags</a>	Provides a calendar from which to select a date
<a href="#">cfcase</a>	<a href="#">Flow-control tags</a>	Used with the <a href="#">cfswitch</a> and <a href="#">cfdefaultcase</a> tags
<a href="#">cfcatch</a>	<a href="#">Exception handling tags</a> , <a href="#">Flow-control tags</a>	Catches exceptions in ColdFusion pages
<a href="#">cfchart</a>	<a href="#">Data output tags</a>	Generates and displays a chart
<a href="#">cfchartdata</a>	<a href="#">Data output tags</a>	Defines chart data points
<a href="#">cfchartseries</a>	<a href="#">Data output tags</a>	Defines style in which chart data displays
<a href="#">cfcol</a>	<a href="#">Data output tags</a>	Defines table column header, properties
<a href="#">cfcollection</a>	<a href="#">Extensibility tags</a>	Administers Verity collections
<a href="#">cfcomponent</a>	<a href="#">Extensibility tags</a>	Creates and defines a component object
<a href="#">cfcontent</a>	<a href="#">Data output tags</a> , <a href="#">Page processing tags</a>	Defines content type and filename of a file to be downloaded by the current page
<a href="#">cfcontinue</a>	<a href="#">Flow-control tags</a>	Returns processing to the top of a loop; used within a <a href="#">cfloop</a> tag.
<a href="#">cfcookie</a>	<a href="#">Variable manipulation tags</a>	Defines and sets cookie variables, including expiration and security options
<a href="#">cfdbinfo</a>	<a href="#">Database manipulation tags</a>	Lets you retrieve information about a data source
<a href="#">cfdefaultcase</a>	<a href="#">Flow-control tags</a>	Receives control if there is no matching <a href="#">cfcase</a> tag value
<a href="#">cfdirectory</a>	<a href="#">File management tags</a>	Performs typical directory-handling tasks from within a ColdFusion application
<a href="#">cfdiv</a>	<a href="#">Display management tags</a>	Creates an HTML tag with that is populated using a bind expressions.
<a href="#">cfdocument</a>	<a href="#">Data output tags</a>	Creates PDF or Adobe® FlashPaper® output from a text block that contains CFML and HTML
<a href="#">cfdocumentitem</a>	<a href="#">Data output tags</a>	Specifies action items, such as header, footer, and page break, for a PDF or FlashPaper document
<a href="#">cfdocumentsection</a>	<a href="#">Data output tags</a>	Divides a PDF or FlashPaper document into sections
<a href="#">cfdump</a>	<a href="#">Debugging tags</a> , <a href="#">Variable manipulation tags</a>	Outputs variables for debugging
<a href="#">cfelse</a>	<a href="#">Flow-control tags</a>	Creates IF-THEN-ELSE constructs
<a href="#">cfelseif</a>	<a href="#">Flow-control tags</a>	Creates IF-THEN-ELSE constructs
<a href="#">cferror</a>	<a href="#">Exception handling tags</a> , <a href="#">Application framework tags</a>	Displays custom HTML error pages when errors occur
<a href="#">cfexchangecalendar</a>	<a href="#">Communications tags</a>	Gets, creates, deletes, modifies, or responds to Microsoft Exchange calendar events

CFML tag	Category	Description
<a href="#">cfexchangeconnection</a>	<a href="#">Communications tags</a>	Opens or closes a persistent connection with an Exchange server
<a href="#">cfexchangecontact</a>	<a href="#">Communications tags</a>	Gets, creates, deletes, or modifies Exchange contacts
<a href="#">cfexchangefilter</a>	<a href="#">Communications tags</a>	Sets filter conditions used in Exchange tag get operations
<a href="#">cfexchangeemail</a>	<a href="#">Communications tags</a>	Gets and deletes Exchange mail messages and sets message properties
<a href="#">cfexchangetask</a>	<a href="#">Communications tags</a>	Gets, creates, deletes, or modifies an Exchange user task
<a href="#">cfexecute</a>	<a href="#">Flow-control tags</a> , <a href="#">Extensibility tags</a>	Executes developer-specified process on server computer
<a href="#">cfexit</a>	<a href="#">Flow-control tags</a>	Aborts processing of executing CFML tag
<a href="#">cffeed</a>	<a href="#">Communications tags</a> , <a href="#">Internet protocol tags</a>	Reads, creates, and converts, Atom and RSS syndication feeds
<a href="#">cffile</a>	<a href="#">File management tags</a>	Performs typical file-handling tasks from within ColdFusion application
<a href="#">cffileupload</a>	<a href="#">File management tags</a> <a href="#">Forms tags</a>	Displays a dialog for uploading multiple files from the user's system.
<a href="#">cffinally</a>	<a href="#">Exception handling tags</a>	Used inside a cftry tag
<a href="#">cfflush</a>	<a href="#">Data output tags</a> , <a href="#">Page processing tags</a>	Flushes currently available data to client
<a href="#">cfform</a>	<a href="#">Forms tags</a>	Builds input form; performs client-side input validation
<a href="#">cfformgroup</a>	<a href="#">Forms tags</a>	Groups form control into a containing object
<a href="#">cfformitem</a>	<a href="#">Forms tags</a>	Adds text and dividing rules to Adobe® Flash® forms
<a href="#">cfftp</a>	<a href="#">Forms tags</a> , <a href="#">Extensibility tags</a> , <a href="#">Internet protocol tags</a>	Permits FTP file operations
<a href="#">cffunction</a>	<a href="#">Extensibility tags</a>	Defines function that you build in CFML
<a href="#">cfgrid</a>	<a href="#">Forms tags</a>	Displays tabular grid control, in <a href="#">cfform</a> tag
<a href="#">cfgridcolumn</a>	<a href="#">Forms tags</a>	Used in <a href="#">cfform</a> ; defines columns in a <a href="#">cfgrid</a>
<a href="#">cfgridrow</a>	<a href="#">Forms tags</a>	Defines a grid row; used with <a href="#">cfgrid</a>
<a href="#">cfgridupdate</a>	<a href="#">Forms tags</a>	Directly updates ODBC data source from edited grid data
<a href="#">cfheader</a>	<a href="#">Data output tags</a> , <a href="#">Page processing tags</a>	Generates HTTP headers
<a href="#">cfhtmlhead</a>	<a href="#">Page processing tags</a>	Writes text and HTML to HEAD section of page
<a href="#">cfhttp</a>	<a href="#">Internet protocol tags</a>	Performs GET and POST to upload file or post form, cookie, query, or CGI variable directly to server
<a href="#">cfhttpparam</a>	<a href="#">Internet protocol tags</a>	Specifies parameters required for a <a href="#">cfhttp</a> POST operation; used with <a href="#">cfhttp</a>
<a href="#">cfif</a>	<a href="#">Flow-control tags</a>	Creates IF-THEN-ELSE constructs
<a href="#">cfimage</a>	<a href="#">Other tags</a>	Creates a cfimage, a ColdFusion data type that can be operated by image functions.

CFML tag	Category	Description
<a href="#">cfimap</a>	<a href="#">Communications tags</a> , <a href="#">Internet protocol tags</a>	Retrieves and manages e-mails and folders in IMAP servers
<a href="#">cfimport</a>	<a href="#">Application framework tags</a>	Imports JSP tag libraries into a CFML page
<a href="#">cfinclude</a>	<a href="#">Flow-control tags</a>	Embeds references to ColdFusion pages
<a href="#">cfindex</a>	<a href="#">Extensibility tags</a>	Creates Verity search indexes
<a href="#">cfinput</a>	<a href="#">Forms tags</a>	Creates an input element (radio button, check box, text entry box); used in <a href="#">cfform</a>
<a href="#">cfinsert</a>	<a href="#">Database manipulation tags</a>	Inserts records in a data source
<a href="#">cfinterface</a>	<a href="#">Application framework tags</a> , <a href="#">Extensibility tags</a>	Defines an interface that a ColdFusion component can implement
<a href="#">cfinvoke</a>	<a href="#">Extensibility tags</a>	Invokes component methods from a ColdFusion page or component
<a href="#">cfinvokeargument</a>	<a href="#">Extensibility tags</a>	Passes a parameter to a component method or a web service
<a href="#">cflayout</a>	<a href="#">Display management tags</a>	Creates a region of its container with a specific layout behavior
<a href="#">cflayoutarea</a>	<a href="#">Display management tags</a>	Defines a display region within a <a href="#">cflayout</a> tag body
<a href="#">cfldap</a>	<a href="#">Internet protocol tags</a>	Provides access to LDAP directory servers
<a href="#">cflocation</a>	<a href="#">Flow-control tags</a>	Controls execution of a page
<a href="#">cflock</a>	<a href="#">Application framework tags</a>	Ensures data integrity and synchronizes execution of CFML code
<a href="#">cflog</a>	<a href="#">Data output tags</a> , <a href="#">Other tags</a>	Writes a message to a log file
<a href="#">cflogin</a>	<a href="#">Security tags</a>	Defines a container for user login and authentication code
<a href="#">cfloginuser</a>	<a href="#">Security tags</a>	Identifies an authenticated user to ColdFusion
<a href="#">cflogout</a>	<a href="#">Security tags</a>	Logs the current user out
<a href="#">cfloop</a>	<a href="#">Flow-control tags</a>	Repeats a set of instructions based on conditions
<a href="#">cfmail</a>	<a href="#">Communications tags</a> , <a href="#">Internet protocol tags</a>	Assembles and posts an e-mail message
<a href="#">cfmailparam</a>	<a href="#">Communications tags</a> , <a href="#">Internet protocol tags</a>	Attaches a file or adds a header to an e-mail message
<a href="#">cfmailpart</a>	<a href="#">Communications tags</a> , <a href="#">Internet protocol tags</a>	Contains one part of a multipart mail message
<a href="#">cfmap</a>	<a href="#">Other tags</a>	Embeds a Google map within a ColdFusion web page
<a href="#">cfmapitem</a>	<a href="#">Other tags</a>	Creates markers on the map; a child tag of the <a href="#">cfmap</a> tag
<a href="#">cfmediaplayer</a>	<a href="#">Other tags</a>	Creates an in-built media player that can play FLV files
<a href="#">cfmenu</a>	<a href="#">Display management tags</a>	Creates a top-level menu or a tool bar.
<a href="#">cfmenuitem</a>	<a href="#">Display management tags</a>	Defines an entry in a menu, including an item that is the head of a submenu.
<a href="#">cfmessagebox</a>	<a href="#">Application framework tags</a>	Defines a control for displaying pop-up messages
<a href="#">cfNTauthenticate</a>	<a href="#">Security tags</a>	Authenticates user information against an NT domain
<a href="#">cfobject</a>	<a href="#">Extensibility tags</a>	Creates COM, component, CORBA, Java, and web service objects

CFML tag	Category	Description
<a href="#">cfobjectcache</a>	<a href="#">Database manipulation tags</a>	Flushes the query cache
<a href="#">cfoutput</a>	<a href="#">Data output tags</a>	Displays the output of a database query or other operation
<a href="#">cfparam</a>	<a href="#">Variable manipulation tags</a>	Defines a parameter and its default value
<a href="#">cfpdf</a>	<a href="#">Forms tags</a>	Manipulates existing PDF documents.
<a href="#">cfpdfform</a>	<a href="#">Forms tags</a>	Creates and manipulates PDF forms.
<a href="#">cfpdfformparam</a>	<a href="#">Forms tags</a>	Creates interactive fields on a PDF form.
<a href="#">cfpdfparam</a>	<a href="#">Forms tags</a>	Child tag of the <a href="#">cfpdf</a> tag. Used only with the merge action to merge multiple pages or PDF documents into one file
<a href="#">cfpdfsubform</a>	<a href="#">Forms tags</a>	Creates subforms within a PDF form.
<a href="#">cfpod</a>	<a href="#">Display management tags</a>	Creates a an area of the browser or layout area with an optional title bar and a body
<a href="#">cfpop</a>	<a href="#">Communications tags,</a> <a href="#">Internet protocol tags</a>	Gets and deletes messages from POP mail server
<a href="#">cfpresentation</a>	<a href="#">Data output tags</a>	Creates a presentation dynamically from an HTML page or SWF files
<a href="#">cfpresentationslide</a>	<a href="#">Data output tags</a>	Creates a slide dynamically from an HTML page or SWF source files (child tag of the <a href="#">cfpresentation</a> tag)
<a href="#">cfpresenter</a>	<a href="#">Data output tags</a>	Describes a presenter in a slide presentation
<a href="#">cfprint</a>	<a href="#">Data output tags</a>	Prints PDF documents. Used for automated print jobs
<a href="#">cfprocessingdirective</a>	<a href="#">Data output tags</a>	Suppresses white space and other output
<a href="#">cfprocparam</a>	<a href="#">Database manipulation tags</a>	Holds parameter information for stored procedure
<a href="#">cfprocresult</a>	<a href="#">Database manipulation tags</a>	Result set name that ColdFusion tags use to access result set of a stored procedure
<a href="#">cfprogressbar</a>	<a href="#">Other tags</a>	Defines a progress bar to indicate the progress of an activity
<a href="#">cfproperty</a>	<a href="#">Extensibility tags</a>	Defines components
<a href="#">cfquery</a>	<a href="#">Database manipulation tags</a>	Passes SQL statements to a database
<a href="#">cfqueryparam</a>	<a href="#">Database manipulation tags</a>	Checks data type of a query parameter
<a href="#">cfregistry</a>	<a href="#">Other tags,</a> <a href="#">Variable manipulation tags</a>	Reads, writes, and deletes keys and values in a Windows system registry
<a href="#">cfreport</a>	<a href="#">Exception handling tags</a>	Embeds a ColdFusion Report Builder or Crystal Reports report
<a href="#">cfreportparam</a>	<a href="#">Exception handling tags</a>	Passes an input parameter to a ColdFusion Report Builder report
<a href="#">cfrethrow</a>	<a href="#">Exception handling tags</a>	Rethrows currently active exception
<a href="#">cfreturn</a>	<a href="#">Extensibility tags</a>	Returns results from a component method
<a href="#">cfsavecontent</a>	<a href="#">Variable manipulation tags</a>	Saves generated content inside tag body in a variable
<a href="#">cfschedule</a>	<a href="#">Variable manipulation tags</a>	Schedules page execution; optionally, produces static pages
<a href="#">cfscript</a>	<a href="#">Application framework tags</a>	Encloses a set of <a href="#">cfscript</a> statements
<a href="#">cfsearch</a>	<a href="#">Extensibility tags</a>	Executes searches against data indexed in Verity collections, using <a href="#">cfindex</a>
<a href="#">cfselect</a>	<a href="#">Forms tags</a>	Creates a drop-down list box form element; used in <a href="#">cfform</a> tag

CFML tag	Category	Description
<a href="#">cfset</a>	<a href="#">Variable manipulation tags</a>	Defines a variable
<a href="#">cfsetting</a>	<a href="#">Other tags</a> , <a href="#">Variable manipulation tags</a>	Defines and controls ColdFusion settings
<a href="#">cfsharepoint</a>	<a href="#">Extensibility tags</a>	Invokes a SharePoint action from ColdFusion
<a href="#">cfsilent</a>	<a href="#">Data output tags</a> , <a href="#">Page processing tags</a>	Suppresses CFML output within tag scope
<a href="#">cfslider</a>	<a href="#">Forms tags</a>	Creates slider control; used in <a href="#">cfform</a>
<a href="#">cfspreadsheet</a>	<a href="#">Extensibility tags</a>	Manages Excel spreadsheet files
<a href="#">cfsprydataset</a>	<a href="#">Internet protocol tags</a>	Creates a spry data set
<a href="#">cfstoredproc</a>	<a href="#">Database manipulation tags</a>	Holds database connection information; identifies a stored procedure to execute
<a href="#">cfswitch</a>	<a href="#">Flow-control tags</a>	Evaluates passed expression; passes control to matching <a href="#">cfcase</a> tag
<a href="#">cftable</a>	<a href="#">Data output tags</a>	Builds a table in a ColdFusion page
<a href="#">cftextarea</a>	<a href="#">Forms tags</a>	Puts a multiline text box in a form
<a href="#">cfthread</a>	<a href="#">Application framework tags</a>	Creates and manages ColdFusion threads, independent streams of execution.
<a href="#">cfthrow</a>	<a href="#">Exception handling tags</a> , <a href="#">Flow-control tags</a>	Throws a developer-specified exception
<a href="#">cftimer</a>	<a href="#">Debugging tags</a>	Displays execution time for a block of code
<a href="#">cftooltip</a>	<a href="#">Display management tags</a>	Specifies text to display when the mouse pointer hovers over the tag body elements
<a href="#">cftrace</a>	<a href="#">Debugging tags</a>	Displays and logs application debugging data
<a href="#">cftransaction</a>	<a href="#">Database manipulation tags</a>	Groups <a href="#">cfquery</a> operations into one transaction; performs rollback processing
<a href="#">cftree</a>	<a href="#">Forms tags</a>	Creates tree control element; used in <a href="#">cfform</a>
<a href="#">cftreeitem</a>	<a href="#">Forms tags</a>	Populates a tree control element in a form; used with <a href="#">cftree</a>
<a href="#">cftry</a>	<a href="#">Exception handling tags</a> , <a href="#">Flow-control tags</a>	Catches exceptions in ColdFusion pages
<a href="#">cfupdate</a>	<a href="#">Database manipulation tags</a>	Updates rows in a database data source
<a href="#">cfwddx</a>	<a href="#">Extensibility tags</a>	Serializes and deserializes CFML data structures to XML-based WDDX format
<a href="#">cfwindow</a>	<a href="#">Display management tags</a>	Creates a pop-up window in the browser
<a href="#">cfxml</a>	<a href="#">Extensibility tags</a>	Creates an XML document object
<a href="#">cfzip</a>	<a href="#">File management tags</a>	Manipulates ZIP and JAR files
<a href="#">cfzipparam</a>	<a href="#">File management tags</a>	Manipulates ZIP and JAR files

## Tags by function

The following tables list tags by their function or purpose.

### Application framework tags

<code>cfapplication</code>	<code>cfimport</code>	<code>cfscript</code>
<code>cfassociate</code>	<code>cfinterface</code>	<code>cfthread</code>
<code>cferror</code>	<code>cflock</code>	

### Communications tags

<code>cfexchangecalendar</code>	<code>cfexchangefilter</code>	<code>cffeed</code>	<code>cfmailpart</code>
<code>cfexchangeconnection</code>	<code>cfexchangeemail</code>	<code>cfmail</code>	<code>cfpop</code>
<code>cfexchangecontact</code>	<code>cfexchangetask</code>	<code>cfmailparam</code>	<code>cfimap</code>

### Database manipulation tags

<code>cfdbinfo</code>	<code>cfprocparam</code>	<code>cfqueryparam</code>	<code>cfupdate</code>
<code>cfinsert</code>	<code>cfprocresult</code>	<code>cfstoredproc</code>	
<code>cfobjectcache</code>	<code>cfquery</code>	<code>cftransaction</code>	

### Data output tags

<code>cfchart</code>	<code>cfdocumentitem</code>	<code>cfpresentation</code>	<code>cfreportparam</code>
<code>cfchartdata</code>	<code>cfdocumentsection</code>	<code>cfpresentationslide</code>	<code>cfsilent</code>
<code>cfchartseries</code>	<code>cfflush</code>	<code>cfpresenter</code>	<code>cftable</code>
<code>cfcol</code>	<code>cfheader</code>	<code>cfprocessingdirective</code>	
<code>cfcontent</code>	<code>cflog</code>	<code>cfprint</code>	
<code>cfdocument</code>	<code>cfoutput</code>	<code>cfreport</code>	

### Debugging tags

<code>cfdump</code>	<code>cftimer</code>	<code>cftrace</code>
---------------------	----------------------	----------------------

### Display management tags

<code>cfdiv</code>	<code>cfmapitem</code>	<code>cfmenuitem</code>	<code>cfprogressbar</code>
<code>cflayout</code>	<code>cfmediaplayer</code>	<code>cfmessagebox</code>	<code>cftooltip</code>

## Tag changes since ColdFusion 5

The following tables list tags, attributes, and values that have changed since ColdFusion 5, and indicate the specific release in which the change was made.

### New tags, attributes, and values

This table lists tags, attributes, and attribute values that have been added since the ColdFusion MX release:

Tag	Attribute or value	Added in this ColdFusion release
Multiple tags	attributeCollection	ColdFusion 8
<a href="#">cfajaximport</a>	All	ColdFusion 8
<a href="#">cfajaxproxy</a>	All	ColdFusion 8
<a href="#">cfapplication</a>	scriptProtect	ColdFusion MX 7
	loginStorage	ColdFusion MX 6.1
<a href="#">cfargument</a>	component value of type attribute	ColdFusion 8
	xml value of type attribute	ColdFusion MX 7
	All	ColdFusion MX
<a href="#">cfcache</a>	cachedirectory, timespan attributes	ColdFusion MX
<a href="#">cfcalendar</a>	onBlur and onFocus attributes	ColdFusion MX 7.01
	All	ColdFusion MX 7

Tag	Attribute or value	Added in this ColdFusion release
cfchart	style,title attributes	ColdFusion MX 7
	xAxisType,yAxisType attributes	ColdFusion MX 6.1
	All	ColdFusion MX
cfchartdata	All	ColdFusion MX
cfchartseries	datalabelstyle attribute	ColdFusion MX 7
	horizontalbar value of type attribute	
	All	ColdFusion MX
cfcollection	categories attribute	ColdFusion MX 7
	New values of the language attribute	
	list and categoryList values of action attribute	
	name attribute	ColdFusion MX
cfcomponent	implements,serviceaddress attributes	ColdFusion 8
	component value of extends attribute	
	style,namespace,serviceportname, porttypename,wsdlfile,bindingname, and output attributes	ColdFusion MX 7
	Extended functionality for the hint and displayname attributes when publishing document-literal style web services	
	All	ColdFusion MX
cfcontent	variable attribute	ColdFusion MX 7
cfcontinue	All	ColdFusion 9
cfdbinfo	All	ColdFusion 8
cfdirectory	listinfo and type attributes	ColdFusion 8
	recurse attribute for list and delete actions	ColdFusion MX 7
cfdiv	All	ColdFusion 8
cfdocument	bookmark,authPassword,authUser,localUrl, proxyHost,proxyPassword,proxyPort, proxyUser,saveAsName and userAgent attributes	ColdFusion 8
	totalsectionpagecount and currentsectionpagenumber scope variables	
	src,srcfile, and mimetype attributes	ColdFusion MX 7.01
	All	ColdFusion MX 7
cfdocumentitem	All	ColdFusion MX 7
cfdocumentsection	name,authPassword,authUser, and userAgent attributes	ColdFusion 8
	All	ColdFusion MX 7

Tag	Attribute or value	Added in this ColdFusion release
<code>cfdump</code>	show, format, hide, keys, metainfo, output, and showUDFs attributes	ColdFusion 8
<code>cfexchangecalendar</code>	All	ColdFusion 8
<code>cfexchangeconnection</code>	All	ColdFusion 8
<code>cfexchangecontact</code>	All	ColdFusion 8
<code>cfexchangefilter</code>	All	ColdFusion 8
<code>cfexchangeemail</code>	All	ColdFusion 8
<code>cfexchangetask</code>	All	ColdFusion 8
<code>cfexecute</code>	variable attribute	ColdFusion MX 6.1
<code>cffeed</code>	All	ColdFusion 8
<code>cffile</code>	result attribute for action="upload" action	ColdFusion MX 7
	fixnewline attribute for action="append" and action="write" actions	
<code>cffileupload</code>	All	ColdFusion 9
<code>cffinally</code>	All	ColdFusion 9
<code>cfform</code>	onSuccess attribute support in AJAX controls for the onError attribute	ColdFusion 8
	name and action attributes are optional	ColdFusion MX 7
	accessible, format, height, width, method, onError, onReset, preloader, scriptsrc, skin, style, timeout, wMode attributes	
<code>cfformgroup</code>	All	ColdFusion MX 7
<code>cfformitem</code>	script value of type attribute	ColdFusion MX 7.01
	All	ColdFusion MX 7
<code>cfftp</code>	fingerprint, key, paraphrase, and secure attributes	ColdFusion 8
	quote, site, allo, and acct values to the action attribute	
	result attribute	ColdFusion MX 7
<code>cffunction</code>	description attribute; the XML value to the returntype attribute	ColdFusion MX 7
	All	ColdFusion MX

Tag	Attribute or value	Added in this ColdFusion release
cfgrid	bind, bindOnLoad, pageSize, preservePageOnSort, stripeRows, stripeRowColor attributes, and HTML value of format attribute.	ColdFusion 8
	onBlur and onFocus attributes	ColdFusion MX 7.01
	format attribute and support for Flash and XML output enabled, onChange, style, tooltip, visible attributes (Flash format only)	ColdFusion MX 7
cfgridcolumn	mask attribute	ColdFusion MX 7
	currency value of type attribute	ColdFusion MX 7
cfhttp	clientCert and clientCertPassword attributes	ColdFusion 8
	never value of GetAsBinary attribute	ColdFusion MX 7.01
	result attribute	ColdFusion MX 7
	HEAD, PUT, DELETE, OPTIONS, and TRACE values of method attribute	ColdFusion MX 6.1
	multipart, getasbinary, proxyUser, proxyPassword attributes	
	charset, firstrowasheaders attributes	ColdFusion MX
cfhttpparam	header and body values of type attribute	ColdFusion MX 6.1
	encoded, mimeType attributes	
cfimage	All	ColdFusion 8
cfimport	All	ColdFusion MX
cfimap	All	ColdFusion 9
cfindex	prefix attribute	ColdFusion MX 7.01
	custom3, custom4, category, and categorytree attributes for update and refresh actions	ColdFusion MX 7
	status attribute for update, refresh, delete, and purge actions	
	New values of the language attribute	

Tag	Attribute or value	Added in this ColdFusion release
cfinput	autosuggest, autosuggestBindDelay, autosuggestMinLength, delimiter, maxResultsDisplayed, showAutosuggestLoadingIcon, sourceForTooltip, and typeahead attributes.	ColdFusion 8
	support for the bind attribute in HTML forms and the bindAttribute, bindOnload, and onBindError attributes.	
	datefield value of the type attribute in HTML forms	
	height and width attributes (all except checkbox and radiobutton)	ColdFusion MX 7
	bind attribute (text and password)	
	label attribute (all but button, image, reset, and submit)	
	mask attribute (text only)	
	validateAt attribute (all but button, image, reset, and submit)	
	datefield, button, file, hidden, image, reset, and submit values of type attribute	
	daynames and monthnames attributes (type="datefield" only)	
	boolean, email, guid, maxlength, noblanks, range, submitOnce, URL, USdate, and uuid values of the validate attribute	
	tooltip, visible, and enabled attributes (Flash forms only)	
	src attribute (image only)	
cfinterface	All	ColdFusion 8
cfinvoke	refreshWSDL, wsdl2java arguments	ColdFusion 8
	servicePort attribute for web services	ColdFusion MX 7
	All	ColdFusion MX
cfinvokeargument	omit attribute	ColdFusion MX 7
	All	ColdFusion MX
cflayout	All	ColdFusion 8
cflayoutarea	All	ColdFusion 8
cfldap	returnAsBinary attribute	ColdFusion MX 7
cflocation	statusCode attribute	ColdFusion 8
cflock	Request value of scope attribute	ColdFusion 8
cflogin	All	ColdFusion MX
cfloginuser	All	ColdFusion MX
cflogout	All	ColdFusion MX

Tag	Attribute or value	Added in this ColdFusion release
<code>cfloop</code>	characters, file, and array attributes	ColdFusion 8
<code>cfmail</code>	prioirity, useSSL, and useTLS	ColdFusion 8
	The <code>cfmail</code> tag no longer lets you send multipart mail by embedding the entire MIME-encoded message in the tag body. Use the <code>cfmailpart</code> tag, instead.	ColdFusion MX 7
	charset, failto, replyTo, userName, password, wrapText attributes	ColdFusion MX 6.1
	spoolEnable attribute	ColdFusion MX
<code>cfmailparam</code>	contentID, dispositionattributes	ColdFusion MX 7
	type attribute	ColdFusion MX 6.1
<code>cfmailpart</code>	All	ColdFusion MX 6.1
<code>cfmap</code>	All	ColdFusion 9
<code>cfmapitem</code>	All	ColdFusion 9
<code>cfmediaplayer</code>	All	ColdFusion 9
<code>cfmenu</code>	All	ColdFusion 8
<code>cfmenuitem</code>	All	ColdFusion 8
<code>cfmessagebox</code>	All	ColdFusion 9
<code>cfNTauthenticate</code>	All	ColdFusion MX 7
<code>cfobject</code>	.net value of type attribute and related assembly, port, protocol, and secure attributes	ColdFusion 8
	password, proxyPassword, proxyPort, proxyServer, proxyUser, refreshWSDL, userName, wsdl2JavaArgs, and wsportname attributes for web services	
	component and webservice attributes	ColdFusion MX
<code>cfobjectcache</code>	All	ColdFusion MX
<code>cfparam</code>	min, max, pattern attributes	ColdFusion MX 7
	creditcard, email, eurodate, float, integer, range, regex, regular_expression, ssn, social_security_number, time, URL, USdate, XML, zipcode values of the type attribute	

Tag	Attribute or value	Added in this ColdFusion release
<a href="#">cfpdf</a>	<p><code>action = "thumbnail"</code> has the following new attributes:</p> <ul style="list-style-type: none"> <li>• <code>hires</code></li> <li>• <code>compressstiffs</code></li> <li>• <code>maxlength</code></li> <li>• <code>maxbreadth</code></li> <li>• <code>maxscale</code></li> </ul> <p><code>action = "optimize"</code> (new action with all new attributes)</p> <p><code>action = "addheader"</code> (new action)</p> <p><code>action = "addfooter"</code> (new action)</p> <p><code>action = "removeheaderfooter"</code> (new action)</p> <p><code>action = "extracttext"</code></p> <p><code>action = "extractimage"</code></p> <p><code>action = "write" package = "true"</code></p> <p><code>action = "merge" encodeall="true"</code></p> <p><code>action = "write" name= #PDF variable#</code></p> <p><code>action = "transform"</code> (new action)</p>	ColdFusion 9

## Deprecated tags, attributes, and values

The following tags, attributes, and attribute values are deprecated. Do not use them in ColdFusion applications. They might not work, and might cause an error, in releases later than ColdFusion MX.

Tag	Attribute or value	Deprecated as of this ColdFusion release
<code>cfcache</code>	cachedirectory, timeout attributes	ColdFusion MX
<code>cfcollection</code>	map and repair options of the action attribute	ColdFusion MX 7
<code>cferror</code>	monitor option of the exception attribute	ColdFusion MX
<code>cffile</code>	system value for attributes attribute	ColdFusion MX
	temporary value for attributes attribute	ColdFusion MX
<code>cfform</code>	passthrough attribute	ColdFusion MX 7
	enableCAB attribute	ColdFusion MX
<code>cfftp</code>	agentname attribute	ColdFusion MX
<code>cfgraph</code>	All	ColdFusion MX
<code>cfgraphdata</code>	All	ColdFusion MX
<code>cfgridupdate</code>	connectString, dbName, dbServer, dbType, provider, providerDSN attributes	ColdFusion MX
<code>cfinput</code>	passthrough attribute	ColdFusion MX 7
<code>cfinsert</code>	connectString, dbName, dbServer, dbType, provider, providerDSN attributes	ColdFusion MX
<code>cfldap</code>	filterFile attribute	ColdFusion MX
<code>cflog</code>	date, thread, time attributes	ColdFusion MX

Tag	Attribute or value	Deprecated as of this ColdFusion release
cfquery	connectString, dbName, dbServer, provider, providerDSN, sql attributes	ColdFusion MX
	The following dbType attribute values: dynamic, ODBC, Oracle73, Oracle80, Sybase11, OLEDB, DB2	ColdFusion MX (The value query is valid.)
cfregistry	All, on UNIX only	ColdFusion MX
cfsearch	external, language attributes	ColdFusion MX
cfselect	passthrough attribute	ColdFusion MX 7
cfServlet	All	ColdFusion MX
cfServletParam	All	ColdFusion MX
cfslider	img, imgStyle, grooveColor, refreshLabel, tickmarkimages, tickmarklabels, tickmarkmajor, tickmarkminor attributes	ColdFusion MX
cfstoredproc	connectString, dbName, dbServer, dbtype, provider, providerDSN attributes	ColdFusion MX
cfTextInput	All	ColdFusion MX 7
cfupdate	connectString, dbName, dbServer, dbtype, provider, providerDSN attributes	ColdFusion MX

## Obsolete tags, attributes, and values

The following tags, attributes, and attribute values are obsolete. Do not use them in ColdFusion applications. They do not work, and might cause an error, in releases later than ColdFusion 5.

Tag	Attribute or value	Obsolete as of this ColdFusion release
cfauthenticate	All	ColdFusion MX
cfchart	rotated attribute	ColdFusion MX 7
cfFile	attributes attribute value archive	ColdFusion MX
cfimpersonate	All	ColdFusion MX
cfindex	action attribute value optimize	ColdFusion MX
	external attribute	
cfinternaladminsecurity	All	ColdFusion MX This tag did not appear in CFML Reference.
cfldap	filterConfig and filterFile attributes	ColdFusion MX
cfnewinternaladminsecurity	All	ColdFusion MX This tag did not appear in CFML Reference.
cfsetting	catchExceptionsByPattern attribute	ColdFusion MX

## Tags a-b

### cfabort

#### Description

Stops the processing of a ColdFusion page at the tag location. ColdFusion returns everything that was processed before the tag. The tag is often used with conditional logic to stop processing a page when a condition occurs.

#### Category

[Flow-control tags](#)

#### Syntax

```
<cfabort  
    showError = "error message">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` whose value is a structure. Specify the structure name in the `attributeCollection` and use the tag's attribute names as structure keys.

#### See also

[cfbreak](#), [cfexecute](#), [cfexit](#), [cfif](#), [cflocation](#), [cfloop](#), [cfswitch](#), [cfthrow](#), [cftry](#); [cfabort](#) and [cfexit](#) in the *Developing ColdFusion Applications*

#### Attributes

Attribute	Req/Opt	Default	Description
showError	Optional		Error to display, in a standard ColdFusion error page, when tag executes.

#### Usage

When you use the `cfabort` and `cferror` tags together, the `cfabort` tag halts processing immediately; the `cferror` tag redirects output to a specified page.

If this tag does not contain a `showError` attribute value, processing stops when the tag is reached and ColdFusion returns the page contents up to the line that contains the `cfabort` tag.

When you use this tag with the `showError` attribute, but do not define an error page using `cferror`, page processing stops when the `cfabort` tag is reached. The message in `showError` displays to the client.

When you use this tag with the `showError` attribute and an error page using `cferror`, ColdFusion redirects output to the error page specified in the `cferror` tag.

#### Example

This example shows the use of `cfabort` to stop processing. In the second example, where `cfabort` is used, the result never displays.

```
<h3>Example A: Let the instruction complete itself</h3>
<!-- first, set a variable -->
<cfset myVariable = 3>
<!-- now, perform a loop that increments this value -->
<cfloop from = "1" to = "4" index = "Counter">
    <cfset myVariable = myVariable + 1>
</cfloop>

<cfoutput>
<p>The value of myVariable after incrementing through the loop #Counter# times is:
    #myVariable#</p>
</cfoutput>

<h3>Example B: Use cfabort to halt the instructions with showmessage attribute and
    cferror</h3>
<!-- Reset the variable and show the use of cfabort. -->
<cfset myVariable = 3>
<!-- Now, perform a loop that increments this value. -->
<cfloop from = "1" to = "4" index = "Counter">
<!-- On the second time through the loop, cfabort. -->
    <cfif Counter is 2>
        <!-- Take out the cferror line to see cfabort error processed by CF error page. -->
        <cferror type="request" template="request_err.cfm">
            <cfabort showerror="CFABORT has been called for no good reason">
    <!-- Processing is stopped, -->
    <!-- and subsequent operations are not carried out. -->
    <cfelse>
        <cfset myVariable = myVariable + 1>
    </cfif>
</cfloop>

<cfoutput>
<p> The value of myVariable after incrementing through the loop#counter# times is:
#myVariable#</p>
</cfoutput>
```

## cfajaximport

### Description

Controls the JavaScript files that are imported for use on pages that use ColdFusion AJAX tags and features.

### Category

[Internet protocol tags](#)

### Syntax

```
<cfajaximport
    cssSrc = "local URL path"
    params = "parameters"
    scriptSrc = "local URL path"
    tags = "comma-delimited list">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` whose value is a structure. Specify the structure name in the `attributeCollection` and use the tag's attribute names as structure keys.

**History**

ColdFusion 8: Added this tag.

**Attributes**

Attribute	Req/Opt	Default	Description
cssSrc	Optional	scriptsrc/ajax	<p>Specifies the URL, relative to the web root, of the directory that contains the CSS files used by ColdFusion AJAX features, with the exception of the rich text editor. This directory must have the same directory structure, and contain the same CSS files, and image files required by the CSS files, as the <i>web_root/CFIDE/scripts/ajax/resources</i> directory.</p> <p>This attribute lets you create different custom styles for ColdFusion AJAX controls in different applications.</p>
params	Optional		<p>This attribute allows you to specify parameters for the CFM page.</p> <p>Currently, the only parameter that you can specify is <code>googlemapkey</code>. You can specify the <code>googlemapkey</code> as follows:</p> <pre>&lt;cfajaximport params=#{googlemapkey="Map API Key"}#&gt;</pre>
scriptSrc	Optional	scriptsrc setting in the Administrator; default path is /CFIDE/scripts/	<p>Specifies the URL, relative to the web root, of the directory that contains the client-side script files used by ColdFusion. This directory includes the JavaScript files and the default location of the CSS files used for all AJAX features.</p> <p>If you use this attribute, the <code>cfajaximport</code> tag must precede all other ColdFusion AJAX tags on the page; that is, all tags that rely on the scripts.</p> <p>You can have only one <code>scriptsrc</code> attribute on a page, in a <code>cfajaximport</code> tag or a <code>cform</code> tag. You can use a <code>scriptsrc</code> attribute in a <code>cfajaximport</code> tag to apply its value to all forms on a page.</p>
tags	Optional		<p>A comma-delimited list of tags or tag-attribute combinations for which to import the supporting JavaScript files on this page.</p> <p>If you use this attribute, it must specify all ColdFusion AJAX tags that you use on the page and on any pages specified in tag <code>source</code> attributes.</p> <p>For a list of valid attribute values and their purposes, see Usage.</p>

**Usage****Using the scriptsrc and cssSrc attributes**

The `scriptsrc` attribute is useful if the JavaScript files are not in the default location. This attribute is required in some hosting environments and configurations that block access to the `/CFIDE` directory.

The default `scriptsrc` value is determined by the Default CFFORM ScriptSrc Directory setting on the Server Settings > Settings page of the ColdFusion Administrator. For `cform` tags, the tag's `scriptsrc` attribute takes precedence over this attribute.

You can use this attribute only if the `cfajaximport` tag is on a top-level page; that is, a page that the client directly requests. You cannot use it, for example, on a page that is specified in a `cfwindow` tag `source` attribute.

When you use the `cfajaximport` tag with a `scriptsrc` attribute, the specified directory must have the same structure as the `/CFIDE/scripts` directory. For example, if you specify `scriptsrc="/resources/myScripts"`, the JavaScript files used by AJAX must be in the `/resources/myScripts/ajax` directory.

This attribute specifies the folder that contains the ColdFusion client-side files for all subsequent tags on the current page, not just for AJAX-based tags. Therefore, the directory tree must include all ColdFusion client-side files used by those tags. For example, if a `cfform` tag on the page is in Flash or applet format, include the `CF_RunActiveContent.js` file in the directory specified by the `scriptsrc` attribute.

You use the `csssrc` attribute to specify the location of the CSS files required by ColdFusion AJAX features. This attribute overrides the `scriptsrc/ajax/resources` directory for the current page. Therefore, if all pages that use a custom `scriptsrc` directory also use a custom `csssrc` directory, you do not have to include the ColdFusion AJAX CSS files in the `scriptsrc` directory tree.

### Using the tags attribute or no attribute

If you do not use the `cfajaximport` tag on a page that contains ColdFusion tags with AJAX UI features, ColdFusion correctly imports the required JavaScript files in most cases. Use this tag to explicitly import JavaScript files in these cases:

- If you use a ColdFusion AJAX JavaScript function, such as `ColdFusion.navigate`, `ColdFusion.Ajax.submitForm`, or `ColdFusion.Log.info` on a page that does not otherwise import any AJAX JavaScript functions, use the `cfajaximport` tag with no attribute to import the base JavaScript functions only. For example, use this tag on a page that does not include any ColdFusion AJAX-based tags,
- If the following conditions are true:
  - You use any `source` attributes in `cflayoutarea`, `cfpod` or `cfwindow` tags, or `bind` attribute in `cfdiv` tag.
  - The file that the `source` or `bind` attribute specifies has any of the tags listed in the following table.
  - You do *not* use each of the listed tags on the top-level page.

If these conditions are true, the top-level page must use the `cfajaximport` tag with a `tags` attribute that specifies the tags that only the other pages use. Otherwise, ColdFusion cannot identify that it will be using the tags and does not import the necessary JavaScript files.

You can specify any or all the following tag attribute values:

Attribute value	Used for
<code>cfdiv</code>	<code>cfdiv</code> tags
<code>cfform</code>	Forms that are in <code>cfpod</code> , <code>cfwindow</code> , or <code>cflayoutarea</code> tag bodies
<code>cfgrid</code>	AJAX format <code>cfgrid</code> tags
<code>cfinput-autosuggest</code>	<code>cfinput</code> tags that use the <code>autosuggest</code> attribute
<code>cfinput-datefield</code>	HTML format <code>cfinput</code> tags that use the <code>datefield</code> attribute
<code>cflayout-border</code>	<code>cflayout</code> tags with a <code>type</code> attribute value of <code>border</code>
<code>cflayout-tab</code>	<code>cflayout</code> tags with a <code>type</code> attribute value of <code>tab</code>
<code>cfmenu</code>	<code>cfmenu</code> tags
<code>cfpod</code>	<code>cfpod</code> tags
<code>cfsprydataset-JSON</code>	<code>cfsprydataset</code> tags that generate Spry JSON data sets
<code>cfsprydataset-XML</code>	<code>cfsprydataset</code> tags that generate Spry XML data sets
<code>cftextarea</code>	HTML format <code>cftextarea</code> tags

Attribute value	Used for
cftooltip	cftooltip tags
cftree	HTML format cftree tags
cfwindow	cfwindow tags

### Example

The following `cfajaximport` tag example specifies separate custom locations for the scripts used for AJAX features and for the AJAX CSS files. It also imports all JavaScript files used for `cftree`, and `cftooltip`.

```
<cfajaximport cssSrc="/collegeApp/application/cssFiles"
  scriptsrc="/collegeApp/ajaxScripts"
  tags="cftooltip, cfwindow">
```

## cfajaxproxy

### Description

Creates a JavaScript proxy for a ColdFusion component, for use in an AJAX client. Alternatively, creates a proxy for a single CFC method, JavaScript function, or URL that is bound to one or more control attribute values.

### Category

[Internet protocol tags](#)

### Syntax

```
<cfajaxproxy
  cfc = "CFC name"
  jsclassname = "JavaScript proxy class name">
```

OR

```
<cfajaxproxy
  bind = "bind expression"
  onError = "JavaScript function name"
  onSuccess = "JavaScript function name">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` whose value is a structure. Specify the structure name in the `attributeCollection` and use the tag's attribute names as structure keys.

### See also

[DeserializeJSON](#), [IsJSON](#), [SerializeJSON](#), [Using Ajax Data and Development Features in the Developing ColdFusion Applications](#)

### History

ColdFusion 8: Added this tag

## Attributes

Attribute	Req/Opt	Default	Description
bind	A bind or cfc attribute is required		A bind expression that specifies a CFC method, JavaScript function, or URL to call. For detailed information about specifying bind expressions, see Binding data to form fields in the <i>Developing ColdFusion Applications</i> .  You cannot use this attribute with the cfc attribute.
cfc	A bind or cfc attribute is required		The CFC for which to create a proxy. Specify a dot-delimited path to the CFC. The path can be an absolute filepath, or relative to location of the CFML page. For example, if the myCFC CFC is in the cfc subdirectory of the ColdFusion page, specify cfc.myCFC.  If the CFC extends another CFC, the extended CFC methods are also available to the JavaScript proxy.  On UNIX-based systems, the tag searches first for a file whose name or path corresponds to the specified name or path, but is in all lowercase. If it does not find it, ColdFusion then searches for a filename or path that corresponds to the attribute value exactly, with identical character casing.  This attribute cannot be used with the bind attribute.
jsclassname	Optional	The value of the cfc attribute	The name to use for the JavaScript proxy class that represents the CFC.  This attribute cannot be used with a bind attribute.
onError	Optional		The name of a JavaScript function to invoke when a bind, specified by the bind attribute fails. The function must take two arguments: an error code and an error message.  This attribute cannot be used with a cfc attribute.
onSuccess	Optional		The name of a JavaScript function to invoke when a bind, specified by the bind attribute succeeds. The function must take one argument, the bind function return value. If the bind function is a CFC function, the return value is automatically converted to a JavaScript variable before being passed to the onSuccess function.  This attribute cannot be used with a cfc attribute.

## Usage

Make sure that the Enable HTTP Status Codes option on the Server Settings > Settings page of the ColdFusion Administrator is selected. Otherwise, the proxy cannot determine if an error occurs in invoking the CFC function and cannot call the error handler.

A cfajaxproxy tag with a bind attribute does not refresh any control that is not specified in the bind expression.

If you specify a URL in the bind attribute, the HTTP response must consist of a single JSON representation of an object, array, or simple value, corresponding to the onSuccess argument.

## Creating a CFC proxy

The cfajaxproxy tag with a cfc attribute generates a JavaScript proxy that represents a CFC on the web client. The tag and the proxy it generates have the following characteristics:

- The proxy provides one function that corresponds to each CFC remote function. Calling these functions in your client-side JavaScript code remotely calls the CFC functions on the server.
- The proxy provides several functions that you call to configure the interaction between the client and the server. These functions set the HTTP method and synchronization mode of the XMLHttpRequest call that the proxy uses to interact with the server. The functions also can specify a JavaScript callback handler and an error handler for asynchronous calls.

- Because JavaScript is case sensitive, ensure that you match the case of the keys in any ColdFusion structure or scope that you send to the client. By default, ColdFusion sets variable names and structure element names to all-uppercase. (You can create structure element names with lowercase characters by specifying the names in associative array notation, for example, `myStruct["myElement"] = "value"`.) The keys for the two arrays in the JSON object that the ColdFusion `serializeJSON` tag generates to represent a query are `COLUMNS` and `DATA`, for example, not `columns` and `data`.

For detailed information on using AJAX CFC proxies, see [Using ColdFusion Ajax CFC proxies](#) in [Using Ajax Data and Development Features](#) in the *Developing ColdFusion Applications*.

**Note:** The proxy passes a `_CF_NODEBUG` Boolean argument to called CFC functions. ColdFusion checks this value, and when it is `true`, does not append to the response any debugging information that it normally would send. This behavior ensures that the JSON responses to AJAX requests do not include any non-JSON (i.e., debug information) text.

### CFC proxy utility functions

When you use the `cfc` option, the JavaScript proxy object provides the following functions that you can use to control interaction with the server:

Function	Description
<code>setAsyncMode()</code>	<p>Sets the call mode to asynchronous. The calling thread (the Java thread of the client system that is processing the page) is not blocked when you make a call to a proxy function, so page processing can continue while waiting for a response from the server.</p> <p>The proxy invokes the function specified by the <code>setCallbackHandler</code> function with the response from the server. If an error occurs, the proxy invokes the error handler specified by the <code>setErrorHandler</code> function.</p>
<code>setCallbackHandler(function)</code>	<p>Specifies the callback handler for an asynchronous call. The <code>function</code> parameter is the JavaScript function to invoke as an argument.</p> <p>The callback function must take one parameter, the return value from the CFC that the proxy has deserialized from JSON to a JavaScript representation.</p> <p>This method automatically sets the call mode to asynchronous.</p>
<code>setErrorHandler(function)</code>	<p>Sets the error handler that the proxy invokes if there is an error in an asynchronous call. The <code>function</code> parameter is the JavaScript function to invoke.</p> <p>The error handler function must take two parameters:</p> <ul style="list-style-type: none"> <li>An HTTP error code</li> <li>A status message</li> </ul> <p>This method automatically sets the call mode to asynchronous.</p>
<code>setForm(ID)</code>	<p>Adds names and values of the fields in the form specified by the <code>ID</code> attribute to the arguments passed by a proxy function that is called immediately after this function.</p> <p>For more information, see <a href="#">Submitting data to a CFC</a> in the <i>Developing ColdFusion Applications</i>.</p>
<code>setHTTPMethod("method")</code>	<p>Sets the HTTP method to use for the call. The <code>method</code> parameter is a case-insensitive string, and must have one of the following values:</p> <ul style="list-style-type: none"> <li>GET (the default method)</li> <li>POST</li> </ul>

Function	Description
<code>setQueryFormat ( <i>format</i> )</code>	<p>Specifies the JSON format in which to return ColdFusion query data. The parameter must have one of the following values:</p> <ul style="list-style-type: none"> <li><code>row</code>: (Default) Sends the data as a JSON object with two entries: the column names and an array of row arrays.</li> <li><code>column</code>: Sends the data as a JSON object that represents WDDX query format. This object has three entries: the number of rows, an array with the column names, and an object where the keys are the column names and the values are arrays containing the column data.</li> </ul> <p>For more information on query formats, see <a href="#">SerializeJSON</a>.</p>
<code>setReturnFormat ( <i>format</i> )</code>	<p>Specifies the format in which the CFC function returns the result. ColdFusion automatically converts the function return value into the specified format before returning it to the client.</p> <p>The parameter must have one of the following values:</p> <ul style="list-style-type: none"> <li><code>json</code> (the default format if you don't use this function)</li> <li><code>plain</code></li> <li><code>wddx</code></li> </ul> <p>If you specify <code>plain</code>, and set the "content-type" header on the response from the server to <code>text/xml</code>, the proxy returns an XML object to the caller or callback function. If the content type is not set to <code>text/xml</code>, the return value from the server is returned as-is.</p> <p>This function is useful if you return XML or a plain string to the browser.</p>
<code>setSyncMode ( )</code>	<p>Sets the call mode to synchronous (the default synchronization mode). The calling thread remains blocked until the call returns. If an error occurs, the proxy throws an exception. In synchronous mode, the methods in the CFC proxy return the CFC method results directly to the caller.</p>

### Example

The following example uses a remote CFC method to populate a drop-down list of employees. When you select a name from the list, it uses a call to the CFC method to get information about the employee, and displays the results.

The application page has the following lines:

```
<!-- The cfajaxproxy tag creates a client-side proxy for the emp CFC.
      View the generated page source to see the resulting JavaScript.
      The emp CFC is in the components subdirectory of the directory that
      contains this page. -->
<cfajaxproxy cfc="components.emp" jsclassname="emp">

<html>
  <head>
    <script type="text/javascript">

      // Function to find the index in an array of the first entry
      // with a specific value.
      // It is used to get the index of a column in the column list.
      Array.prototype.findIdx = function(value){
        for (var i=0; i < this.length; i++) {
          if (this[i] == value) {
            return i;
          }
        }
      }
    }
  }
```

```
// Use an asynchronous call to get the employees for the
// drop-down employee list from the ColdFusion server.
var getEmployees = function(){
    // create an instance of the proxy.
    var e = new emp();
    // Setting a callback handler for the proxy automatically makes
    // the proxy's calls asynchronous.
    e.setCallbackHandler(populateEmployees);
    e.setErrorHandler(myErrorHandler);
    // The proxy getEmployees function represents the CFC
    // getEmployees function.
    e.getEmployees();
}

// Callback function to handle the results returned by the
// getEmployees function and populate the drop-down list.
var populateEmployees = function(res)
{
    with(document.simpleAJAX){
        var option = new Option();
        option.text='Select Employee';
        option.value='0';
        employee.options[0] = option;
        for(i=0;i<res.DATA.length;i++){
            var option = new Option();
            option.text=res.DATA[i][res.COLUMNS.findIdx('FIRSTNAME')]
                + ' ' + res.DATA[i][res.COLUMNS.findIdx('LASTNAME')];
            option.value=res.DATA[i][res.COLUMNS.findIdx('EMP_ID')];
            employee.options[i+1] = option;
        }
    }
}

// Use an asynchronous call to get the employee details.
// The function is called when the user selects an employee.
var getEmployeeDetails = function(id){
    var e = new emp();
    e.setCallbackHandler(populateEmployeeDetails);
    e.setErrorHandler(myErrorHandler);
    // This time, pass the employee name to the getEmployees CFC
    // function.
    e.getEmployees(id);
}

// Callback function to display the results of the getEmployeeDetails
// function.
var populateEmployeeDetails = function(employee)
{
    var eId = employee.DATA[0][0];
    var efname = employee.DATA[0][1];
    var elname = employee.DATA[0][2];
    var eemail = employee.DATA[0][3];
    var ephone = employee.DATA[0][4];
    var edepartment = employee.DATA[0][5];

    with(document.simpleAJAX){
        empData.innerHTML =
            '<span style="width:100px">Employee Id:</span>'
```

The following component, which gets the data from the data source, must be in a file named `emp.cfc` in the components subdirectory of the application directory. The CFC uses the `cfdocexamples` data source that is installed with ColdFusion if you install the documentation.

```
<cfcomponent>
  <cfset this.dsn = "cfdocexamples">
  <cffunction name="getEmployees" access="remote" returnFormat="json"
    output="false">
    <cfargument name="empid" required="no" type="string" default="0">
    <cfquery name="qryEmp" datasource="#this.dsn#">
      select * from Employees
    <cfif empid neq 0>
      where Emp_ID = #empid#
    </cfif>
    </cfquery>
    <cfreturn qryEmp>
  </cffunction>
</cfcomponent>
```

## cfapplet

### Description

This tag references a registered custom Java applet. To register a Java applet, in the ColdFusion Administrator, select Extensions > Java Applets.

Using this tag within a `cfform` tag is optional. If you use it within `cfform`, and the `method` attribute is defined in the Administrator, the return value is incorporated into the form.

### Category

[Forms tags](#)

### Syntax

```
<cfapplet
  appletSource = "applet name"
  name = "form variable name"
  align = "alignment option"
  height = "height in pixels"
  hSpace = "space on each side in pixels"
  notSupported = "message to display for non-Java browser"
  param_1 = "applet parameter name"
  param_2 = "applet parameter name"
  param_n = "applet parameter name"
  vSpace = "space above and below in pixels"
  width = "width in pixels">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` whose value is a structure. Specify the structure name in the `attributeCollection` and use the tag's attribute names as structure keys.

### See also

[cfform](#), [cfformgroup](#), [cfformitem](#), [cfgrid](#), [cfinput](#), [cfobject](#), [cfselect](#), [cfservlet](#), [cfslider](#), [cftextarea](#), [cftree](#)

### History

ColdFusion MX:

- Removed the requirement that you use this tag within a `cfform` tag.

- Changed the behavior when this tag is used within a `cfform` tag; if the `method` attribute is defined in the Administrator, the return value of the applet's method is incorporated into the form.

### Attributes

Attribute	Req/Opt	Default	Description
<code>appletSource</code>	Required		Name of registered applet.
<code>name</code>	Required		Form variable name for applet.
<code>align</code>	Optional		Alignment: <ul style="list-style-type: none"> <li>• Left</li> <li>• Right</li> <li>• Bottom</li> <li>• Top</li> <li>• TextTop</li> <li>• Middle</li> <li>• AbsMiddle</li> <li>• Baseline</li> <li>• AbsBottom</li> </ul>
<code>height</code>	Optional		Height of applet, in pixels.
<code>hSpace</code>	Optional		Space on left and right of applet, in pixels.
<code>notSupported</code>	Optional	See description	Text to display if a page that contains a Java applet-based <code>cfform</code> control is opened by a browser that does not support Java or has Java support disabled, for example: <code>notSupported = "&lt;b&gt;Browser must support Java to view ColdFusionJava Applets&lt;/b&gt;"</code> Default value: <code>&lt;b&gt;Browser must support Java to&lt;br&gt; view ColdFusion Java Applets!&lt;/b&gt;</code>
<code>param_n</code>	Optional		Registered parameter for applet. Specify only to override values for applet in ColdFusion Administrator.
<code>vSpace</code>	Optional		Space above and below applet, in pixels.
<code>width</code>	Optional		Width of applet, in pixels.

### Usage

You can specify the `applet method` attribute only in the Administrator, Java Applets view. For other attributes, you can accept the default values in the Administrator view, or specify values in this tag and override the defaults.

If Java applet components are stored in a JAR file, enter the information in the J2EE Archives > ColdFusion Administrator. For more information, see *Embedding Java applets* in the *Developing ColdFusion Applications*

### Example

<p>cfapplet lets you reference custom Java applets that have been registered using the ColdFusion Administrator.

<p>To register a Java applet, open the ColdFusion Administrator and click "Applets" link under "extensions" section.

<p>This example applet copies text that you type into a form. Type some text, and then click "copy" to see the copied text.

```
<cfform action = "index.cfm">
    <cfapplet appletsources = "copytext" name = "copytext">
</cfform>
```

## cfapplication

### Description

Defines the scope of a ColdFusion application; enables and disables storage of Client variables; specifies the Client variable storage mechanism; enables Session variables; and sets Application variable time-outs.

### Category

[Application framework tags](#)

### Syntax

```
<cfapplication
    datasource="data_source_name"
    name = "application name"
    applicationTimeout = #CreateTimeSpan(days, hours, minutes, seconds)#
    clientManagement = "yes|no"
    clientStorage = "data_source_name|Registry|Cookie"
    loginStorage = "cookie|session"
    googleMapKey = "map key"
    scriptProtect = "none|all|list"
    serverSideFormValidation = "yes|no"
    sessionManagement = "yes|no"
    sessionTimeout = #CreateTimeSpan(days, hours, minutes, seconds)#
    setClientCookies = "yes|no"
    setDomainCookies = "yes|no">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` whose value is a structure. Specify the structure name in the `attributeCollection` and use the tag's attribute names as structure keys.

### See also

[cfassociate](#), [cferror](#), [cflock](#), [cfmessagebox](#); [Application.CFC Reference](#); Designing and Optimizing a ColdFusion Application and Integrating J2EE and Java Elements in CFML Applications in the *Developing ColdFusion Applications*

### History

ColdFusion 9: Added `datasource`, `googleMapKey`, and `serverSideFormValidation` attribute

ColdFusion 8: Added `secureJSON` and `SecureJSONPrefix` attributes

ColdFusion MX 7: Added `scriptProtect` attribute

ColdFusion MX 6.1: Added `loginStorage` attribute

#### ColdFusion MX:

- Changed how persistent scopes are available: Server, Session, and Application scope variables are stored in memory as structures. In earlier releases, only Session and Application scope variables were stored this way. You cannot access the UDF function scope as a structure.
- Changed the algorithm for setting the CFTOKEN variable value: if the registry key UUIDToken is a nonzero value, ColdFusion uses a number constructed from the UUID plus a random number. Otherwise, ColdFusion sets the CFTOKEN variable default value using a positive random integer. (In earlier releases, ColdFusion always used a number constructed from the UUID plus a random number.)

#### Attributes

Attribute	Req/Opt	Default	Description
datasource	Optional		Name of the data source from which the query retrieves data.
name	See Description		Name of application. Up to 64 characters. For Application and Session variables: Required. For Client variables: Optional
applicationTimeout	Optional	Specified in Variables page of ColdFusion Administrator	Lifespan of application variables. CreateTimeSpan function and values in days, hours, minutes, and seconds, separated by commas.
clientManagement	Optional	no	<ul style="list-style-type: none"> <li>• yes: enables client variables.</li> <li>• no</li> </ul>
clientStorage	Optional	registry	How client variables are stored: <ul style="list-style-type: none"> <li>• datasource_name: in ODBC or native data source. Create storage repository in the Administrator.</li> <li>• registry: in the system registry.</li> <li>• cookie: on client computer in a cookie. Scalable. If client disables cookies in the browser, client variables do not work.</li> </ul>
googleMapKey	Optional		The Google Maps API key required to embed Google Maps in your web pages.
loginStorage	Optional	cookie	<ul style="list-style-type: none"> <li>• cookie: store login information in the Cookie scope.</li> <li>• session: store login information in the Session scope.</li> </ul>
scriptProtect	Optional	Determined by ColdFusion Administrator Enable Global Script Protection setting	Specifies whether to protect variables from cross-site scripting attacks <ul style="list-style-type: none"> <li>• none: do not protect variables</li> <li>• all: protect Form, URL, CGI, and Cookie variables</li> <li>• comma-delimited list of ColdFusion scopes: protect variables in the specified scopes.</li> </ul> For more information, see Usage.

Attribute	Req/Opt	Default	Description
secureJSON	Optional	Administrator value	<p>A Boolean value that specifies whether to add a security prefix in front of any value that a ColdFusion function returns in JSON-format in response to a remote call.</p> <p>The default value is the value of the Prefix serialized JSON setting in the Administrator Server Settings &gt; Settings page (which defaults to <code>false</code>). You can override this variable value in the <code>cffunction</code> tag.</p> <p>For more information see Improving security in the <i>Developing ColdFusion Applications</i>.</p>
serverSideFormValidation	Optional	yes	If <code>no</code> , disables validation on <code>cfform</code> fields when the form is submitted.
secureJSONPrefix	Optional	Administrator value	<p>The security prefix to put in front of the value that a ColdFusion function returns in JSON-format in response to a remote call if the <code>secureJSON</code> setting is <code>true</code>.</p> <p>The default value is the value of the Prefix serialized JSON setting in the Administrator Server Settings &gt; Settings page (which defaults to <code>//</code>, the JavaScript comment character).</p> <p>For more information see Improving security in the <i>Developing ColdFusion Applications</i>.</p>
sessionManagement	Optional	no	<ul style="list-style-type: none"> <li>yes: enables session variables.</li> <li>no</li> </ul>
sessionTimeout	Optional	Specified in Variables page of ColdFusion Administrator	Life span of session variables. <code>CreateTimeSpan</code> function and values in days, hours, minutes, and seconds, separated by commas.
setClientCookies	Optional	yes	<ul style="list-style-type: none"> <li>yes: enables client cookies.</li> <li>no: ColdFusion does not automatically send CFID and CFTOKEN cookies to client browser; you must manually code CFID and CFTOKEN on the URL for every page that uses Session or Client variables.</li> </ul>
setDomainCookies	Optional	no	<ul style="list-style-type: none"> <li>yes: uses domain cookies for CFID and CFTOKEN cookies and for all Client variables when using cookies for client variable storage. Required for applications running on clusters.</li> <li>no: uses host-specific cookies for CFID, CFTOKEN, and all client variable cookies.</li> </ul>

### Usage

This tag is typically used in the `Application.cfm` file, to set defaults for a ColdFusion application.

**Note:** You can also set the application defaults in the `Application.cfc` file. For more information, see [“Application variables”](#) on page 1453.

This tag enables application variables, unless they are disabled in the ColdFusion Administrator. The Administrator setting also overrides the `sessionManagement` attribute. For more information, see *Configuring and Administering ColdFusion*.

If ColdFusion is running on a cluster, specify `clientStorage = "cookie"` or a data source name; you cannot specify `"registry"`.

ColdFusion generates an error if the application name is longer than 64 characters.

The CFTOKEN variable is 8 bytes in length. Its range is 10000000 —99999999.

**Note:** If you specify `ClientStorage=cookie`, any `Client` scope variables set following a `cfflush` tag are not saved in the `Client` browser.

### Protecting variables from cross-site scripting attacks

The `ScriptProtect` attribute lets you protect one or more variable scopes from cross-site scripting attacks, where a client attempts to get your application to send malicious code back to a user's browser. In these attacks, user input (for example, from form fields or from URL variables) sets a CF variable which is destined for user output. The submitted data includes malicious code, such as JavaScript or an applet or object reference, which then executes on the user's system.

**Note:** The ColdFusion Administrator Settings page *Enable Global Script Protection* option determines the default script protection setting. You can use the `scriptProtect` attribute to override the Administrator setting. You can also use the `Application.cfc` initialization code to set the protection value.

The ColdFusion cross-site scripting protection operation is done when ColdFusion processes the application settings at the beginning of a request. Thus, it can process the URL, and Cookie, CGI, and Form variables in a user's request. By default, it replaces occurrences of the following HTML tag names with the text `InvalidTag:` `object`, `embed`, `script`, `applet`, and `meta`. It allows these names in plain text, and replaces the words if they are used as tag names.

You can specify any or all ColdFusion scopes for protection, but only the Form, URL, CGI, and Cookie scopes have variables that are often provided by unknown sources. Also, protecting a scope requires additional processing. For these reasons, the `all` attribute value applies protection to only the four scopes.

The script protection mechanism applies a regular expression that is defined in the `cf_root/lib/neo-security.xml` file in the server configuration, or the `cf_root/WEB-INF/cfusion/lib/neo-security.xml` file in the J2EE configuration to the variable value. You can customize the patterns that ColdFusion replaces by modifying the regular expression in the `CrossSiteScriptPatterns` variable.

### Locking server, application, and session variables

When you set or update variables in the server, application, and session scopes, use the `cflock` tag with the `scope` attribute set to the following value:

- For server variables, specify `server`
- For application variables, specify `application`
- For session variables, specify `session`

In some cases, you must also lock code that reads variables in these scopes. For information about locking scopes, see "[cflock](#)" on page 379.

### Example

```
<!--- This example shows how to use cflock to prevent race conditions during data updates to
variables in Application, Server, and Session scopes. --->
<h3>cfapplication Example</h3>
<p>cfapplication defines scoping for a ColdFusion application and enables or disables
application and/or session variable storage. This tag is placed in a special file called
Application.cfm that automatically runs before any other CF page in a directory (or
subdirectory) where the Application.cfm file appears.</p>

<cfapplication name = "ETurtle"
sessionTimeout = #CreateTimeSpan(0, 0, 0, 60)#
sessionManagement = "Yes">

<!--- Initialize session and application variables used by E-Turtleneck. --->
<cfparam name="application.number" default="1">
<cfparam name="session.color" default= "">
<cfparam name="session.size" default="">

<cfif IsDefined("session.numPurchased") AND IsNumeric(trim(session.cartTotal))>
<!--- Use the application scope for the application variable to prevent race condition. This
variable keeps track of total number of turtlenecks sold. --->
    <cflock scope = "Application" timeout = "30" type = "Exclusive">
        <cfset application.number = application.number + session.numPurchased>
    </cflock>
</cfif>

<cfoutput>
E-Turtleneck is proud to say that we have sold #application.number# turtlenecks to date.
</cfoutput>
<!--- End of Application.cfm --->
```

## cfargument

### Description

Creates a parameter definition within a component definition. Defines a function argument. Used within a [cffunction](#) tag.

### Category

[Extensibility tags](#)

### Syntax

```
<cfargument
    name="string"
    default="default value"
    displayname="descriptive name"
    hint="extended description"
    required="yes|no"
    type="data type">
```

### See also

[cfcomponent](#), [cffunction](#), [cfinterface](#), [cfinvoke](#), [cfinvokeargument](#), [cfobject](#), [cfproperty](#), [cfreturn](#)

### History

ColdFusion 8: Added `component` as a valid value for the `ReturnType` attribute.

ColdFusion MX 7: Added the `xml` value of `type` attribute.

ColdFusion MX: Added this tag.

### Attributes

Attribute	Req/Opt	Default	Description
<code>name</code>	Required		String; an argument name.
<code>default</code>	Optional		If no argument is passed, specifies a default argument value.
<code>displayname</code>	Optional	<code>name</code> attribute value	Meaningful only for CFC method parameters. A value to display when using introspection to show information about the CFC.

Attribute	Req/Opt	Default	Description
hint	Optional		Meaningful only for CFC method parameters. Text to display when using introspection to show information about the CFC. The <code>hint</code> attribute value follows the <code>displayname</code> attribute value in the parameter description line. Use this attribute to describe the purpose of the parameter.
required	Optional	no	<p><b>Note:</b> All arguments are required when invoked as a web service, irrespective of how they are defined.</p> <p>Specifies whether the parameter is required to execute the component method. The parameter is <i>not</i> required if you specify a <code>default</code> attribute.</p> <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul>
type	Optional	any	<p>String; a type name; data type of the argument.</p> <ul style="list-style-type: none"> <li>• any</li> <li>• array</li> <li>• binary</li> <li>• boolean</li> <li>• component: the argument must be a ColdFusion component.</li> <li>• date</li> <li>• guid: the argument must be a UUID or GUID of the form <code>xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxx</code> where each <code>x</code> is a character representing a hexadecimal number (0-9A-F).</li> <li>• numeric</li> <li>• query</li> <li>• string</li> <li>• struct</li> <li>• uuid: the argument must be a ColdFusion UUID of the form <code>xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxx</code> where each <code>x</code> is a character representing a hexadecimal number (0-9A-F).</li> <li>• variableName: a string formatted according to ColdFusion variable naming conventions.</li> <li>• xml: XML objects and XML strings</li> <li>• a component name: if the <code>type</code> attribute value is not one of the preceding items, ColdFusion treats it as the name of a ColdFusion component. When the function executes, it generates an error if the argument that is passed in is not a CFC with the specified name.</li> </ul>

### Usage

This tag must be in a `cffunction` tag, before any other tags in the `cffunction` tag body.

Arguments that are passed when a method is invoked can be accessed from the method body in the following ways:

- With shorthand syntax: `#myargument#`  
(This example accesses the argument `myargument`.)
- Using the arguments scope as an array: `#arguments[1]#`

(This example accesses the first defined argument in the `cffunction`.)

- Using the arguments scope as a struct: `#arguments.myargument#`

(This example accesses the argument `myargument` in the array.)

### Example

```
<!--- This example defines a function that takes a course number parameter and returns the
course description. --->
<cffunction name="getDescription">
    <!--- Identify argument. --->
    <cfargument name="Course_Number" type="numeric" required="true">
    <!--- Use the argument to get a course description from the database. --->
    <cfquery name="Description" datasource="cfdocexamples">
        SELECT Descript
        FROM Courses
        WHERE Number = '#Course_Number#'
    </cfquery>
    <!--- Specify the variable that the function returns. --->
    <cfreturn Description.Descript>
</cffunction>
```

## cfassociate

### Description

Allows subtag data to be saved with a base tag. Applies only to custom tags.

### Category

[Application framework tags](#)

### Syntax

```
<cfassociate
    baseTag = "base tag name"
    dataCollection = "collection name">
```

**Note:** You can specify the attributes of this tag in an `attributeCollection` whose value is a structure. Specify the structure name in the `attributeCollection` and use the tag's attribute names as structure keys.

### See also

[cfapplication](#), [cferror](#), [cflock](#), [cfmessagebox](#); High-level data exchange in the *Developing ColdFusion Applications*.

### Attributes

Attribute	Req/Opt	Default	Description
baseTag	Required		Base tag name.
dataCollection	Optional	AssocAttribs	Structure in which base tag stores subtag data.

### Usage

Call this tag within a subtag, to save subtag data in the base tag.

When ColdFusion passes subtag attributes back to the base tag, it saves them in a structure whose default name is `AssocAttrs`. To segregate subtag attributes (in a base tag that can have multiple subtags), specify a structure name in the `dataCollection` attribute. The structure is appended to an array whose name is *thisTag.collectionName*.

In the custom tag code, the attributes passed to the tag by using the `cfmodule` tag `attributeCollection` attribute are saved as independent values, with no indication that they are grouped into a structure by the custom tag's caller. Therefore, in the called tag, if you assign a value to a specific attribute, it replaces the value passed in the `attributeCollection` attribute that you used when calling the subtag.

### Example

```
<!--- Find the context. --->
<cfif thisTag.executionMode is "start">
    <!--- Associate attributes. --->
    <cfassociate baseTag = "CF_TAGBASE">

    <!--- Define defaults for attributes. --->
    <cfparam name = "attributes.happy" default = "yes">
    <cfparam name = "attributes.sad" default = "no">
    ...
</cfif>
```

## cfauthenticate

### Description

This tag is obsolete. Use the newer security tools; see [“Conversion functions”](#) on page 689 and *Securing Applications* in the *Developing ColdFusion Applications*.

### History

ColdFusion MX: This tag is obsolete. It does not work in ColdFusion MX and later releases.

## cfbreak

### Description

Used within a `cfloop` tag. Breaks out of a loop.

### Category

[Flow-control tags](#)

### Syntax

```
<cfbreak>
```

### See also

[cfabort](#), [cfcontinue](#), [cfexecute](#), [cfif](#), [cflocation](#), [cfloop](#), [cfthrow](#), [cftry](#); `cfloop` and `cfbreak` in the *Developing ColdFusion Applications*

### Example

```
<!--- This shows the use of cfbreak to return processing to the top of a loop.--->
<!--- Select courses; use cfloop to find a condition; then break the loop. --->
<!--- Check that number is numeric. --->
<cfif IsDefined("form.course_number")>
    <cfif Not IsNumeric(form.course_number)>
        <cfabort>
    </cfif>
</cfif>
<cfquery name="GetCourses" datasource="cfdocexamples">
    SELECT *
    FROM COURSES
    ORDER by NUMBER
</cfquery>
```

<p> This example uses CFLOOP to cycle through a query to find a value.  
(In our example, a list of values corresponding to courses in the cfdocexamples  
datasource). When the conditions of the query are met, CFBREAK stops the loop. </p>

<p> Please enter a Course Number, and hit the "submit" button: </p>

```
<cfform>
    <cfselect name="courseNum">
        <cfoutput query="GetCourses">
            <option value="#NUMBER#">#NUMBER#
        </cfoutput>
    </cfselect>
    <cfinput type="Submit" name="" value="Search on my Number">
</cfform>
<!--- If the courseNum variable is not defined, don't loop through the query.--->
<cfif IsDefined ("form.courseNum") IS "True">
<!--- Loop through query until value found, then use CFBREAK to exit query.--->
    <cfloop query="GetCourses">
        <cfif GetCourses.NUMBER IS form.courseNum>
            <cfoutput>
                <h4>Your Desired Course was found:</h4>
                <pre>#NUMBER# #DESCRIPT#</pre>
            </cfoutput>
            <cfbreak>
        <cfelse>
            <br> Searching...
        </cfif>
    </cfloop>
</cfif>
```

## Tags c

### cfcache

#### Description

Stores a copy of a page on the server and/or client computer, to improve page rendering performance. To do this, the tag creates temporary files that contain the static HTML returned from a ColdFusion page.

Use this tag if it is not necessary to get dynamic content each time a user accesses a page.

You can use this tag for simple URLs and for URLs that contain URL parameters.

## Category

[Page processing tags](#)

## Syntax

```
<cfcache  
    action = "action"  
    dependsOn = "variable name list"  
    directory = "directory path"  
    expireURL = "wildcarded URL reference"  
    id = "object identifier"  
    idleTime = "decimal number of days"  
    key = "key value"  
    metadata = "variable name"  
    name = "variable name"  
    password = "password"  
    port = "port number"  
    protocol = "http://|https://"  
    stripWhiteSpace = "false|true"  
    throwOnError = "false|true"  
    timespan = "decimal number of days">  
    useCache = "true|false"  
    usequerystring = "false|true"  
    username = "username"  
    value = "value">
```

The page fragment to be cached, if any.

```
</cfcache>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## History

ColdFusion 9:

- Added support for the following features:
  - Caching in memory. Memory is now the default cache location.
  - Caching page fragments.
  - Caching specific objects, including the ability to put, get, and flush cached objects.
  - Setting cache dependencies.
  - Setting an idle timeout.
  - Getting metadata about cached objects.
  - The ability to strip white space from cached page fragments.
  - The ability to throw an exception if an error occurs when flushing a cached object.
- Added `get` and `put` values of the `action` attribute. These values support caching of objects.

- Added `dependsOn`, `id`, `idleTime`, `key`, `metadata`, `name`, `stripWhiteSpace`, `throwOnError`, `useCache`, `usequerystring`, and `value` attributes.

#### ColdFusion MX:

- Deprecated the `cachedirectory` and `timeout` attributes. They might not work, and might cause an error, in later releases.
- Added the `timespan` attribute.
- Changed how pages are cached: the default `action` attribute value, `cache`, caches a page on the server and the client. (In earlier releases, this option cached a page only on the server.)
- Changed the source of the `protocol` and `port` values: the default `protocol` and `port` values are now taken from the current page URL. (In earlier releases, they were "http" and "80", respectively.)
- Changed how session state is handled when caching a page: this tag can cache pages that depend on session state, including pages that are secured with a ColdFusion login. (In earlier releases, the session state was cleared when caching the page, causing authentication to be lost.)
- Changed how files are cached: this tag uses a `hash()` of the URL for the filename to cache a file. (In earlier releases, ColdFusion used the `cfcache.map` file.)

#### Attributes

Attribute	Actions	Req/Opt	Default	Description
<code>action</code>	All	Optional	<code>serverCache</code>	<ul style="list-style-type: none"> <li>• <code>cache</code>: server-side and client-side page caching.</li> <li>• <code>clientcache</code>: browser-side page caching only. To cache a personalized page, use this option.</li> <li>• <code>flush</code>: remove the current versions of cached pages, fragments, or an object from the cache. The cache is refreshed the next time a user accesses the item. For more information see Description.</li> <li>• <code>get</code>: get an object from the cache.</li> <li>• <code>optimal</code>: same as <code>cache</code>.</li> <li>• <code>put</code>: Add an object to the cache.</li> <li>• <code>serverCache</code>: server-side caching only.</li> </ul>
<code>dependsOn</code>	<code>cache</code> , <code>serverCache</code> , <code>optimal</code>	Optional		A comma separated list of variables. If any of the variable values change, ColdFusion updates the cache. This attribute can take an expression that returns a list of variables.
<code>directory</code>	<code>cache</code> , <code>serverCache</code> , <code>clientCache</code> , <code>optimal</code> , <code>flush</code> , <code>put</code>	Optional	Cache in memory	Absolute path of cache directory.
<code>expireURL</code>	<code>flush</code>	Optional	Flush all cached pages	A URL reference. Can include wildcards, for example: <code>"/view.cfm?id=*"</code> . ColdFusion flushes, from the cache, pages that match the specified URL or pattern.
<code>id</code>	<code>flush</code> , <code>get</code> , <code>put</code>	See description		<p>The identifier for a cached object. This attribute can also take a comma-separated list of identifiers.</p> <p>This attribute is required for the any operation on an object. Therefore it is required for the <code>get</code> and <code>put</code> actions, and to flush an object. It is not required to flush a page.</p>

Attribute	Actions	Req/Opt	Default	Description
idleTime	cache, serve rCache, clientCache, optimal, flush, put	Optional	No idle timeout	Flushes the cached item if it is not accessed for the specified time span: <ul style="list-style-type: none"> <li>A decimal number of days, for example: ".25", for one-fourth day (6 hours); "1", for one day; "1.5", for one and one half days</li> <li>A return value from the <a href="#">CreateTimeSpan</a> function, for example, <code>"#CreateTimeSpan(0,6,0,0)#" .</code></li> </ul>
key		Optional		Used to reference a user-defined cache.
metadata	get	Optional		The name of a structure variable in which to put object metadata. The get operation returns the following data: <ul style="list-style-type: none"> <li>timespan: The time span during which the cached item is valid; the value of the timespan attribute for the cached item.</li> <li>createdtime: The time when the cache was created</li> <li>lasthit: The time when the cached item was most recently used.</li> <li>hitnumber: Number of times the cached item has been used.</li> <li>missnumber: Number of misses</li> </ul>
name	get	Required		The name of the variable in which to put the retrieved object.
password	cache, serve rCache, clientCache, optimal, flush	Optional		A password. Provide this if the page requires authentication at the web-server level.
port	cache, serve rCache, clientCache, optimal, flush	Optional	The port for the current page	Port number of the web server from which the URL for the cached page is requested. In the internal call from <code>cfcache</code> to <code>cfhttp</code> , ColdFusion resolves each URL variable in the page; this ensures that links in the page remain functional.
protocol	cache, serve rCache, clientCache, optimal, flush	Optional	The current page protocol	Protocol that is used to create URL from cache. <ul style="list-style-type: none"> <li><code>http://</code></li> <li><code>https://</code></li> </ul>
stripWhiteSpace	cache, serve rCache, optimal	Optional	false	Specifies whether to strip any unnecessary white space characters from a cached page fragment. Does not have any effect on cached pages or objects.
throwOnError	flush with id attribute	Optional	false	A Boolean value specifying whether to throw an error if the <code>flush</code> action encounters an error. Otherwise the action does not generate an error if it fails. If this attribute is <code>true</code> you can handle the error in a <code>cfcatch</code> block, for example, if a specified id value is invalid.
timespan	cache, serve rCache, clientCache, optimal, flush, put	Optional	See Description	The interval until the item is flushed from the cache. <ul style="list-style-type: none"> <li>A decimal number of days, for example: ".25", for one-fourth day (6 hours); "1", for one day; "1.5", for one and one half days</li> <li>A return value from the <a href="#">CreateTimeSpan</a> function, for example, <code>"#CreateTimeSpan(0,6,0,0)#" .</code></li> </ul> <p>The default action is to flush the item when it is idle for the time specified by the <code>idleTime</code> attribute, or <code>cfcache action="flush"</code> executes.</p>
useCache	cache, serve rCache, optimal,	Optional	true	Specifies whether to use caching for a page. This attribute can be useful during development. For example, you could use a function to predict when to use a cache, based on the application state.

Attribute	Actions	Req/Opt	Default	Description
usequerystring		Optional	false	If <code>true</code> , generates a template cache ID that includes the query string. This means that a new template cache is created whenever the query string changes.  If set to <code>true</code> , the attribute <code>dependson</code> considers the URL parameters defined in the query string as well to generate template caches.  Also see the Usage section
username	cache, serve, rCache, clientCache, optimal, flush	Optional		A username. Provide this if the page being cached or flushed requires authentication at the web server level.
value	put	Required		The object to cache.

## Usage

### ColdFusion 9 additions

The following information applies to features added for ColdFusion 9. For additional information, see the History section and the Attributes table.

**Page fragments:** To cache a page fragment, put the fragment in the body of the tag, between the begin tag and the end tag. Do not use a tag body to cache full pages or objects.

**flush:** The `flush` action can have two formats: One uses the `ExpireURL` attribute to specify the page to flush, the other uses the `id` attribute to specify the object to flush. When you flush an object, ColdFusion ignores errors by default. If you specify a `throwOnError` attribute with a `true` value, the action throws the errors, and you can use a catch block to handle them. This is useful to determine if you use invalid cache ID values.

**User-defined cache:** To create user-defined cache,

- 1 Add the following snippet to the `ehcache.xml` (in the `CF_root\lib\`):

```
<cache name="cf9"
maxElementsInMemory="10000"
eternal="false"
timeToIdleSeconds="86400"
timeToLiveSeconds="86400"
overflowToDisk="true"
diskSpoolBufferSizeMB="30"
maxElementsOnDisk="10000000"
diskPersistent="true"
diskExpiryThreadIntervalSeconds="3600"
memoryStoreEvictionPolicy="LRU"/>
```

- 2 To reference the user-defined cache, use the `key` attribute as follows:

```
<cfcache key="cf9" timespan=#createtimespan(0,0,1,0)# >
    <cfoutput>#now()#</cfoutput>
</cfcache>
```

By default, caching is memory-based and not disk-based. For each application, the default setting is 10000 object caches and 10000 template caches. It is important to note the limit imposed on the number of objects/templates that can be cached.

Diskoverflow for caching by default is `false`. To enable disk caching, set `overflowToDisk` as `true` in the `ehcache.xml`. To make the cached data available on server restart, set `diskPersistent` to `true`.

For further details of the properties in the ehcache.xml, refer to the documentation available at the following URL:

<http://ehcache.org/>

#### **From ColdFusion 8 and earlier**

The following remaining information for this tag also applied to previous releases.

Use this tag in pages whose content is not updated frequently. Taking this action can greatly improve the performance of your application.

The output of a cached page is stored in a file on the client browser and/or the ColdFusion server. Instead of regenerating and downloading the output of the page each time it is requested, ColdFusion uses the cached output. ColdFusion regenerates and downloads the page only when the cache is flushed, as specified by the `timespan` attribute, or by invoking `cfcache action=flush`.

To enable a simple form of caching, put a `cfcache` tag, specifying the `timespan` attribute, at the top of a page. Each time the specified time span passes, ColdFusion flushes (deletes) the copy of the page from the cache and caches a new copy for users to access.

You can specify client-side caching or a combination of client-side and server-side caching (the default), using the `action` attribute. The advantage of client-side caching is that it requires no ColdFusion resources; the browser stores pages in its own cache, improving performance. The advantage of combination caching is that it optimizes server performance; if the browser does not have a cache of the page, the server can get data from its own cache. (Adobe recommends that you use combination caching, and do not use server-side only caching.)

If a page contains personalized content, use the `action = "clientcache"` option to avoid the possibility of caching a personalized copy of a page for other users.

Debug settings have no effect on `cfcache` unless the application page enables debugging. When generating a cached file, `cfcache` uses `cfsetting showDebugOutput = "no"`.

The `cfcache` tag evaluates each unique URL, including URL parameters, as a distinct page, for caching purposes. For example, the output of `http://server/view.cfm?id=1` and the output of `http://server/view.cfm?id=2` are cached separately.

The `cfcache` tag uses the `cfhttp` tag to get the contents of a page to cache. If there is an HTTP error accessing the page, the contents are not cached. If a ColdFusion error occurs, the error is cached.

For more information, see Caching ColdFusion pages that change infrequently in the *Developing ColdFusion Applications*.

#### **Change in behaviour**

Till ColdFusion 9, the request query string was automatically used as part of the page identifier, so that pages with different query strings (URL parameters) are cached independent of each other. In ColdFusion 9, this behavior changed. Now you must specify the new optional attribute `usequerystring` with value set to `true`, to achieve the older behavior.

### Example

<!-- This example produces as many cached files as there are URL parameter permutations. You can see that the page is cached when the timestamp doesn't change.-->

```
<cfcache
    timespan="#createTimeSpan(0,0,10,0)#">
<body>

<h3>This is a test of some simple output</h3>

<cfoutput>
    This page was generated at #now()#<br>
</cfoutput>

<cfparam name = "URL.x" default = "no URL parm passed">
<cfoutput>The value of URL.x = # URL.x #</cfoutput>
```

## cfcalendar

### Description

Puts an interactive Flash format calendar in an HTML or Flash form. Not supported in XML format forms. The calendar lets a user select a date for submission as a form variable.

### Category

[Forms tags](#)

### Syntax

```
<cfcalendar
    name = "name of calendar"
    dayNames = "days of the week labels"
    disabled = "yes|no|no attribute value"
    enabled = "yes|no"
    endRange = "last disabled date"
    height = "height"
    mask = "character pattern"
    monthNames = "month labels"
    onBlur = "ActionScript to invoke"
    onChange = "ActionScript to invoke"
    onFocus = "ActionScript to invoke"
    selectedDate = "date"
    startRange = "first disabled date"
    style="Flash ActionScript style"
    tooltip = "text"
    visible = "yes|no"
    width = "width">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

## History

ColdFusion MX 7.01: Added support for `onBlur` and `onFocus` events.

ColdFusion MX 7: Added tag.

## Attributes

Attribute	Req/Opt	Default	Description
<code>name</code>	Required		The name of the calendar.
<code>dayNames</code>	Optional	S, M, T, W, Th, F, S	A comma-delimited list that sets the names of the weekdays displayed in the calendar. Sunday is the first day and the rest of the weekday names follow in the normal order.
<code>disabled</code>	Optional	Not disabled	Disables all user input, making the control read-only. To disable input, specify <code>disabled</code> without an attribute or <code>disabled="Yes"</code> (or any ColdFusion positive boolean value, such as <code>true</code> ). To enable input, omit the attribute or specify <code>disabled="No"</code> (or any ColdFusion negative Boolean value, such as <code>false</code> ).
<code>enabled</code>	Optional	yes	Flash only: Boolean value that specifies whether the control is enabled. A disabled control appears in light gray. This is the inverse of the <code>disabled</code> attribute.
<code>endRange</code>	Optional		The end of a range of dates that are disabled. Users cannot select dates from the date specified by the <code>startRange</code> attribute through this date.
<code>firstDayOfWeek</code>	Optional	0	Integer in the range 0-6 specifying the first day of the week in the calendar: 0 indicates Sunday; 6 indicates Saturday.
<code>height</code>	Optional	Determined by Flash	The vertical dimension of the calendar specified in pixels.
<code>mask</code>	Optional	MM/DD/YYYY	A pattern that specifies the format of the submitted date. Mask characters are: <ul style="list-style-type: none"> <li>D = day; can use 0–2 mask characters</li> <li>M = month; can use 0–4 mask characters</li> <li>Y = year; can use 0, 2, or 4 characters</li> <li>E = day in week; can use 0–4 characters</li> <li>Any other character = put the character in the specified location</li> </ul> For more information on masking, see “Masking input data” in the <a href="#">cfinput</a> reference page.
<code>monthNames</code>	Optional	January, February, March, April, May, June, July, August, September, October, November, December	A comma-delimited list of the month names that are displayed at the top of the calendar.
<code>onBlur</code>	Optional		ActionScript that runs when the calendar loses focus.
<code>onChange</code>	Optional		ActionScript that runs when the user selects a date.
<code>onFocus</code>	Optional		ActionScript that runs when the calendar gets focus.
<code>selectedDate</code>	Optional	None (Flash shows the current month)	The date that is initially selected. It is highlighted in a color determined by the form skin. Must be in <code>mm/dd/yyyy</code> or <code>dd/mm/yyyy</code> format, depending on the current locale. (Use the <code>setLocale</code> function to set the locale, if necessary.)

Attribute	Req/Opt	Default	Description
startRange	Optional		The start of a range of dates that are disabled. Users cannot select dates from this date through the date specified by the <code>endRange</code> attribute.
style	Optional		Flash ActionScript style or styles to apply to the calendar. For more information, see <i>Setting styles and skins in Flash forms</i> in the <i>Developing ColdFusion Applications</i> .
tooltip	Optional		Flash only: Text to display when the mouse pointer hovers over the control.
visible	Optional	yes	Flash only: Boolean value that specifies whether to show the control. Space that would be occupied by an invisible control is blank.
width	Optional	Determined by Flash	The horizontal dimension of the calendar specified in pixels.

### Usage

The `cfcalendar` tag displays a calendar month, showing the month, the year, a grid of the days of the month, and headings for the days of the week. The calendar contains forward and back arrow buttons to let you change the month and year that are displayed.

If you include a value for the `selectedDate` attribute, that date is highlighted in green and determines the month and year that display initially. Changing the month and year display does not change the selected date. A user can change the selected date by clicking a different date on the calendar. The `onChange` attribute can specify an ActionScript event handler function that runs when the user selects a date.

The current date is highlighted in reverse (that is, a white number on a black background). If the selected date is in a different month or year, however, the current date does not appear unless you move to it by clicking the forward or back arrows.

The `mask` attribute lets you specify the format of the selected date that is returned to the application.

You can use the keyboard to access and select dates from a `cfcalendar` control:

- Use the Up, Down, Left, and Right Arrow keys to change the selected date.
- Use the Home and End keys to reach the first and last enabled date in a month, respectively.
- Use the Page Up and Page Down keys to reach the previous and next month, respectively.

**Note:** The `cfcalendar` tag is not supported in XML format forms.

### Example

This example produces a 200-pixel by 150-pixel calendar with a Flash `haloBlue` skin. It displays abbreviated month names and two-character days of the week. It initially displays today's date as determined by the `selectedDate` attribute. When you click the Save button, the form submits back to the current page, which displays the submitted information.

The example also has three `dateField` controls that let the user change the initial selected date that displays on the calendar and a blocked-out date range. The initial blocked-out date is a four-day period immediately preceding today's date.

**Note:** This example must be modified to work in locales that do not use `mm/dd/yyyy` date formats. To do so, use the `LSDateFormat` function in place of the `DateFormat` function and a mask that is appropriate for your locale, such as `dd/mm/yyyy`.

```
<!--- Set initial selected and blocked-out dates.--->
<cfparam name="Form.startdate" default="#dateformat(now()-5, 'mm/dd/yyyy')#">
<cfparam name="Form.enddate" default="#dateformat(now()-1, 'mm/dd/yyyy')#">
<cfparam name="Form.selectdate" default="#dateformat(now(), 'mm/dd/yyyy')#">

<!--- If the form has been submitted, display the selected date. --->
<cfif isDefined("Form.submitit")>
    <cfoutput><b>You selected #Form.selectedDate#</b><br><br></cfoutput>
</cfif>

<b>Please select a date on the calendar and click Save.</b><br>
<br>
<cfform name="form1" format="Flash" skin="haloBlue" width="375" height="350" >

```

## cfcase

### Description

Used only inside the [cfswitch](#) tag body. Contains code to execute when the expression specified in the [cfswitch](#) tag has one or more specific values.

### Category

[Flow-control tags](#)

### Syntax

```
<cfcase
    value = "value|delimited set of values"
    delimiters = "delimiter characters">
```

### See also

[cfdefaultcase](#), [cfswitch](#); [cfswitch](#), [cfcase](#), and [cfdefaultcase](#) in the *Developing ColdFusion Applications*

## History

ColdFusion 8: Changed the way ColdFusion parses `cfcase` values. Previously, `cfcase` tags with numeric value dates did not return expected results. For example, `<cfcase value="00">` and `<cfcase value="0A">` were both evaluated to 0. The value "0A" was treated as a date and converted to 0 number of days from 12/30/1899. The value "00" was also evaluated to the value 0. This caused the exception "Context validation error for tag CFCASE. The CFSWITCH has a duplicate CFCASE for value "0.0"." The `cfswitch` tag now returns the expected result.

## Attributes

Attribute	Req/Opt	Default	Description
value	Required		The value or values that the <code>expression</code> attribute of the <code>cfswitch</code> tag must match. To specify multiple matching values, separate the values with the <code>delimiter</code> character. The value or values must be simple constants or constant expressions, not variables.
delimiters	Optional	, (comma)	Specifies the delimiter character or characters that separate multiple values to match. If you specify multiple delimiter characters, you can use any of them to separate the values to be matched.

## Usage

The contents of the `cfcase` tag body executes only if the `expression` attribute of the `cfswitch` tag evaluates to a value specified by the `value` attribute. The contents of the `cfcase` tag body can include HTML and text, and CFML tags, functions, variables, and expressions. You do not have to explicitly break out of the `cfcase` tag, as you do in some languages.

One `cfcase` tag can match multiple `expression` values. To do this, separate the matching values with the default value of the delimiter character. For example the following line matches "red", "blue", or "green":

```
<cfcase value="red,blue,green">
```

You can use the `delimiter` attribute to specify one or more delimiters to use in place of the comma. For example, the following line matches "cargo, live", "cargo, liquid", and "cargo, solid":

```
<cfcase value="cargo, live;cargo, liquid-cargo, solid" delimiters=";-">
```

## Example

The following example displays a grade based on a 1-10 score. Several of the `cfcase` tags match more than one score. For simplicity, the example sets the score to 7.

```
<cfset score="7">
<cfswitch expression="#score#">
    <cfcase value="10">
        <cfset grade="A">
    </cfcase>
    <cfcase value="9;8" delimiters=";">
        <cfset grade="B">
    </cfcase>
    <cfcase value="7;6" delimiters=";">
        <cfset grade="C">
    </cfcase>
    <cfcase value="5;4;" delimiters=";">
        <cfset grade="D">
    </cfcase>
    <cfdefaultcase>
        <cfset grade="F">
    </cfdefaultcase>
</cfswitch>
<cfoutput>
    Your grade is #grade#
</cfoutput>
```

## cfcatch

### Description

Used inside a [cftry](#) tag. Together, they catch and process exceptions in ColdFusion pages. *Exceptions* are events that disrupt the normal flow of instructions in a ColdFusion page, such as failed database operations, missing include files, and developer-specified events.

### Category

[Exception handling tags](#)

### Syntax

```
<cfcatch type = "exception type">
    Exception processing code here</cfcatch>
```

### See also

[cftry](#), [cferror](#), [cffinally](#), [cfrethrow](#), [cfthrow](#), [onError](#); Handling Errors in the *Developing ColdFusion Applications*

### History

ColdFusion MX:

- Changed SQLSTATE value behavior: the SQLSTATE return value in a `cfcatch` tag depends on the database driver type:
  - Type 1 (JDBC-ODBC bridge): the value is the same as in ColdFusion 5.
  - Type 4 (100% Java, no native methods): the value might be different.

If your application depends on SQLSTATE values for flow control, the application might produce unexpected behavior with ColdFusion MX.

- Changed the behavior of this tag when `type="any"`: it is not necessary, when you include a `cfcatch` tag with `type="any"`, to do so in the last `cfcatch` tag in the block, to ensure that all other tests are executed before it. ColdFusion finds the best-match `cfcatch` block.
- Changed the behavior of the `cfscript` tag: it includes `try` and `catch` statements that are equivalent to the `cftry` and `cfcatch` tags.
- Changed object modification: you cannot modify the object returned by `cfcatch`.
- Changed thrown exceptions: the `cfcollection`, `cfindex`, and `cfsearch` tags can throw the SEARCHENGINE exception. In earlier releases, an error in processing these tags threw only an UNKNOWN exception.

### Attributes

Attribute	Req/Opt	Default	Description
type	Optional	Any	<ul style="list-style-type: none"><li>• <code>application</code>: catches application exceptions</li><li>• <code>database</code>: catches database exceptions</li><li>• <code>template</code>: catches ColdFusion page exceptions</li><li>• <code>security</code>: catches security exceptions</li><li>• <code>object</code>: catches object exceptions</li><li>• <code>missingInclude</code>: catches missing include file exceptions</li><li>• <code>expression</code>: catches expression exceptions</li><li>• <code>lock</code>: catches lock exceptions</li><li>• <code>custom_type</code>: catches the specified custom exception type that is defined in a <code>cfthrow</code> tag</li><li>• <code>searchengine</code>: catches Verity search engine exceptions</li><li>• <code>any</code>: catches all exception types</li></ul>

### Usage

You must code at least one `cfcatch` tag within a `cftry` block. Put `cfcatch` tags at the end of a `cftry` block. ColdFusion tests `cfcatch` tags in the order in which they appear. This tag requires an end tag.

If `type="any"`, ColdFusion catches exceptions from any CFML tag, data source, or external object. To get the exception type use code such as the following:

```
#cfcatch.type#
```

Applications can use the `cfthrow` tag to throw developer-defined exceptions. Catch these exceptions with any of these `type` options:

- `"custom_type"`
- `"Application"`
- `"Any"`

The `custom_type` type is a developer-defined type specified in a `cfthrow` tag. If you define a custom type as a series of strings concatenated by periods (for example, `"MyApp.BusinessRuleException.InvalidAccount"`), ColdFusion can catch the custom type by its character pattern. ColdFusion searches for a `cfcatch` tag in the `cftry` block with a matching exception type, starting with the most specific (the entire string), and ending with the least specific.

For example, you could define a type as follows:

```
<cfthrow type = "MyApp.BusinessRuleException.InvalidAccount">
```

If you have the following `cfcatch` tag, it handles the exception:

```
<cfcatch type = "MyApp.BusinessRuleException.InvalidAccount">
```

Otherwise, if you have the following `cfcatch` tag, it handles the exception:

```
<cfcatch type = "MyApp.BusinessRuleException">
```

Finally, if you have the following `cfcatch` tag, it handles the exception:

```
<cfcatch type = "MyApp">
```

You can code `cfcatch` tags in any order to catch a custom exception type.

If you specify `type = "Application"`, the `cfcatch` tag catches only custom exceptions that have the `Application` type in the `cfthrow` tag that defines them.

The `cfinclude`, `cfmodule`, and `cferror` tags throw an exception of `type = "template"`.

An exception that is thrown within a `cfcatch` block cannot be handled by the `cftry` block that immediately encloses the `cfcatch` tag. However, you can rethrow the currently active exception with the [cfrethrow](#) tag.

The `cfcatch` variables provide the following exception information:

cfcatch variable	Content
<code>cfcatch.type</code>	Type: Exception type, as specified in <code>cfcatch</code> .
<code>cfcatch.message</code>	Message: Exception's diagnostic message, if provided; otherwise, an empty string; in the <code>cfcatch.message</code> variable.
<code>cfcatch.detail</code>	Detailed message from the CFML interpreter or specified in a <code>cfthrow</code> tag. When the exception is generated by ColdFusion (and not <code>cfthrow</code> ), the message can contain HTML formatting and can help determine which tag threw the exception.
<code>cfcatch.tagcontext</code>	An array of tag context structures, each representing one level of the active tag context at the time of the exception.
<code>cfcatch.NativeErrorCode</code>	Applies to <code>type="database"</code> . Native error code associated with exception. Database drivers typically provide error codes to diagnose failing database operations. Default value is -1.
<code>cfcatch.SQLState</code>	Applies to <code>type="database"</code> . SQLState associated with exception. Database drivers typically provide error codes to help diagnose failing database operations. Default value is -1.
<code>cfcatch.Sql</code>	Applies to <code>type="database"</code> . The SQL statement sent to the data source.
<code>cfcatch.queryError</code>	Applies to <code>type="database"</code> . The error message as reported by the database driver.
<code>cfcatch.where</code>	Applies to <code>type="database"</code> . If the query uses the <code>cfqueryparam</code> tag, query parameter name-value pairs.
<code>cfcatch.ErrNumber</code>	Applies to <code>type="expression"</code> . Internal expression error number.
<code>cfcatch.MissingFileName</code>	Applies to <code>type="missingInclude"</code> . Name of file that could not be included.
<code>cfcatch.LockName</code>	Applies to <code>type="lock"</code> . Name of affected lock (if the lock is unnamed, the value is "anonymous").
<code>cfcatch.LockOperation</code>	Applies to <code>type="lock"</code> . Operation that failed (Timeout, Create Mutex, or Unknown).
<code>cfcatch.ErrorCode</code>	Applies to <code>type="custom"</code> . String error code.
<code>cfcatch.ExtendedInfo</code>	Applies to <code>type="application"</code> and <code>"custom"</code> . Custom error message; information that the default exception handler does not display.

### Example

```
<!--- The cfcatch example that uses TagContext to display the tag stack. --->
<h3>cftry Example</h3>
<!--- Open a cftry block. --->
<cftry>
    <!--- Notice misspelled tablename "employees" as "employeeas". --->
    <cfquery name = "TestQuery" dataSource = "cfdocexamples">
        SELECT *
        FROM employeeas
    </cfquery>
    <!--- Other processing goes here. --->
    <!--- Specify the type of error for which we search. --->
    <cfcatch type = "Database">
        <!--- The message to display. --->
        <h3>You've Thrown a Database <b>Error</b></h3>
        <cfoutput>
            <!--- The diagnostic message from ColdFusion. --->
            <p>#cfcatch.message#</p>
            <p>Caught an exception, type = #CFCATCH.TYPE#</p>
            <p>The contents of the tag stack are:</p>
            <cfdump var="#cfcatch.tagcontext#">
        </cfoutput>
    </cfcatch>
</cftry>
```

## cfchart

### Description

Generates and displays a chart.

### Category

[Data output tags](#), [Extensibility tags](#)

## Syntax

```
<!--- This syntax uses an XML file or string to specify the chart style. --->
<cfchart

    yAxisType = "scale|category"
    yOffset = "number between -1 and 1">
</cfchart>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfchartdata](#), [cfchartseries](#), [cfdocument](#), Controlling chart appearance in the *Developing ColdFusion Applications*

## History

ColdFusion 8:

- Added the new attribute `showLegend` to the chart style files, which are the XML files located in the `charting\styles` directory- This attribute displays an entry for each point and is applicable only to charts that contain a single series. By default, the value of `showLegend` is set to `true`. To turn off this feature, you can either modify the setting in all the chart style files, or use a custom style file.

ColdFusion MX 7.01: Changed documentation to state that the `fontSize` attribute can accept a number that is not an integer.

ColdFusion MX 7:

- Added `style` and `title` attributes.
- Added support for eight-digit hexadecimal values to specify RGB color and transparency.
- Removed the `rotated` attribute.

ColdFusion MX 6.1:

- Added the `xAxisType` and `yAxisType` attributes.
- Changed interpolation behavior: the tag now interpolates data points on line charts with multiple series.

ColdFusion MX: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
<code>backgroundColor</code>	Optional		Color of the area between the data background and the chart border, around labels and around the legend.  Hexadecimal value or supported named color; see the name list in Usage. For a hexadecimal value, use the form " <code>##xxxxxx</code> " or " <code>##xxxxxxxx</code> ", where x = 0-9 or A-F; use two number signs or none.
<code>chartHeight</code>	Optional	240	Chart height; integer number of pixels.
<code>chartWidth</code>	Optional	320	Chart width; integer number of pixels.
<code>dataBackgroundColor</code>	Optional	<code>white</code>	Color of area around chart data.  Hexadecimal value or supported named color; see the name list in the Usage section.  For a hexadecimal value, use the form " <code>##xxxxxx</code> " or " <code>##xxxxxxxx</code> ", where x = 0-9 or A-F; use two number signs or none.
<code>font</code>	Optional	<code>arial</code>	Name of text font: <ul style="list-style-type: none"><li><code>arial</code></li><li><code>times</code></li><li><code>courier</code></li><li><code>arialunicodeMS</code>. This option is required, if you are using a double-byte character set on UNIX, or using a double-byte character set in Windows with a file type of Flash.</li></ul>

Attribute	Req/Opt	Default	Description
fontBold	Optional	no	Whether to make the text bold: <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul>
fontItalic	Optional	no	Whether to make the text italicized: <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul>
fontSize	Optional	11	Font size. If the number is not an integer, ColdFusion rounds the number up to the next integer.
foregroundColor	Optional	black	Color of text, grid lines, and labels.  Hexadecimal value or supported named color; see name list in the Usage section.  For a hexadecimal value, use the form "##xxxxxx" or "##xxxxxxxx", where x = 0-9 or A-F; use two number signs or none.
format	Optional	flash	File format in which to save the graph: <ul style="list-style-type: none"> <li>• flash</li> <li>• jpg</li> <li>• png</li> </ul>
gridlines	Optional	10, including top and bottom	Number of grid lines to display on the value axis, including axis; positive integer.
labelFormat	Optional	number	Format for y-axis labels: <ul style="list-style-type: none"> <li>• number</li> <li>• currency</li> <li>• percent</li> <li>• date</li> </ul>
markerSize	Optional	(Automatic)	Size of data point marker in pixels; integer.
name	Optional		Page variable name; string. Generates the graph as binary data and assigns it to the specified variable. Suppresses chart display. You can use the name value in the cffile tag to write the chart to a file.
pieSliceStyle	Optional	sliced	Applies to the cfchartseriestype attribute value pie. <ul style="list-style-type: none"> <li>• solid: displays pie as if unsliced.</li> <li>• sliced: displays pie as if sliced.</li> </ul>
scaleFrom	Optional	Determined by data	Y-axis minimum value; integer.
scaleTo	Optional	Determined by data	Y-axis maximum value; integer.

Attribute	Req/Opt	Default	Description
seriesPlacement	Optional	default	Relative positions of series in charts that have more than one data series. <ul style="list-style-type: none"> <li>default: ColdFusion determines relative positions, based on graph types</li> <li>cluster</li> <li>stacked</li> <li>percent</li> </ul>
show3D	Optional	yes	Whether to display the chart with three-dimensional appearance: <ul style="list-style-type: none"> <li>yes</li> <li>no</li> </ul>
showBorder	Optional	no	Whether to display a border around the chart: <ul style="list-style-type: none"> <li>yes</li> <li>no</li> </ul>
showLegend	Optional	yes	Whether to display the legend if the chart contains more than one data series: <ul style="list-style-type: none"> <li>yes</li> <li>no</li> </ul>
showMarkers	Optional	yes	Whether to display markers at data points in line, curve, and scatter graphs: <ul style="list-style-type: none"> <li>yes</li> <li>no</li> </ul>
showXGridlines	Optional	no	Whether to display x-axis gridlines: <ul style="list-style-type: none"> <li>yes</li> <li>no</li> </ul>
showYGridlines	Optional	yes	Whether to display y-axis gridlines: <ul style="list-style-type: none"> <li>yes</li> <li>no</li> </ul>
sortXAxis	Optional	no	Whether to display column labels in alphabetic order along the x axis: <ul style="list-style-type: none"> <li>yes</li> <li>no</li> </ul> Ignored if the <code>xAxisType</code> attribute is <code>scale</code> .
style	Optional		XML file or string to use to specify the style of the chart.
title	Optional		Title of the chart.
tipbgcolor	Optional	white	Background color of tips. Applies only to Flash format graph files.  Hexadecimal value or supported named color; see the name list in the Usage section.  For a hexadecimal value, use the form " <code>##xxxxxx</code> ", where <code>x</code> = 0-9 or A-F; use two number signs or none.

Attribute	Req/Opt	Default	Description
tipStyle	Optional	mouseOver	<p>Determines the action that opens a pop-up window to display information about the current chart element.</p> <ul style="list-style-type: none"> <li>• <code>mouseDown</code>: display if the user positions the cursor at the element and clicks the mouse. Applies only to Flash format graph files. (For other formats, this option functions the same as <code>mouseOver</code>.)</li> <li>• <code>mouseOver</code>: displays if the user positions the cursor at the element.</li> <li>• <code>none</code>: suppresses display.</li> </ul>
url	Optional		<p>URL to open if the user clicks item in a data series; the <code>onClick</code> destination page.</p> <p>You can specify variables within the URL string; ColdFusion passes current values of the variables.</p> <ul style="list-style-type: none"> <li>• <code>\$VALUE\$</code>: the value of the selected row. If none, the value is an empty string.</li> <li>• <code>\$ITEMLABEL\$</code>: the label of the selected item. If none, the value is an empty string.</li> <li>• <code>\$SERIESLABEL\$</code>: the label of the selected series. If none, the value is an empty string, for example: "somepage.cfm?item=\$ITEMLABEL\$&amp;series=\$SERIESLABEL\$&amp;value=\$VALUE\$"</li> <li>• <code>"javascript:..."</code>: executes a client-side script.</li> </ul>
xAxisTitle	Optional		Title that appears on the x axis; text.
xAxisType	Optional	category	<p>Whether the x axis indicates data or is numeric:</p> <ul style="list-style-type: none"> <li>• <code>category</code>: The axis indicates the data category. Data is sorted according to the <code>sortXAxis</code> attribute.</li> <li>• <code>scale</code>: The axis is numeric. All <code>cfchartdataitem</code> attribute values must be numeric. The x axis is automatically sorted numerically.</li> </ul>
xOffset	Optional	0.1	Number of units by which to display the chart as angled, horizontally. Applies if <code>show3D="yes"</code> . The number can be between -1 and 1, where "-1" specifies 90 degrees left and "1" specifies 90 degrees right.
yAxisTitle	Optional		Title of the y axis; text.
yAxisType	Optional	category	Currently has no effect, as the y axis is always used for data values.
yOffset	Optional	0.1	Number of units by which to display the chart as angled, vertically. Applies if <code>show3D="yes"</code> . The number can be between -1 and 1, where "-1" specifies 90 degrees left and "1" specifies 90 degrees right.

## Usage

The `cfchart` tag defines a *container* in which a graph displays: its height, width, background color, labels, and so on. The `cfchartseries` tag defines the chart style in which data displays: bar, line, pie, and so on. The `cfchartdata` tag defines a data point.

Data is passed to the `cfchartseries` tag in the following ways:

- As a query
- As data points, using the `cfchartdata` tag

For the `font` attribute value `ArialUnicodeMS`, the following rules apply:

- In Windows, to permit Flash charts (`type = "flash"`) to render a double-byte character set, select this value.
- In UNIX, for all `type` values, to render a double-byte character set, select this value.
- If this value is selected, the `fontBold` and `fontItalic` attributes have no effect.

The following table lists W3C HTML 4 named color value or hexadecimal values that the `color` attribute accepts:

Color name	RGB value
Aqua	##00FFFF
Black	#000000
Blue	##0000FF
Fuchsia	##FF00FF
Gray	##808080
Green	##008000
Lime	##00FF00
Maroon	##800000
Navy	##000080
Olive	##808000
Purple	##800080
Red	##FF0000
Silver	##C0C0C0
Teal	##008080
White	##FFFFFF
Yellow	##FFFF00

For all other color values, enter the hexadecimal value. You can enter a six-digit value, which specifies the RGB value, or an eight-digit value, which specifies the RGB value and the transparency. The first two digits of an eight-digit hexadecimal value specify the degree of transparency, with FF indicating opaque and 00 indicating transparent. Values between 00 and FF are allowed.

For more color names that are supported by popular browsers, go to [www.w3.org/TR/css3-color](http://www.w3.org/TR/css3-color).

You can specify whether charts are cached in memory, the number of charts to cache, and the number of chart requests that ColdFusion can process concurrently. To set these options in the ColdFusion Administrator, select Server Settings > Charting.

### Example

```
<!---The following example analyzes the salary data in the cfdocexamples database and
generates a bar chart showing average salary by department. The body of the
cfchartseries tag includes one cfchartdata tag to include data that is not available
from the query. --->

<!--- Get the raw data from the database. --->
<cfquery name="GetSalaries" datasource="cfdocexamples">
    SELECT Departmt.Dept_Name,
           Employee.Dept_ID,
           Employee.Salary
    FROM Departmt, Employee
    WHERE Departmt.Dept_ID = Employee.Dept_ID
</cfquery>

<!--- Use a query of queries to generate a new query with --->
<!--- statistical data for each department. --->
<!--- AVG and SUM calculate statistics. --->
<!--- GROUP BY generates results for each department. --->
<cfquery dbtype = "query" name = "DataTable">
    SELECT Dept_Name,
           AVG(Salary) AS avgSal,
           SUM(Salary) AS sumSal
    FROM GetSalaries
    GROUP BY Dept_Name
</cfquery>

<!--- Reformat the generated numbers to show only thousands. --->
<cfloop index = "i" from = "1" to = "#DataTable.RecordCount#">
    <cfset DataTable.sumSal[i] = Round(DataTable.sumSal[i]/1000)*1000>
    <cfset DataTable.avgSal[i] = Round(DataTable.avgSal[i]/1000)*1000>
</cfloop>

<h1>Employee Salary Analysis</h1>
<!--- Bar graph, from Query of Queries --->
<cfchart format="flash"
    xaxistitle="Department"
    yaxistitle="Salary Average">

    <cfchartseries type="bar"
        query="DataTable"
        itemcolumn="Dept_Name"
        valuecolumn="avgSal">

        <cfchartdata item="Facilities" value="35000">

    </cfchartseries>
</cfchart>
```

## cfchartdata

### Description

Used with the [cfchart](#) and [cfchartseries](#) tags. This tag defines chart data points. Its data is submitted to the [cfchartseries](#) tag.

## Category

[Data output tags](#), [Extensibility tags](#)

## Syntax

```
<cfchartdata  
    item = "text"  
    value = "number">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfchart](#), [cfchartseries](#); [Creating Charts and Graphs in the Developing ColdFusion Applications](#)

ColdFusion MX: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
item	Required		Data point name; string.
value	Required		Data point value; number or expression.

## Example

```
<!--- The following example analyzes the salary data in the cfdocexamples  
database and generates a bar chart showing average salary by department. The  
body of the cfchartseries tag loops over a cfchartdata tag to include data  
available from the query. --->
```

```
<!--- Get the raw data from the database. --->  
<cfquery name="GetSalaries" datasource="cfdocexamples">  
    SELECT Departmt.Dept_Name,  
           Employee.Dept_ID,  
           Employee.Salary  
    FROM Departmt, Employee  
    WHERE Departmt.Dept_ID = Employee.Dept_ID  
</cfquery>  
  
<!--- Use a query of queries to generate a new query with --->  
<!--- statistical data for each department. --->  
<!--- AVG and SUM calculate statistics. --->  
<!--- GROUP BY generates results for each department. --->  
<cfquery dbtype = "query" name = "DataTable">  
    SELECT Dept_Name,  
           AVG(Salary) AS avgSal,  
           SUM(Salary) AS sumSal  
    FROM GetSalaries  
    GROUP BY Dept_Name  
</cfquery>
```

```
<!--- Reformat the generated numbers to show only thousands. --->  
<cfloop index = "i" from = "1" to = "#DataTable.RecordCount#">
```

```
<cfset DataTable.sumSal[i] = Round(DataTable.sumSal[i]/1000)*1000>
<cfset DataTable.avgSal[i] = Round(DataTable.avgSal[i]/1000)*1000>
</cfloop>

<h1>Employee Salary Analysis</h1>
<!-- Bar graph, from Query of Queries. --->
<cfchart format="flash"
xaxisitle="Department"
yaxisitle="Salary Average">

<cfchartseries type="bar"
itemcolumn="Dept_Name"
valuecolumn="avgSal">

<cfloop query="DataTable">
<cfchartdata item="#DataTable.Dept_Name#" value="#DataTable.avgSal#">
</cfloop>

</cfchartseries>
</cfchart>
```

## cfchartseries

### Description

Used with the `cfchart` tag. This tag defines the chart style in which the data displays: bar, line, pie, and so on.

### Category

[Data output tags](#), [Extensibility tags](#)

### Syntax

```
<cfchartseries
  type="type"
  itemColumn="query column"
  valueColumn="query column"
  colorlist = "list"
  dataLabelStyle="style"
  markerStyle="style"
  paintStyle="plain|raise|shade|light"
  query="query name"
  seriesColor="hexadecimal value|web color"
  seriesLabel="label text">
</cfchartseries>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfchart](#), [cfchartdata](#); Creating Charts and Graphs in the *Developing ColdFusion Applications*

### History

ColdFusion MX 7:

- Added the `dataLabelStyle` attribute.

- Added the `horizontalbar` value of the `type` attribute.

ColdFusion MX 6.1: Changed interpolation behavior: the tag now interpolates data points on line charts with multiple series.

ColdFusion MX: Added this tag.

### Attributes

Attribute	Req/Opt	Default	Description
<code>type</code>	Required		<p>Sets the chart display style:</p> <ul style="list-style-type: none"> <li>• <code>bar</code></li> <li>• <code>line</code></li> <li>• <code>pyramid</code></li> <li>• <code>area</code></li> <li>• <code>horizontalbar</code></li> <li>• <code>cone</code></li> <li>• <code>curve</code></li> <li>• <code>cylinder</code></li> <li>• <code>step</code></li> <li>• <code>scatter</code></li> <li>• <code>pie</code></li> </ul>
<code>itemColumn</code>	Required if <code>query</code> attribute is specified		Name of a column in the query specified in the <code>query</code> attribute; contains the item label for a data point to graph.
<code>valueColumn</code>	Required if <code>query</code> attribute is specified		Name of a column in the query specified in the <code>query</code> attribute; contains data values to graph.
<code>colorlist</code>	Optional		<p>Sets colors for each data point. Applies if the <code>cfchartseriestype</code> attribute is <code>pie</code>, <code>pyramid</code>, <code>area</code>, <code>horizontalbar</code>, <code>cone</code>, <code>cylinder</code>, or <code>step</code>.</p> <p>Comma-delimited list of hexadecimal values or supported, named web colors; see the name list and information about six- and eight-digit hexadecimal values in the <a href="#">cfchart</a> Usage section.</p> <p>For a hexadecimal value, use the form "<code>#####</code>" or "<code>#####</code>", where x = 0-9 or A-F; use two number signs or none.</p>
<code>dataLabelStyle</code>	Optional	<code>none</code>	<p>Specifies the way in which the color is applied to the item in the series:</p> <ul style="list-style-type: none"> <li>• <code>none</code>: nothing is printed.</li> <li>• <code>value</code>: the value of the datapoint.</li> <li>• <code>rowLabel</code>: the row's label.</li> <li>• <code>columnLabel</code>: the column's label.</li> <li>• <code>pattern</code>: combination of column label, value, and aggregate information, such as the <code>columnLabel</code> value for the percentage of total graph, for example, <code>Sales 55,000 20% of 277,000</code>.</li> </ul>

Attribute	Req/Opt	Default	Description
markerStyle	Optional	rectangle	Sets the icon that marks a data point for two-dimensional line, curve, and scatter graphs: <ul style="list-style-type: none"> <li>rectangle</li> <li>triangle</li> <li>diamond</li> <li>circle</li> <li>letter</li> <li>mcross</li> <li>snow</li> <li>rcross</li> </ul>
paintStyle	Optional	plain	Sets the paint display style of the data series: <ul style="list-style-type: none"> <li>plain: solid color.</li> <li>raise: the appearance of a button.</li> <li>shade: gradient fill, darker at the edges.</li> <li>light: a lighter shade of color; gradient fill.</li> </ul>
query	Optional		Name of the ColdFusion query from which to get data to graph.
seriesColor	Optional		Color of the main element (such as the bars) of a chart. For a pie chart, the color of the first slice.  Hexadecimal value or supported named color; see the name list and information about six- and eight-digit hexadecimal values in the Usage section for the <a href="#">cfchart</a> tag.  For a hexadecimal value, use the form " <code>##xxxxxx</code> " or " <code>##xxxxxxxxxx</code> ", where x = 0-9 or A-F; use two number signs or none.
seriesLabel	Optional		Text of the data series label

### Usage

For a pie chart, ColdFusion sets pie slice colors as follows:

- If the `seriesColor` attribute is omitted, ColdFusion automatically determines the colors of the slices.
- If the `seriesColor` attribute is specified, ColdFusion automatically determines the colors of the slices after the first one, starting with the specified color for the first slice.

### Example

<!-- The following example analyzes the salary data in the cfdocexamples database and generates a bar chart showing average salary by department. -->

```
<!-- Get the raw data from the database. -->
<cfquery name="GetSalaries" datasource="cfdocexamples">
    SELECT Departmt.Dept_Name,
           Employee.Dept_ID,
           Employee.Salary
    FROM Departmt, Employee
    WHERE Departmt.Dept_ID = Employee.Dept_ID
</cfquery>

<!-- Use a query of queries to generate a new query with -->
<!-- statistical data for each department. -->
<!-- AVG and SUM calculate statistics. -->
<!-- GROUP BY generates results for each department. -->
<cfquery dbtype = "query" name = "DataTable">
    SELECT
    Dept_Name,
    AVG(Salary) AS avgSal,
    SUM(Salary) AS sumSal
    FROM GetSalaries
    GROUP BY Dept_Name
</cfquery>

<!-- Reformat the generated numbers to show only thousands. -->
<cfloop index = "i" from = "1" to = "#DataTable.RecordCount#">
<cfset DataTable.sumSal[i] = Round(DataTable.sumSal[i]/1000)*1000>
<cfset DataTable.avgSal[i] = Round(DataTable.avgSal[i]/1000)*1000>
</cfloop>

<h1>Employee Salary Analysis</h1>
<!-- Bar graph, from Query of Queries -->
<cfchart format="flash"
xaxisitle="Department"
yaxisitle="Salary Average">

<cfchartseries type="bar"
query="DataTable"
itemcolumn="Dept_Name"
valuecolumn="avgSal" />
</cfchart>
```

## cfcol

### Description

Defines table column header, width, alignment, and text. Used within a `cftable` tag.

### Category

[Data output tags](#)

## Syntax

```
<cfcol
    header = "column header text"
    text = "column text"
    align = "left|right|center"
    width = "number that indicates width of column">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfcontent](#), [cfoutput](#), [cftable](#); Performing file operations with `cftp` in the *Developing ColdFusion Applications*

## History

ColdFusion MX: Added the ability to construct dynamic `cfcol` statements.

## Attributes

Attribute	Req/Opt	Default	Description
header	Required		Column header text. To use this attribute, you must also use the <a href="#">cftablecolHeaders</a> attribute.
text	Required		Double-quotation mark-delimited text; determines what to display. Rules: same as for <code>cfoutput</code> sections. You can embed hyperlinks, image references, and input controls.
align	Optional	left	Column alignment: <ul style="list-style-type: none"> <li>• left</li> <li>• right</li> <li>• center</li> </ul>
width	Optional	20	Column width. If the length of data displayed exceeds this value, data is truncated to fit. To avoid this, use an HTML <code>table</code> tag.  If the surrounding <a href="#">cftable</a> tag includes the <code>htmltable</code> attribute, <code>width</code> specifies the percent of the table width and it does not truncate text; otherwise, <code>width</code> specifies the number of characters.

## Usage

At least one `cfcol` tag is required within the `cftable` tag. You must put `cfcol` and `cftable` tags adjacent in a page. The only tag that you can nest within the `cftable` tag is the `cfcol` tag. You cannot nest `cftable` tags.

To display the `cfcolheader` text, specify the `cfcolheader` and the `cftablecolHeader` attribute. If you specify either attribute without the other, the header does not display. No error is thrown.

### Example

```
<!--- This example shows the use of cfcol and cftable to align
      information returned from a query. --->
<!--- Query selects information from cfdocexamples data source. --->
<cfquery name = "GetEmployees" dataSource = "cfdocexamples">
    SELECT Emp_ID, FirstName, LastName, EMail, Phone, Department
    FROM Employees
</cfquery>
<html>
<body>
<h3>cfcol Example</h3>
<!--- Uses the HTMLTable attribute to display cftable as an HTML
      table, rather than PRE formatted information --->
<cftable
    query = "GetEmployees"
    startRow = "1" colSpacing = "3"
    HTMLTable colheaders>
<!--- Each cfcol tag sets the width of a column in the table,
      the header information, and the text/CFML for the cell. --->
    <cfcol header = "<b>ID</b>"
        align = "Left"
        width = 2
        text= "#Emp_ID#">
    <cfcol header = "<b>Name/Email</b>"
        align = "Left"
        width = 15
        text= "<a href = 'mailto:#{Email#}'>#{FirstName#} #{LastName#}</A>">
    <cfcol header = "<b>Phone Number</b>"
        align = "Center"
        width = 15
        text= "#Phone#">
</cftable>
```

## cfcollection

### Description

Creates and administers Verity or Solr search engine collections.

### Category

[Extensibility tags](#)

### Syntax

```
<cfcollection
    action = "action"
    categories = "yes|no"
    collection = "collection name"
    engine = "verity|solr"
    language = "language"
    name = "query name"
    path = "c">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfexecute](#), [cfindex](#), [cfobject](#), [cfreport](#), [cfsearch](#), [cfwddx](#)

### History

ColdFusion 9: Added the `engine` attribute (required for Solr support).

ColdFusion MX 7:

- Starting with ColdFusion MX 7, you cannot use the `cfcollection` tag to create alias names for existing collections. Because Verity maintains all the collection information, you cannot have two names point to the same collection.
- Removed reference to external collections.
- Deprecated the `map` and `repair` options of the `action` attribute. They might not work, and might cause an error, in later releases.
- Added `categories` attribute and `categorylist` action.
- Added `CATEGORIES`, `SIZE`, `DOCCOUNT`, and `LASTMODIFIED` to list of variables returned by the `list` action.
- Marked as obsolete the `MAPPED`, `ONLINE`, and `REGISTERED` variables returned by the `list` action.

ColdFusion MX:

- Changed the requirements for the `action` attribute: it is now required.
- Added the `action` attribute `list` value. It is the default.
- Changed the requirements for the `action` attribute value `map`: it is not necessary to specify the `action` attribute value `map`. (ColdFusion detects collections and creates maps collections as required.)
- Changed acceptable collection naming: this tag accepts collection names that include spaces.
- Changed Verity operations behavior: ColdFusion supports Verity operations on Acrobat PDF files.
- Changed thrown exceptions: this tag can throw the `SEARCHENGINE` exception.

## Attributes

Attribute	Req/Opt	Default	Description
action	Required; see Usage	list	<ul style="list-style-type: none"> <li><b>categorylist:</b> (Verity only) retrieves categories from the collection and indicates how many documents are in each one. Returns a structure of structures in which the category representing each substructure is associated with a number of documents. For a category in a category tree, the number of documents is the number at <i>or below</i> that level in the tree.</li> <li><b>create:</b> registers the collection with ColdFusion. If the collection is present, the tag creates a map to it. If the collection is not present, the tag creates it.</li> <li><b>delete:</b> unregisters a collection and deletes its directories.</li> <li><b>list:</b> returns a query result set, named from the <code>name</code> attribute value, of the attributes of the collections that are registered by ColdFusion. If you have Solr and Verity collections and omit the <code>engine</code> attribute, ColdFusion lists information for both types of collections.</li> <li><b>map:</b> creates a map to a collection. If the action is <code>create</code> and the collection exists, ColdFusion also creates a map to the collection.</li> <li><b>optimize:</b> optimizes the structure and contents of the collection for searching; recovers space. Causes collection to be taken offline, preventing searches and indexing.</li> <li><b>repair:</b> deprecated. Does nothing.</li> </ul>
categories	See Usage	no	<p>Used only for creating a collection:</p> <ul style="list-style-type: none"> <li><b>yes:</b> this collection includes support for categories.</li> <li><b>no:</b> this collection does not support categories.</li> </ul>
collection	See Usage		<ul style="list-style-type: none"> <li>A collection name. The name can include spaces.</li> </ul>
engine	Optional	verity	<p>The search engine for the collection:</p> <ul style="list-style-type: none"> <li><b>solr:</b> the Apache Lucene open source search engine</li> <li><b>verity:</b> the Verity search engine.</li> </ul> <p>For the <code>create</code> and <code>map</code> actions, the default is <code>verity</code>. For the <code>list</code> action, the default is to list all collections, Verity and Solr. For all other actions ColdFusion determines the collection type.</p>
language	See Usage	English	<p>For a list of options, see Usage.</p> <p>For languages other than English, Verity requires the appropriate (European or Asian) Verity Locales language pack.</p>
name	See Usage		Name for the query results returned by the <code>list</code> and <code>categorylist</code> actions.
path	See Usage		<p>Absolute path to a collection.</p> <p>To map an existing collection, specify a fully qualified path to the collection (not including the collection name); for example, "C:\MyCollections\".</p>

## Usage

With this tag you can

- Create Solr or Verity collections.
- Administer Solr or Verity collections created by this tag or the ColdFusion Administrator.
- Administer Verity collections that were created by a Verity application.

The following table shows the dependence relationships among this tag's attribute values:

This attribute is required, optional, or unnecessary (blank):	For this action attribute value:						
	list	create	map	optimize	repair	delete	category list
collection		Required	Required	Required	Required	Required	Required
path		Required	Required				
language		Optional	Optional				
name	Required						Required
categories							

The following examples show the structures returned by the `categorylist` action:

CATEGORIES	
blue	10
green	3
magenta	3
purple	2
CATEGORYTREES	
a/	10
a/b	10
a/b/c	10
a/b/c/subdir	3

The `list` action returns the following information in a result set that contains one row per collection:

Column	Contents
CATEGORIES	<ul style="list-style-type: none"> <li><code>yes</code>: the collection has category support enabled.</li> <li><code>no</code>: the collection does not have category support enabled.</li> </ul>
CHARSET	The character set of the collection.
CREATED	The date and time that the collection was created.
DOCCOUNT	The number of documents in this collection.
EXTERNAL	<ul style="list-style-type: none"> <li><code>yes</code>: the collection is external.</li> <li><code>no</code>: the collection is not external.</li> <li><code>not found</code>: the collection is registered but is not available in the defined path.</li> </ul>
LANGUAGE	The locale setting of the collection. This information is not available for K2Server collections.
LASTMODIFIED	The date and time that the collection was last changed.
MAPPED	Obsolete.

Column	Contents
NAME	The name of the collection.
ONLINE	Obsolete.
PATH	Absolute path to the collection.
REGISTERED	Obsolete.
SIZE	The size of the collection, expressed in kilobytes.

You can also specify `uni` to enable support for multiple languages.

If the Verity Server is not running when the `list` action is executed on a Verity collection, the tag throws an error.

To determine whether a collection exists, use code, such as the following, to execute a query of queries:

```
<cfcollection action="list" name="myCollections" >
<cfquery name="qoq" dbtype="query">
    SELECT * from myCollections
    WHERE myCollections.name = 'myCollectionName'
</cfquery>
<cfif qoq.recordcount GT 0>
    <!--- Collection exists --->
    <cfdump var = #qoq#>
</cfif>
```

The code determines whether a Verity collection exists as Verity is the default engine. You may also specify `engine="verity"` in the code.

To determine whether a Solr collection exists, you must specifically add the attribute `engine` and provide the value as `solr`. For example,

```
<cfcollection action="list" name="myCollections" engine="solr">
```

To get a result set with values for all the collections that are registered with the search server, use code such as the following:

```
<cfcollection action="list" name="myCollections">
<cfoutput query="myCollections">
    #name#<br>
</cfoutput>
```

To add content to a collection, use [cfindex](#). To search a collection, use [cfsearch](#).

You cannot delete Verity collections on Windows if they are created outside of the ColdFusion collections directory or on a drive other than C:, D: or E:. To use a different drive letter, edit the `cf_dir/verity/common/verity.cfg` file and replace an entry with the directory you wish to use as follows:

```
alias11=path6
mapping11=F:\
dirmode11=rw
```

Restart the ColdFusion Search Service for this change to take effect.

For Solr collections, the `language` attribute of this tag supports the following options:

Brazilian	cjk (Chinese, Japanese, Korean)	French	Russian
Czech	Dutch	German	Thai
Chinese	English	Greek	

For Verity collections, the `language` attribute of this tag supports the following options:

<b>Asian Language Pack</b>			
Japanese	Korean	Chinese	Traditional Chinese
<b>Multilanguage Language Pac</b>			
Unicode			
<b>Western European Language Pack</b>			
Bokmal	Finnish	Italian	Spanish
Danish	French	Nynorsk	Swedish
Dutch	German	Portuguese	
<b>Eastern European/Middle Eastern Language Pack</b>			
Arabic	Greek	Polish	Turkish
Bulgarian	Hebrew	Russian	
Czech	Hungarian	Russian2	

The default location for all collections is as follows:

- Server configuration:
  - Windows: C:\ColdFusion9\verity\collections
  - UNIX system: /opt/coldfusion9/verity/collections
- J2EE configuration: *webapp\_root*/WEB-INF/cfusion/verity/collections

### Example

```
<!-------
(coll_actn.cfm)
Check for server platform and use its default Verity Collection directory.
If you did not install ColdFusion in the default directory, or if you use
the J2EE configuration, or if your webroot is not C:\ColdFusion9\wwwroot, you
might need to change the path in this example. For example, for JRun4 the path
might be C:\JRun4\Verity\Collections\
----->
<cfif Find("Windows", Server.OS.Name)>
    <cfset collPath = "C:\JRun4\Verity\Collections\">
<cfelse>
    <cfset collpath = "/opt/coldfusion9/verity/collections/">
</cfif>

<!-------
Process form input and do the requested cfcollection operation.
----->

<cfif IsDefined("form.CollectionName") AND IsDefined("form.CollectionAction")>
    <cfif form.CollectionName is not "">
        <cfswitch expression="#FORM.CollectionAction#">

## cfcomponent

### Description

Creates and defines a component object; encloses functionality that you build in CFML and enclose in [cffunction](#) tags. This tag contains one or more [cffunction](#) tags that define methods. Code within the body of this tag, other than [cffunction](#) tags, is executed when the component is instantiated.

A component file has the extension CFC and is stored in any directory of an application.

A component method is invoked in the following ways:

- In the [cfinvoke](#) tag in a ColdFusion page
- In a URL that calls a CFC file and passes a method name as a URL parameter
- In the [cfscript](#) tag
- As a web service
- From Flash code

### Category

[Extensibility tags](#)

## Syntax

```
<cfcomponent
    accessors = "yes|no"
    alias = "ActionScript 3 type alias"
    bindingname = "binding element name"
    displayname = "string"
    extends = "component name"
    hint = "string"
    implements = "ColdFusion interface"
    mappedSuperClass = "yes|no"
    namespace = "default service namespace"
    output = "no value|no|yes"
    porttypename = "port type element name"
    Serializable = "yes|no"
    serviceaddress = "service URL"
    serviceportname = "port element name"
    style = "rpc|document"
    wsdlfile = "path">
    variable declarations
    <cffunction ...>
        ...
    </cffunction>

    <cffunction ...>
        ...
    </cffunction>
</cfcomponent>
```

## See also

## History

ColdFusion 9.0.1: Added the attribute `mappedSuperClass`

ColdFusion 9: Added the attributes `serializable` and `accessors`.

ColdFusion 8:

- Added the `implements` and `serviceaddress` attributes.
- Added support for the `onMissingMethod` function.

ColdFusion MX 7:

- Added support for publishing document-literal style web services.
- Added the `style`, `namespace`, `serviceportname`, `porttypename`, `wsdlfile`, `bindingname`, and `output` attributes.
- Extended functionality for the `hint` and `displayname` attributes when publishing document-literal style web services.

ColdFusion MX: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
accessors	Optional	yes (for persistent CFC) no for others	If set to <code>yes</code> , lets you invoke implicit getters and setters. For persistent CFC, <code>accessors</code> is always enabled.
alias	Optional		Specifies the <code>type</code> label to give the object when it is converted from CFML to ActionScript 3. It matches the <code>alias</code> attribute of AS3 types. This attribute applies only to Flash Remoting and LiveCycle Data Services value objects, and lets you work with typed objects in both ColdFusion and Flash.
bindingname	Optional		Specifies the <code>binding</code> attribute of the <code>port</code> element in the WSDL. If you don't specify this attribute, ColdFusion derives the value from the CFC class name.
displayname	Optional		A string that displays when you use introspection to show information about the CFC. The information appears on the heading, following the component name.
extends	Optional	WEB-INF.cftags.component	Name of parent component from which to inherit methods and properties. You can use the keyword <code>component</code> to specify the default value.
hint	Optional		Text that displays when you use introspection to show information about the CFC. The <code>hint</code> attribute value appears below the component name heading. Use this attribute to describe the purpose of the parameter.
implements	Optional		Name of the ColdFusion interface or interfaces that this component implements. If the component implements an interface, it must define all the functions in the interface, and the function definitions must conform to the definitions specified in the interface. For more information, see <a href="#">cfinterface</a> .  A component can implement any number of interfaces. To specify multiple interfaces, use a comma-delimited list with the format <code>interface1, interface2</code> .
mappedSuperClass Added in ColdFusion 9.0.1	Optional	no	If set to <code>yes</code> on a non-persistent CFC, child CFCs can inherit its properties. For example, you can define a base CFC with common properties such as <code>ID</code> , <code>version</code> , or <code>createdOn</code> which all other persistent CFCs would extend and thus get one common behavior.  <code>mappedSuperClass</code> cannot be set to <code>yes</code> on a persistent CFC.
namespace	Optional	class name	Specifies the namespace used in the WSDL for a CFC that is invoked as a web service. If you don't specify this attribute, ColdFusion derives the value from the CFC class name.
output	Optional	Component body displayable text that is processed as standard CFML	Specifies whether constructor code in the component can generate HTML output; does not affect output in the body of <code>cffunction</code> tags in the component. <ul style="list-style-type: none"> <li>• <code>yes</code>: Constructor code is processed as if it were within a <code>cfoutput</code> tag. Variable names surrounded by number signs (<code>#</code>) are automatically replaced with their values.</li> <li>• <code>no</code>: Constructor code is processed as if it were within a <code>cfsilent</code> tag.</li> <li>• If you do not specify this attribute, constructor code is processed as standard CFML. Any variables must be in <code>cfoutput</code> tags.</li> </ul>

Attribute	Req/Opt	Default	Description
porttypename	Optional		Specifies the <code>name</code> attribute of the <code>port</code> type element in the WSDL. If you don't specify this attribute, ColdFusion derives the value from the CFC class name.
serializable	Optional	true	Specifies whether this component can be serialized. If you set this value to <code>false</code> , the component and the data in the component's <code>This</code> and <code>Variables</code> scopes cannot be serialized, so they are not retained on session replication, and the component is in its default state.
serviceaddress	Optional	URL of the CFC	Specifies the SOAP URL of the web service. If you don't specify this attribute, ColdFusion uses the URL of the CFC in the WSDL service description. Use this attribute to specify the protocol, for example, by specifying a URL that starts with <code>https://</code> .  This attribute applies only for web services.
serviceportname	Optional		Specifies the <code>name</code> attribute of the <code>port</code> element in the WSDL. If you don't specify this attribute, ColdFusion derives the value from the CFC class name.
style	Optional	rpc	Specifies whether a CFC used for web services uses RPC-encoded style or document-literal style: <ul style="list-style-type: none"><li>• <code>rpc</code>: RPC-encoded style</li><li>• <code>document</code>: Document-literal style</li></ul>
wsdlfile	Optional		A properly formatted WSDL file to be used instead of WSDL generated by ColdFusion.

### Usage

If you specify the `extends` attribute, the data and methods of the parent component are available to CFC methods as if they were parts of the current component. If the `managerCFC` component extends the `employeeCFC` component, and the `employeeCFC` component has a `getEmployeeName` method, you can call this method by using the `managerCFC`, as follows:

```
<cfinvoke component="managerCFC" method="getEmployeeName" returnVariable="managerName"
EmployeeID=#EmpID#>
```

This tag requires an end tag.

If you specify `style="document"`, ColdFusion publishes the CFC as a document-literal style web service. For more information, see *Publishing document-literal style web services* in the *Developing ColdFusion Applications*.

CFCs support an `onMissingMethod` function. By defining an `onMissingMethod` function in the `cfcomponent` tag body in the CFC, you can handle calls to methods that are not implemented in the CFC. If an application calls a function that is not defined in the CFC, ColdFusion calls the `onMissingMethod` function and passes it the requested method's name and arguments. If you do not define an `onMissingMethod` function, a call to a method that is not defined in the CFC causes ColdFusion to throw an error that must be handled in the calling code.

The `onMissingMethod` function is useful for several purposes:

- To handle errors directly in the component, instead of requiring that each instance of code that calls the component handles them.
- To create a dynamic proxy, an object that can take arbitrary calls and dynamically determines the correct action.

The `onMissingMethod` function must have the following format:

```
<cffunction name="onMissingMethod">
    <cfargument name="missingMethodName" type="string">
    <cfargument name="missingMethodArguments" type="struct">
        code to handle call to nonexistent method
</cffunction>
```

**Note:** The argument name for `onMissingMethod` must not change.

### Example

```
<cfcomponent>
    <cffunction name="getEmp">
        <cfquery name="empQuery" datasource="cfdocexamples" >
            SELECT FIRSTNAME, LASTNAME, EMAIL
            FROM tblEmployees
        </cfquery>
        <cfreturn empQuery>
    </cffunction>

    <cffunction name="getDept">
        <cfquery name="deptQuery" datasource="cfdocexamples" >
            SELECT *
            FROM tblDepartments
        </cfquery>
        <cfreturn deptQuery>
    </cffunction>
</cfcomponent>
```

## cfcontent

### Description

Does either or both of the following:

- Sets the MIME content encoding header for the current page; if the encoding information includes a character encoding, sets the character encoding of generated output.
- Sends the contents of a file, or of a variable that contains binary data, as the page output.

To restrict this tag, use the settings in the ColdFusion Administrator > Security > Sandbox Security. For more information, see the Administrator online Help.

### Category

[Data output tags](#)

### Syntax

```
<cfcontent
    deleteFile = "yes|no"
    file = "filename"
    reset = "yes|no"
    type = "file type"
    variable = "variable name">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfcol](#), [cfheader](#), [cfhttp](#), [cfoutput](#), [cftable](#)

### History

ColdFusion 8: Changed the behavior of the tag if the `type` attribute is not specified and the `file` attribute is specified. Previously, ColdFusion assumed a default file type of `text/html`. Now, ColdFusion attempts to get the content type from the file.

ColdFusion MX 7: Added the `variable` attribute.

### Attributes

Attribute	Req/Opt	Default	Description
<code>deleteFile</code>	Optional	<code>no</code>	Applies only if you specify a file with the <code>file</code> attribute. <ul style="list-style-type: none"><li>• <code>yes</code>: deletes the file on the server after sending its contents to the client.</li><li>• <code>no</code>: leaves the file on the server.</li></ul>
<code>file</code>	Optional		Name of an on-disk or in-memory file whose contents provide the page output. The filename must start with a drive letter and a colon, or a forward or backward slash. When using ColdFusion in a distributed configuration, the <code>file</code> attribute must refer to a path on the system on which the web server runs. When you use this attribute, any other output on the current CFML page is ignored; only the contents of the file are sent to the client.

Attribute	Req/Opt	Default	Description
reset	Optional	yes	<p>If you specify a <code>file</code> or <code>variable</code> attribute, this attribute has no effect; otherwise, it does the following:</p> <ul style="list-style-type: none"> <li>• <code>yes</code>: discards output that precedes call to <code>cfcontent</code></li> <li>• <code>no</code>: preserves output that precedes call to <code>cfcontent</code>. In this case, all output is sent with the specified type.</li> </ul>
type	Optional		<p>The MIME content type of the page, optionally followed by a semicolon and the character encoding. By default, ColdFusion sends pages as <code>text/html</code> content type in the UTF-8 character encoding. However, if the <code>file</code> attribute is specified, ColdFusion attempts to get the content type from the file.</p> <p>The content type determines how the browser or client interprets the page contents.</p> <p>The following are some of the content type values that you can use:</p> <ul style="list-style-type: none"> <li>• <code>text/html</code></li> <li>• <code>text/plain</code></li> <li>• <code>application/x-shockwave-flash</code></li> <li>• <code>application/msword</code></li> <li>• <code>image/jpeg</code></li> </ul> <p>The following list includes commonly used character encoding values:</p> <ul style="list-style-type: none"> <li>• <code>utf-8</code></li> <li>• <code>iso-8859-1</code></li> <li>• <code>windows-1252</code></li> <li>• <code>us-ascii</code></li> <li>• <code>shift_jis</code></li> <li>• <code>iso-2022-jp</code></li> <li>• <code>euc-jp</code></li> <li>• <code>euc-kr</code></li> <li>• <code>big5</code></li> <li>• <code>euc-cn</code></li> <li>• <code>utf-16</code></li> </ul> <p>For example:</p> <pre>type = "text/html" type = "text/html; charset=ISO-8859-1"</pre>
variable	Optional		<p>Name of a ColdFusion binary variable whose contents can be displayed by the browser, such as the contents of a chart generated by the <code>cfchart</code> tag or a PDF or Excel file retrieved by a <code>cffile</code> <code>action="readBinary"</code> tag. When you use this attribute, any other output on the current CFML page is ignored; only the contents of the file are sent to the client.</p>

### Usage

To set the character encoding (character set) of generated output, including the page HTML, use code such as the following:

```
<cfcontent type="text/html; charset=ISO-8859-1">
```

When ColdFusion processes an HTTP request, it determines the character encoding to use for the data it returns in the HTTP response. By default, ColdFusion returns character data using the Unicode UTF-8 format, regardless of the value of an HTML meta tag in the page. You can use the `cfcontent` tag to override the default character encoding of the response. For example, to tell ColdFusion to return the page using Japanese EUC character encoding, use the `type` attribute, as follows:

```
<cfcontent type="text/html; charset=EUC-JP">
```

If you call the `cfcontent` tag from a custom tag, and you do not want the tag to discard the current page when it is called from another application or custom tag, set `reset = "no"`.

If a file delete operation is unsuccessful, ColdFusion throws an error.

Do not use this tag after the `cfflush` tag on a page, it has no effect or ColdFusion throws an error.

The following tag can force most browsers to display a dialog box that asks users whether they want to save the contents of the file specified by the `cfcontent` tag using the filename specified by the `filename` value. If the user selects to open the file, most browsers open the file in the related application, not the browser window.

```
<cfheader name="Content-Disposition" value="attachment; filename=filename.ext">
```

Some file types, such as PDF documents, do not use executable code and can display directly in most browsers. To request the browser to display the file directly, use a `cfheader` tag similar to the following:

```
<cfheader name="Content-Disposition" value="inline; filename=name.ext">
```

You can use any value for the `filename` part of the `filename` attribute, but the `ext` part must be the standard Windows extension for the file type.

For file types that might contain executable code, such as Microsoft Excel documents, most browsers always ask before opening the document. For these file types, the inline content disposition specification requests the browser to display the file directly if the user selects to open the file.

For more information on character encodings, see the following web pages:

- The page at [www.w3.org/International/O-charset.html](http://www.w3.org/International/O-charset.html) provides general information on character encodings and the web, and has several useful links.
- The page at [www.iana.org/assignments/character-sets](http://www.iana.org/assignments/character-sets) is a complete list of character sets names used on the Internet, maintained by the Internet Assigned Numbers Authority.
- ColdFusion uses the Java JCE for encoding support. The page at <http://java.sun.com/javase/6/docs/technotes/guides/intl/encoding.doc.html> lists the character encodings that JCE 6, and therefore ColdFusion, can interpret. This list uses Java internal names, not the IANA character encoding names that you use in the `SetEncoding` `charset` parameter and other ColdFusion attributes and parameters.

For a complete list of media types used on the Internet, see [www.iana.org/assignments/media-types/](http://www.iana.org/assignments/media-types/).

## Example

<!-- CFCONTENT Example 1

This example shows the use of cfcontent to return the contents of the CF Documentation page dynamically to the browser. You might need to change the path and/or drive letter depending on how ColdFusion is installed on your system. Notice that the graphics do not display and the hyperlinks do not work, because the html page uses relative filename references. The root of the reference is the ColdFusion page, not the location of the html page. --->

```
<cfcontent type = "text/html"
    file = "C:\ColdFusion9\wwwroot\cfdocs\dochome.htm"
    deleteFile = "no">
```

<!-- CFCONTENT Example 2

This example shows how the Reset attribute changes text output. Notice how the first text section ("This example shows how the Reset attribute changes output for text reset = "Yes":123) does NOT print out to the screen. --->

```
<p>This example shows how the Reset attribute changes output for text.</p>
<p>reset = "Yes": 123 <BR> <cfcontent type = "text/html" reset = "Yes">456</p>
<p>This example shows how the Reset attribute changes output for text.</p>
<p>reset = "No": 123 <BR> <cfcontent type = "text/html" reset = "No">456</p>
<!-- CFCONTENT Example 3
```

This example triggers a download of an Excel file. The user is prompted with an option to save the file or open it in the browser. --->

```
<cfheader name="Content-Disposition" value="inline; filename=acmesales03.xls">
    <cfcontent type="application/vnd.ms-excel" file="c:\temp\acmesales03.xls">
```

<!-- CFCONTENT Example 4

This example triggers a download of a Word document then deletes the original from the "temp" directory. The user is prompted with an option to save the file or open it in the browser. --->

```
<cfheader name="Content-Disposition" value="inline; filename=temp.doc">
<cfcontent type="application/msword" file="c:\temp\Cable.doc" deletefile="yes">
```

<!-- CFCONTENT Example 5

This example causes the browser to treat the HTML table as Excel data. Excel interprets the table format. Because Excel can include executable code, the browser prompts the user whether to save the file or open it in a browser. --->

```
<cfheader name="Content-Disposition" value="inline; filename=acmesalesQ1.xls">
<cfcontent type="application/vnd.msexcel">
```

```
<table border="2">
<tr><td>Month</td><td>Quantity</td><td>$ Sales</td></tr>
<tr><td>January</td><td>80</td><td> $245</td></tr>
<tr><td>February</td><td>100</td><td>$699</td></tr>
<tr><td>March</td><td>230</td><td> $2036</td></tr>
<tr><td>Total</td><td>=Sum(B2..B4)</td><td>=Sum(C2..C4)</td></tr>
</table>
```

## cfcontinue

### Description

Used within a cfloop tag. Returns processing to the top of a loop.

### Category

[Flow-control tags](#)

### Syntax

```
<cfcontinue>
```

### See also

[cfabort](#), [cfbreak](#), [cfexecute](#), [cfif](#), [cflocation](#), [cfloop](#), [cfthrow](#), [cftry](#); cfloop and cfbreak in the *Developing ColdFusion Applications*

### History

ColdFusion 9: Added the tag.

### Example

```
<!--- This shows the use of to return processing to the top of a loop when a condition is
met. --->
<!--- Select courses; use cfloop to find a condition; then break the loop. --->
<!--- Check that number is numeric. --->
<cfif IsDefined("form.course_number")>
    <cfif Not IsNumeric(form.course_number)>
        <cfabort>
    </cfif>
</cfif>
<cfquery name="GetCourses" datasource="cfdocexamples">
    SELECT *
    FROM Courses
    ORDER by course_number
</cfquery>
```

<p> This example uses CFLOOP to cycle through a query to find a value.  
(In our example, a list of values corresponding to courses in the cfdocexamples  
datasource). When the conditions of the query are met, CFBREAK stops the loop. </p>  
<p> Please enter a Course Number, and hit the "submit" button: </p>  
<form action="cfbreak.cfm" method="POST">  
 <select name="courseNum">  
 <cfoutput query="GetCourses">

```
        <option value="#course_number#">#course_number#
    </cfoutput>
</select>
    <input type="Submit" name="" value="Search on my Number">
</form>
<!-- If the courseNum variable is not defined, don't loop through the query.-->
<cfif IsDefined ("form.courseNum") IS "True">
<!-- Loop through query until value found, then use CFBREAK to exit query.-->
    <cfloop query="GetCourses">
        <cfif GetCourses.course_number IS form.courseNum>
            <cfoutput>
                <h4>Your Desired Course was found:</h4>
                <pre>#course_number# #descript#</pre>
            </cfoutput>
            <cfbreak>
        <cfelse>
            <br> Searching...
        </cfif>
    </cfloop>
</cfif>
```

## cfcookie

### Description

Defines web browser cookie variables, including expiration and security options.

### Category

[Forms tags](#), [Variable manipulation tags](#)

### Syntax

```
<cfcookie
    name = "cookie name"
    domain = ".domain"
    expires = "period"
    httponly = "yes|no"
    path = "URL"
    secure = "yes|no"
    value = "text">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfdump](#), [cfparam](#), [cfregistry](#), [cfsavecontent](#), [cfschedule](#), [cfset](#)

### History

ColdFusion MX 6.1:

- Changed the `expires` attribute: it now accepts a date time object.
- Cookie names can include all ASCII characters except commas, semicolons, or whitespace characters.

ColdFusion 9:

- Added the attribute `httponly`.

### Attributes

Attribute	Req/Opt	Default	Description
<code>name</code>	Required		Name of cookie variable. ColdFusion converts cookie names to all-uppercase. Cookie names set using this tag can include any printable ASCII characters except commas, semicolons, or white space characters.
<code>domain</code>	Required if <code>path</code> attribute is specified. Optional otherwise		<p>Domain in which cookie is valid and to which cookie content can be sent from the user's system. By default, the cookie is only available to the server that set it. Use this attribute to make the cookie available to other servers.</p> <p>Must start with a period. If the value is a subdomain, the valid domain is all domain names that end with this string. This attribute sets the available subdomains on the site on which the cookie can be used.</p> <p>For a <code>domain</code> value that ends in a country code, the specification must contain at least three periods; for example, ".mongo.state.us". For top-level domains, two periods are required; for example, ".mgm.com".</p> <p>You cannot use an IP address as a domain.</p>
<code>expires</code>	Optional	session only	<p>Expiration of cookie variable.</p> <ul style="list-style-type: none"> <li>• The cookie expires when the user closes the browser, that is, the cookie is "session only".</li> <li>• A date or date/time object (for example, 10/09/97).</li> <li>• A number of days (for example, 10, or 100).</li> <li>• <code>now</code>: deletes cookie from client cookie.txt file (but does not delete the corresponding variable the Cookie scope of the active page).</li> <li>• <code>never</code>: The cookie expires in 30 years from the time it was created (effectively never in web years).</li> </ul>
<code>httponly</code>	Optional		If <code>yes</code> , sets cookie as <code>httponly</code> so that it cannot be accessed using JavaScripts. Note that the browser must have <code>httponly</code> compatibility.
<code>path</code>	Optional		<p>URL, within a domain, to which the cookie applies; typically a directory. Only pages in this path can use the cookie. By default, all pages on the server that set the cookie can access the cookie.</p> <p><code>path = "/services/login"</code></p> <p>To specify multiple URLs, use multiple <code>cfcookie</code> tags.</p> <p>If you specify <code>path</code>, also specify <code>domain</code>.</p>
<code>secure</code>	Optional		<p>If browser does not support Secure Sockets Layer (SSL) security, the cookie is not sent. To use the cookie, the page must be accessed using the <code>https</code> protocol.</p> <ul style="list-style-type: none"> <li>• <code>yes</code>: Variable must be transmitted securely.</li> <li>• <code>no</code></li> </ul>
<code>value</code>	Optional		Value to assign to cookie variable. Must be a string or variable that can be stored as a string.

### Usage

If this tag specifies that a cookie is saved beyond the current browser session, the client browser writes or updates the cookie in its local cookies file. Until the browser is closed, the cookie resides in browser memory. If the `expires` attribute is not specified, the cookie is not written to the browser cookies file.

If you use this tag after the `cfflush` tag on a page, ColdFusion does not send the cookie to the browser; however, the value you set is available to ColdFusion in the Cookie scope during the browser session.

**Note:** You can also create a cookie that expires when the current browser session expires by using the `cfset` tag or a CFScript assignment statement to set a variable in the Cookie scope, as in `<cfset Cookie.mycookie="sugar">`. To get a cookie's value, refer to the cookie name in the Cookie scope, as in `<cfif Cookie.mycookie is "oatmeal">`.

You can use dots in cookie names, as the following examples show:

```
<cfcookie name="person.name" value="wilson, john">
<cfset cookie.person.lastname="Santiago">
```

To access cookies, including cookies that you set and all cookies that are sent by the client, use the Cookie scope. For example, to display the value of the `person.name` cookie set in the preceding code, use the following line:

```
<cfoutput>#cookie.person.name#</cfoutput>
```

### Example

```
<!--- This example shows how to set/delete a cfcookie variable. --->
<!--- Select users who have entered comments into a sample database. --->
<cfquery name = "GetAolUser" dataSource = "cfdocexamples">
    SELECT EMail, FromUser, Subject, Posted
    FROM Comments
</cfquery>
<html>
<body>
<h3>cfcookie Example</h3>
<!--- If the URL variable delcookie exists, set cookie expiration date
to NOW --->
<cfif IsDefined("url.delcookie") is True>
    <cfcookie name = "TimeVisited"
        value = "#Now()#"
        expires = "NOW">
<cfelse>
<!--- Otherwise, loop through list of visitors; stop when you match
the string aol.com in a visitor's e-mail address. --->
<cfloop query = "GetAolUser">
    <cfif FindNoCase("aol.com", Email, 1) is not 0>
        <cfcookie name = "LastAOLVisitor"
            value = "#Email#"
    </cfif>
</cfloop>
```

```
        expires = "NOW" >
    </cfif>
</cfloop>
<!--- If the timeVisited cookie is not set, set a value. --->
    <cfif IsDefined("Cookie.TimeVisited") is False>
        <cfcookie name = "TimeVisited"
            value = "#Now()#"
            expires = "10">
    </cfif>
</cfif>
<!--- Show the most recent cookie set. --->
<cfif IsDefined("Cookie.LastAOLVisitor") is "True">
    <p>The last AOL visitor to view this site was
    <cfoutput>#Cookie.LastAOLVisitor#</cfoutput>, on
    <cfoutput>#DateFormat(COOKIE.TimeVisited)#</cfoutput>
<!--- Use this link to reset the cookies. --->
<p><a href = "cfcookie.cfm?delcookie = yes">Hide my tracks</A>
<cfelse>
    <p>No AOL Visitors have viewed the site lately.
</cfif>
```

## Tags d-e

### cfdbinfo

#### Description

Lets you retrieve information about a data source, including details about the database, tables, queries, procedures, foreign keys, indexes, and version information about the database, driver, and JDBC.

#### Category

[Database manipulation tags](#)

#### Syntax

```
<cfdbinfo
    datasource="data source name"
    name="result name"
    type="dbnames|tables|columns|version|procedures|foreignkeys|index"
    dbname="database name"
    password="password"
    pattern="filter pattern"
    table="table name"
    username="username">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

#### See also

## History

ColdFusion 8: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
datasource	Optional		Datasource to use to connect to the database.
name	Required		Name to use to refer to the result.
type	Required		Type of information to get: <ul style="list-style-type: none"><li>• dbnames: database name and type</li><li>• tables: name, type, and remarks</li><li>• columns: name, SQL data type, size, decimal precision, default value, maximum length in bytes of a character or integer data type column, whether nulls are allowed, ordinal position, remarks, whether the column is a primary key, whether the column is a foreign key, the table that the foreign key refers to, the key name the foreign key refers to</li><li>• version: database product name and version, driver name and version, JDBC major and minor version</li><li>• procedures: name, type, and remarks</li><li>• foreignkeys: foreign key name and table, primary key name, delete, and update rules</li><li>• index: name, column on which the index is applied, ordinal position, cardinality, whether the row represents a table statistic or an index, number of pages used by the table or index, whether the index values are unique</li></ul>
dbname	Optional		Name of the database. Used only if the action = "This overrides the one mentioned as a part of datasource definition."
password	Optional		Password to connect to the database.
pattern	Optional		Used only if type = "tables", type = "columns", or type = "procedures". Specifies a filter to retrieve information about specific tables, columns, or stored procedures. Use an underline ( ) to represent a single wildcard character and a percent sign (%) to represent a wildcard of zero or more characters.
table	Required if type = "columns" or type = "foreignkeys" or type = "index"		Name of the table from which you retrieve information.
username	Optional	no	User name to connect to the database.

## Usage

Use the `cfdbinfo` tag to return a query object that contains information about a database. The query object varies, depending on the value that you specify in the `type` attribute. The following table lists the query object contents for each type:

Type	Column name	Description
dbnames	DATABASE_NAME	Name of the database.
	TYPE	Type of the database, whether schema or catalog.
tables	TABLE_NAME	Name of the table.
	TABLE_TYPE	Type of the table, including view, table, synonym, and system table.
	REMARKS	Remarks of the table.
columns	COLUMN_NAME	Name of the column.
	TYPE_NAME	SQL data type of the column.
	IS_NULLABLE	Whether the column allows nulls.
	IS_PRIMARYKEY	Whether the column is a primary key.
	IS_FOREIGNKEY	Whether the column is a foreign key.
	REFERENCED_PRIMARYKEY	If the column is a foreign key, the name of the table it refers to.
	REFERENCED_PRIMARYKEY_TABLE	If the column is a foreign key, the key name it refers to.
	COLUMN_SIZE	Size of the column
	DECIMAL_DIGITS	Number of digits to the right of the decimal point.
	COLUMN_DEFAULT_VALUE	Default value of column.
	CHAR_OCTET_LENGTH	Maximum length in bytes of a character or integer data type column.
	ORDINAL_POSITION	Ordinal position of the column.
	REMARKS	Remarks of the column.
version	DATABASE_VERSION	Version of the database management system.
	DATABASE_PRODUCTNAME	Name of the database management system.
	DRIVER_VERSION	Version of the database driver.
	DRIVER_NAME	Name of the database driver.
	JDBC_MAJOR_VERSION	Major version number of the driver.
	JDBC_MINOR_VERSION	Minor version number of the driver.
procedures	PROCEDURE_NAME	Name of the stored procedure.
	REMARKS	Remarks for the stored procedure.
	PROCEDURE_TYPE	Procedure type, which indicates whether the procedure returns a result.
foreignkeys	FKCOLUMN_NAME	Foreign key name.
	FKTABLE_NAME	Foreign key table name.
	PKCOLUMN_NAME	Primary key name.
	DELETE_RULE	Specifies what action to take when you delete a record that has dependent records.
	UPDATE_RULE	Specifies what action to take when you update a record that has dependent records.

Type	Column name	Description
index	INDEX_NAME	Name of the index, empty if type is table statistic.
	COLUMN_NAME	Name of the column on which the index is applied, empty if the type is table statistic.
	ORDINAL_POSITION	Ordinal position.
	CARDINALITY	Number of unique values if the type is index, or number of rows if the type is statistic
	TYPE	Whether the row represents a table statistic or an index. Index types are clustered, hashed, or other.
	PAGES	Number of pages used by the table if the type is table statistic, or the number of pages used by the index.
	NON_UNIQUE	Whether the index values are unique.

### Example

```
<cfset datasrc = "oratest">

<cfdbinfo
    type="dbnames"
    datasource="#datasrc#"
    name="dbdata">

<cfoutput>
The #datasrc# data source has the following databases:<br />
</cfoutput>
<table border="1">
<tr>
    <th valign="top" align="left">Database name</th><th>Type</th>
</tr>
    <cfoutput query="dbdata">
        <tr>
            <td>#dbdata.DATABASE_NAME#</td><td>#dbdata.TYPE#</td>
        </tr>
    </cfoutput>
</table>
```

## cfdefaultcase

### Description

Used only inside the [cfswitch](#) tag body. Contains code to execute when the expression specified in the [cfswitch](#) tag does not match the value specified by a [cfcase](#) tag.

### Category

[Flow-control tags](#)

### Syntax

```
<cfdefaultcase>
```

### See also

[cfcase](#), [cfswitch](#); [cfswitch](#), [cfcase](#), and [cfdefaultcase](#) in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed placement requirements: this tag does not have to follow all `cfcase` tags in the `cfswitch` tag body.

### Usage

The contents of the `cfdefaultcase` tag body executes if the `expression` attribute of the `cfswitch` tag does not match any of the values specified by the `cfcase` tags in the `cfswitch` tag body. The contents of the `cfdefaultcase` tag body can include HTML and text, and CFML tags, functions, variables, and expressions.

You can specify only one `cfdefaultcase` tag within a `cfswitch` tag. You can put the `cfdefaultcase` tag at any position within a `cfswitch` statement; it is not required to be the last item, but it is good programming practice to put it last.

### Example

```
<!--- The following example displays a grade based on a 1-10 score.
      Several of the cfcase tags match more than one score.
      For simplicity, the example sets the score to 7. --->
<cfset score="7">
<cfswitch expression="#score#">
    <cfcase value="10">
        <cfset grade="A">
    </cfcase>
    <cfcase value="9;8" delimiters=";">
        <cfset grade="B">
    </cfcase>
    <cfcase value="7;6" delimiters=";">
        <cfset grade="C">
    </cfcase>
    <cfcase value="5;4;" delimiters=";">
        <cfset grade="D">
    </cfcase>
    <cfdefaultcase>
        <cfset grade="F">
    </cfdefaultcase>
</cfswitch>
<cfoutput>
    Your grade is #grade#
</cfoutput>
```

## cfdirectory

### Description

Manages interactions with directories.

### Category

[File management tags](#)

## Syntax

```
<cfdirectory
  directory = "directory name"
  action = "list|create|delete|rename"
  filter = "list filter"
  listInfo = "name|all"
  mode = "permission"
  name = "query name"
  newDirectory = "new directory name"
  recurse = "yes|no"
  sort = "sort specification"
  storeACL = "S3_premissions"
  storeLocation = "location"
  type = "file|dir|all">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cffile](#)

## History

ColdFusion 9.0.1: Added the `storeACL` and `storeLocation` attributes.

ColdFusion 8: Added the `listinfo` and `type` attributes.

ColdFusion MX 7: Added the `recurse` attribute and `directory` result-set column.

ColdFusion MX:

❖ Changed behavior for `action = "list"`:

- On Windows, `cfdirectoryaction = "list"` no longer returns the directory entries "." (dot) or ".." (dot dot), which represent "the current directory" and "the parent directory."
- On Windows, `cfdirectoryaction = "list"` no longer returns the values of the `Archive` and `System` attributes.
- On UNIX and Linux, `cfdirectoryaction = "list"` does not return any information in the `mode` column.

## Attributes

Attribute	Req/Opt	Default	Description
directory	Required		Absolute pathname of directory against which to perform action.  You can use an IP address, as in the following example:  <pre>&lt;cfdirectory directory="//12.3.123.123/c_drive/" name="dirQuery" action="LIST"&gt;</pre>
action	Optional	list	<ul style="list-style-type: none"> <li>list: returns a query record set of the files in the specified directory. The directory entries "." (dot) and ".." (dot dot), which represent the current directory and the parent directory, are not returned.</li> <li>create</li> <li>delete</li> <li>rename</li> </ul>
filter	Optional if action = "list"		File extension filter applied to returned names, for example, *.cfm. One filter can be applied.
listinfo	Optional	all	<ul style="list-style-type: none"> <li>all: includes all information in the result set.</li> <li>name: includes only filenames in the result set.</li> </ul>
mode	Optional		Used with action = "create". Permissions. Applies only to UNIX and Linux. Octal values of chmod command. Assigned to owner, group, and other, respectively, for example: <ul style="list-style-type: none"> <li>644: assigns read/write permission to owner; read permission to group and other.</li> <li>777: assigns read/write/execute permission to all.</li> </ul>
name	Required if action = "list"		Name for output record set.
newDirectory	Required if action = "rename"		New name for directory.
recurse	Optional	no	Whether ColdFusion performs the action on subdirectories: <ul style="list-style-type: none"> <li>yes</li> <li>no</li> </ul> Valid for action="list" and action="delete".
sort	Optional; used if action = "list"	ASC	Query columns by which to sort a directory listing. Delimited list of columns from query output.  To qualify a column, use one of the following values: <ul style="list-style-type: none"> <li>asc: ascending (a to z) sort order.</li> <li>desc: descending (z to a) sort order.</li> </ul> For example: <pre>sort = "directory ASC, size DESC, datelastmodified"</pre>
storeACL	Optional; used if action = "create"		An array of struct where each struct represents a permission or grant.  For details, see Using Amazon S3 storage in <i>Developing Adobe ColdFusion 9 Applications</i>

Attribute	Req/Opt	Default	Description
StoreLocation	Optional; used if action = "create"	US	Used to change the location of the created bucket. The location can either be EU, US, or US-WEST.  For details, see Using Amazon S3 storage in <i>Developing Adobe ColdFusion 9 Applications</i> .
type	Optional	all	<ul style="list-style-type: none"><li>file: includes only filenames.</li><li>dir: includes only directory names.</li><li>all: includes both filenames and directory names.</li></ul>
storeLocation	Optional		Used to change the location of the created bucket. The location can either be EU or US. The default location is US.
storeACL	Optional		An array of struct where each struct represents a permission or grant.

### Usage

If you put ColdFusion applications on a server that is used by multiple customers, you must consider the security of files and directories that could be uploaded or otherwise manipulated with this tag by unauthorized users. For more information about securing ColdFusion tags, see *Configuring and Administering ColdFusion*.

If `action = "list"`, `cfdirectory` returns the following result columns, which you can reference in a `cfoutput` tag:

- name: Directory entry name. The entries "." and ".." are not returned.
- directory: Directory that contains the entry.
- size: Directory entry size.
- type: File type: file, for a file; dir, for a directory.
- dateLastModified: The date that an entry was last modified.
- attributes: File attributes, if applicable.
- mode: Empty column; retained for backward compatibility with ColdFusion 5 applications on UNIX.

Use the following result columns in standard CFML expressions, preceding the result column name with the query name:

```
#mydirectory.name#  
#mydirectory.directory#  
#mydirectory.size#  
#mydirectory.type#  
#mydirectory.dateLastModified#  
#mydirectory.attributes#  
#mydirectory.mode#
```

**Note:** If the `cfdirectory` tag does not appear to work, for example, if a list operation returns an empty result set, make sure that you have correct permissions to access the directory. For example, if you run ColdFusion as a service on Windows, it operates by default as System, and cannot access directories on a remote system or mapped drive; to resolve this issue, do not run ColdFusion using the local system account.

The `filter` attribute specifies a pattern of one or more characters. All names that match that pattern are included in the list. On Windows systems, pattern matching ignores text case, on UNIX and Linux, pattern matches are case-sensitive.

The following two characters have special meaning in the pattern and are called metacharacters:

- The asterisk (\*) matches any zero or more characters.

- The question mark (?) matches any single character.

The following table shows examples of patterns and filenames that they match:

Pattern	Matches
foo.*	Any file called foo with any extension; for example, foo.html, foo.cfm, and foo.xml.
*.html	All files with the suffix .html, but not files with the suffix .htm.
??	All files with two-character names.

### Example

```
<!--- EXAMPLE 1: Creating and Renaming
Check that the directory exists to avoid getting a ColdFusion error message. --->
<cfset newDirectory = "otherNewDir">
<cfset currentDirectory = GetDirectoryFromPath(GetTemplatePath()) & "newDir">
<!--- Check whether the directory exists. --->
<cfif DirectoryExists(currentDirectory)>
<!--- If yes, rename the directory. --->
    <cfdirectory action = "rename" directory = "#currentDirectory#"
        newDirectory = "#newDirectory#" >
    <cfoutput>
    <p>The directory existed and the name has been changed to: #newDirectory#</p>
    </cfoutput>
<cfelse>
    <!--- If no, create the directory. --->
    <cfdirectory action = "create" directory = "#currentDirectory#" >
    <cfoutput><p>Your directory has been created.</p></cfoutput>
</cfif>

<!--- EXAMPLE 2: Deleting a directory
Check that the directory exists and that files are not in the directory to avoid getting
ColdFusion error messages. --->

<cfset currentDirectory = GetDirectoryFromPath(GetTemplatePath()) & "otherNewDir">
<!--- Check whether the directory exists. --->
<cfif DirectoryExists(currentDirectory)>
    <!--- If yes, check whether there are files in the directory before deleting. --->
    <cfdirectory action="list" directory="#currentDirectory#"
        name="myDirectory">
    <cfif myDirectory.recordcount gt 0>
    <!--- If yes, delete the files from the directory. --->
        <cfoutput>
        <p>Files exist in this directory. Either delete the files or code
            something to do so.</P>
        </cfoutput>
    <cfelse>
    <!--- Directory is empty - just delete the directory. --->
        <cfdirectory action = "delete" directory = "#currentDirectory#">
        <cfoutput>
        <p>The directory existed and has been deleted.</P>
        </cfoutput>
    </cfif>
<cfelse>
    <!--- If no, post message or do some other function. --->
    <cfoutput><p>The directory did NOT exist.</p></cfoutput>
```

```
</cfif>
<!---EXAMPLE 3: List directories
The following example creates both an array of directory names and a query that contains entries
for the directories only. --->

<cfdirectory directory="C:/temp" name="dirQuery" action="LIST">

<!--- Get an array of directory names. --->
<cfset dirsArray=arraynew(1)>
<cfset i=1>
<cfloop query="dirQuery">
<cfif dirQuery.type IS "dir">
    <cfset dirsArray[i]=dirQuery.name>
    <cfset i = i + 1>
</cfif>
</cfloop>
<cfdump var="#dirsArray#">
<br>
<!--- Get all directory information in a query of queries.--->
<cfquery dbtype="query" name="dirsOnly">
SELECT * FROM dirQuery
WHERE TYPE='Dir'
</cfquery>
<cfdump var="#dirsOnly#">
```

## cfdiv

### Description

Creates an HTML `div` tag or other HTML container tag and lets you use asynchronous form submission or a bind expression to dynamically control the tag contents.

### Category

[Display management tags](#)

### Syntax

```
<cfdiv
    bind = "bind expression"
    bindOnLoad = "true|false"
    ID = "HTML tag ID"
    onBindError = "JavaScript function name"
    tagName = "HTML tag name"
/>

OR

<cfdiv
    ID = "HTML tag ID"
    tagName = "HTML tag name">
    tag body contents
</cfdiv>
```

If the tag does not have a body and end tag, close it with `/>` character combination.

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute name as structure key.

### See also

[cfajaximport](#), [cflayout](#), [cfpod](#), [cfwindow](#)

### History

ColdFusion 8: Added this tag

### Attributes

The following table lists attributes that ColdFusion uses directly. The tag passes any other attributes that you specify directly as tag attributes to the generated HTML tag.

Attribute	Req/Opt	Default	Description
<code>bind</code>	Optional		A bind expression that returns the container contents. If you specify this attribute the <code>cfdiv</code> tag cannot have a body.  <b>Note:</b> If a CFML page specified in this attribute contains tags that use AJAX features, such as <code>cfform</code> , <code>cfgrid</code> , and <code>cfwindow</code> , you must use a <code>cfajaximport</code> tag on the page with the <code>cfdiv</code> tag. For more information, see <a href="#">cfajaximport</a> .
<code>bindOnLoad</code>	Optional	<code>true</code>	<ul style="list-style-type: none"><li><b>true:</b> executes the <code>bind</code> attribute expression when first loading the tag.</li><li><b>false:</b> does not execute the <code>bind</code> attribute expression until the first bound event.</li></ul> To use this attribute, also specify a <code>bind</code> attribute.  For more information, see Using the <code>bindOnLoad</code> attribute in Using Ajax User Interface Components and Features in the <i>Developing ColdFusion Applications</i> .
<code>ID</code>	Optional		The HTML <code>ID</code> attribute value to assign to the generated container tag.
<code>onBindError</code>	Optional	See Description	The name of a JavaScript function to execute if evaluating a bind expression results in an error. The function must take two attributes: an HTTP status code and a message.  If you omit this attribute, and have specified a global error handler (by using the <a href="#">ColdFusion.setGlobalErrorHandler</a> function), it displays the error message; otherwise a default error pop-up window appears.  To use this attribute, also specify a <code>bind</code> attribute.
<code>tagName</code>	Optional	<code>DIV</code>	The HTML container tag to create.

### Usage

By default, the `cfdiv` tag creates a `div` HTML element. You can use standard HTML and CSS techniques to control the position and appearance of the element and its contents.

Use the `tagName` attribute to create and populate an HTML content element, such as `span` or `b`. Use the `cfdiv` tag to create tags that can take HTML markup content directly in the body, such as `span`, `i`, `b`, or `p`, and not for tags that cannot, such as `input`, `option`, and `frameset`.

If you submit a form that is inside a `cfdiv` tag (including in HTML returned by a bind expression), the form submits asynchronously, and the response from the form submission populates the `cfdiv` region.

If you specify a `bind` attribute, the tag dynamically populates the element using a bind expression. The bind expression can specify a CFC function, a JavaScript function, a URL, or a string that contains bind parameters. An animated icon and the text "Loading..." appears while the contents are being fetched. For detailed information on using the bind attribute and bind expressions, see *Using Ajax Data and Development Features* in the *Developing ColdFusion Applications*.

### Example

The following simple example shows how you can use the `cfdiv` tag. It uses binding to display the contents of a text input field in an HTML DIV region.

The `cfdivtag.cfm` file, the main application file, has the following contents.

```
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>cfdiv Example</title>
</head>

<body>
<cfform>
    <cfinput name="tinput1" type="text">
</cfform>

<h3> using a div</h3>
<cfdiv bind="url:divsource.cfm?InputText={tinput1}" ID="theDiv"
        style="background-color:##CCffFF; color:red; height:350"/>
</body>
</html>
```

The `divsource.cfm` file that defines the contents of the div region has the following code:

```
<h3>Echoing main page input:</h3>
<cfoutput>
    <cfif isdefined("url.InputText") AND url.InputText NEQ "">
        #url.InputText#
    <cfelse>
        No input
    </cfif>
</cfoutput>
```

To test the code, run the `cfdivtag.cfm` page, enter some text, and tab out of the text box or click outside the text box. The div region appears with a light blue background and red text, and when you exit the text box, it shows the text you entered.

## cfdocument

### Description

Creates PDF or FlashPaper output from a text block containing CFML and HTML.

### Category

[Data output tags](#)

## Syntax

```
<cfdocument
    format = "PDF|FlashPaper"
    authPassword = "authentication password"
    authUser = "authentication user name"
    backgroundVisible = "yes|no"
    bookmark = "yes|no"
    encryption = "128-bit|40-bit|none"
    filename = "filename"
    fontEmbed = "yes|no"
    formfields = "yes|no"
    formsType = "FDF|PDF|HTML|XML"
    localUrl = "yes|no"
    marginBottom = "number"
    marginLeft = "number"
    marginRight = "number"
    marginTop = "number"
    mimeType = "text/plain|application/xml|image/jpeg|image/png|image/bmp|image/gif"
    name = "output variable name"
    openpassword = "password to open protected documents"
    orientation = "portrait|landscape"
    overwrite = "yes|no"
    ownerPassword = "password"
    pageHeight = "page height in inches"
    pageType = "page type"
    pageWidth = "page width in inches"
    pdfa = "yes|no"
    permissions = "permission list"
    permissionspassword = "password to access restricted permissions"
    proxyHost = "IP address or server name for proxy host"
    proxyPassword = "password for the proxy host"
    proxyPort = "port of the proxy host"
    proxyUser = "user name for the proxy host"
    saveAsName = "PDF filename"
    scale = "percentage less than 100"
    src = "URL|pathname relative to web root"
    srcfile = "absolute pathname to a file"
    tagged = "yes|no"
    unit = "in|cm"
    userAgent = "HTTP user agent identifier"
    userPassword = "password">
    HTML and CFML code
</cfdocument>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## History

ColdFusion 9: Add ppt support to the `srcFile` attribute.

Added the following attributes to support conversion of a Word document to PDF or HTML using OpenOffice libraries:

- `formfields` attribute
- `formsType` attribute
- `openpassword` attribute
- `permissionspassword` attribute
- `pdfa` attribute
- `tagged` attribute

ColdFusion 8: Added the following attributes and variables:

- `bookmark` attribute
- `localUrl` attribute
- Ability to embed existing PDF forms by using the `cfpdfform` tag in the `cfdocument` tag.
- ColdFusion determines the MIME type of a source file based on the source filename, if the `mimeType` attribute is not specified.
- Ability to pass a PDF variable created with the `cfdocument` tag as the source for the `cfpdf` tag.
- `authPassword`, `authUser`, `proxyHost`, `proxyPassword`, `proxyPort`, `proxyUser`, and `userAgent` attributes
- `saveAsName` attribute
- `totalsectionpagecount` and `currentsectionpagenumber` scope variables.

ColdFusion MX 7.01: Added the `src`, `srcfile`, and `mimetype` attributes.

ColdFusion MX 7: Added this tag.

### Attributes

Attribute	Req/Opt	Default	Description
<code>authPassword</code>	Optional		Password sent to the target URL for Basic Authentication. Combined with <code>username</code> to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerebos authentication.
<code>authUser</code>	Optional		User name sent to the target URL for Basic Authentication. Combined with <code>password</code> to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerebos authentication.
<code>backgroundVisible</code>	Optional	no	Specifies whether the background prints when the user prints the document: <ul style="list-style-type: none"> <li>• <code>yes</code>: includes the background when printing.</li> <li>• <code>no</code>: does not includes the background when printing.</li> </ul>
<code>bookmark</code>	Optional	no	Specifies whether bookmarks are created in the document: <ul style="list-style-type: none"> <li>• <code>yes</code>: creates bookmarks.</li> <li>• <code>no</code>: does not create bookmarks.</li> </ul>

Attribute	Req/Opt	Default	Description
encryption	Optional	none	(format="PDF" only) Specifies whether the output is encrypted: <ul style="list-style-type: none"> <li>128-bit</li> <li>40-bit</li> <li>none</li> </ul>
filename	Optional		Pathname of a file to contain the PDF or FlashPaper output.  If you omit the filename attribute, ColdFusion displays the output in the browser.
fontEmbed	Optional	yes	Specifies whether ColdFusion embeds fonts in the output: <ul style="list-style-type: none"> <li>yes: embeds fonts.</li> <li>no: does not embed fonts.</li> <li>selective: embeds all fonts except Java fonts and core fonts.</li> </ul>
format	Required		Report format: <ul style="list-style-type: none"> <li>PDF</li> <li>FlashPaper</li> </ul>
formfields	Optional	yes	This attribute is available only if you have integrated OpenOffice with ColdFusion.  A Boolean value that specifies if form fields are exported as widgets or only their fixed print representation is exported.
formtype	Optional	FDF	This attribute is available only if you have integrated OpenOffice with ColdFusion.  Specifies the submitted format of a PDF form. It can be one of the following values: <ul style="list-style-type: none"> <li>FDF</li> <li>PDF</li> <li>HTML</li> <li>XML</li> </ul>
localUrl	Optional	no	Specifies whether to retrieve image files directly from the local drive: <ul style="list-style-type: none"> <li>yes: ColdFusion retrieves image files directly from the local drive rather than by using HTTP, HTTPS, or proxy.</li> <li>no: ColdFusion uses HTTP, HTTPS, or proxy to retrieve image files even if the files are stored locally.</li> </ul> For more information, see the "Using an image file URL" section.
marginBottom	Optional		Bottom margin in inches (default) or centimeters. To specify the bottom margin in centimeters, include the unit=cm attribute.
marginLeft	Optional		Left margin in inches (default) or centimeters. To specify the left margin in centimeters, include the unit=cm attribute.
marginRight	Optional		Right margin in inches (default) or centimeters. To specify the right margin in centimeters, include the unit=cm attribute.

Attribute	Req/Opt	Default	Description
marginTop	Optional		Top margin in inches (default) or centimeters. To specify the top margin in centimeters, include the <code>unit=cm</code> attribute.
contentType	Optional	text/html	MIME type of the source document. Supported MIME types are: <ul style="list-style-type: none"> <li>• text/html</li> <li>• text/plain</li> <li>• application/xml</li> <li>• image/bmp</li> <li>• image/jpeg</li> <li>• image/png</li> <li>• image/gif</li> </ul> If you do not specify this attribute explicitly, ColdFusion uses the filename to determine the MIME type.
name	Optional		Name of an existing variable into which the tag stores the PDF or FlashPaper output.
openpassword	Optional		This attribute is available only if you have integrated OpenOffice with ColdFusion.  Password required to open a password-protected document.
orientation	Optional	portrait	Page orientation: <ul style="list-style-type: none"> <li>• portrait</li> <li>• landscape</li> </ul>
overwrite	Optional	no	Specifies whether ColdFusion overwrites an existing file. Used in conjunction with the <code>filename</code> attribute.
ownerPassword	Optional		(format="PDF" only) Specifies the owner password.
pageHeight	Optional		Page height in inches (default) or centimeters. This attribute is only valid if <code>pageType=custom</code> . To specify page height in centimeters, include the <code>unit=cm</code> attribute.
pageType	Optional	letter	Page type into which ColdFusion generates the report: <ul style="list-style-type: none"> <li>• legal: 8.5 inches x 14 inches.</li> <li>• letter: 8.5 inches x 11 inches.</li> <li>• A4: 8.27 inches x 11.69 inches.</li> <li>• A5: 5.81 inches x 8.25 inches.</li> <li>• B4: 9.88 inches x 13.88 inches.</li> <li>• B5: 7 inches x 9.88 inches.</li> <li>• B4-JIS: 10.13 inches x 14.31 inches.</li> <li>• B5-JIS: 7.19 inches x 10.13 inches.</li> <li>• custom: custom height and width. If you specify custom, also specify the <code>pageHeight</code> and <code>pageWidth</code> attributes, can optionally specify <code>margin</code> attributes and whether the units are inches or centimeters.</li> </ul>

Attribute	Req/Opt	Default	Description
pageWidth	Optional		Page width in inches (default) or centimeters. This attribute is only valid if <code>pageType=custom</code> . To specify page width in centimeters, include the <code>unit=cm</code> attribute.
pdfa	Optional	no	This attribute is available only if you have integrated OpenOffice with ColdFusion.  A Boolean value that specifies if you need to create a PDF of type PDF/A-1 (ISO 19005-1:2005).
permissionpasswr	Optional		This attribute is available only if you have integrated OpenOffice with ColdFusion.  Password required to access restricted permissions. The restricted permissions are specified using the <code>permissions</code> attribute.
permissions	Optional		( <code>format="PDF"</code> only) Sets one or more of the following permissions: <ul style="list-style-type: none"> <li>• <code>AllowPrinting</code></li> <li>• <code>AllowModifyContents</code></li> <li>• <code>AllowCopy</code></li> <li>• <code>AllowModifyAnnotations</code></li> <li>• <code>AllowFillIn</code></li> <li>• <code>AllowScreenReaders</code></li> <li>• <code>AllowAssembly</code></li> <li>• <code>AllowDegradedPrinting</code></li> </ul> Separate multiple permissions with commas.
proxyHost	Optional		Host name or IP address of a proxy server to which to send the request.
proxyPassword	Optional		Password required by the proxy server.
proxyPort	Optional	80	The port to connect to on the proxy server.
proxyUser	Optional		User name to provide to the proxy server.
scale	Optional	Calculated by ColdFusion	Scale factor as a percentage. Use this option to reduce the size of the HTML output so that it fits on that paper. Specify a number less than 100.
saveAsName	Optional		( <code>format="PDF"</code> only) The filename that appears in the SaveAs dialog when a user saves a PDF file written to the browser.
src	Optional		URL or the relative path to the web root. You cannot specify both the <code>src</code> and <code>srcfile</code> attributes. The file must be in a browser-writable format such as, HTML, HTM, BMP, PNG, and so on.
srcfile	Optional		Absolute path of a file that is on the server. You cannot specify both the <code>src</code> and <code>srcfile</code> attributes. The file must be a PPT file, a Word file, or be in a browser-writable format such as, HTML, HTM, BMP, PNG, and so on.
tagged	Optional	no	This attribute is available only if you have integrated OpenOffice with ColdFusion.  A Boolean value that determines if the PDF is created using the Tagged PDF tag.

Attribute	Req/Opt	Default	Description
unit	Optional	in	Default unit for the <code>pageHeight</code> , <code>pageWidth</code> , and <code>margin</code> attributes: <ul style="list-style-type: none"><li>• <code>in</code>: inches.</li><li>• <code>cm</code>: centimeters.</li></ul>
userAgent	Optional	ColdFusion	Text to put in the HTTP User-Agent request header field. Used to identify the request client software.
userPassword	Optional		( <code>format="PDF"</code> only) Specifies a user password.

### Usage

Use the `cfdocument` tag to render HTML and CFML output into PDF or FlashPaper format. ColdFusion does not return HTML and CFML outside of the `<cfdocument></cfdocument>` pair.

The `cfdocument` tag can render HTML that supports the following standards:

- HTML 4.01
- XML 1.0
- DOM Level 1 and 2
- CSS1 and CSS2 (For more information, see the “Supported CSS styles” section).

The `cfdocument` tag does not support the Internet Explorer-specific HTML generated by Microsoft Word.

Use the following syntax in the `filename` attribute to specify an in-memory file, which is not written to disk. In-memory files speed processing of transient data.

```
ram:///filepath
```

The filepath can include directories, for example `ram:///petStore/tracking/ordersummary.pdf`. Create the directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files in the Developing ColdFusion Applications*.

You can use the `src`, `srcfile`, and `mimeType` attributes to create PDF or FlashPaper output from a specified file or URL. Use the `src` and `srcfile` attributes instead of using the `cfhttp` tag to display the result in the `cfdocument` tag. When you specify the `src` or `srcfile` attributes, do not include any other content inside the `cfdocument` tag: ColdFusion ignores the additional content.

The PDF or FlashPaper document returned by the `cfdocument` tag overwrites any previous HTML in the input stream and ignores any HTML after the `</cfdocument>` tag.

You cannot embed a `cfreport` tag in a `cfdocument` tag.

**Note:** If you notice that the header text is cropped in the `cfdocument` tag output, increase the value of the `marginTop` attribute.

### Supported CSS styles

The `cfdocument` tag supports the following CSS styles:

background	background-attachment	background-color	background-image
background-position	background-repeat	border	border-bottom
border-bottom-color	border-bottom-style (solid border only)	border-bottom-width	border-color

border-left	border-left-color	border-left-style (solid border only)	border-left-width
border-right	border-right-color	border-right-style (solid border only)	border-right-width
border-spacing	border-style (solid border only)	border-top	border-top-color
border-top-style (solid border only)	border-top-width	border-width	bottom
clear	clip	color	content (strings, counters only)
counter-increment	counter-reset	cursor	display
float	font	font-family	font-size
font-style	font-weight	height	left
letter-spacing	line-height	list-style-type	margin
margin-bottom	margin-left	margin-right	margin-top
outline	outline-color	outline-style (solid, dotted, dashed only)	outline-width
padding	padding-bottom	padding-left	padding-right
padding-top	page-break-after	page-break-before	page-break-inside
position	right	text-align (left, right, and center)	text-decoration
text-indent	top	unicode-bidi	vertical-align
visibility	white space (normal, nowrap only)	width	z-index

### Using an image file URL

For optimal performance and reliability, Adobe recommends that you specify a local file URL for images stored on the server. In the following example, the `cfdocument` tag requests the server for images over HTTP even though the image files are stored locally:

```
<cfdocument format="PDF">
  <table>
    <tr>
      <td>bird</td>
      <td><image src="images/bird.jpg"></td>
    </tr>
    <tr>
      <td>fruit</td>
      <td><image src="images/fruit.jpg"></td>
    </tr>
    <tr>
      <td>rose</td>
      <td><image src="images/rose.jpg"></td>
    </tr>
  </table>
</cfdocument>
```

Also, in some applications, the browser displays a Red X image error instead of the image in the browser. For better performance, and to avoid Red X image errors, set the `localUrl` attribute to `yes`:

```
<cfdocument localUrl="yes" format="PDF">
  <table>
    <tr>
      <td>bird</td>
      <td><image src="images/bird.jpg"></td>
    </tr>
    <tr>
      <td>fruit</td>
      <td><image src="images/fruit.jpg"></td>
    </tr>
    <tr>
      <td>rose</td>
      <td><image src="images/rose.jpg"></td>
    </tr>
  </table>
</cfdocument>
```

### Scope variables

When you use the `cfdocument` tag, ColdFusion creates a scope named `cfdocument`. This scope contains the following variables:

- `currentpagenumber`
- `totalpagecount`
- `totalsectionpagecount`
- `currentsectionpagenumber`

ColdFusion lets you use the scope variables inside any expression within a `cfdocumentitem` tag.

For example, you can use the `currentpagenumber` variable to place the section name on even pages and the chapter name on odd pages in the header, as follows:

```
<cfdocument format="flashpaper">
  <cfdocumentitem type="header" evalAtPrint="true">
    <cfif (cfdocument.currentpagenumber mod 2) is 0>
      <cfoutput>#cfdocument.totalpagecount#</cfoutput>
    <cfelse>
      <cfoutput>#cfdocument.currentpagenumber#</cfoutput>
    </cfif>
  </cfdocumentitem>
  ...
</cfdocument>
```

If you define the `cfdocumentsection` tag within the `cfdocument` tag, then specify the `totalsectionpagecount` variable as follows:

```
<cfdocument format="pdf">
  <cfdocumentitem type="header" evalatprint="true" >
    <cfif (cfdocument.currentpagenumber mod 2) is 0>
      <cfoutput>#cfdocument.totalpagecount#</cfoutput>
    <cfelse>
      <cfoutput>#cfdocument.currentpagenumber#</cfoutput>
    </cfif>
  <cfoutput>cfdocument.currentpagenumber :#cfdocument.currentpagenumber#</cfoutput>
  <cfoutput>cfdocument.totalpagecount :#cfdocument.totalpagecount#</cfoutput>
  <cfoutput>cfdocument.totalsectionpagecount :#cfdocument.totalsectionpagecount#</cfoutput>
  <cfoutput>cfdocument.currentsectionpagenumber
  :#cfdocument.currentsectionpagenumber#</cfoutput>
</cfdocumentitem>

<cfdocumentitem type="footer" evalatprint="true" >
  <cfif ! (cfdocument.currentpagenumber mod 2) is 0>
    <cfoutput>if#cfdocument.totalpagecount#</cfoutput>
  <cfelse>
    <cfoutput>else#cfdocument.currentpagenumber#</cfoutput>
  </cfif>
</cfdocumentitem>
<cfdocumentsection >Example Text
</cfdocumentsection>
</cfdocument>
```

## Bookmarks

ColdFusion 9 supports bookmarks. In the `cfdocument` tag, set the `bookmark` attribute to `yes`. Then specify the bookmark name for each `cfdocumentsection` tag.

The following example shows how to specify bookmarks for document sections:

```
<!--- This example creates two bookmarks named "Section 1" and "Section 2" in a PDF file. --->
<cfdocument format="pdf" bookmark="yes">
  <cfdocumentsection name="Section 1">
    <!--- Insert HTML content here. --->
  </cfdocumentsection>
  <cfdocumentsection name="Section 2">
    <!--- Insert HTML content here. --->
  </cfdocumentsection>
</cfdocument>
```

## Example

### Example 1

```
<!--- This example creates generates a FlashPaper document. --->
<cfdocument format="flashpaper">
<p>This is a document rendered by the cfdocument tag.</p>

<table width="50%" border="2" cellspacing="2" cellpadding="2">
<tr>
<td><strong>Name</strong></td>
<td><strong>Role</strong></td>
</tr>
<tr>
<td>Bill</td>
<td>Lead</td>
</tr>
<tr>
<td>Susan</td>
<td>Principal Writer</td>
</tr>
<tr>
<td>Adelaide</td>
<td>Part Time Senior Writer</td>
</tr>
<tr>
<td>Thomas</td>
<td>Full Time for 6 months</td>
</tr>
<tr>
<td>Michael</td>
<td>Full Time for 4 months</td>
</tr>
</table>
</cfdocument>
```

## Example 2

<!--- The following example shows how to use the cfdocument scope variables to generate section numbers and page numbers. --->

```
<cfdocument format="pdf">
<cfdocumentitem type="header" evalatprint="true">
  <table width="100%" border="0" cellpadding="0" cellspacing="0">
    <tr><td align="right"><cfoutput>#cfdocument.currentsectionpagenumber# of
      #cfdocument.totalsectionpagecount#</cfoutput></td></tr>
  </table>
</cfdocumentitem>

<cfdocumentitem type="footer" evalatprint="true">
  <table width="100%" border="0" cellpadding="0" cellspacing="0">
    <tr><td align="center"><cfoutput>#cfdocument.currentpagenumber# of
      #cfdocument.totalpagecount#</cfoutput></td></tr>
  </table>
</cfdocumentitem>

<cfdocumentsection>
  <h1>Section 1</h1>
  <cfloop from=1 to=50 index="i">
    Lorem ipsum dolor sit amet, consectetur adipisicing elit, sed do eiusmod tempor
    incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam, quis nostrud exercitation
```

```
    ullamco laboris nisi ut aliquip ex ea commodo consequat. Duis aute irure dolor in reprehenderit
    in voluptate velit esse cillum dolore eu fugiat nulla pariatur. Excepteur sint occaecat
    cupidatat non proident, sunt in culpa qui officia deserunt mollit anim id est laborum.<p>
  </cfloop>
</cfdocumentsection>

<cfdocumentsection>
  <h1>Section 2</h1>
  <cfloop from=1 to=50 index="i">
    Lorem ipsum dolor sit amet, consectetur adipisicing elit, sed do eiusmod tempor
    incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam, quis nostrud exercitation
    ullamco laboris nisi ut aliquip ex ea commodo consequat. Duis aute irure dolor in reprehenderit
    in voluptate velit esse cillum dolore eu fugiat nulla pariatur. Excepteur sint occaecat
    cupidatat non proident, sunt in culpa qui officia deserunt mollit anim id est laborum.<p>
  </cfloop>
</cfdocumentsection>

<cfdocumentsection>
<h1>Section 3</h1>
  <cfloop from=1 to=50 index="i">
    Lorem ipsum dolor sit amet, consectetur adipisicing elit, sed do eiusmod tempor
    incididunt ut labore et dolore magna aliqua. Ut enim ad minim veniam, quis nostrud exercitation
    ullamco laboris nisi ut aliquip ex ea commodo consequat. Duis aute irure dolor in reprehenderit
    in voluptate velit esse cillum dolore eu fugiat nulla pariatur. Excepteur sint occaecat
    cupidatat non proident, sunt in culpa qui officia deserunt mollit anim id est laborum.<p>
  </cfloop>
</cfdocumentsection>
</cfdocument>
```

## cfdocumentitem

### Description

Specifies action items for a PDF or FlashPaper document created by the `cfdocument` tag. Action items include the following:

- header
- footer
- pagebreak

### Category

[Data output tags](#)

### Syntax

```
<cfdocument ...>
  <cfdocumentitem
    type = "pagebreak|header|footer"
    evalAtPrint = "true"
    header/footer text</cfdocumentitem>
</cfdocument>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfreport](#), [cfdocument](#), [cfdocumentsection](#)

## History

ColdFusion 9: Added the `evalAtPrint` attribute.

ColdFusion 8: Added support for `cfdocument.currentpagenumber`, `cfdocument.totalpagecount`, `cfdocument.totalsectionpagecount`, and `cfdocument.currentsectionpagenumber` scope variables.

ColdFusion MX 7.01: Added the `src`, `srcfile`, and `mimetype` attributes.

ColdFusion MX 7: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
<code>type</code>	Required		Specifies the action: <ul style="list-style-type: none"> <li><code>pagebreak</code>: starts a new page at the location of the tag.</li> <li><code>header</code>: uses the text between the <code>&lt;cfdocumentitem&gt;</code> and <code>&lt;/cfdocumentitem&gt;</code> tags as the running header.</li> <li><code>footer</code>: uses the text between the <code>&lt;cfdocumentitem&gt;</code> and <code>&lt;/cfdocumentitem&gt;</code> tags as the running footer.</li> </ul>
<code>evalAtPrint</code>	Optional	<code>false</code>	A Boolean value that determines if the contents of the <code>cfdocumentitem</code> tag body has to be evaluated at the time of printing the document. <ul style="list-style-type: none"> <li><code>true</code>: evaluates the contents of the <code>cfdocumentitem</code> tag body only at the time of printing the document.</li> <li><code>false</code>: evaluates the contents of the <code>cfdocumentitem</code> tag body immediately.</li> </ul>

## Usage

Use the `evalAtPrint` tag to evaluate the contents of the document before printing and to also accept additional attributes.

Use the `cfdocumentitem` tag to control the formatting of a PDF or FlashPaper report. This tag must be wrapped inside a `<cfdocument></cfdocument>` pair.

Write code for one `cfdocumentitem` tag for each page break, running header, or running footer.

ColdFusion has added support for `cfdocument` scope variables within the `cfdocumentitem` tag. You can use the `cfdocument` scope variable, `cfdocument.currentpagenumber`, to display the current page number in a header or footer. You can also use `cfdocument.totalpagecount` to display the total number of pages, for example:

```
...
<cfdocumentitem type= "footer">
    #cfdocument.currentpagenumber# of #cfdocument.totalpagecount#
</cfdocumentitem>
```

For an example that uses the `cfdocument.totalsectionpagecount` and `cfdocument.currentsectionpagenumber` scope variables, see [cfdocument](#).

You can use `cfdocumentitem` tags with or without the [cfdocumentsection](#) tag, as follows:

**Without `cfdocumentsection`** The `cfdocumentitem` attribute applies to the entire document, as follows:

- If the tag is at the top of the document, it applies to the entire document.

- If the tag is in the middle of the document, it applies to the rest of the document.
- If the tag is at the end of the document, it has no affect.

**With `cfdocumentsection` tags** The `cfdocumentitem` attribute applies only to the section and overrides previously specified header and footer specifications.

### Example

```
<cfquery datasource="cfdocexamples" name="parksQuery">
    SELECT parkname, suptmgr from parks
</cfquery>

<cfdocument format="PDF">
<cfdocumentitem type="header">National Parks Report</cfdocumentitem>
<!--- Use a footer with current page of totalpages format. --->
<cfdocumentitem type="footer">
<cfoutput>Page #cfdocument.currentpagenumber# of #cfdocument.totalpagecount#</cfoutput>
    </cfdocumentitem>

<h1>Park list</h1>
<table width="95%" border="2" cellspacing="2" cellpadding="2" >
<tr>
<th>Park</th>
<th>Manager</th>
</tr>
    <cfoutput query="parksQuery">
        <tr>
<td><font size="-1">#parkname#</font></td>
<td><font size="-1">#suptmgr#</font></td>
        </tr>
    </cfoutput>
</table>
</cfdocument>
```

## cfdocumentsection

### Description

Divides a PDF or FlashPaper document into sections. By using this tag in conjunction with a `cfdocumentitem` tag, each section can have unique headers, footers, and page numbers.

### Category

[Data output tags](#)

## Syntax

```
<cfdocument ...>
  <cfdocumentsection
    authPassword = "authentication password"
    authUser = "authentication user name"
    marginBottom = "number"
    marginLeft = "number"
    marginRight = "number"
    marginTop = "number"
    mimeType = "text/plain|application/xmlimage/jpeg|image/png|image/bmp|image/gif"
    name = "bookmark for the section"
    src = "URL|path relative to web root"
    srcfile = "absolute path of file"
    userAgent = "HTTP user agent identifier">
    HTML, CFML, and cfdocumentitem tags
  </cfdocumentsection>
</cfdocument>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfreport](#), [cfdocument](#), [cfdocumentitem](#)

## History

ColdFusion 8: Added the `name`, `authPassword`, `authUser`, and `userAgent` attributes.

ColdFusion MX 7.01: Added the `src`, `srcfile`, and `mimeType` attributes.

ColdFusion MX 7: Added this tag and the `marginTop`, `marginBottom`, `marginLeft`, `marginRight` attributes.

## Attributes

Attribute	Req/Opt	Default	Description
<code>authPassword</code>	Optional		Password sent to the target URL for Basic Authentication. Combined with <code>username</code> to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerebos authentication.
<code>authUser</code>	Optional		User name sent to the target URL for Basic Authentication. Combined with <code>password</code> to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerebos authentication.
<code>marginBottom</code>	Optional		Bottom margin in inches (default) or centimeters. To specify the bottom margin in centimeters, include the <code>unit="cm"</code> attribute in the parent <code>cfdocument</code> tag.
<code>marginLeft</code>	Optional		Left margin in inches (default) or centimeters. To specify the left margin in centimeters, include the <code>unit="cm"</code> attribute in the parent <code>cfdocument</code> tag.
<code>marginRight</code>	Optional		Right margin in inches (default) or centimeters. To specify the right margin in centimeters, include the <code>unit="cm"</code> attribute in the parent <code>cfdocument</code> tag.
<code>marginTop</code>	Optional		Top margin in inches (default) or centimeters. To specify the top margin in centimeters, include the <code>unit="cm"</code> attribute in the parent <code>cfdocument</code> tag.

Attribute	Req/Opt	Default	Description
contentType	Optional	text/html	MIME type of the source document. Supported MIME types are: <ul style="list-style-type: none"><li>• text/html</li><li>• text/plain</li><li>• application/xml</li><li>• image/jpeg</li><li>• image/png</li><li>• image/gif</li></ul> If you do not specify this attribute explicitly, ColdFusion uses the filename to determine the MIME type.
name	Optional		Bookmark name for the section.
src	Optional		URL or the relative path to the web root. You cannot specify both the <code>src</code> and <code>srcfile</code> attributes.
srcfile	Optional		Absolute path of an on-disk or in-memory file that is on the server. You cannot specify both the <code>src</code> and <code>srcfile</code> attributes.
userAgent	Optional	ColdFusion	Text to put in the HTTP User-Agent request header field. Used to identify the request client software.

### Usage

Use the `cfdocumentsection` tag to divide a report into sections. Within each `cfdocumentsection` tag, you can use one or more `cfdocumentitem` tags to specify unique headers and footers for each section.

When using `cfdocumentsection`, ColdFusion ignores HTML and CFML not enclosed within `cfdocumentsection` tags.

The margin attributes override margins specified in previous sections or in the parent `cfdocument` tag. If you specify margin attributes, the units are controlled by the `unit` attribute of the parent `cfdocument` tag; the `unit` attribute has a default value of inches. The `cfdocumentsection` tag forces a page break so that each section starts on a new page.

ColdFusion has added the `name` attribute to support bookmarks. Bookmarks defined at the `documentsection` tag level are children of the `cfdocument` root.

### Example

Example 1

```

<cfquery datasource="cfdocexamples" name="empSalary">
SELECT Emp_ID, firstname, lastname, e.dept_id, salary, d.dept_name
FROM employee e, departmt d
WHERE e.dept_id = d.dept_id
ORDER BY d.dept_name
</cfquery>

<cfdocument format="PDF">
<cfoutput query="empSalary" group="dept_id">
    <cfdocumentsection>
        <cfdocumentitem type="header">
            <font size="-3"><i>Salary Report</i></font>
        </cfdocumentitem>
        <cfdocumentitem type="footer">
            <font size="-3">Page #cfdocument.currentpagenumber#</font>
        </cfdocumentitem>
        <h2>#dept_name#</h2>
        <table width="95%" border="2" cellspacing="2" cellpadding="2" >
            <tr>
                <th>Employee</th>
                <th>Salary</th>
            </tr>
            <cfset deptTotal = 0 >
            <!-- inner cfoutput -->
            <cfoutput>
                <tr>
                    <td><font size="-1">
                        #empSalary.lastname#, #empSalary.firstname#</font>
                    </td>
                    <td align="right"><font size="-1">
                        #DollarFormat(empSalary.salary)#</font>
                    </td>
                </tr>
                <cfset deptTotal = deptTotal + empSalary.salary>
            </cfoutput>
            <tr>
                <td align="right"><font size="-1">Total</font></td>
                <td align="right"><font size="-1">#DollarFormat(deptTotal)#</font></td>
            </tr>
            <cfset deptTotal = 0>
        </table>
    </cfdocumentsection>
</cfoutput>
</cfdocument>

```

## Example 2: Bookmarks

```

<!-- This example uses the name attribute to define bookmarks in a PDF document at the
section level. -->
<cfdocument format="pdf" bookmark="yes">
    <cfdocumentsection name="section 1">
        <!-- Insert some HTML content here. -->
    </cfdocumentsection>
    <cfdocumentsection name="section 2">
        <!-- Insert some HTML content here. -->
    </cfdocumentsection>
</cfdocument>

```

## cfdump

### Description

Use the `cfdump` tag to get the elements, variables, and values of most kinds of ColdFusion objects. Useful for debugging. You can display the contents of simple and complex variables, objects, components, user-defined functions, and other elements. The `cfdump` now shows component properties defined by `cfproperty` when you dump a CFC. A new key called `PROPERTIES` has been added in the component dump, which is expanded, by default. The text format of `cfdump` also provides this information.

### Category

[Debugging tags](#), [Variable manipulation tags](#)

### Syntax

```
<cfdump
  var = "#variable#"
  output = "browser|console|file"
  format = "text|html"
  abort = "true|false">
  label = "text"
  metainfo = "yes|no"
  top = "number of rows|number of levels"
  show = "columns|keys"
  hide = "columns|keys"
  keys = "number of keys to display for structures"
  expand = "yes|no"
  showUDFs = "yes|no">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfcookie](#), [cfparam](#), [cfsavecontent](#), [cfschedule](#), [cfset](#), [cftimer](#), [cfwddx](#)

### History

- ColdFusion 9: Added the attribute `abort`.
- ColdFusion 8: Added the `show`, `format`, `hide`, `keys`, `metainfo`, `output`, and `showUDFs` attributes.
- ColdFusion MX 7: Added the `top` attribute.
- ColdFusion MX 6.1: Added the ability to dump COM objects; it displays the methods and Get and Put properties typeinfo information for the object.

## Attributes

Attribute	Req/Opt	Default	Description
var	Required		<p>Variable to display. Enclose a variable name in number signs.</p> <p>These kinds of variables yield meaningful <code>cfdump</code> output:</p> <ul style="list-style-type: none"> <li>• array</li> <li>• CFC</li> <li>• COM object</li> <li>• file object</li> <li>• Java object</li> <li>• simple</li> <li>• query</li> <li>• structure</li> <li>• UDF</li> <li>• wddx</li> <li>• xml</li> </ul>
expand	Optional	yes	<ul style="list-style-type: none"> <li>• yes: in Internet Explorer and Mozilla, expands views.</li> <li>• no: contracts expanded views.</li> </ul>
format	Optional	text	Use with the <code>output</code> attribute to specify whether to save the results of a <code>cfdump</code> to a file in text or HTML format.
hide	Optional	all	<p>For a query, this is a column name or a comma-delimited list of column names. For a structure, this is a key or a comma-delimited list of keys.</p> <p>If you specify a structure element that doesn't exist, ColdFusion ignores it and does not generate an error.</p>
keys	Optional	9999	For a structure, the number of keys to display.
label	Optional		A string; header for the dump output. Ignored if the value of the <code>var</code> attribute is a simple types.
metainfo	Optional	yes for query no for persistence CFCs	For use with queries and persistence CFCs. Includes information about the query in the <code>cfdump</code> results, including whether the query was cached, the execution time, and the SQL. Specify <code>metainfo="no"</code> to exclude this information from the query result. For persistence CFCs, if <code>metainfo="yes"</code> , returns property attributes such as getters and setters.
output	Optional	browser	<p>Where to send the results of <code>cfdump</code>. The following values are valid:</p> <ul style="list-style-type: none"> <li>• browser</li> <li>• console</li> <li>• filename</li> </ul> <p>The filename must include the full pathname of the file. You can specify an absolute path, or a path that is relative to the ColdFusion temporary directory. You can use the <code>GetTempDirectory()</code> function to determine the ColdFusion temporary directory.</p>
show	Optional	all	For a query, this is a column name or a comma-delimited list of column names. For a structure, this is a key or a comma-delimited list of keys.

Attribute	Req/Opt	Default	Description
showUDFs	Optional	yes	<ul style="list-style-type: none"><li>• yes: includes UDFs, with the methods collapsed.</li><li>• no: excludes UDFs.</li></ul>
top	Optional	9999	The number of rows to display. For a structure, this is the number of nested levels to display.
abort	Optional	false	If this attribute is set to "true", it stops processing the current page at the tag location.

### Usage

The expand/contract display capability is useful when working with large structures, such as XML document objects, structures, and arrays.

To display a construct, use code such as the following, in which *myDoc* is a variable of type XmlDocument:

```
<cfif IsXmlDoc(mydoc) is "yes">
    <cdump var="#mydoc#">
</cfif>
```

The tag output is color-coded according to data type.

If a table cell is empty, this tag displays "[empty string]".

### Example

```
<!--- This example shows how to use this tag to display the CGI scope as a structure: --->

<cdump var="#cgi#"> <!--- This displays information about file objects. --->
<cfscript>
myfile = FileOpen("c:\temp\test1.txt", "read");
</cfscript>
myfile refers to:
<cdump var="#myfile.filepath#">
```

## cfelse

### Description

Used as the last control block in a `cfif` tag block to handle any case not identified by the `cfif` tag or a `cfelseif` tag.

### Category

Flow-control tags

### Syntax

```
<cfif expression>
    HTML and CFML tags<cfelseif expression>
    HTML and CFML tags
<cfelse>
    HTML and CFML tags
</cfif>
```

### See also

`cfif`, `cfelseif`, `cfabort`, `cfbreak`, `cfexecute`, `cfexit`, `cflocation`, `cfloop`, `cfswitch`, `cfthrow`, `cftry`

### Usage

If the values of the *expressions* in the containing `cfif` tag and all `cfelseif` tags are no, ColdFusion processes the code between this tag and the `cfif` end tag. This tag must be inside a `cfif` tag block. It does not require an end tag.

For more information and an example, see [cfif](#).

## cfelseif

### Description

Used as a control block in a [cfif](#) tag block to handle any case not identified by the `cfif` tag or a `cfelseif` tag.

### Category

[Flow-control tags](#)

### Syntax

```
<cfif expression>
    HTML and CFML tags<cfelseif expression>
    HTML and CFML tags <cfelse>
    HTML and CFML tags</cfif>
```

### See also

[cfif](#), [cfelse](#), [cfabort](#), [cfbreak](#), [cfexecute](#), [cfexit](#), [cflocation](#), [cfloop](#), [cfswitch](#), [cfthrow](#), [cftry](#)

### Usage

If the value of the *expression* in this tag is yes, and the values of the *expressions* in the containing `cfif` tag and preceding `cfelseif` tags are no, ColdFusion processes the code between this tag and a following `cfelseif` or `cfelse` tag, or the `cfif` end tag and then skips to the code following the `cfif` end tag. Otherwise, ColdFusion skips the code.

This tag must be inside a `cfif` tag block. It does not require an end tag.

For more information and an example, see “[cfif](#)” on page 304.

## cferror

### Description

Displays a custom HTML page when an error occurs. This lets you maintain a consistent look and feel among an application’s functional and error pages.

### Category

[Exception handling tags](#), [Extensibility tags](#), [Application framework tags](#)

### Syntax

```
<cferror
    template = "template path"
    type = "exception|validation|request"
    exception = "exception type"
    mailTo = "e-mail address">
```

**Note:** You can specify this tag’s attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag’s attribute names as structure keys.

### See also

[cfrethrow](#), [cfthrow](#), [cftry](#), Handling Errors in the *Developing ColdFusion Applications*.

### History

ColdFusion MX: Deprecated the `monitor` option of the `exception` attribute. It might not work, and might cause an error, in later releases.

### Attributes

Attribute	Req/Opt	Default	Description
template	Required		Relative path to the custom error page. (A ColdFusion page was formerly called a template.)
type	Required		Type of error that the custom error page handles. The type also determines how ColdFusion handles the error page. For more information, see <i>Specifying a custom error page</i> in the <i>Developing ColdFusion Applications</i> . <ul style="list-style-type: none"><li><code>exception</code>: an exception of the type specified by the <code>exception</code> attribute.</li><li><code>validation</code>: errors recognized by server-side type validation.</li><li><code>request</code>: any encountered error.</li></ul>
exception	Optional	any	Type of exception that the tag handles: <ul style="list-style-type: none"><li><code>application</code>: application exceptions.</li><li><code>database</code>: database exceptions.</li><li><code>template</code>: ColdFusion page exceptions.</li><li><code>security</code>: security exceptions.</li><li><code>object</code>: object exceptions.</li><li><code>missingInclude</code>: missing include file exceptions.</li><li><code>expression</code>: expression exceptions.</li><li><code>lock</code>: lock exceptions.</li><li><code>custom_type</code>: developer-defined exceptions, defined in the <code>cfthrow</code> tag.</li><li><code>any</code>: all exception types.</li></ul> For more information on exception types, see <a href="#">cftry</a> .
mailto	Optional		An e-mail address. This attribute is available on the error page as the variable <code>error.mailto</code> . ColdFusion does not automatically send anything to this address.

### Usage

Use this tag to provide custom error messages for pages in an application. This lets you maintain a consistent look and feel within the application, even when errors occur.

You generally embed this tag in your `Application.CFC` or `Application.cfm` file to specify error-handling responsibilities for an entire application. You **must** put it in one of these files if you specify `type="validation"`; ColdFusion ignores it on any other page.

The `cftry` and `cfcatch` tags provide a more interactive way to handle ColdFusion errors within a ColdFusion page than the `cferror` tag, but the `cferror` tag is a good safeguard against general errors.

To ensure that error pages display successfully, avoid using the `cfencode` utility to encode pages that include the `cferror` tag.

### Page types

The following table describes the types of errors you can specify and code you can use on the pages that handle these error type:

Page type	Description	Use
Exception	Dynamically invoked by the CFML language processor when it detects an unhandled exception condition.  Uses the full range of CFML tags. Error variables must be in <code>cfoutput</code> tags.	Can handle specific exception types or display general information for exceptions.
Request	Includes the error variables described in the Error variables section.  Cannot include CFML tags, but you can display values of the error variables by enclosing them in number signs (#), as in <code>#error.MailTo#</code> .	Use as a backup error handler to other error handling methods, including exception type.
Validation	Handles data input validation errors that occur when submitting a form that uses hidden form-field validation or onSubmit validation.  Cannot include CFML tags, but you can display values of the error variables by enclosing them in number signs (#), as in <code>#Error.InvalidFields#</code> .  Specify the validation error handler in the <code>Application.cfc</code> or <code>Application.cfm</code> file.	Handles hidden form-field or onSubmit format validation errors only.

### Error variables

The exception-handling page specified in the `cferror` tag `template` attribute contains one or more error variables. ColdFusion substitutes the value of the error variable when an error displays.

The following table lists error variables:

Page type	Error variable	Description
Validation only	<code>error.validationHeader</code>	Validation message header text.
	<code>error.invalidFields</code>	Unordered list of validation errors.
	<code>error.validationFooter</code>	Validation message footer text.
Request and Exception	<code>error.diagnostics</code>	Detailed error diagnostics from ColdFusion.
	<code>error.mailTo</code>	E-mail address (same as value in <code>cferror.MailTo</code> ).
	<code>error.dateTime</code>	Date and time when error occurred.
	<code>error.browser</code>	Browser that was running when error occurred.
	<code>error.remoteAddress</code>	IP address of remote client.
	<code>error.HTTPReferer</code>	Page from which client accessed link to page where error occurred.
	<code>error.template</code>	Page executing when error occurred.
	<code>error.generatedContent</code>	The content generated by the page up to the point where the error occurred.
	<code>error.queryString</code>	URL query string of client's request.

Page type	Error variable	Description
Exception only	error.message	Error message associated with the exception.
	error.rootCause	The root cause of the exception. This structure contains the information that is returned by a <code>cfcatch</code> tag. For example, for a database exception, the SQL statement that caused the error is in the <code>error.RootCause.Sql</code> variable. For Java exceptions, this variable contains the Java servlet exception reported by the JVM as the cause of the "root cause" of the exception.
	error.tagContext	Array of structures containing information for each tag in the tag stack. The tag stack consists of each tag that is currently open.
	error.type	Exception type.

**Note:** If `type = "exception"`, you can substitute the prefix `cferror` for `Error`; for example, `cferror.diagnostics`, `cferror.mailTo`, or `cferror.dateTime`.

### Example

```
<h3>cferror Example</h3>
```

```
<!--- Example of cferror call within a page.
```

```
    NOTE: If you use cferror type="VALIDATION" you MUST put it in
    Application.cfc or Application.cfm --->
```

```
<cferror type = "REQUEST"
```

```
template = "request_err.cfm"
```

```
mailTo = "admin@mywebsite.com">
```

```
<!--- This query calls a non-existent datasource, triggering an error to be handled. --->
```

```
<cfquery name="testQuery" datasource="doesNotExist">
```

```
select * from nothing
```

```
</cfquery>
```

```
<!--- Example of the page (request_err.cfm) to handle this error. --->
```

```
<html>
```

```
<head>
```

```
<title>We're sorry -- An Error Occurred</title>
```

```
</head>
```

```
<body>
```

```
<h2>We're sorry -- An Error Occurred</h2>
```

```
<p>
```

```
If you continue to have this problem, please contact #error.mailTo#
with the following information:</p>
```

```
<p>
```

```
<ul>
```

```
<li><b>Your Location:</b> #error.remoteAddress#
```

```
<li><b>Your Browser:</b> #error.browser#
```

```
<li><b>Date and Time the Error Occurred:</b> #error.dateTime#
```

```
<li><b>Page You Came From:</b> #error.HTTPReferer#
```

```
<li><b>Message Content</b>:
```

```
<p>#error.diagnostics#</p>
```

```
</ul>
```

## cfexchangecalendar

### Description

Creates, deletes, modifies, gets, and responds to Microsoft Exchange calendar events, and gets calendar event attachments.

### History

ColdFusion 8: Added this tag.

### Category

[Communications tags](#)

### Syntax

#### create

```
<cfexchangecalendar
    required
    action = "create"
    event = "#event information structure#"
    optional
    connection = "connection ID"
    result = "variable for event UID">
```

#### delete

```
<cfexchangecalendar
    required
    action = "delete"
    uid = "event UID,event UID, ..."
    optional
    connection = "connection ID"
    message = "string"
    notify = "yes|no">
```

#### deleteAttachments

```
<cfexchangecalendar
    required
    action = "deleteAttachments"
    uid = "event UID"
    optional
    connection = "connection ID">
```

#### get

```
<cfexchangecalendar
    required
    action = "get"
    name = "query identifier"
    optional
    connection = "connection ID">
```

#### getAttachments

```
<cfexchangecalendar
    required
    action = "getAttachments"
    name = "query identifier"
    uid = "event UID"
```

```
    optional
    attachmentPath = "directory path"
    connection = "connection ID">
    generateUniqueFileNames = "no|yes"
```

#### modify

```
<cfexchangecalendar
    required
    action = "modify"
    event = "#event information structure#"
    uid = "event UID"
    optional
    connection = "connection ID">
```

#### respond

```
<cfexchangecalendar
    required
    action = "respond"
    responseType = "accept|decline|tentative"
    uid = "event UID"
    optional
    connection = "connection ID"
    message = "string">
    notify = "yes|no">
```

**Note:** For all actions, see [cfexchangeconnection](#) for additional attributes that you use if you do not specify the `connection` attribute. If you omit the `connection` attribute, create a temporary connection by specifying `cfexchangeconnection` tag attributes in the `cfexchangecalendar` tag. In this case, ColdFusion closes the connection when the tag completes. For details, see the [cfexchangeconnection](#) tag `open` action.

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

Working with meetings and appointments in the *Developing ColdFusion Applications*

## Attributes

Attribute	Action	Req/Opt	Default	Description
action	N/A	Required		The action to take. Must be one of the following values: <ul style="list-style-type: none"> <li>• create</li> <li>• delete</li> <li>• deleteAttachments</li> <li>• get</li> <li>• getAttachments</li> <li>• modify</li> <li>• respond</li> </ul>
attachmentPath	getAttachments	Optional		The filepath of the on-disk or in-memory directory in which to put the attachments. If an on-disk directory does not exist, ColdFusion creates it.  <b>Note:</b> If you omit this attribute, ColdFusion does not save any attachments. If you specify a relative path, the path root is the ColdFusion temporary directory, which is returned by the <code>GetTempDirectory</code> function.
connection	all	Optional		The name of the connection to the Exchange server, as specified in the <code>cfexchangeconnection</code> tag.  If you omit this attribute, you must create a temporary connection by specifying <code>cfexchangeconnection</code> tag connection attributes in the <code>cfexchangecalendar</code> tag.
event	create modify	Required		A reference to the structure that contains the event properties to be set or changed, and their values. Specify this attribute in number signs (#). The event attribute also supports the categories key.  For more information on the event structure, see Usage.
generateUnique Filenames	getAttachments	Optional	no	A Boolean value that specifies whether to generate unique filenames if multiple attachments have the same filenames. If two or more attachments have the same filename and this option is <i>yes</i> , ColdFusion appends a number to the filename body (before the extension) of any conflicting filenames. Thus, if three attachments have the name <code>myfile.txt</code> , ColdFusion saves the attachments as <code>myfile.txt</code> , <code>myfile1.txt</code> , and <code>myfile2.txt</code> .
message	delete respond	Optional		The text of an optional message to send in the response or deletion notification.
name	getAttachments	Required		The name of the ColdFusion query variable that contains the retrieved events or information about the attachments that were retrieved. For more information on the returned data, see Usage.
notify	delete respond	Optional	true	Boolean value that specifies whether to notify others of the changes made to the event.

Attribute	Action	Req/Opt	Default	Description
responseType	respond	Required		Must be one of the following values: <ul style="list-style-type: none"><li>• accept</li><li>• decline</li><li>• tentative</li></ul>
result	create	Optional		The name of a variable that contains the UID of the event that is created. You use the UID value in the <code>uid</code> attribute of actions other than <code>create</code> to identify the event to be acted on.
uid	delete getAttachments modify respond	Required		Case-sensitive Exchange UID value or values that uniquely identify the event or events on which to perform the action.  For the <code>delete</code> action, this attribute can be a comma-delimited list of UID values.  The <code>deleteAttachments</code> , <code>getAttachments</code> , <code>modify</code> , and <code>respond</code> actions allow only a single UID value.

### Usage

The `cfexchangecalendar` tag manages calendar events on the Exchange server. Use the `cfexchangecalendar` to do the following actions:

- Create an appointment or meeting event. You can create all-day events.
- Delete one or more events.
- Get one or more events that conform to an optional set of filter specifications, such as the subject, sender or recipient ID, time received, and so on.
- Get the attachments for a specific event.
- Modify an existing event.
- Respond to an event.

To use this tag, you must have a connection to an Exchange server. If you are using multiple tags that interact with the Exchange server, such as if you are creating several contact records, use the `cfexchangeconnection` tag to create a persistent connection. Then specify the connection identifier in each `cfexchangecalendar` tag, or in any other ColdFusion Exchange tag, if you are also accessing tasks, contacts, or mail. Doing this eliminates the overhead of creating and closing the connection for each tag.

Alternatively, you can create a temporary connection that lasts only for the time that ColdFusion processes the single `cfexchangecalendar` tag. To do this, specify the connection attributes directly in the `cfexchangecontact` tag. For details on the connection attributes, see the [cfexchangeconnection](#) tag.

**Note:** To create an Exchange calendar appointment, create a calendar event and do not specify any required or optional attendees.

### The create action

When you specify the `create` action, the `event` attribute must specify a structure that contains the information that defines the events. The structure can have the following entries:

Element	Default	Description
AllDayEvent	no	A Boolean value that indicates whether this is an all-day event.
Attachments		One or more paths to the files to send as attachments. Separate filepaths with semicolons (;) for Windows, and colons (:) for UNIX and Linux. Paths to the attachments must be absolute.  If you specify one or more attachments for a <code>modify</code> action, the specified attachments are added to any existing attachments; the pre-existing attachments are not deleted.
Categories		A comma-delimited list of categories. The filter searches for events that match all the categories in the list.
Duration		The duration of the event in minutes.
EndTime		The end time of the event, in any valid ColdFusion date-time format.
Importance	normal	One of the following values: <ul style="list-style-type: none"> <li>• high</li> <li>• normal</li> <li>• low.</li> </ul>
IsRecurring		A Boolean value that indicates whether this event repeats. If yes, specify a <code>RecurrenceType</code> element and elements to specify the recurrence details. For information on the recurrence fields, see the next table.
Location		A string that specifies the location of the event.
Message		A string that contains a message about the event. The string can include HTML formatting.
OptionalAttendees		A comma-delimited list of mail IDs.
Organizer		A string that specifies the name of the meeting organizer.
Reminder		The time, in minutes before the event, at which to display a reminder message.
RequiredAttendees		A comma-delimited list of mail IDs.
Resources		A comma-delimited list of mail IDs for Exchange scheduling resources, such as conference rooms and display equipment.
Sensitivity		The valid values are <code>normal</code> , <code>company-confidential</code> , <code>personal</code> , and <code>private</code> .
StartTime		The start time of the event, in any valid ColdFusion date-time format.  If you specify a date and time in this attribute and specify a <code>YEARLYRecurrenceType</code> with no other recurrence attributes, the event recurs yearly at the day and time specified in this attribute.
Subject		A string that describes the event subject.

The following table lists the elements that you use to specify the event recurrence if you set the `IsRecurring` field to a yes value. For a detailed description of how to specify event recurrence, see *Specifying Calendar recurrence* in the *Developing ColdFusion Applications*.

Element	Type	Default	Description
RecurrenceType	all	DAILY	Used only if the structure has a <code>yesIsRecurring</code> element. Must be one of the following values: <ul style="list-style-type: none"> <li>DAILY</li> <li>WEEKLY</li> <li>MONTHLY</li> <li>YEARLY</li> </ul>
RecurrenceNoEndDate	all	yes	Boolean value; if <code>yes</code> , the event recurs until you change or delete the event. Cannot be used with <code>RecurrenceCount</code> or <code>RecurrenceEndDate</code> .
RecurrenceCount	all		The number of times the event recurs. Cannot be used with <code>RecurrenceEndDate</code> or <code>RecurrenceNoEndDate</code> .
RecurrenceEndDate	all		The date of the last recurrence. Cannot be used with <code>RecurrenceCount</code> or <code>RecurrenceNoEndDate</code> .
RecurrenceFrequency	DAILY, WEEKLY, MONTHLY	1	The frequency of the recurrence in days, weeks, or months, depending on the type. For example, for <code>DAILY</code> recurrence, a <code>RecurrenceFrequency</code> of 3 schedules the event every three days.
RecurEveryWeekDay	DAILY		The recurrence of the event on every week day, but not on Saturday or Sunday. Cannot be used with <code>RecurrenceFrequency</code> .
RecurrenceDays	WEEKLY		The day or days of the week on which the event occurs. Must be one or more of the following values in a comma-delimited list:  MON, TUE, WED, THU, FRI, SAT, SUN  If you omit this field for a weekly recurrence, the event recurs on the day of the week that corresponds to the specified start date.

Element	Type	Default	Description
RecurrenceDay	MONTHLY, YEARLY		The day of the week on which the event occurs. Must be one of the following values: <ul style="list-style-type: none"> <li>• MON</li> <li>• TUE</li> <li>• WED</li> <li>• THU</li> <li>• FRI</li> <li>• SAT</li> <li>• SUN</li> </ul>
RecurrenceWeek	MONTHLY, YEARLY		The week of the month or year on which the event recurs. The valid values are: <ul style="list-style-type: none"> <li>• first</li> <li>• second</li> <li>• third</li> <li>• fourth</li> <li>• last</li> </ul>
RecurrenceMonth	YEARLY		The month of the year on which the event recurs. The valid values are JAN, FEB, MAR, APR, MAY, JUN, JUL, AUG, SEP, OCT, NOV, and DEC.

### The delete action

When you specify the `delete` action, specify a `uid` attribute with a comma-delimited list of one or more Exchange UUIDs that identify the events to delete. Use the `get` action, with an appropriate filter expression, to determine the UUID values to specify.

If all UUIDs that you specify are invalid, the `cfexchangecalendar` tag generates an error. If at least one UUID is valid, the tag ignores any invalid UUIDs and deletes the items specified by the valid UUID.

### The get action

When you specify the `get` action, use child `cfexchangefilter` tags to specify the messages to get. For detailed information on filters, see [cfexchangefilter](#).

When the tag completes processing, the query object specified by the `name` attribute contains one record for each retrieved message. Each record has the following columns:

AllDayEvent	Duration	EndTime	From
HasAttachment	HtmlMessage	Importance	IsRecurring
Location	Message	OptionalAttendees	Organizer
Reminder	RequiredAttendees	Resources	Sensitivity
StartTime	Subject	UID	Categories

The following table describes the `From`, `HtmlMessage`, `Message`, and `UID` fields. For detailed information on the other fields, see the table in the `create` action description.

Column	Description
From	The Exchange ID of the person who created the event.
HtmlMessage	An HTML-formatted version of the message about the event.
Message	A plain-text version of the message about the event.
UID	The Exchange unique identifier for the mail event. Use this value to identify the event in the <code>delete</code> , <code>getAttachments</code> , and <code>modify</code> actions.

### The `getAttachments` action

When you use the `getAttachments` action, specify a single `UID` and a `name` attribute. The `cfexchangecalendar` tag populates a query object with the specified name. Each record has the following information about an attachment to the event specified by the `UID`:

Column	Description
attachmentFileName	The filename of the attachment.
attachmentFilePath	The absolute path of the attachment file on the server. If you omit the <code>attachmentPath</code> attribute, this column contains the empty string.
CID	The content-ID of the attachment. Typically used in HTML <code>img</code> tags to embed images in a message.
mimeType	The MIME type of the attachment, such as <code>text/html</code> .
isMessage	A Boolean value that specifies whether the attachment is a message.
size	The attachment size in bytes.

The tag places the attachments in the directory specified by the `attachmentPath` attribute. If you omit the `attachmentPath` attribute, ColdFusion does not get any attachments, it gets the information about the attachments. This lets you determine the event's attachments without incurring the overhead of getting the attachment files.

Use the following syntax to specify an in-memory `attachmentPath` directory. In-memory files are not written to disk and speed processing of transient data.

```
attachmentpath = "ram:///path"
```

The path can include multiple directories, for example `ram:///petStore/orders/messageAttachments`. Create all directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files* in the *Developing ColdFusion Applications*.

The `getAttachments` action works only if authentication for EWS (Exchange Web Services) is set to basic in the server setup of Exchange. IWA (Integrated Windows Authentication) is not supported.

### The `modify` action

When you specify the `modify` action, you select the event to modify by specifying a `uid` attribute with single event UID; multiple UIDs are not allowed. You populate the `event` structure with only the fields that you are changing. For a detailed description of the fields and their valid values, see the table in the `create` action.

If an event has attachments and you specify attachments when you modify the event, the new attachments are added to the previous attachments; they do not replace them. Use the `deleteAttachments` action to remove any attachments.

### The respond action

You use the `respond` action to respond to a meeting notification that you received by using the `cfexchangemail` tag. A meeting does not appear in your calendar, and cannot be accessed by using the `cfexchangecalendar` tag, until you respond to the mail message and accept or tentatively accept the request.

When you specify the `respond` action, specify the UID, from the notification mail message, of the event to which you are responding. Also specify the response type; that is, whether you are accepting, rejecting, or tentatively accepting the event. You can optionally specify a message to include in the response and set a flag whether to notify the creator of the event of your response.

For detailed information on using the `respond` action, see *Working with meeting notices and requests* in the *Developing ColdFusion Applications*.

### Example

The following example lets you create, and then modify a calendar event. When you first submit the form, ColdFusion creates the calendar event and redisplay the form with the data you entered. Accept the event before you modify the form and resubmit it. When you submit the form a second time, ColdFusion sends the modification information. For more information, see *Working with meetings and appointments* in the *Developing ColdFusion Applications*.

This example resends all the event data (to limit the example length), but you could change the example so that it only sends modified data.

```
<!--- Create a structure to hold the event information. --->
<!--- A self-submitting form for the event information --->
<!--- This example omits recurrence to keep the code relatively simple --->
<cfparam name="form.eventID" default="0">

<!--- If the form was submitted, populate the event structure from it. --->
<cfif isDefined("Form.Submit")>
    <cfscript>
        sEvent.AllDayEvent="no";
        sEvent=StructNew();
        sEvent.Subject=Form.subject;
        if (IsDefined("Form.allDay")) {
            sEvent.AllDayEvent="yes";
            sEvent.StartTime=createDateTime(Year(Form.date), Month(Form.date),
                Day(Form.date), 8, 0, 0);
        }
        else {
            sEvent.StartTime=createDateTime(Year(Form.date), Month(Form.date),
                Day(Form.date), Hour(Form.startTime), Minute(Form.startTime), 0);
            sEvent.EndTime=createDateTime(Year(Form.date), Month(Form.date),
                Day(Form.date), Hour(Form.endTime), Minute(Form.endTime), 0);
        }
        sEvent.Location=Form.location;
        sEvent.RequiredAttendees=Form.requiredAttendees;
        sEvent.OptionalAttendees=Form.optionalAttendees;
        //sEvent.Resources=Form.resources;
        if (Form.reminder NEQ "") {

## cfexchangeconnection

### Description

Opens or closes a persistent connection to a Microsoft Exchange server, or gets information about mailbox subfolders. You must have a persistent or temporary connection to use the `cfexchangecalendar`, `cfexchangecontact`, `cfexchangeemail`, and `cfexchangetask` tags.

### History

ColdFusion 8: Added this tag.

### Category

[Communications tags](#)

## Syntax

### open

```
<cfexchangeconnection
    required
    action = "open"
    connection = "connection ID">
    server = "Exchange server ID"
    username = "Exchange user ID">
    optional
    ExchangeApplicationName = "Application name"
    ExchangeServerLanguage = "Language name"
    formBasedAuthentication = "no|yes">
    formBasedAuthenticationURL = "URL">
    mailboxName = "Exchange mailbox">
    password = "user password"
    port = "IP port"
    protocol = "http|https"
    proxyHost = "proxy host URL"
    proxyPort = "proxy IP port"
```

### getSubfolders

```
<cfexchangeconnection
    required
    action = "getSubfolders"
    connection = "connection ID">
    name = "query name"
    optional
    folder = "Exchange folder path">
    recurse = "no|yes">
```

OR

```
<cfexchangeconnection
    required
    action = "getSubfolders"
    name = "query name"
    server = "Exchange server ID"
    username = "Exchange user ID">
    optional
    ExchangeApplicationName = "Application name"
    ExchangeServerLanguage = "Language name"
    folder = "Exchange folder path">
    formBasedAuthentication = "no|yes">
    formBasedAuthenticationURL = "URL">
    mailboxName = "Exchange mailbox">
    password = "user password"
    port = "IP port"
    protocol = "http|https"
    proxyHost = "proxy host URL"
    proxyPort = "proxy IP port"
    recurse = "no|yes">
```

### close

```
<cfexchangeconnection
    required
    action = "close"
    connection = "connection ID">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

### Attributes

Attribute	Action	Req/Opt	Default	Description
action	all	Required		The action to take. Must be one of the following values: <ul style="list-style-type: none"> <li>• <code>open</code>: Open a new persistent named connection</li> <li>• <code>close</code>: Close a named connection</li> <li>• <code>getSubfolders</code>: Get information about the subfolders of a specific folder.</li> </ul>
connection	all	Required for open and close actions		The name of the connection. You can specify this ID in any tag that you use with the open connection.
ExchangeApplicationName	open getSubfolders	Optional	exchange	The name of the Exchange application to use in the URL that accesses the server. Specify this attribute if your IIS server does not use the default name for your Exchange application.
ExchangeServerLanguage	open getSubfolders	Optional	english	The language of the Exchange server. If you are not sure, you can specify the empty string. For all values except english, including the empty string, the tag tries to get folder names from the server in the client's local language. In some cases, such as when there is a large amount of data on the server, it might take significant time to get folder names from Exchange server in the local language.
folder	getSubfolders	Optional	The root of the mailbox	The forward slash (/) delimited path from the root of the mailbox to the folder for which to get subfolders.  If a folder name contains a forward slash, use the <code>_xF8FF_</code> escape sequence to specify the character in the name.
formBasedAuthentication	open getSubfolders	Optional	no	A Boolean value that specifies whether to display a login form and use form based authentication when making the connection. If the attribute value is <code>no</code> (the default), and the Exchange server returns a 440 error status when ColdFusion tries to connect, ColdFusion displays the login form and attempts to use form based authentication. Therefore, you can safely omit this attribute if you do not know if the server requires form based authentication.

Attribute	Action	Req/Opt	Default	Description
formBasedAuthenticationURL	open getSubfolders	Optional		The URL to which to post the user ID and password when an Exchange server uses form-based authentication. Use this attribute only if your Exchange server does not use default URL for form-based authentication. The default URL has the form <code>https://exchangeServer/exchweb/bin/auth/owaauth.dll</code> , for example, <code>https://exchange.mycompany.com/exchweb/bin/auth/owaauth.dll</code> .
mailboxName	open getSubfolders	Optional		The ID of the Exchange mailbox to use. Specify this attribute to access a mailbox whose owner has delegated access rights to the account specified in the <code>username</code> attribute.
name	getSubfolders	Required		The name of the ColdFusion query variable that contains information about the subfolders.
password	open getSubfolders	Optional		The user's password for accessing the Exchange server.
port	open getSubfolders	Optional	80	The port the server listens to, most commonly port 80.
protocol	open getSubfolders	Optional	http	The protocol to use for the connection. Valid values are <code>http</code> and <code>https</code> .
proxyHost	open getSubfolders	Optional		The URL or IP address of a proxy host, if necessary for access to the network.
proxyPort	open getSubfolders	Optional		The port on the proxy server to connect to, most commonly port 80.
recurse	getSubfolders	Optional	false	A Boolean value: <ul style="list-style-type: none"> <li><code>true</code>: get information on the immediate subfolders of the specified folder only.</li> <li><code>false</code>: get information on all levels of subfolders of the specified folder.</li> </ul>
server	open getSubfolders	Required		The IP address or URL of the server that is providing access to Exchange.
username	open getSubfolders	Required		The Exchange user ID.

**Note:** If you specify the `getSubfolders` action, you can specify the attributes that are listed as working for both the `open` and `getSubfolders` actions only if you do not specify a connection attribute.

### Usage

The `cfexchangeconnection` tag can open or close a persistent connection with an Exchange server. If you use the `cfexchangeconnection` to open a connection before you use any `cfexchangecalendar`, `cfexchangecontact`, `cfexchangemail`, or `cfexchangetask` tags, you can use multiple tags to interact with the Exchange server without incurring the overhead of creating a connection for each tag.

**Note:** To establish any connection, the Exchange server must grant you Outlook Web Access. For information on how to enable this access, see *Enabling access to the Exchange server in the Developing ColdFusion Applications*. Also, you cannot establish a connection to an Exchange server if you require a special authentication step, such as requiring a VPN PIN or performing biometric authentication, on a server that is outside your firewall, and the authentication server then routes the messages to your Exchange server inside the firewall.

Use the `cfexchangeconnection` tag to close a persistent connection when you are finished accessing the Exchange server. If you do not close the connection, it remains open and does not time out.

The `cfexchangecalendar`, `cfexchangecontact`, `cfexchangemail`, and `cfexchangetask` tags also let you specify the `open` action connection attributes (but not the `connection` attribute) to create a temporary connection that lasts for the duration of the single tag's activities, without requiring you to use the `cfexchangeconnection` tag to create the connection. In this case, ColdFusion automatically closes the connection when the tag completes processing.

The `getSubfolders` action can get information about the immediate subfolders of a specified folder (or of the top level of the mailbox), or information about all levels of subfolders. You must have a persistent connection to get the subfolders.

The query returned by the `getSubfolders` action has the following columns:

Column	Contents
FOLDERNAME	The name of the subfolder, for example, ColdFusion.
FOLDERPATH	The forward slash (/) delimited path to the folder from the mailbox root, including the folder name, for example, Inbox/Marketing/ColdFusion.
FOLDERSIZE	Size of the folder in bytes.

**Note:** The ColdFusion exchange tags, including `cfexchangeconnection` use WebDAV to connect to the exchange server. HTTP access must be enabled on the exchange server to use the tags.

### Example

The following example opens a connection, gets all mail sent from spamsource.com, and deletes the messages from the Exchange server:

```
<cfexchangeConnection
    action="open"
    username="#user1#"
    password="#password1#"
    server="#exchangeServerIP#"
    connection="testconn1">

<cfexchangemail action="get" name="spamMail" connection="testconn1">
    <cfexchangefilter name="fromID" value="spamsource.com">
</cfexchangemail>

<cfloop query="spamMail">
    <cfexchangeMail action="delete" connection="testconn1" uid="#spamMail.uid#">
</cfloop>

<cfexchangeConnection
    action="close"
    connection="testconn1">
```

## cfexchangecontact

### Description

Creates, deletes, modifies, and gets Microsoft Exchange contact records, and gets contact record attachments.

### History

ColdFusion 8: Added this tag.

### Category

[Communications tags](#)

### Syntax

#### create

```
<cfexchangecontact
    required
    action = "create"
    contact = "#contact information structure#"
    optional
    connection = "connection ID"
    result = "variable for contact UID">
```

#### delete

```
<cfexchangecontact
    required
    action = "delete"
    uid = "contact UID,contact UID, ..."
    optional
    connection = "connection ID">
```

#### deleteAttachments

```
<cfexchangecontact
    required
    action = "deleteAttachments"
    uid = "contact UID"
    optional
    connection = "connection ID">
```

#### get

```
<cfexchangecontact
    required
    action = "get"
    name = "query identifier"
    optional
    connection = "connection ID">
```

#### getAttachments

```
<cfexchangecontact
    required
    action = "getAttachments"
    name = "query identifier"
    uid = "contact UID"
    optional
    attachmentPath = "directory path"
    connection = "connection ID"
    generateUniqueFileNames = "no|yes">
```

#### modify

```
<cfexchangecontact
    required
    action = "modify"
    contact = "#contact information structure#"
    uid = "contact UID"
    optional
    connection = "connection ID">
```

**Note:** If you omit the `connection` attribute, create a temporary connection by specifying `cfexchangeconnection` tag attributes in the `cfexchangecontact` tag. In this case, ColdFusion closes the connection when the tag completes. For details, see the [cfexchangeconnection](#) tag open action.

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

Interacting with Microsoft Exchange Servers in the *Developing ColdFusion Applications*

## Attributes

Attribute	Action	Req/Opt	Default	Description
action	N/A	Required		The action to take. Must be one of the following values: <ul style="list-style-type: none"> <li>create</li> <li>delete</li> <li>deleteAttachments</li> <li>get</li> <li>getAttachments</li> <li>modify</li> </ul>
attachmentPath	getAttachments	Optional		The absolute filepath of the directory in which to put the attachments. If the directory does not exist, ColdFusion creates it.  <b>Note:</b> If you omit this attribute, ColdFusion does not save any attachments.
connection	all	Optional		The name of the connection to the Exchange server, as specified in the <code>cfexchangeconnection</code> tag.  If you omit this attribute, create a temporary connection by specifying <code>cfexchangeconnection</code> tag <code>connection</code> open action attributes in the <code>cfexchangecontact</code> tag.
contact	create modify	Required		A reference to the structure that contains the <code>contact</code> properties to be set or changed and their values. Specify this attribute in number signs (#).  For more information on the event structure, see Usage.
generateUniqueFilenames	getAttachments	Optional	no	A Boolean value that specifies whether to generate unique filenames if multiple attachments have the same filenames. If two or more attachments have the same filename and this option is <code>yes</code> , ColdFusion appends a number to the filename body (before the extension) of any conflicting filenames. Thus, if three attachments have the name <code>myfile.txt</code> , ColdFusion saves the attachments as <code>myfile.txt</code> , <code>myfile1.txt</code> , and <code>myfile2.txt</code> .
name	get getAttachments	Required		The name of the ColdFusion query variable that contains the returned contact records or information about the attachments that were retrieved. For more information on the returned data, see Usage.
result	create	Optional		The name of a variable that contains the UID of the contact that is created. Use this value in the <code>uid</code> attribute of other actions to identify the contact to be acted on.
uid	getAttachments delete modify	Required		A case-sensitive Exchange UID value that uniquely identifies the contacts on which to perform the action. For the <code>delete</code> action, this attribute can be a comma-delimited list of UID values. The <code>deleteAttachments</code> , <code>getAttachments</code> , and <code>modify</code> actions allow only a single UID value.

When you specify the `create` or `modify` action, the `contact` attribute must specify a structure that contains information that defines the events. The structure can have the following elements. Include only the elements that you are setting or changing.

Assistant	Attachments	BusinessAddress	BusinessFax
BusinessPhoneNumber	Categories	Company	Department
Description	DisplayAs	Email1	Email2
Email3	FirstName	HomeAddress	HomePhoneNumber
JobTitle	LastName	MailingAddressType	Manager
MiddleName	MobilePhoneNumber	NickName	Office
OtherAddress	OtherPhoneNumber	Pager	Profession
SpouseName	WebPage		

All fields except the `BusinessAddress`, `HomeAddress`, and `OtherAddress` fields contain text; the three address fields must contain structures with the following text fields:

- Street
- City
- State
- Zip
- Country

The `Attachments` field must contain the pathnames of any attachments to include in the contact. To specify multiple files, separate filepaths with semicolons (;) for Windows, and colons (:) for UNIX and Linux. Use absolute paths.

If you specify one or more attachments for a `modify` action, they are added to any existing attachments; the pre-existing attachments are not deleted.

The `Categories` field can have a comma-delimited list of the contact's categories.

If you do not specify a `DisplayAs` field, Exchange sets the display name to `FirstName`, `LastName`.

### Usage

The `cfexchangecontact` tag manages contact records on the Exchange server. Use the `cfexchangecontact` tag to perform the following actions:

- Create a contact.
- Delete one or more contacts.
- Get one or more contact records that conform to an optional set of filter specifications, such as the last name, job title, or home phone number, and so on.
- Get the attachments for a specific contact record.
- Modify an existing contact.

To use this tag, you must have a connection to an Exchange server. If you are using multiple tags that interact with the Exchange server, such as if you are creating several contact records, use the `cfexchangeconnection` tag to create a persistent connection. You then specify the connection identifier in each `cfexchangecontact`, or any other ColdFusion Exchange tag, if you are also accessing tasks, contacts, or mail. Doing this eliminates the overhead of creating and closing the connection for each tag.

Alternatively, you can create a temporary connection that lasts only for the time that ColdFusion processes the single `cfexchangecontact` tag. To do this, you specify the connection attributes directly in the `cfexchangecontact` tag. For details on the connection attributes, see the [cfexchangeconnection](#) tag `open` action.

#### attachmentPath attribute

Use the following syntax to specify an in-memory `attachmentPath` directory. In-memory files are not written to disk and speed processing of transient data.

```
attachmentpath = "ram:///filepath"
```

The path can include multiple directories, for example `ram:///petStore/orders/messageAttachments`. Create all directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files in the Developing ColdFusion Applications*.

#### The delete action

When you specify the `delete` action you must specify a `uid` attribute with a comma-delimited list of one or more Exchange UUIDs that identify the contacts to delete. You can use the `get` action, with an appropriate filter expression, to determine the UUID values to specify.

If all UUIDs that you specify are invalid, the `cfexchangecontact` tag generates an error. If at least one UUID is valid, the tag ignores any invalid UUIDs and deletes the items specified by the valid UUID.

#### The get action

When you specify the `get` action, the query object specified by the `name` attribute contains one record for each retrieved contact. The query object has columns with the same names and data formats as the fields listed for the `contact` attribute structure, with the following changes:

- The query object has a Boolean `HasAttachment` column, and does not have an `Attachments` column. If the `HasAttachment` field is `yes`, use the `getAttachments` action to retrieve the attachments.
- The query object has an additional `UID` column with the unique identifier for the contact record in the Exchange server. Use this value in the `uid` attribute of the `getAttachments`, `delete`, and `modify` actions to identify the required record.
- The query object has an additional `HtmlDescription` column. The `Description` column has a plain-text version of the description, and the `HtmlDescription` column text includes the description's HTML formatting.

You use child `cfexchangefilter` tags to specify the messages to get. For detailed information, see [cfexchangefilter](#).

#### The getAttachments action

When you use the `getAttachments` action, specify a single UUID and a `name` attribute. The `cfexchangecontact` tag populates a query object with the specified name. Each record has the following information about an attachment to the contact specified by the UUID:

Column name	Description
<code>attachmentFileName</code>	The filename of the attachment.
<code>attachmentFilePath</code>	The absolute path of the attachment file on the server. If you omit the <code>attachmentPath</code> attribute, this column contains the empty string.
<code>CID</code>	The content-ID of the attachment. Typically used in HTML <code>img</code> tags to embed images in a message.

Column name	Description
contentType	The MIME type of the attachment, such as text/html.
isMessage	A Boolean value specifying whether the attachment is a message.
size	The attachment size in bytes.

The tag places the attachments in the directory specified by the `attachmentPath` attribute. If you omit the `attachmentPath` attribute, ColdFusion does not get any attachments, it gets the information about the attachments. This lets you determine the attachments without incurring the overhead of getting the attachment files.

Use the following syntax to specify an in-memory `attachmentPath` directory. In-memory files are not written to disk and speed processing of transient data.

```
attachmentPath = "ram:///path"
```

The path can include multiple directories, for example `ram:///petStore/orders/messageAttachments`. Create all directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files in the Developing ColdFusion Applications*.

The `getAttachments` action works only if authentication for EWS (Exchange Web Services) is set to basic in the server setup of Exchange. IWA (Integrated Windows Authentication) is not supported.

### The modify action

If you specify the `modify` action, the `uid` attribute must specify a single Exchange UID. The `contact` structure must specify only the fields that you are changing. Any fields that you do not specify remain unchanged.

If a contact has attachments and you specify attachments when you modify the contact, the new attachments are added to the previous attachments, and do not replace them. Use the `deleteAttachments` action to remove any attachments.

### Example

The following example lets a user enter information in a form and creates a contact on the Exchange server with the information:

```
<!--- Create a structure to hold the contact information. --->
<cfset sContact="#StructNew()"#>

<!--- A self-submitting form for the contact information --->
<cfform format="flash" width="550" height="460">
    <cfformitem type="html"><b>Name</b></cfformitem>
    <cfformgroup type="horizontal" label="">
        <cfinput type="text" label="First" name="firstName" width="200">
        <cfinput type="text" label="Last" name="lastName" width="200">
    </cfformgroup>
    <cfformgroup type="VBox">
        <cfformitem type="html"><b>Address</b></cfformitem>
        <cfinput type="text" label="Company" name="Company" width="435">
        <cfinput type="text" label="Street" name="street" width="435">
        <cfinput type="text" label="City" name="city" width="200">
        <cfselect name="state" label="State" width="100">
            <option value="CA">CA</option>
            <option value="MA">MA</option>
            <option value="WA">WA</option>
        </cfselect>
        <cfinput type="text" label="Country" name="Country" width="200" Value="U.S.A.">
    </cfformgroup>
</cfform>
```

```
<cfformitem type="html"><b>Phone</b></cfformitem>
<cfinput type="text" validate="telephone" label="Business" name="businessPhone"
width="200">
<cfinput type="text" validate="telephone" label="Mobile" name="cellPhone"
width="200">
<cfinput type="text" validate="telephone" label="Fax" name="fax" width="200">
<cfformitem type="html"><b>Email</b></cfformitem>
<cfinput type="text" validate="email" name="email" width="200">
</cfformgroup>

<cfinput type="Submit" name="submit" value="Submit" >
</cfform>

<!-- If a form was submitted, populate the contact structure from it. -->
<cfif isDefined("Form.Submit")>
  <cfscript>
    sContact.FirstName=Form.firstName;
    sContact.Company=Form.company;
    sContact.LastName=Form.lastName;
    sContact.BusinessAddress.Street=Form.street;
    sContact.BusinessAddress.City=Form.city;
    sContact.BusinessAddress.State=Form.state;
    sContact.BusinessAddress.Country=Form.country;
    sContact.BusinessPhoneNumber=Form.businessPhone;
    sContact.MobilePhoneNumber=Form.cellPhone;
    sContact.BusinessFax=Form.fax;
    sContact.Email1=Form.email;
  </cfscript>

  <!-- Create the contact in Exchange -->
  <cfexchangecontact action="create"
    username = "#user1#"
    password="#password1#"
    server="#exchangeServerIP#"
    contact="#sContact#"
    result="theUID">

    <!-- Display a confirmation that the contact was added. -->
    <cfif isDefined("theUID")>
      <cfoutput>Contact Added. UID is#theUID#</cfoutput>
    </cfif>
  </cfif>
```

## cfexchangefilter

### Description

Specifies filter parameters that control the actions of `cfexchangeemail`, `cfexchangecalendar`, `cfexchangetask`, and `cfexchangecontact`, get operations.

### History

ColdFusion 8: Added this tag.

## Category

Communications tags

## Syntax

```
<cfexchangefilter
    name = "filter type"
    value = "filter value">
```

OR

```
<cfexchangefilter
    name = "filter type"
    from = "date/time"
    to = "date/time">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

Getting Exchange items and attachments in the *Developing ColdFusion Applications*

## Attributes

Attribute	Req/Opt	Default	Description
name	Required		The type of filter to use.
from	Optional		The start date or date/time combination of the range to use for filtering. Cannot be used with the <code>value</code> attribute. If you specify a <code>from</code> attribute without a <code>to</code> attribute, the filter selects for all entries on or after the specified date or time.  The value can be in any date/time format recognized by ColdFusion, but must correspond to a value that is appropriate for the filter type.
to	Optional		The end date or date/time combination for the range used for filtering. Cannot be used with the <code>value</code> attribute. If you specify a <code>to</code> attribute without a <code>from</code> attribute, the filter selects for all entries on or before the specified date or time.  The value can be in any date/time format recognized by ColdFusion, but must correspond to a value that is appropriate for the filter type.
value	Optional		The filter value for all filters that do not take a date or time range. Cannot be used with the <code>from</code> and <code>to</code> attributes.  ColdFusion generates an error if you specify this attribute with an empty contents. Therefore, you cannot use the empty string to search for empty values.  If you set this attribute to the empty string (""), ColdFusion searches for entries where the specified field is empty. 6.07

The `cfexchangeCalendar` tag filters can have the following `name` attributes and associated `value`, or `to` and `from` attributes that you use to specify the filter parameters for the specified action:

name attribute	Specification attributes	Valid specification attribute values
maxRows	value	A positive integer specifying the maximum number of matching rows to return. By default, the maximum number of rows is 100.  You can also specify -1; to return all matching rows.
allDayEvent	value	A Boolean value.
duration	value	An integer number of minutes.
endTime	from to	A string that ColdFusion can interpret as a date-time value.
fromID	value	An Exchange user ID.
hasAttachment	value	A Boolean value.
importance	value	One of the following values: <ul style="list-style-type: none"> <li>• high</li> <li>• normal</li> <li>• low</li> </ul>
isRecurring	value	A Boolean value.
location	value	A string.
message	value	A string.
optionalAttendees	value	A comma-delimited list of Exchange user IDs.
organizer	value	A string that identifies the organizer. This value does not need to be an Exchange ID or e-mail address.
requiredAttendees	value	A comma-delimited list of Exchange user IDs.
sensitivity	value	One of the following values: <ul style="list-style-type: none"> <li>• normal</li> <li>• personal</li> <li>• private</li> <li>• confidential</li> </ul>
startTime	from to	A string that ColdFusion can interpret as a date-time value.
subject	value	A string.
UID	value	A case-sensitive Exchange message UID that uniquely identifies one calendar entry.

The `cfexchangecontact` tag filters can have the following `name` attributes and associated `value` attributes. Unlike other tags, you do not use `from` or `to` attributes.

name attribute	value attribute
maxRows	A positive integer that specifies the maximum number of matching rows to return. By default, the maximum number of rows is 100.  You can also specify -1; to return all matching rows.
assistant	A string.
businessAddress	A structure with the following fields: Street, City, State, Zip, Country.
businessFax	A string.
businessPhoneNumber	A string.
categories	A comma-delimited list of categories. The filter searches for contacts that match all the categories in the list.
company	A string.
description	A string.
displayAs	A string.
email1	A string.
email2	A string.
email3	A string.
firstName	A string.
hasAttachment	A Boolean value.
homeAddress	A structure with the following fields: Street, City, State, Zip, Country.
homePhoneNumber	A string.
jobTitle	A string.
lastName	A string.
mailingAddressType	One of the following values: Home, Business, Other.
manager	A string.
middleName	A string.
mobilePhoneNumber	A string.
nickName	A string.
office	A string.
otherAddress	A structure with the following fields: Street, City, State, Zip, Country.
otherPhoneNumber	A string.
pager	A string.
profession	A string.
spouseName	A string.
webPage	A string.

The `cfexchangeemail` tag filters can have the following name attributes and associated value, or `to` and `from` attributes that you use to specify the filter parameters for the specified action:

name attribute	Specification attributes	Specification attribute values
maxRows	value	A positive integer that specifies the maximum number of matching rows to return. By default, the maximum number of rows is 100.  You can also specify -1; to return all matching rows.
bcc	value	A comma-delimited list of Exchange or web e-mail addresses.
cc	value	A comma-delimited list of Exchange or web e-mail addresses.
folder	value	The forward slash (/) delimited path from the root of the Exchange mailbox to the folder to search. By default, the filter searches the top level of the Inbox. The <code>cfexchangemail</code> tag searches only the specified folder, and does not search any subfolders.  If a folder name contains a forward slash, use the <code>_xF8FF_</code> escape sequence to specify the character in the name.  For the <code>get</code> and <code>move</code> actions, you can use the <code>cfexchangemail</code> tag <code>folder</code> attribute instead of this field; however, this field takes precedence over the value specified in the <code>folder</code> attribute.
fromID	value	An Exchange or web e-mail address.
hasAttachment	value	A Boolean value
importance	value	One of the following values: <ul style="list-style-type: none"><li>• high</li><li>• normal</li><li>• low</li></ul>
isRead	value	A Boolean value.
message	value	A string.
MessageType	value	One of the following values: <code>Mail</code> , <code>Meeting</code> , <code>Meeting_Cancel</code> , <code>Meeting_Request</code> , <code>Meeting_Response</code> , or <code>All</code> .  If you omit this attribute, the filter gets messages of all types.  The <code>Meeting</code> attribute gets messages with <code>Meeting_Cancel</code> , <code>Meeting_Request</code> , and <code>Meeting_Response</code> types.
MeetingUID	value	A case-sensitive Exchange calendar event UID. Meeting UIDs are used in <code>Meeting_request</code> or <code>Meeting_response</code> message types only. Do not specify this field if you specify a <code>MessageType</code> field value of <code>Mail</code> .
sensitivity	value	One of the following values: <ul style="list-style-type: none"><li>• normal</li><li>• personal</li><li>• private</li><li>• confidential</li></ul>
subject	value	A string.
timeReceived	from to	A string that ColdFusion can interpret as a date-time value.

name attribute	Specification attributes	Specification attribute values
timeSent	from to	A string that ColdFusion can interpret as a date-time value.
toID	value	A comma-delimited list of Exchange or web e-mail addresses.
uid	value	A case-sensitive Exchange message UID.

The `cfexchangetask` tag filters can have the following name attributes and associated value, or `to` and `from` attributes that you use to specify the filter parameters for the specified action:

name attribute	Specification attributes	Specification attribute values
maxRows	value	A positive integer specifying the maximum number of matching rows to return. By default, the maximum number of rows is 100.  You can also specify -1; to return all matching rows.
actualWork	value	A number representing the number of hours. Use decimal numbers to specify minutes.
billingInfo	value	A string.
companies	value	A string.
dateCompleted	value	A string that ColdFusion can interpret as a date-time value.
dueDate	from to	A string that ColdFusion can interpret as a date-time value.
mail_ID	value	A comma-delimited list of Exchange mail IDs. This filter value is useful if the connection user has delegate rights for multiple users and you want to select the tasks of a limited number of those users.
message	value	A string.
mileage	value	A string.
percentCompleted	value	A number between 0 and 100.
priority	value	One of the following values: <ul style="list-style-type: none"> <li>• high</li> <li>• normal</li> <li>• low</li> </ul>
reminderDate	value	A string that ColdFusion can interpret as a date-time value.
startDate	from to	A string that ColdFusion can interpret as a date-time value.

name attribute	Specification attributes	Specification attribute values
status	value	Must be one of the following values: <ul style="list-style-type: none"><li>• NOT_STARTED</li><li>• IN_PROGRESS</li><li>• COMPLETED</li><li>• WAITING</li><li>• DEFERRED</li></ul>
subject	value	A string.
totalWork	value	A number that represents the number of hours. Use decimal numbers to specify minutes.
UID	value	A case-sensitive Exchange UID.

### Usage

The `cfexchangefilter` tag specifies the conditions to match when ColdFusion gets mail messages, calendar entries, tasks, or contacts. Only those entries that match the specified filter conditions are returned in the structure specified by the parent tag's `name` attribute. If the filter specifies a field that takes a text string, such as `Message` and or `Subject`, ColdFusion returns items that contain the exact phrase that you specify in the `value` attribute.

The `cfexchangefilter` tag must be a child tag of a `cfexchangecalendar`, `cfexchangecontact`, `cfexchangemail`, or `cfexchangetask` tag with an `action` attribute value of `get`.

If you specify multiple `cfexchangefilter` tags in the body of a ColdFusion exchange tag, such as `cfexchangemail`, the specified filters are cumulative, and the selected records match the conditions specified in all the `cfexchangefilter` tags. If you specify multiple `cfexchangefilter` tags with the same `name` attribute value, the last tag with that attribute specifies the filter conditions.

### Example

The following example gets the mail messages that were sent to a user during the last week from any e-mail address that includes `adobe.com`. To focus on getting messages, rather than on displaying data, the example uses the `cfdump` tag to show the results.

```
<cfset endTime = Now()>
<cfset startTime = DateAdd("d",-7, endTime)>
<cfexchangemail action="get" name="weeksMail" server="#exchangeServerIP#"
    username="#user1#" password="#password1#">
    <cfexchangefilter name="FromID" value="adobe.com">
    <cfexchangefilter name="TimeSent" from="#startTime#" to="#endTime#">
</cfexchangemail>

<cfdump var="#weeksMail#">
```

## cfexchangemail

### Description

Gets mail messages and attachments, deletes messages, and sets properties for messages on a Microsoft Exchange server.

## History

ColdFusion 8: Added this tag.

## Category

[Communications tags](#)

## Syntax

### **delete**

```
<cfexchangemail
    required
    action = "delete"
    uid = "message UID,message UID,..."
    optional
    connection = "connection ID"
    folder = "Exchange folder path">
```

### **deleteAttachments**

```
<cfexchangemail
    required
    action = "deleteAttachments"
    uid = "message UID"
    optional
    connection = "connection ID">
    folder = "Exchange folder path">
```

### **get**

```
<cfexchangemail
    required
    action = "get"
    name = "query identifier"
    optional
    connection = "connection ID"
    folder = "Exchange folder path">

    <cfexchangeheader name = "filter type" value = "filter value">
    <cfexchangeheader name = "filter type" value = "filter value">
    ...
</cfexchangemail>
```

### **getAttachments**

```
<cfexchangemail
    required
    action = "getAttachments"
    name = "query identifier"
    uid = "message UID"
    optional
    attachmentPath = "directory path"
    connection = "connection ID"
    folder = "Exchange folder path"
    generateUniqueFilenames = "no|yes">
```

### **getMeetingInfo**

```
<cfexchangemail
    required
    action = "getMeetingInfo"
```

```
meetingUID = "meeting UID"
name = "query identifier"
optional
connection = "connection ID"
mailUID = "message UID">
```

#### move

```
<cfexchangemail
  required
  action = "move"
  destinationFolder = "Exchange folder path"
  optional
  connection = "connection ID"
  folder = "Exchange folder path">

  <cfexchangefilter name = "filter type" value = "filter value">
  <cfexchangefilter name = "filter type" value = "filter value">
  ...
</cfexchangemail>
```

#### set

```
<cfexchangemail
  required
  action = "set"
  message = "#structure with values to set#">
  uid = "message UID">
  optional
  connection = "connection ID"
  folder = "Exchange folder path">
```

**Note:** If you omit the `connection` attribute, create a temporary connection by specifying `cfexchangeconnection` tag attributes in the `cfexchangemail` tag. In this case, ColdFusion closes the connection when the tag completes. For details, see the [cfexchangeconnection](#) tag `open` action.

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

Interacting with Microsoft Exchange Servers in the *Developing ColdFusion Applications*

#### Attributes

**Note:** If an attribute, such as `folder` or `destinationFolder` takes a folder path, and the folder name contains forward slashes (/), specify the folder name by using the `_xF8FF_` escape character to prevent exchange from interpreting the character as a path delimiter.

Attribute	Action	Req/Opt	Default	Description
action	all	Required		<p>The action to take. Must be one of the following values:</p> <ul style="list-style-type: none"> <li>• delete</li> <li>• deleteAttachments</li> <li>• get</li> <li>• getAttachments</li> <li>• getMeetingInfo</li> <li>• move</li> <li>• set</li> </ul>
attachmentPath	getAttachments	Optional		<p>The filepath of the directory in which to put the attachments. If the directory does not exist, ColdFusion creates it.</p> <p><b>Note:</b> If you omit this attribute, ColdFusion does not save any attachments. If you specify a relative path, the path root is the ColdFusion temporary directory, which is returned by the <code>GetTempDirectory</code> function.</p>
connection	all	Optional		<p>The name of the connection to the Exchange server, as specified in the <code>cfexchangeconnection</code> tag.</p> <p>If you omit this attribute, create a temporary connection by specifying <code>cfexchangeconnection</code> tag <code>open</code> action attributes in the <code>cfexchangecalendar</code> tag.</p>
destinationFolder	move	Required		<p>The forward slash (/) delimited path, relative to the root of the mailbox, of the folder to which to move the message or messages.</p>
folder	all <i>except</i> getMeetingInfo	Optional		<p>The forward slash (/) delimited path, relative to the root of the mailbox, of the folder that contains the message or messages. The <code>cfexchangemail</code> tag looks in the specified folder only, and does not search subfolders.</p> <p>For the <code>get</code> and <code>move</code> actions specifying a <code>cfexchangefilter</code> child tag with a <code>name="folder"</code> attribute is equivalent to setting this attribute, and takes precedence over this attribute's value.</p> <p>If you omit this attribute, or for <code>get</code> and <code>move</code> actions, if you do not use the corresponding <code>cfexchangefilter</code> setting, Exchange looks in the top level of the Inbox.</p>
generateUniqueFilenames	getAttachments	Optional	no	<p>A Boolean value that specifies whether to generate unique filenames if multiple attachments have the same filenames. If two or more attachments have the same filename and this option is <code>yes</code>, ColdFusion appends a number to the filename body (before the extension) of any conflicting filenames. Thus, if three attachments have the name <code>myfile.txt</code>, ColdFusion saves the attachments as <code>myfile.txt</code>, <code>myfile1.txt</code>, and <code>myfile2.txt</code>.</p>

Attribute	Action	Req/Opt	Default	Description
mailUID	getMeetingInfo	Optional		The case-sensitive UID of the mail message that contains the meeting request, response, or cancellation notification. Use this attribute if there are multiple messages about a single meeting.
meetingUID	getMeetingInfo	Required		The case-sensitive UID of the meeting for which you received the notification.
message	set	Required		A reference to a structure that contains the properties to be set and their values. Specify this attribute in number signs (#).  For more information on the message structure, see Usage.
name	get getAttachments getMeetingInfo	Required		The name of the ColdFusion query variable that contains the returned mail messages or the retrieved information about the attachments or meeting. For more information on the returned data, see Usage.
uid	delete getAttachments set	Required		The case-sensitive UIDs of the messages on which to perform the action.  For the <code>delete</code> action, this attribute can be a comma-delimited list of UID values. The <code>deleteAttachments</code> , <code>getAttachments</code> , and <code>set</code> actions allow only a single UID value.

### Usage

The `cfexchangemail` tag performs mail actions on an Exchange server that you cannot do by using the `cfmail` tag. (You must use the `cfmail` tag to send, forward, and reply to mail messages.) Use the `cfexchangemail` tag to perform the following actions:

- Permanently delete one or more mail messages from the server.
- Get the attachments for a specific message.
- Get one or more messages that conform to an optional set of filter specifications, such as the subject, sender or recipient ID, time received, and so on.
- Get the attachments for a specific message.
- Get detailed information about a meeting for which you have a notification, such as a meeting request or cancellation notice.
- Move one or more messages from one folder to another, including to the Deleted Items folder.
- Set the properties of a specific mail message.

To use this tag, you must have a connection to an Exchange server. If you are using multiple tags that interact with the exchange server, such as if you are creating several contact records, use the `cfexchangeconnection` tag to create a persistent connection. You then specify the connection identifier in each `cfexchangemail` tag, or any other ColdFusion Exchange tag, if you are also accessing tasks, contacts, or connections. Doing this saves the overhead of creating and closing the connection for each tag.

Alternatively, you can create a temporary connection that lasts only for the time that ColdFusion processes the single `cfexchangemail` tag. To do this, you specify the connection attributes directly in the `cfexchangemail` tag. For details on the connection attributes, see the [cfexchangeconnection](#) tag.

### The delete action

The `delete` action permanently deletes a message from the server, and is equivalent to the Outlook Shift-Delete keystroke action. Use the `move` action to move a message to the Deleted Items folder, which is equivalent to the Outlook Delete keystroke action.

When you specify the `delete` action you must specify a `uid` attribute with a comma-delimited list of one or more Exchange UUIDs that identify the tasks that you want to delete. You can use the `get` action, with an appropriate filter expression, to determine the UUID values to specify.

If all UUIDs that you specify are invalid, the `cfexchangemail` tag generates an error. If at least one UUID is valid, the tag ignores any invalid UUIDs and deletes the items specified by the valid UUID.

### The get action

When you specify the `get` action, you use child `cfexchangefilter` tags to specify the messages to get. For detailed information, see [cfexchangefilter](#). When the tag completes processing, the query object specified by the `name` attribute contains one record for each matching message that was found. Each record has the following columns:

Column	Description
BCC	A comma-delimited list of Exchange user IDs or web e-mail.
CC	A comma-delimited list of Exchange user IDs or web e-mail addresses.
Folder	The forward slash (/) delimited path from the root of the Exchange mailbox to the mail folder containing the message.
FromID	An Exchange user IDs or web e-mail addresses.
HasAttachment	A Boolean value that indicates whether the message has at least one attachment.
HTMLMessage	A string containing a HTML-formatted version of the message.
IsRead	A Boolean value.
Message	A string with a plain-text version of the message contents.
MessageType	One of the following strings: <ul style="list-style-type: none"> <li>Mail</li> <li>Meeting_Cancel</li> <li>Meeting_Request</li> <li>Meeting_Response</li> </ul>
MeetingResponse	If the message type is <code>Meeting_response</code> , this column contains the response code as one of the following strings: <code>Accept</code> , <code>Decline</code> , or <code>Tentative</code> . This field is not used for other message types.
MeetingUID	If the message type is <code>Meeting_Cancel</code> , <code>Meeting_request</code> , or <code>Meeting_response</code> this column contains the UID of the calendar event for which this message was sent. Use this value in the <code>cfexchangecalendar</code> tag to respond to a request. This field is not used for the <code>Mail</code> message type.
Sensitivity	One of the following strings: <ul style="list-style-type: none"> <li>public</li> <li>private</li> <li>normal</li> <li>company-confidential</li> </ul>

Column	Description
Subject	A string.
TimeReceived	A ColdFusion date-time object.
TimeSent	A Coldfusion date-time object.
Told	A comma-delimited list of Exchange user IDs or web mail IDs.
UID	The Exchange UID of the message.

**Note:** An invitation sender can get a meeting request message only if the sender is on the attendee list.

### The `getAttachments` action

When you use the `getAttachments` action, specify a single UID and a `name` attribute. The `cfexchangecontact` tag populates a query object specified by the `name` attribute with one record for each attachment. Each record has the following information about the mail attachment specified by the UID:

Column name	Description
<code>attachmentFileName</code>	The filename of the attachment.
<code>attachmentFilePath</code>	The absolute path of the attachment file on the server. If you omit the <code>attachmentPath</code> attribute, this column contains the empty string.
<code>CID</code>	The content-ID of the attachment. Used in HTML <code>img</code> tags to embed images in a message.
<code>mimeType</code>	The MIME type of the attachment, such as <code>text/html</code> .
<code>isMessage</code>	A Boolean value that specifies whether the attachment is a message.
<code>size</code>	The attachment size in bytes.

The tag places the attachments in the directory specified by the `attachmentPath` attribute. If you omit the `attachmentPath` attribute, ColdFusion does not get any attachments; it gets the information about the attachments. This lets you determine the attachments without incurring the overhead of getting the attachment files.

If a message has multiple attachments with the same name, the attachment information structure always lists the attachments with their original, duplicate, names, even if you specify `generateUniqueFileNames="yes"`. The `generateUniqueFileNames` attribute only affects the names of the files on disk.

Use the following syntax to specify an in-memory `attachmentPath` directory. In-memory files are not written to disk and speed processing of transient data.

```
attachmentpath = "ram:///path"
```

The path can include multiple directories, for example `ram:///petStore/orders/messageAttachments`. Create all directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files in the Developing ColdFusion Applications*.

The `getAttachments` action works only if authentication for EWS (Exchange Web Services) is set to basic in the server setup of Exchange. IWA (Integrated Windows Authentication) is not supported.

### The `getMeetingInfo` action

You use the `getMeetingInfo` action to get meeting-specific information, such as the meeting start and end times, location, and so on, about a meeting for which you have received a notification message, such as an invitation request or cancellation notice. This information is not available directly in the notification message query object that is returned by the `get` action.

**Note:** At the time of publication, the following information does not completely reflect the behavior of the `getMeetingInfo` action. For updated information, see `cfexchangemail` in the ColdFusion documentation available online in HTML on the Adobe website.

When you specify the `getMeetingInfo` action, you specify a `meetingUID` attribute with the UID of the meeting. You get this UID value from the query record that is returned by the `get` action. You can optionally specify a `messageUID` attribute with the UID of the specific message that contains the notification; if you receive multiple messages about a single meeting, you can use this attribute to select a single notification message.

When the tag completes processing, the query object specified by the `name` attribute contains one record for each matching message that was found. Each record has the following columns:

Field	Description
AllDayEvent	A Boolean value that indicates whether this is an all day event.
Duration	The duration of the event in minutes.
EndTime	The end time of the event, in ColdFusion ODBC date-time format.
From	The mail ID of the person who sent the meeting notification.
HasAttachment	A Boolean value that indicates whether this event has attachments.
Importance	One of the following values: <ul style="list-style-type: none"> <li>• high</li> <li>• normal</li> <li>• low</li> </ul>
IsRecurring	A Boolean value that indicates whether this event repeats.
Location	A string that specifies the location of the event.
MeetingUID	The UID of the event in the calendar.
Message	A string that contains a message about the event.
OptionalAttendees	A comma-delimited list of mail IDs.
Organizer	A string. This value is not necessarily an Exchange ID or e-mail address.
Reminder	The time, in minutes before the event, at which to display a reminder message.
RequiredAttendees	A comma-delimited list of mail IDs.
Resources	A comma-delimited list of mail IDs for Exchange scheduling resources, such as conference rooms and display equipment.
Sensitivity	One of the following values: <ul style="list-style-type: none"> <li>• normal</li> <li>• company-confidential</li> <li>• personal</li> <li>• private</li> </ul>
StartTime	The start time of the event, in ODBC date-time format.

Field	Description
Subject	A string describing the event subject.
TimeReceived	The time the message was received, in ODBC date-time format.
UID	The UID of the message that contains the event notification.

### The move action

Use the `move` action to move one or more messages from one folder to another folder. You can use this action to move messages to the Deleted Items folder, which is equivalent to the Outlook Delete keystroke action.

When you specify the `move` action you specify the destination folder, and optionally the folder containing the messages to move. (The default source folder is the Inbox). You use child `cfexchangefilter` tags to specify the messages to get. For detailed information, see [cfexchangefilter](#).

### The set action

When you specify the `set` action, the structure specified by the `message` attribute contains key-value pairs that specify the message properties to set. The following table lists the key names and their valid values:

Key name	Valid values
IsRead	yes, no
Importance	high, normal, low
Sensitivity	normal, company-confidential, personal, private

### Example

The following example gets the attachments to all mail messages in the Inbox from docuser2 in the last week. It puts each message's attachments in a directory with a unique name. It cannot use the UID as a filename because, for each message with attachments, the UID can contain the application reports of the UID, directory path, subject, date, and sender of the message, followed by a table that lists the message's attachments. The table includes the attachment name, size, and MIME type.

```
<!--- Index for message attachment directory --->
<cfset i=1>
<!--- Dates for date range --->
<cfset rightNow = Now()>
<cfset lastWeek = DateAdd("d", "-7", rightNow)>

<cfexchangeconnection
    action="open"
    username = "#user1#"
    password="#password1#"
    server="#exchangeServerIP#"
    connection="testconn1">

<cfexchangemail action="get" folder="Inbox" name="weeksMail" connection="testconn1">
    <cfexchangefilter name="FromID" value="docuser2">
    <cfexchangefilter name="TimeSent" from="#lastWeek#" to="#rightNow#">
</cfexchangemail>

<cfloop query="weeksMail">
    <cfif weeksmail.HasAttachment>
        <cfexchangemail action="getAttachments"
```

```
connection="testconn1"
folder="Inbox/MailTest"
uid="#weeksmail.uid#"
name="attachData"
attachmentPath="C:\temp\cf_files\attachments\msg_#i#"
generateUniqueFileNames="yes">
<cfoutput>
  Message ID #weeksmail.uid# attachments are in the directory
    C:\temp\cf_files\attachments\Msg_#i#<br />

  <cftable query="attachData" colheaders="yes">
    <cfcol header="File Name" text="#attachmentFilename#">
    <cfcol header="Size" text="#size#">
    <cfcol header="MIME type" text="#mimeType#">
  </cftable>
</cfoutput>
<cfset i++>
</cfif>
</cfloop>
<cfexchangeconnection action="close" connection="testconn1">
```

## cfexchangetask

### Description

Creates, deletes, modifies, and gets Microsoft Exchange tasks, and gets task attachments.

**Note:** For all actions, see [cfexchangeconnection](#) for additional attributes that you use if you do not specify the connection attribute.

### History

ColdFusion 8: Added this tag.

### Category

[Communications tags](#)

## Syntax

### **create**

```
<cfexchangetask
    required
    action = "create"
    task = "#task information structure#"
    optional
    connection = "connection ID"
    result = "variable for event UID">
```

### **delete**

```
<cfexchangetask
    required
    action = "delete"
    uid = "task UID,task UID, ..."
    optional
    connection = "connection ID">
```

### **deleteAttachments**

```
<cfexchangetask
    required
    action = "deleteAttachments"
    uid = "task UID"
    optional
    connection = "connection ID">
```

### **get**

```
<cfexchangetask
    required
    action = "get"
    name = "query identifier"
    optional
    connection = "connection ID">
```

### **getAttachments**

```
<cfexchangetask
    required
    action = "getAttachments"
    name = "query identifier"
    uid = "task UID"
    optional
    attachmentPath = "directory path"
    connection = "connection ID"
    generateUniqueFileNames = "no|yes">
```

### **modify**

```
<cfexchangetask
    required
    action = "modify"
    task = "#task information structure#"
    uid = "task UID">
    optional
    connection = "connection ID">
```

**Note:** If you omit the `connection` attribute, create a temporary connection by specifying `cfexchangeconnection` tag attributes in the `cfexchangetask` tag. In this case, ColdFusion closes the connection when the tag completes. For details, see the [cfexchangeconnection](#) tag open action.

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### Attributes

The following table provides detailed information about each attribute. It lists the attribute name, the actions (action attribute values) to which it applies, whether it is required or optional for those actions, and its default value, if any, and provides a detailed description of the attribute and its valid values.

Attribute	Action	Req/Opt	Default	Description
action	all	Required		The action to take. Must be one of the following values: <ul style="list-style-type: none"><li>• create</li><li>• delete</li><li>• deleteAttachments</li><li>• get</li><li>• getAttachments</li><li>• modify</li></ul>
attachmentPath	getAttachments	Optional		The filepath of the directory in which to put the attachments. If the directory does not exist, ColdFusion creates it.  <b>Note:</b> If you omit this attribute, ColdFusion does not save any attachments. If you specify a relative path, the path root is the ColdFusion temporary directory, which is returned by the <code>GetTempDirectory</code> function.
connection	all	Optional		The name of the connection to the Exchange server, as specified in the <code>cfexchangeconnection</code> tag.  If you omit this attribute, create a temporary connection by specifying <code>cfexchangeconnection</code> tag connection attributes in the <code>cfexchangetask</code> tag.
generateUnique Filenames	getAttachments	Optional	no	A Boolean value that specifies whether to generate unique filenames if multiple attachments have the same filenames. If two or more attachments have the same filename and this option is <code>yes</code> , ColdFusion appends a number to the filename body (before the extension) of any conflicting filenames. Thus, if three attachments have the name <code>myfile.txt</code> , ColdFusion saves the attachments as <code>myfile.txt</code> , <code>myfile1.txt</code> , and <code>myfile2.txt</code> .
name	get getAttachments	Required		The name of the ColdFusion query variable that contains the returned task records or information about the attachments that were retrieved. For more information on the returned data, see <a href="#">Usage</a> .

Attribute	Action	Req/Opt	Default	Description
result	create	Optional		The name of a variable that contains the UID of the task that is created. You use this value in the <code>uid</code> attribute of other actions to identify the task to be acted on.
task	create modify	Required		A reference to the structure that contains the task properties to be set or changed and their values. Specify this attribute in number signs (#).  For more information on the event structure, see Usage.
uid	delete getAttachments modify	Required		A case-sensitive Exchange UID value that uniquely identifies the tasks on which to perform the action. For the <code>delete</code> action, this attribute can be a comma-delimited list of UID values. The <code>deleteAttachments</code> , <code>getAttachments</code> , and <code>modify</code> actions allow only a single UID value.

When you specify the `create` or `modify` action, the `task` attribute must specify a structure that contains information that defines the events. The structure can have the following fields. Include only the fields that you are setting or changing.

Column	Description
ActualWork	A number in minutes. Cannot be less than zero.
Attachments	The pathnames of any attachments to include in the task. To specify multiple files, separate filepaths with semicolons (;) for Windows, and colons (:) for UNIX and Linux. Use absolute paths.  If you specify one or more attachments for a <code>modify</code> action, these are added to any existing attachments; the pre-existing attachments are not deleted.
Categories	A comma-delimited list of categories. The filter searches for tasks that match all the categories in the list.
BillingInfo	A string.
Companies	A string.
DateCompleted	A string in a date format that is valid in ColdFusion.  If you omit this field and set the <code>Status</code> field to <code>completed</code> , or set the <code>PercentCompleted</code> field to 100, this value is set to the current date.  If you set this date, the <code>Status</code> value is set to <code>Completed</code> and the <code>PercentCompleted</code> field is set to 100.
DueDate	A string in a date format that is valid in ColdFusion.
Message	A string containing the task description.
Mileage	A string.
PercentCompleted	A number in the range 0–100.  If you set this field to 100, The following values are set: <ul style="list-style-type: none"><li>• The <code>Status</code> value is set to <code>Completed</code>.</li><li>• If the <code>DateCompleted</code> value is or was not set, it is set to the current date.</li></ul> If you set this value to a number with a value less than 100, the following values are set: <ul style="list-style-type: none"><li>• If <code>Status</code> field is or was set to <code>Completed</code>, the <code>Status</code> is set to <code>In_Progress</code>.</li><li>• The <code>DateCompleted</code> value is cleared.</li></ul>

Column	Description
Priority	One of the following values: <ul style="list-style-type: none"> <li>low</li> <li>normal</li> <li>high</li> </ul>
ReminderDate	A string in a date format that is valid in ColdFusion.
StartDate	A string in a date format that is valid in ColdFusion. When you create a task, the default value <code>defaults</code> is the current date.
Status	<p>The following values are valid: <code>Not_Started</code>, <code>In_Progress</code>, <code>Completed</code>, <code>Waiting</code>, or <code>Deferred</code>.</p> <p>If you omit this field and the <code>PercentCompleted</code> value is less than 100, the <code>Status</code> value it is set to <code>In_Progress</code>.</p> <p>If you set this field to <code>Completed</code>, the following values are also set:</p> <ul style="list-style-type: none"> <li>The <code>PercentCompleted</code> value is set to 100.</li> <li>If the <code>DateCompleted</code> value is not set, it is set to the current date.</li> </ul> <p>If you set this field to a value other than <code>Completed</code>, the following values are also set:</p> <ul style="list-style-type: none"> <li>If the <code>PercentCompleted</code> field is or was 100, the <code>PercentCompleted</code> value is reset to 0.</li> <li>The <code>DateCompleted</code> value is set to 0.</li> </ul>
Subject	A String.
TotalWork	A number in minutes. Cannot be less than zero.

### Usage

The `cfexchangetask` tag manages task records on the Exchange server. Use the `cfexchangetask` tag to perform the following actions:

- Create a task.
- Delete one or more tasks.
- Get one or more task records that conform to an optional set of filter specifications, such as the last name, job title, or home phone number, and so on.
- Get the attachments for a specific task record.
- Modify an existing task

To use this tag, you must have a connection to an Exchange server. If you are using multiple tags that interact with the exchange server, such as if you are creating several task records, use the `cfexchangeconnection` tag to create a persistent connection. You then specify the connection identifier in each `cfexchangetask`, or any other ColdFusion Exchange tag, if you are also accessing calendar entries, contacts, or mail. Doing this saves the overhead of creating and closing the connection for each tag.

Alternatively, you can create a temporary connection that lasts only for the time that ColdFusion processes the single `cfexchangetask` tag. To do this, you specify the connection attributes directly in the `cfexchangetask` tag. For details on the connection attributes, see the [cfexchangeconnection](#) tag.

### The delete action

When you specify the `delete` action, specify a `uid` attribute with a comma-delimited list of one or more Exchange UUIDs that identify the tasks to delete. You can use the `get` action, with an appropriate filter expression, to determine the UUID values to specify.

If all UUIDs that you specify are invalid, the `cfexchangetask` tag generates an error. If at least one UUID is valid, the tag ignores any invalid UUIDs and deletes the items specified by the valid UUID.

### The get action

When you specify the `get` action, the query object specified by the `name` attribute contains one record for each retrieved task. The query object has columns with the same names and data formats as the fields listed for the `task` attribute structure, with the following differences:

- The query object has a Boolean `HasAttachment` column, and does not have an `Attachments` column. If the `HasAttachment` field value is `yes`, use the `getAttachments` action to retrieve the attachments.
- The query object has an additional `UID` column with the unique identifier for the task in the Exchange server. You can use this value in the `uid` attribute of the `getAttachments`, `delete`, and `modify` actions to identify the required task.
- The query object has an additional `HtmlMessage` column. The `Message` column has a plain-text version of the task description, and the `HtmlMessage` column text includes the description's HTML formatting.

You use child `cfexchangefilter` tags to specify the messages to get. For detailed information, see [cfexchangefilter](#).

### The getAttachments action

When you use the `getAttachments` action, specify a single UUID and a `name` attribute. The `cfexchangetask` tag populates a query object specified by the `name` attribute with the specified name. Each record has the following information about an attachment to the specified task:

Column name	Description
<code>attachmentFileName</code>	The filename of the attachment.
<code>attachmentFilePath</code>	The absolute path of the attachment file on the server. If you omit the <code>attachmentPath</code> attribute, this column contains the empty string.
<code>CID</code>	The content-ID of the attachment. Typically used in HTML <code>img</code> tags to embed images in a message.
<code>mimeType</code>	The MIME type of the attachment, such as <code>text/html</code>
<code>isMessage</code>	A Boolean value that specifies whether the attachment is a message.
<code>size</code>	The attachment size, in bytes.

The tag places the attachments in the directory specified by the `attachmentPath` attribute. If you omit the `attachmentPath` attribute, ColdFusion does not get any attachments, it gets the information about the attachments. This lets you determine the attachments without incurring the overhead of getting the attachment files.

Use the following syntax to specify an in-memory `attachmentPath` directory. In-memory files are not written to disk and speed processing of transient data.

```
attachmentPath = "ram:///path"
```

The path can include multiple directories, for example `ram:///petStore/orders/messageAttachments`. Create all directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files in the Developing ColdFusion Applications*.

The `getAttachments` action works only if authentication for EWS (Exchange Web Services) is set to basic in the server setup of Exchange. IWA (Integrated Windows Authentication) is not supported.

### The modify action

If you specify the `modify` action, the `uid` attribute must specify a single Exchange UID. The `task` structure must specify only the fields that you are changing. Any fields that you do not specify remain unchanged. For a detailed description of the contents of the task structure, see the [Attributes](#) section.

If a task has attachments and you specify attachments when you modify the task, the new attachments are added to the previous attachments, and do not replace them. Use the `deleteAttachments` action to remove any attachments.

### Example

The following example uses a transient connection to create a single task:

```
<!--- Create a structure with the task fields --->
<cfscript>
    stask=StructNew();
    stask.Priority="high";
    stask.Status="Not_Started";
    stask.DueDate="3:00 PM 09/14/2007";
    stask.Subject="My New Task";
    stask.PercentCompleted=0;
    Message="Do this NOW!";
</cfscript>

<!--- Create the task using a transient connection. --->
<cfexchangetask action="create"
    username = "#user1#"
    password="#password1#"
    server="#exchangeServerIP#"
    task="#stask#"
    result="theUID">

<!--- display the UID to confirm that the action completed. --->
<cfdump var="#theUID#">
```

## cfexecute

### Description

Executes a ColdFusion developer-specified process on a server computer.

### Category

[Extensibility tags](#), [Flow-control tags](#)

## Syntax

```
<cfexecute  
    name = "application name"  
    arguments = "command line arguments"  
    outputFile = "output filename"  
    timeout = "timeout interval"  
    variable = "variable name">  
    ...  
</cfexecute>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfcollection](#), [cfindex](#), [cfobject](#), [cfreport](#), [cfsearch](#), [cfwddx](#)

## History

ColdFusion MX 6.1:

- Added the `variable` attribute.
- Changed filepath behavior for the `outputFile` attribute: if you do not specify an absolute filepath in the `outputFile` attribute, the path is relative to the ColdFusion temporary directory.

## Attributes

Attribute	Req/Opt	Default	Description
name	Required		Absolute path of the application to execute. On Windows, specify an extension, for example, C:\myapp.exe.
arguments	Optional		Command-line variables passed to application. If specified as string, it is processed as follows: <ul style="list-style-type: none"><li>• Windows: passed to process control subsystem for parsing.</li><li>• UNIX: tokenized into an array of arguments. The default token separator is a space; you can delimit arguments that have embedded spaces with double-quotation marks.</li></ul> If passed as array, it is processed as follows: <ul style="list-style-type: none"><li>• Windows: elements are concatenated into a string of tokens, separated by spaces. Passed to process control subsystem for parsing.</li><li>• UNIX: elements are copied into an array of <code>exec()</code> arguments.</li></ul>

Attribute	Req/Opt	Default	Description
outputFile	Optional		File to which to direct program output. If no <code>outputFile</code> or <code>variable</code> attribute is specified, output is displayed on the page from which it was called.  If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.
timeout	Optional	0	Length of time, in seconds, that ColdFusion waits for output from the spawned program.  <ul style="list-style-type: none"> <li>0: equivalent to nonblocking mode.</li> <li>A very high value: equivalent to blocking mode.</li> </ul> <p>If the value is 0:</p> <ul style="list-style-type: none"> <li>ColdFusion starts a process and returns immediately. ColdFusion may return control to the calling page before any program output displays. To ensure that program output displays, set the value to 2 or higher.</li> <li>If the <code>outputFile</code> attribute is not specified, any program output is discarded</li> </ul>
variable	Optional		Variable in which to put program output. If no <code>outputFile</code> or <code>variable</code> attribute is specified, output is displayed on page from which it was called.

### Usage

Do not put other ColdFusion tags or functions between the start and end tags of `cfexecute`. You cannot nest `cfexecute` tags.

### Exceptions

Throws the following exceptions:

- If the application name is not found: `java.io.IOException`
- If the effective user of the ColdFusion executing thread does not have permissions to execute the process: a security exception

The time-out values must be between zero and the longest time-out value supported by the operating system.

### Example

```
<h3>cfexecute</h3>
<p>This example executes the Windows NT version of the netstat network monitoring program, and places its output in a file.

<cfexecute name = "C:\WinNT\System32\netstat.exe"
  arguments = "-e"
  outputFile = "C:\Temp\output.txt"
  timeout = "1">
</cfexecute>
```

## cfexit

### Description

This tag aborts processing of the currently executing CFML custom tag, exits the page within the currently executing CFML custom tag, or re-executes a section of code within the currently executing CFML custom tag.

## Category

Debugging tags, Flow-control tags

## Syntax

```
<cfexit  
    method = "method">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfabort](#), [cfbreak](#), [cfexecute](#), [cfif](#), [cflocation](#), [cfloop](#), [cfswitch](#), [cfthrow](#), [cftry](#); [cfabort](#) and [cfexit](#) in the *Developing ColdFusion Applications*

## Attributes

Attribute	Req/Opt	Default	Description
method	Optional	exitTag	<ul style="list-style-type: none"> <li><code>exitTag</code>: aborts processing of currently executing tag.</li> <li><code>exitTemplate</code>: exits page of currently executing tag.</li> <li><code>loop</code>: re-executes body of currently executing tag.</li> </ul>

## Usage

If this tag is encountered outside the context of a custom tag, for example in the base page or an included page, it executes in the same way as `cfabort`. The `cfexit` tag can help simplify error checking and validation logic in custom tags.

The `cfexit` tag function depends on its location and execution mode:

Method value	Location of <code>cfexit</code> call	Behavior
exitTag	Base page	Terminate processing
	Execution mode = Start	Continue after end tag
	Execution mode = End	Continue after end tag
exitTemplate	Base page	Terminate processing
	Execution mode = Start	Continue from first child in body
	Execution mode = End	Continue after end tag
loop	Base page	Error
	Execution mode = Start	Error
	Execution mode = End	Continue from first child in body

## Example

```
<h3>cfexit Example</h3>
<p>cfexit can be used to abort the processing of the currently executing CFML custom tag.
Execution resumes following the invocation of the custom tag in the page that called the tag.
<h3>Usage of cfexit</h3>
<p>cfexit is used primarily to perform a conditional stop of processing inside a custom tag.
cfexit returns control to the page that called that custom tag, or in the case of a tag called
by another tag, to the calling tag.</p>

<!-- cfexit can be used within a CFML custom tag, as follows: -->
<!-- Place this code (uncomment the appropriate sections) within the customtags directory. -
-->

<!-- MyCustomTag.cfm -->
<!-- This simple custom tag checks for the existence of myValue1 and myValue2. If they are
both defined, the tag adds them and returns the result to the calling page in the variable
"result". If either or both of the expected attribute variables is not present, an error message
is generated, and cfexit returns control to the calling page. -->

<!-- <cfif NOT IsDefined("attributes.myValue2")>
    <cfset caller.result = "Value2 is not defined">
    <cfexit method = "exitTag">
<cfelseif NOT IsDefined("attributes.myValue1")>
    <cfset caller.result = "Value1 is not defined">
    <cfexit method = "exitTag">
<cfelse>
    <cfset value1 = attributes.myValue1>
    <cfset value2 = attributes.myValue2>
    <cfset caller.result = value1 + value2>
</cfif> -->
<!-- End MyCustomTag.cfm -->

<!-- Place this code within your page -->

<!-- <p>The call to the custom tag, and then the result: </p>
<CF_myCustomTag
    myvalue2 = 4>
<cfoutput>#result#</cfoutput> -->
<p>If cfexit is used outside a custom tag, it functions like a cfabort. For example, the text
after this message is not processed:</p>
<cfexit>
<p>This text is not executed because of the cfexit tag above it.</p>
```

# Tags f

## cffeed

### Description

Reads or creates an RSS or Atom syndication feed. This tag can read RSS versions 0.90, 0.91, 0.92, 0.93, 0.94, 1.0, and 2.0, and Atom 0.3 or 1.0. It can create RSS 2.0 or Atom 1.0 feeds.

## Category

Communications tags, Internet protocol tags

## Syntax

### create

```
required
<cffeed
  action = "create"
  name = "#structure#"
    One or both of the following: outputFile = "path"
  xmlVar = "variable name"
optional
  overwrite = "no|yes">
  escapeChars = "true|false">
```

OR

```
required
<cffeed
  action = "create"
  properties = "#metadata structure#"
  query = "#items/entries query name#"
    One or both of the following: outputFile = "path"
  xmlVar = "variable name"
optional
  columnMap = "mapping structure"
  overwrite = "no|yes">
```

### read

```
required
<cffeed
  source = "feed source"
    One or more of the following: name = "structure"
  properties = "metadata structure"
  query = "items/entries query"
  outputFile = "path"
  xmlVar = "variable name"
optional
  action = "read"
  enclosureDir = "path"
  ignoreEnclosureError = "no|yes"
  overwrite = "no|yes"
  overwriteEnclosure = "no|yes"
  proxyServer = "IP address or server name for proxy host"
  proxyPassword = "password for the proxy host"
  proxyPort = "port of the proxy host"
  proxyUser = "user name for the proxy host"
  timeout = "request time-out in seconds"
  userAgent = "HTTP user agent identifier">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## History

ColdFusion 8: Added this tag.

ColdFusion 9: The `escapeChars` attribute is newly added.

### Attributes

Attribute	Req/Opt	Default	Description
<code>action</code>	Optional	<code>read</code>	<p>The action to take, one of the following values:</p> <ul style="list-style-type: none"> <li><code>create</code>: creates an RSS 2.0 or Atom 1.0 feed XML document and saves it in a variable, writes it to a file, or both.</li> <li><code>read</code>: parses an RSS or Atom feed from a URL or an XML file and saves it in a structure or query. You can also get feed metadata in a separate structure.</li> </ul>
<code>columnMap</code>	Optional		<p>Used only for the <code>create</code> action with a <code>query</code> attribute.</p> <p>A structure that specifies a mapping between the names of the columns in the object specified by the <code>query</code> attribute and the columns of the ColdFusion feed format (see the section Query object rules).</p> <p>The key for each field must be a column name (see the table in the Query object rules section). The value of the field must be the name of the corresponding column in the query object used as input to the <code>create</code> action.</p>
<code>enclosureDir</code>	Optional		<p>Used only for the <code>read</code> action.</p> <p>Path to the directory in which to save any enclosures that are available in the feed being read. The path can be absolute or relative to the CFML file.</p> <p>If the directory does not exist, ColdFusion generates an error. If you omit this attribute, ColdFusion does not save enclosures. To specify the directory that contains the current page, set this attribute to <code>"."</code> (period).</p>
<code>escapeChars</code>	Optional	<code>false</code>	<p>Used only for the <code>create</code> action.</p> <p>If this attribute is <code>true</code>, escapes/replaces all the invalid characters as per W3C specification.</p> <p><b>Note:</b> Japanese characters that are not part of UTF-8 encoding are replaced. Non-UTF-8 Japanese characters remain in the feed as they are.</p> <p>If this attribute is <code>false</code>, does not escape invalid characters and tries to generate feed. If JDOM fails to write the file with these invalid characters, the error message "Invalid Character in Input" is displayed.</p>
<code>ignoreEnclosureError</code>	Optional	<code>no</code>	<p>If this attribute is <code>yes</code>, ColdFusion attempts to save all enclosures. If it encounters an error downloading one enclosure, it continues downloading other enclosures and writes the error information in the server log.</p> <p>If this attribute is <code>no</code>, when ColdFusion encounters an error downloading an enclosure, it stops downloading all enclosures and generates an error.</p> <p><b>Note:</b> Enclosure errors can occur if the specified enclosure is of a type that the web server does not allow to be downloaded.</p>
<code>name</code>	See Note		<p>A structure that contains complete feed data:</p> <ul style="list-style-type: none"> <li>The output of a <code>read</code> action.</li> <li>The input definition of the feed to create.</li> </ul> <p>When you specify the <code>name</code> attribute for a <code>create</code> action, enclose it in number signs (#).</p> <p>For more information, see Name and properties structure rules section.</p>
<code>outputFile</code>	See Note		<p>Path of the file in which to write the feed as XML text.</p> <p>The path can be absolute, or relative to the CFML file.</p>

Attribute	Req/Opt	Default	Description
overwrite	Optional	no	Whether to overwrite the XML feed file if it exists. If you do not set this attribute to <code>yes</code> and the <code>cffeed</code> tag tries to write to a file that exists, ColdFusion generates an error.
overwriteEnclosure	Optional	no	Used only for the <code>read</code> action.  Whether to overwrite files in the enclosure directory if they exist. If you do not set this attribute to <code>yes</code> and the <code>cffeed</code> tag tries to write to a file that exists, ColdFusion generates an error.
properties	See Note		A structure that contains the feed metadata, the information about the entire feed. Can contain either of the following: <ul style="list-style-type: none"> <li>The output of a <code>read</code> action.</li> <li>Input to a <code>create</code> action.</li> </ul> The <code>properties</code> and <code>query</code> attributes combined provide complete feed information.  When you specify the <code>properties</code> attribute for a <code>create</code> action, enclose it in number signs (#).  For more information, see Name and properties structure rules section.
proxyPassword	Optional		Password required by the proxy server.
proxyPort	Optional	80	The port to connect to on the proxy server.
proxyServer	Optional		Host name or IP address of a proxy server to which to send the request.
proxyUser	Optional		User name to provide to the proxy server.
query	See Note		A query object that contains the Atom entries or RSS items in the feed. Can contain either of the following: <ul style="list-style-type: none"> <li>The output of a <code>read</code> action.</li> <li>Input to a <code>create</code> action.</li> </ul> The <code>properties</code> and <code>query</code> attributes combined provide complete feed information.  When you specify the <code>query</code> attribute for a <code>create</code> action, enclose it in number signs (#).  For more information, see section Query object rules.
source	Required		Used only for the <code>read</code> action.  The URL of the feed or the path to the XML file that contains the feed contents. A path can be absolute, or relative to the CFML file.
timeout	Optional	Request time-out	The number of seconds to wait for a response from the feed source. A value of 0 specifies that the request does not time out.  By default, ColdFusion uses the request time-out setting of the ColdFusion Administrator Server Settings > Settings page.
userAgent	Optional	Cold Fusion	Text to put in the HTTP User-Agent request header field. Used to identify the request client software.
xmlVar	See Note		A variable in which to save the read or created feed as XML text.

## Usage

### Specifying file and directory attributes

Use the following syntax to specify an in-memory file or directory. In-memory files are not written to disk and speed processing of transient data.

```
ram:///filepath
```

A filepath can include multiple directories, for example `ram:///petStore/images/poodle.jpg`. Create the directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files in the Developing ColdFusion Applications*.

### Setting and getting feed information

The `cffeed` tag lets you specify and save feed data in many, flexible ways.

## Usage

Use the following syntax to specify an in-memory file, which is not written to disk. In-memory files speed processing of transient data.

```
ram:///filepath
```

The filepath can include directories, for example `ram:///petStore/images/poodle.jpg`. Create the directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files in the Developing ColdFusion Applications*.

### When you create a feed

- You specify the feed data in either of the following ways:
  - By putting all metadata and entry or item data in a single structure specified by the `name` attribute.
  - By putting the metadata in a structure specified by the `properties` structure and the entries or items as rows in a query object specified by the `query` attribute.
- You save the resulting feed XML in one or both of the following places:
  - A file specified by the `OutputFile` attribute. The `cffeed` tag saves the data in UTF-8 encoding.
  - An variable specified by the `xmlVar` attribute

### When you read a feed

You can save the feed data in any combination of the following forms:

- By saving all entry or item data and metadata in a single structure specified by the `name` attribute
- By saving entries or items as rows in a query object specified by the `query` attribute
- By saving the metadata in a structure specified by the `properties` structure
- By writing the feed XML in a file specified by the `OutputFile` attribute. The `cffeed` tag saves the data in UTF-8 encoding.
- By saving the feed XML in a ColdFusion XML variable specified by the `xmlVar` attribute

When you save feed data, you do not have to save both the metadata and the entry or item data. You can specify only the `properties` attribute, or only the `query` attribute.

### Name and properties structure rules

The `name` and `properties` structures must conform to the following rules. For more information on requirements for specific metadata entries, see the section [Representing feed metadata](#).

- All structure key names must be identical to the corresponding feed element names, with the exception of the `version` and `encoding` fields. Also, the key names for Dublin Core and Apple® iTunes extension elements start with `DC_` and `ITUNES_` respectively.
- The `properties` structure fields are identical to the metadata fields in the `name` structure.
- When you read a feed, the structure contains only those elements and attribute values that exist in the feed. For requirements for the `create` action, see the section [Creating feeds](#).
- If the feed can have multiple elements of the same type (such as `entry`, `item`, or `link`), the `name` or `property` structure has a single entry that contains the data for all of the elements. The structure entry has the following format:
  - The key is the element name (for example, `item`)
  - The value is an array of structures
  - Each structure in the array represents one element.

ColdFusion uses an array even if there is only a single element. If an Atom feed has only one `link` element, for example, you must specify that element in a `name` attribute structure by using the following format:

```
structureName.link[1]
```

For example, to specify a `link` metadata entry in an Atom 1.0 feed, you could use the following code:

```
<cfset meta.link = arrayNew(1)>  
<cfset meta.link[1] = structNew()>  
<cfset meta.link[1].href = "http://www.myCo.com">
```

- If an element can have multiple attributes, or can have at least one attribute and a value, the element is represented as a structure, even if the element specifies only one attribute or only a value.
- If an element has one or more attributes and a value (body), the value is in a field of the element structure named `value`. For example, the text of the `summary` element for the third `entry` in an Atom feed would go in a field whose name has the following format:

```
structureName.entry[3].summary.value.
```

- When the `cffeed` tag reads a feed, it reports dates as follows:
  - Atom: W3C date format, such as 2006-07-11T18:19:00Z.
  - RSS: in RFC 822 Format, such as Thu, 05 Oct 2006 18:19:00 GMT.
- When the `cffeed` tag creates a feed, you can use W3C or RFC 822 formats for both feed types. You can also use any standard date or date/time format accepted by ColdFusion.

### Query object rules

The query object specified by the `query` attribute conforms to the following rules:

- The query object format supports multiple feed formats, and many feeds do not include all optional feed attributes or elements. As a result:
  - When you read a feed, the returned query object contains entries for all standard RSS and Atom fields, even for fields that are not supported by the feed type. Any columns that are not used by the feed format, or are not used in that specific feed, contain empty strings or undefined values.

- When you read a feed, the query object contains all iTunes extension fields if the feed contains any iTunes extension elements, and the query object contains all Dublin Core extension fields if the feed contains any Dublin Core extension elements. Otherwise, the query results do not contain any of the extension fields.
- When you create a feed, the query that you define requires only those columns that contain data for your feed; you can omit unused columns.
- If a feed entry or item has multiple child elements with the same name, the query column represents the element values as a comma-delimited list. RSS 2.0 items can have multiple `category` elements. Atom 1.0 entries can have multiple `category`, `author`, `contributor`, and `link` elements. The Dublin Core extensions allow all multiples of all element types.
- Many entry or item elements that can have multiple instances have multiple attributes, not all of which are required for any particular element instance. If an entry or item has multiple instances of an element, and any of those elements omit attributes, ColdFusion represents the omitted attribute in the lists by a space. In XML, an Atom entry, for example, might contain three author elements, as follows:

```
<author>
  <person>Anthony</person>
  <uri>http://www.MyCo.com</uri>
  <email>Tony@MyCo.com</email>
</author>
<author>
  <person>Beverly</person>
</author>
<author>
  <person>Cathy</person>
  <email>cathy@MyCo.com</email>
</author>
```

The ColdFusion query represents these columns as follows:

AUTHOR_PERSON	AUTHOR_URI	AUTHOR_EMAIL
Anthony,Beverly,Cathy	http://www.MyCo.com, ,	Tony@MyCo.com, ,cathy@MyCo.com

The following table lists the columns of the standard query object specified by the `query` attribute. If an RSS feed includes either Dublin Core extensions or iTunes extensions, the query includes additional columns. For information on these fields, see the sections Dublin Core Extensions and Apple iTunes Extensions.

Column	Atom entry	RSS item
AUTHOREMAIL	author element email attribute	author item
AUTHORNAME	author element name attribute	Not used
AUTHORURI	author element uri attribute	Not used
CATEGORYLABEL	category element label attribute	category item value
CATEGORYSCHEME	category element scheme attribute	category item domain attribute
CATEGORYTERM	category element term attribute	Not used
COMMENTS	Not used	comments item value
CONTENT	content element value	description item value
CONTENTMODE	content element mode attribute (Atom 0.3 only)	Not used
CONTENTSRC	content element src attribute	Not used

Column	Atom entry	RSS item
CONTENTTYPE	content element type attribute	Not used
CONTRIBUTOREMAIL	contributor element email attribute	Not used
CONTRIBUTORNAME	contributor element name attribute	Not used
CONTRIBUTORURI	contributor element uri attribute	Not used
CREATEDDATE	created element value (Atom 0.3 only)	Not used
EXPIRATIONDATE	Not used	expirationDate item value (RSS 0.93 only)
ID	id element value	guid item value
IDPERMALINK	Not used	guid item ispermalink attribute
LINKHREF	link element href attribute	enclosure item url attribute
LINKHREFLANG	link element hreflang attribute	Not used
LINKLENGTH	link element length attribute	enclosure item length attribute
LINKREL	link element rel attribute	Not used
LINKTITLE	link element title attribute	Not used
LINKTYPE	link element type attribute	enclosure item type attribute
PUBLISHEDDATE	published element value (issued in Atom 0.3)	pubDate item value
RIGHTS	rights element value (copyright in Atom 0.3)	Not used
RSSLINK	Not used	link item value
SOURCE	Not used	source item value
SOURCEURL	Not used	source item url attribute
SUMMARY	summary element value	Not used
SUMMARYMODE	summary element mode attribute (Atom 0.3 only)	Not used
SUMMARYSRC	Blank for all well-formed Atom feeds. Contains data only if an Atom 1.0 feed uses a content element format for the summary element.	Not used
SUMMARYTYPE	summary element type attribute	Not used
TITLE	title element value	title item value
TITLETYPE	title element type attribute	Not used
UPDATEDDATE	updated element value (modified in Atom 0.3)	Not used
URI	Not used	RSS 1.0 link item rdf:about attribute
XMLBASE	content element xml:base attribute	Not used

### Representing feed metadata

When you create a feed, the `name` and `properties` structures can represent all standard metadata for RSS 2 or Atom 1 feeds, in the format described in the Name and properties structure rules section. Similarly, when you read a feed, the structures represent all received metadata. The following rules apply to specific feed metadata fields in the `name` and `properties` structures:

- The `version` field identifies or specifies the feed version in the form *format\_versionNumber*. For the `create` action, specify `atom_1.0` or `rss_2.0`. When you read an RSS 0.91 feed, the version field value is `rss_0.91U`, not `rss_0.91`.
- The `feedExtension` field identifies whether the feed includes iTunes or Dublin Core extension content. Valid values are `itunes` and `DublinCore`. You do not have to specify this field when you create a feed with iTunes extensions; ColdFusion automatically determines that you have specified extension fields. (You cannot create a feed with Dublin Core extensions.)
- For the `read` action, an `encoding` field identifies the XML encoding attribute, such as `iso-8859-1`. Do not specify an `encoding` field for a `create` action. Currently, ColdFusion generates all feeds in UTF-8 format and ignores any `encoding` value that you specify.
- For RSS feeds, the `skiphours` field contains a comma-delimited list of up to 24 numbers in the range 0–23, specifying hours of the day when aggregators should not read the feed. The hour beginning at midnight is hour zero. Your application can use the field to decide when to read the feed.
- For RSS feeds, the `skipdays` field contains a comma-delimited list of up to seven day-name values, specifying days of the week when aggregators must not read the feed. The valid names are `Monday`, `Tuesday`, `Wednesday`, `Thursday`, `Friday`, `Saturday` and `Sunday`. Your application can use the field to decide when to read the feed.

### Dublin Core Extensions

Dublin Core extension elements provide additional metadata about the feed or an item. You can use the `cffeed` tag to read feeds that include elements that conform to the Dublin Core Metadata Element Set specification as metadata (channel elements) or as item elements. For detailed information Dublin Core extension elements, see the Dublin Core Metadata Element Set specification. At the time this topic was written, this specification was available at <http://dublincore.org/documents/dces/>.

ColdFusion support for Dublin Core extensions has the following limitations:

- You cannot create feeds containing these elements.
- You cannot get Dublin Core extension elements that are contained in a top-level (metadata) `image` element. ColdFusion ignores these elements.
- ColdFusion supports only the Dublin Core Metadata Element Set. It does not support the additional Dublin Core Metadata Initiative elements and element refinements.

When feed items include the Dublin Core extensions, the query specified by a `query` attribute includes all of the columns listed in the following table. If the feed does not include any Dublin Core extension elements, the query does not include the columns. With the exception of the `DC_SUBJECT_TAXONOMURI` and `DC_SUBJECT_VALUE` columns, each column name (without the `DC_` prefix) corresponds directly to a Dublin Core extension element name.

Column	Description
DC_CONTRIBUTOR	The people or organizations responsible for contributing to the resource
DC_COVERAGE	The extent of the content in the resource
DC_CREATOR	The person or organization responsible for creating this resource
DC_DATE	A date or date and time associated with this resource

Column	Description
DC_DESCRIPTION	A summary of the resource contents
DC_FORMAT	The file format, physical medium, or dimensions of the resource
DC_IDENTIFIER	A string that can be used to unambiguously identify the resource
DC_LANGUAGE	The language in which the resource is written
DC_PUBLISHER	The person or organization responsible for making the resource available.
DC_RELATION	The identifier of a related resource, typically.
DC_RIGHT	Information about the property rights for the resource.
DC_SOURCE	A reference to the material from which this resource was derived.
DC_SUBJECT_TAXONOMYURI	The <code>taxonomyURI</code> attribute of the Dublin Core <code>subject</code> element
DC_SUBJECT_VALUE	The value of the Dublin Core <code>subject</code> element; a string that defines the topic of the resource
DC_TITLE	A name to use for the resource
DC_TYPE	The nature or genre of the resource

When you get data for a feed that includes Dublin Core elements as a structure, the element names are identical to the query column names listed above, with the exception of the representation of the Dublin Core `subject` element. The structure format represents the `subject` element as a `dc_subject` entry, which consists of an array of structures. The structures in the array have keys with the names `value`, for the element value, and `taxonomyURI`, for the `taxonomyURI` attribute.

### Apple iTunes Extensions

You can use the `cffeed` tag to create or read feeds that contain elements defined in the Apple iTunes RSS podcast specification. For detailed information on iTunes extension format, see the Apple iTunes RSS specification. At the time this topic was written, this specification was available at <http://www.apple.com/itunes/store/podcaststechspecs.html>.

You can create feeds with only a subset of the iTunes RSS extensions. When you read a feed, ColdFusion ignores all iTunes extension elements that are not in the supported subset.

The following table lists the names of structure entries or query column names for the supported elements. (These names consist of the `ITUNES_` prefix followed by the iTunes extension element name.) The table also indicates which elements are used in the metadata, which are used in the individual items, and which can be used in both:

Element	Used in	Description
ITUNES_AUTHOR	Both	Artist name
ITUNES_BLOCK	Both	a value of <code>yes</code> requests to prevent the podcast or item (episode) from appearing.  When ColdFusion reads a feed your application must determine this field's value and take any appropriate action.
ITUNES_DURATION	Item	The length of the item in second, or in HH:MM:SS format.
ITUNES_EXPLICIT	Both	A string indicating whether the item or items contain explicit material. Valid values are <code>yes</code> , <code>no</code> , and <code>clean</code> .
ITUNES_KEYWORDS	Both	A comma-delimited list of words or phrases used when searching in the iTunes music store.
ITUNES_SUBTITLE	Both	Short description text, usually only a few words.
ITUNES_SUMMARY	Both	A longer description (up to 4000 characters)/

You can also use the following channel elements in the `name` or `properties` structures.

Element	Description
itunes_category	A structure that specifies the iTunes Music Store category. The structure has two fields: <ul style="list-style-type: none"> <li>category</li> <li>subcategory</li> </ul> Notice that these element names do <i>not</i> have the <code>itunes_</code> prefix.
itunes_image	The URL of the artwork for the podcast.
itunes_owner	A structure that contains contact information about the owner of the podcast for communication. The structure has two fields: <ul style="list-style-type: none"> <li>itunes_email</li> <li>itunes_mail</li> </ul>

### Creating feeds

When you create a feed, you specify the feed contents in a `name` structure or in the combination of a `query` object and a `properties` structure. The `cffeed` tag generates the feed XML and saves in to the variable specified by the `xmlVar` attribute, the file specified by the `outputFile` attribute, or both.

To create an RSS 2.0 feed you must specify the following metadata fields in a `name` structure or in a `properties` structure. All other RSS2.0 metadata fields, and all item fields, are optional.

- title
- link
- description
- version (must be “`rss_2.0`”)

The `cffeed` tag does not enforce any rules on the Atom feed structure that it creates. You are responsible for ensuring that the feed is valid.

In most cases, a database table uses column names that differ from the column names you must use to create the feed. Therefore, use the `columnmap` attribute to map the input query column names to the required column names. The attribute is a structure whose keys are the column names required by the `cffeed` tag and whose values are the corresponding input query columns.

**Note:** Always capitalize the input query column names irrespective of whether the database column names are capitalized or not.

The following example creates a feed using the `cfartgallery` data source’s `orders` table. It maps the `orders` table `ORDERDATE` column to the query `publisheddate` column, the `ADDRESS` column to the `content` column, and so on. The sample code then displays the generated query XML to show the results.

```
<!--- Get the feed data as a query from the orders table. --->
<cfquery name="getOrders" datasource="cfartgallery">
    SELECT * FROM orders
</cfquery>

<!--- Map the orders column names to the feed query column names. --->
<cfset columnMapStruct = StructNew()>
<cfset columnMapStruct.publisheddate = "ORDERDATE">
<cfset columnMapStruct.content = "ADDRESS">
<cfset columnMapStruct.title = "CUSTOMERFIRSTNAME">
<cfset columnMapStruct.rsslink = "ORDERID">

<!--- Set the feed metadata. --->
<cfset meta.title = "Art Orders">
<cfset meta.link = "http://feedlink">
<cfset meta.description = "Orders at the art gallery">
<cfset meta.version = "rss_2.0">

<!--- Create the feed. --->
<cffeed action="create"
    query="#getOrders#"
    properties="#meta#"
    columnMap="#columnMapStruct#"
    xmlvar="rssXML">

<cfdump var="#XMLParse(rssXML)#">
```

### Reading feeds

The `cffeed` tag does not validate the feeds that it reads. It can read invalid or loosely formatted feeds, but ignores some or all of the invalid content. For example, if you put more than one `rights` element in the Atom feed (which invalidates the feed), the `cffeed` tag ignores the elements after the first one, and doesn't generate an error.

Dates and times in feeds that are being read must be in W3C or RFC 822 format. ColdFusion can also read iTunes extension dates in the format normally used by the iTunes music store.

### Example

The following example creates an RSS feed. Enter fields for the feed title, link, and description elements. Also enter title, link, and description fields for one item. A second item is optional. The application saves the feed in a `createRSSOutput.xml` file in the `feedTest` subdirectory of the directory that contains the CFML page.

```
<!--- Generate the feed when the user submits a filled in form. --->
<cfif isDefined("Form.Submit")>
    <cfscript>

        // Create the feed data structure and add the metadata.
        myStruct = StructNew();
        myStruct.link = form.link;
        myStruct.title = form.title;
        myStruct.description = form.description;
        myStruct.pubDate = Now();
        myStruct.version = "rss_2.0";

        /* Add the feed items. A more sophisticated application would use dynamic variables
           and support varying numbers of items. */
        myStruct.item = ArrayNew(1);
        myStruct.item[1] = StructNew();
        myStruct.item[1].description = StructNew();
        myStruct.item[1].description.value = form.item1text;
        myStruct.item[1].link = form.item1link;
        myStruct.item[1].pubDate = Now();
        myStruct.item[1].title = form.item1title;
        myStruct.item[2] = StructNew();
        myStruct.item[2].description = StructNew();
        myStruct.item[2].description.value = form.item2text;
        myStruct.item[2].link = form.item2link;
        myStruct.item[2].pubDate = Now();
        myStruct.item[2].title = form.item2title;

    </cfscript>

    <!--- Generate the feed and save it to a file and variable. --->
    <cffeed action = "create"
        name = "#myStruct#"
        outputFile = "feedTest/createRSSOutput.xml"
        overwrite = "yes"
        xmlVar = "myXML">

</cfif>

<!--- The user input form. --->
<cfform format="xml" preservedata="yes" style="width:500" height="700">
    <cfformitem type = "text"> Enter The Feed Metadata</cfformitem>
    <cfinput type = "text" label = "title" name = "title"
        style = "width:435" required = "yes"> <br />
    <cfinput type = "text" label = "link" name = "link">
```

```
        style = "width:435" required = "yes" validate = "url"> <br />
<cftextarea name = "description"
    style = "width:435; height:70" required = "yes" />

<cfformitem type = "text"> Enter Item 1</cfformitem>
<cfinput type="text" label="title" name="item1title"
    style="width:435" required="yes"> <br />
<cfinput type="text" label="link" name="item1link"
    style="width:435" required="yes" validate="url"> <br />
<cftextarea name = "item1text"
    style = "width:435; height:70" required = "yes" /> <br />

<cfformitem type = "text"> Enter Item 2</cfformitem>
<cfinput type = "text" label = "title" name = "item2title" style = "width:435"> <br />
<cfinput type = "text" label = "link" name = "item2link" style = "width:435"
    validate = "url"> <br />
<cftextarea name = "item2text" style = "width:435; height:70" /> <br />

<cfinput type = "Submit" name = "submit" value = "Submit" >
</cfform>
```

The following application is a simple feed reader that handles RSS and Atom feeds. It displays the feed title; for each item or entry, it shows the title as a link, and shows the published date and the item or entry contents. To use this example to read the feed created by the first application, enter the URL for the file the application created, for example, <http://localhost:8500/cffeed/feedTest/createRSSOutput.xml>.

```
<!--- Process the feed data if the user submitted the form --->
<cfif isDefined("Form.Submit")>
    <cffeed source = "#theURL#"
        properties = "myProps"
        query = "myQuery">

    <!--- Display the feed output.
        Use conditional logic for to handle different feed formats. --->
    <cfoutput>
        <h2>#myProps.title#</h2>
    </cfoutput>
    <cfoutput query = "myQuery">
        <cfif myProps.version IS "atom_1.0">
            <h3><a href = "#linkhref#">#title#</a></h3>
            <p><b>Published:</b> #DateFormat(publisheddate)#</p>
        <cfelse>
            <h3><a href = "#rsslink#">#title#</a></h3>
            <p><b>Published:</b> #publisheddate#</p>
        </cfif>
        <p>#content#</p>
    </cfoutput>
</cfif>

<!--- The form for specifying the feed URL or file --->
<cfform name = "SetFeed" preserveData = "yes">
    Enter Feed URL:
    <cfinput type = "text" size = "60" name = "theURL"><br><br>
    <cfinput type = "Submit" name = "submit" value = "Submit">
</cfform>
```

## cffile

### Description

Manages interactions with server files.

The following sections describe the actions of the `cffile` tag:

- `cffile action = "append"`
- `cffile action = "copy"`
- `cffile action = "delete"`
- `cffile action = "move"`
- `cffile action = "read"`
- `cffile action = "readBinary"`
- `cffile action = "rename"`
- `cffile action = "upload"`
- `cffile action = "uploadAll"`
- `cffile action = "write"`

**Note:** To execute, this tag must be enabled in the ColdFusion Administrator. For more information, see *Configuring and Administering ColdFusion*.

If your ColdFusion applications run on a server used by multiple customers, consider the security of the files that could be uploaded or manipulated by `cffile`. For more information, see *Configuring and Administering ColdFusion*.

### Category

[File management tags](#)

### Syntax

The tag syntax depends on the `action` attribute value. See the following sections.

### See also

[cfdirectory](#)

### History

ColdFusion 9: `uploadAll` action

ColdFusion 8: Support for reading and writing `cfimages`.

ColdFusion MX 7:

- Added the `result` attribute, which allows you to specify an alternate variable in which to receive result parameters. Used for `action="upload"` action.
- Added the `fixnewline` attribute for `action = "append"` and `action = "write"` actions.

ColdFusion MX 6.1:

- Changed file path requirements: if you do not specify an absolute file path, the path is relative to the ColdFusion temporary directory, which is returned by the [GetTempDirectory](#) function.

- Changed behavior for `action="read"`: if the file starts with a byte order mark (BOM) ColdFusion uses it to determine the character encoding.
- Changed behavior for `action="upload" nameConflict="MakeUnique"` ColdFusion now makes filenames unique by appending an incrementing number, 1 for the first file, 2 for the second and so on, to the name. In ColdFusion, filenames were made unique by appending an additional "1" for each file, as in 1, 11, 111, and so on.

#### ColdFusion MX:

- Changed use of slashes in paths: you can use forward (/) or backward (\) slashes in paths on both UNIX and Windows systems.
- Changed file hierarchy requirements: ColdFusion does not require that you put files and directories that you manipulate with this tag below the root of the web server document directory.
- Changed directory path requirements for the `destination` attribute: a directory path that you specify in the `destination` attribute does not require a trailing slash.
- Deprecated the `system` value of the `attributes` attribute.
- Deprecated the `temporary` value of the `attributes` attribute. In ColdFusion, it is a synonym for `normal`. It might not work in later releases.
- Changed the `action` attribute options `read`, `write`, `append` and `move`: they support a new attribute, `charset`.
- The `archive` value of the `attributes` attribute is obsolete and has no effect.

#### Example

```
<!--- This shows how to write, read, update, and delete a file using CFFILE.
This is a view-only example. --->
<!---
<cfif IsDefined("form.formsubmit") is "Yes">
    <!--- The form has been submitted, now do the action. --->
    <cfif form.action is "new">
        <!--- Make a new file. --->
        <cffile action="Write"
            file="#GetTempDirectory()#foobar.txt"
            output="#form.the_text#">
    </cfif>
    <cfif form.action is "read">
        <!--- Read existing file. --->
        <cffile action="Read"
            file="#GetTempDirectory()#foobar.txt"
            variable="readText">
    </cfif>

    <cfif form.action is "add">
        <!--- Update existing file. --->
        <cffile action="Append"
            file="#GetTempDirectory()#foobar.txt"
            output="#form.the_text#">
    </cfif>

    <cfif form.action is "delete">
        <!--- Delete existing fil. --->
        <cffile action="Delete"
            file="#GetTempDirectory()#foobar.txt">
    </cfif>
</cfif>
```

```
<!--- Set some variables. --->
<cfparam name="fileExists" default="no">
<cfparam name="readText" default="">
<!--- First, check whether canned file exists. --->
<cfif FileExists("#GetTempDirectory()#foobar.txt") is "Yes">
    <cfset fileExists="yes">
</cfif>
<!--- Now, make the form that runs the example. --->
<form action="index.cfm" method="POST">
<h4>Type in some text to include in your file:</h4> <p>
<cfif fileExists is "yes">
    <p>A file exists (foobar.txt, in <cfoutput>#GetTempDirectory()#</cfoutput>).
    You may add to it, read from it, or delete it. </p>
</cfif>
<!--- If reading from a form, let that information display in textarea. --->
<textarea name="the_text" cols="40" rows="5">
    <cfif readText is not "">
        <cfoutput>#readText#</cfoutput>
    </cfif></textarea>
<!--- Select from the actions depending on whether the file exists. --->
<select name="action">
<cfif fileExists is "no">
    <option value="new">Make new file
</cfif>
<cfif fileExists is "yes">
    <option value="add">Add to existing file
    <option value="delete">Delete file
    <option value="read">Read existing file
</cfif>
</select>
<input type="Hidden" name="formsubmit" value="yes">
<input type="Submit" name="" value="make my changes">
</form> --->
```

## cffile action = "append"

### Description

Appends text to a text file on the server.

### Syntax

```
<cffile
    action = "append"
    file = "full pathname"
    output = "string"
    addNewLine = "yes|no"
    attributes = "file attributes list"
    charset = "character set option"
    fixnewline = "yes|no"
    mode = "mode">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfdirectory](#)

### History

See the History section of the main [cffile](#) tag page.

### Attributes

Attribute	Req/Opt	Default	Description
action	Required		Type of file manipulation that the tag performs.
file	Required		Pathname of the file to which to append content of <code>output</code> attribute.  If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.
output	Required		String to append to the file.
addNewLine	Optional	yes	<ul style="list-style-type: none"><li>• <code>yes</code>: appends newline character to text written to file.</li><li>• <code>no</code></li></ul>
attributes	Optional		Applies to Windows. A comma-delimited list of attributes to set on the file.  If omitted, the file's attributes are maintained.  Each value must be specified explicitly. For example, if you specify <code>attributes="readOnly"</code> , all other attributes are overwritten. <ul style="list-style-type: none"><li>• <code>readOnly</code></li><li>• <code>hidden</code></li><li>• <code>normal</code></li></ul>

Attribute	Req/Opt	Default	Description
charset	Optional	JVM default file character set	<p>The character encoding in which the file contents is encoded. The following list includes commonly used values:</p> <ul style="list-style-type: none"> <li>• utf-8</li> <li>• iso-8859-1</li> <li>• windows-1252</li> <li>• us-ascii</li> <li>• shift_jis</li> <li>• iso-2022-jp</li> <li>• euc-jp</li> <li>• euc-kr</li> <li>• big5</li> <li>• euc-cn</li> <li>• utf-16</li> </ul> <p>For more information character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>.</p>
fixnewline	Optional	No	<ul style="list-style-type: none"> <li>• yes: changes embedded line-ending characters in string variables to operating-system specific line endings</li> <li>• no: (default) do not change embedded line-ending characters in string variables.</li> </ul> <p>For an example that uses this attribute, see <a href="#">cffile action = "write"</a>.</p>
mode	Optional		<p>Applies only to UNIX and Linux. Permissions. Octal values of UNIX <code>chmod</code> command. Assigned to owner, group, and other, respectively; for example:</p> <ul style="list-style-type: none"> <li>• 644: assigns read/write permission to owner; read permission to group and other.</li> <li>• 777: assigns read/write/execute permission to all.</li> </ul>

### Example

```
<!--The first example creates the file \temp\foo on a windows system and sets attributes to normal. --->
<cffile action = "write" file = "\temp\foo" attributes = normal output = "some text">

<!-- The second example appends to the file. --->
<cffile action = "append" file = "\temp\foo" attributes = normal output = "Is this a test?">
```

## cffile action = "copy"

### Description

Copies a file from one directory to another on the server.

## Syntax

```
<cffile  
    action = "copy"  
    destination = "full pathname"  
    source = "full pathname"  
    attributes = "file attributes list"  
    mode = "mode">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfdirectory](#)

## History

See the History section of the main [cffile](#) tag page.

## Attributes

Attribute	Req/Opt	Default	Description
action	Required		Type of file manipulation that the tag performs.
destination	Required		Pathname of a directory or file on web server where the file is copied. If you specify a filename without a directory path, ColdFusion copies it relative to the source directory.
source	Required		Pathname of the file to copy.  If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.
attributes	Optional		Applies to Windows. A comma-delimited list of attributes to set on the file.  If omitted, the file's attributes are maintained.  Each value must be specified explicitly. For example, if you specify <code>attributes="readOnly"</code> , all other attributes are overwritten. <ul style="list-style-type: none"><li>• <code>readOnly</code></li><li>• <code>hidden</code></li><li>• <code>normal</code></li></ul>
mode	Optional		Applies only to UNIX and Linux. Permissions. Octal values of UNIX <code>chmod</code> command. Assigned to owner, group, and other, respectively; for example: <ul style="list-style-type: none"><li>• <code>644</code>: assigns read/write permission to owner; read permission to group and other.</li><li>• <code>777</code>: assigns read/write/execute permission to all.</li></ul>

## Example

This example copies the `keymemo.doc` file to the `c:\files\backup\` directory:

```
<cffile action = "copy" source = "c:\files\upload\keymemo.doc"  
    destination = "c:\files\backup\">
```

## cffile action = "delete"

### Description

Deletes a file on the server.

### Syntax

```
<cffile  
    action = "delete"  
    file = "full pathname">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfdirectory](#)

### Attributes

Attribute	Req/Opt	Default	Description
action	Required		Type of file manipulation that the tag performs.
file	Required		Pathname of the file to delete.  If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.

### Example

The following example deletes the specified file:

```
<cffile action = "delete"  
    file = "c:\files\upload\#Variables.DeleteFileName#">
```

## cffile action = "move"

### Description

Moves a file from one location to another on the server.

### Syntax

```
<cffile  
    action = "move"  
    destination = "full pathname"  
    source = "full pathname"  
    attributes = "file attributes list"  
    charset = "character set option"  
    mode = "mode">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## Attributes

Attribute	Req/Opt	Default	Description
action	Required		Type of file manipulation that the tag performs.
destination	Required		Pathname of the destination directory or file. If not an absolute path, it is relative to the source directory.
source	Required		Pathname of the file to move.  If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.
attributes	Optional		Applies to Windows. A comma-delimited list of attributes to set on the file.  If omitted, the file's attributes are maintained.  Each value must be specified explicitly. For example, if you specify <code>attributes="readOnly"</code> , all other attributes are overwritten. <ul style="list-style-type: none"> <li>• <code>readOnly</code></li> <li>• <code>hidden</code></li> <li>• <code>normal</code></li> </ul>
charset	Optional	JVM default file character set	The character encoding in which the file contents is encoded. The following list includes commonly used values: <ul style="list-style-type: none"> <li>• <code>utf-8</code></li> <li>• <code>iso-8859-1</code></li> <li>• <code>windows-1252</code></li> <li>• <code>us-ascii</code></li> <li>• <code>shift_jis</code></li> <li>• <code>iso-2022-jp</code></li> <li>• <code>euc-jp</code></li> <li>• <code>euc-kr</code></li> <li>• <code>big5</code></li> <li>• <code>euc-cn</code></li> <li>• <code>utf-16</code></li> </ul> For more information character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a> .
mode	Optional		Applies only to UNIX and Linux. Permissions. Octal values of UNIX <code>chmod</code> command. Assigned to owner, group, and other, respectively; for example: <ul style="list-style-type: none"> <li>• <code>644</code>: assigns read/write permission to owner; read permission to group and other.</li> <li>• <code>777</code>: assigns read/write/execute permission to all.</li> </ul>

### Example

The following example moves the keymemo.doc file from the c:\files\upload\ directory to the c:\files\memo\ directory in Windows:

```
<cffile
  action = "move"
  source = "c:\files\upload\keymemo.doc"
  destination = "c:\files\memo\">
```

In this example, the destination directory is “memo.”

### cffile action = "read"

**Note:** You can specify this tag’s attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag’s attribute names as structure keys.

### Description

Reads a text file on the server. The file is read into a dynamic, local variable that you can use in the page. For example:

- Read a text file; insert the file’s contents into a database
- Read a text file; use the find and replace function to modify the file’s contents

**Note:** This action reads the file into a variable in the local Variables scope. It is not intended for use with large files, such as logs, because this can bring down the server.

### Syntax

```
<cffile
  action = "read"
  file = "full pathname"
  variable = "variable name"
  charset = "character set option">
```

### See also

[cfdirectory](#)

### History

See the History section of the main [cffile](#) tag page.

### Attributes

Attribute	Req/Opt	Default	Description
action	Required		Type of file manipulation that the tag performs.

Attribute	Req/Opt	Default	Description
file	Required		Pathname of the file to read.  If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.
variable	Required		Name of variable to contain contents of text file.
charset	Optional	Character encoding identified by the file's byte order mark, if any; otherwise, JVM default file character set.	The character encoding in which the file contents is encoded. The following list includes commonly used values: <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> If the file starts with a byte order mark and you set this attribute to a conflicting character encoding, ColdFusion generates an error.  For more information character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a> .

## Usage

The following example creates a variable named Message for the contents of the file message.txt:

```
<cffile action = "read"
  file = "c:\web\message.txt"
  variable = "Message">
```

The variable Message can be used in the page. For example, you could display the contents of the message.txt file in the final web page as follows:

```
<cfoutput>#Message#</cfoutput>
```

ColdFusion supports functions for manipulating the contents of text files. You can also use the variable that is created by a cffile action = "read" operation in the [ArrayToList](#) and [ListToArray](#) functions.

**Note:** If you use this tag to read a file that is encoded using the Windows Cp1252 (windows-1252) encoding of the Latin-1 character set on a system whose default character encoding is Cp1252, and the files has characters encoded in the Hex 8x or 9x range, specify charset="windows-1252" attribute, even though this is the default encoding. Otherwise, some characters in the Hex8x and 9x ranges that do not map correctly and display incorrectly.

## cffile action = "readBinary"

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### Description

Reads a binary file (such as an executable or image file) on the server, into a binary object parameter that you can use in the page. To send it through a web protocol (such as HTTP or SMTP) or store it in a database, first convert it to Base64 using the [ToBase64](#) function.

**Note:** This action reads the file into a variable in the local Variables scope. It is not intended for use with large files, such as logs, because they can bring down the server.

### Syntax

```
<cffile  
    action = "readBinary"  
    file = "full pathname"  
    variable = "variable name">
```

### See also

[cfdirectory](#)

### Attributes

Attribute	Req/Opt	Default	Description
action	Required		Type of file manipulation that the tag performs.
file	Required		Pathname of a binary file to read.  If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.
variable	Required		Name of variable to contain contents of binary file.

### Usage

You convert the binary file to Base64 to transfer it to another site.

ColdFusion supports reading an image file as a binary and passing the result to a `cfimage`, for example:

```
<!--- Convert a JPG image to a binary object. --->  
<cffile action="readBinary" file="maxwell105.jpg" variable="binaryObject">  
<!--- Create a cfimage from the binary object variable. --->  
<cfset myImage=ImageNew(binaryObject)>
```

### Example

The following example reads the binary file `somewhere.jpg`, writes it to a different folder as `somewhereB.jpg`, and then displays the new file:

```
<cffile action = "readBinary" file =  
"C:\inetpub\wwwroot\cfdocs\getting_started\photos\somewhere.jpg" variable = "aBinaryObj">  
  
<!--- Output binary object to JPEG format for viewing. --->  
<cffile action="write" file = "c:\files\updates\somewhereB.jpg"  
    output = "#toBinary(aBinaryObj)#">  
  
<!--- HTML to view image. --->  

```

## cffile action = "rename"

### Description

Renames or moves a file on the server.

### Syntax

```
<cffile  
    action = "rename"  
    destination = "pathname"  
    source = "full pathname"  
    attributes = "file attributes list"  
    mode = "mode">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfdirectory](#)

### History

See the History section of the main [cffile](#) tag page.

### Attributes

Attribute	Req/Opt	Default	Description
action	Required		Type of file manipulation that the tag performs.
destination	Required		Destination file or directory. If not an absolute path, it is relative to the source directory.

Attribute	Req/Opt	Default	Description
source	Required		Pathname of file to rename.  If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.
attributes	Optional		Applies to Windows. A comma-delimited list of attributes to set on the file.  If omitted, the file's attributes are maintained.  Each value must be specified explicitly. For example, if <code>attributes="readOnly"</code> , all other attributes are overwritten. <ul style="list-style-type: none"> <li>• <code>readOnly</code></li> <li>• <code>hidden</code></li> <li>• <code>normal</code></li> </ul>
mode	Optional		Applies only to UNIX and Linux. Permissions. Octal values of UNIX <code>chmod</code> command. Assigned to owner, group, and other. For example: <ul style="list-style-type: none"> <li>• <code>644</code>: assigns read/write permission to owner; read permission to group and other.</li> <li>• <code>777</code>: assigns read/write/execute permission to all.</li> </ul>

### Usage

The `rename` action renames or move a file. The `destination` attribute must be a pathname, not just a new name for the file. If the destination is a directory, the file is moved and not renamed.

### Example

Windows example:

```
<!-- Source Document is read-only but when renamed it becomes normal (not hidden or
read-only). -->
<cffile action = "rename" source = "c:\files\memo\readonlymemo.doc"
destination = "c:\files\memo\normalmemo.doc" attributes="normal">
```

UNIX example:

```
<cffile action = "rename" source = "#myWR#/memo/sample.txt"
destination = "#myWR#/memo/other_sample.txt" mode="666">
```

## cffile action = "upload"

### Description

Copies a file to a directory on the server.

## Syntax

```
<cffile
    action = "upload"
    destination = "full pathname"
    fileField = "form field"
    accept = "MIME type|file type"
    attributes = "file attribute or list"
    mode = "permission"
    nameConflict = "behavior"
    result = "result name">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfdirectory](#)

## History

See the History section of the main [cffile](#) tag page.

## Attributes

Attribute	Req/Opt	Default	Description
action	Required		Type of file manipulation that the tag performs.
destination	Required		Pathname of directory in which to upload the file. If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.  If the destination you specify does not exist, ColdFusion creates a file with the specified destination name. For example, if you specify the destination, C:\XYZ, ColdFusion creates a file XYZ in the C: drive.
fileField	Required		Name of form field used to select the file.  Do not use number signs (#) to specify the field name.
accept	Optional		Limits the MIME types to accept. Comma-delimited list. For example, the following code permits JPEG and Microsoft Word file uploads:  <code>accept="image/jpeg, application/msword"</code>  The browser uses the file extension to determine file type.
attributes	Optional		Applies to Windows. A comma-delimited list of attributes to set on the file.  If omitted, the file's attributes are maintained.  Each value must be specified explicitly. For example, if you specify <code>attributes="readOnly"</code> , all other attributes are overwritten. <ul style="list-style-type: none"> <li>• <code>readOnly</code></li> <li>• <code>hidden</code></li> <li>• <code>normal</code> (if you use this option with other attributes, it is overridden by them)</li> </ul>

Attribute	Req/Opt	Default	Description
mode	Optional		Applies only to UNIX and Linux. Permissions. Octal values of <code>chmod</code> command. Assigned to owner, group, and other, respectively, for example: <ul style="list-style-type: none"> <li>644: assigns read/write permission to owner; read permission to group and other.</li> <li>777: assigns read/write/execute permission to all.</li> </ul>
nameConflict	Optional	Error	Action to take if filename is the same as that of a file in the directory. <ul style="list-style-type: none"> <li>Error: file is not saved. ColdFusion stops processing the page and returns an error.</li> <li>Skip: file is not saved. This option permits custom behavior based on file properties.</li> <li>Overwrite: replaces file.</li> <li>MakeUnique: forms a unique filename for the upload; name is stored in the file object variable <code>serverFile</code>.</li> </ul>
result	Optional		Lets you specify a name for the variable in which <code>cffile</code> returns the result (or status) parameters. If you do not specify a value for this attribute, <code>cffile</code> uses the prefix <code>cffile</code> . For more information, see Usage.

### Usage

After a file upload is completed, you can get status information using file upload parameters. To refer to parameters, use either the `cffile` prefix or, if you specified an alternate name in the `result` attribute, the name you specified there. For example, if you did not specify a name in the `result` attribute, access the `fileExisted` parameter as `#cffile.fileExisted#`. If you set the `result` attribute to `myResult`, however, access `fileExisted` as `#myResult.fileExisted#`.

Status parameters can be used anywhere that other ColdFusion parameters can be used.

When you use a `cfform` tag or an HTML form tag to submit the form with the file to be uploaded, specify `enctype="multipart/form-data"` in the tag, as shown in the example for this tag. By default, ColdFusion sends the form with the encoding type of `application/x-www-form-urlencoded`, which causes an error in the `cffile` tag.

*The `result` attribute allows functions or CFCs that get called from multiple pages at the same time to avoid overwriting the results of one call with another.*

**Note:** The `file` prefix is deprecated, in favor of the `cffile` prefix. Do not use the `file` prefix in new applications.

*If your page is uploading a file that was selected on a form or was otherwise sent to your page via a `multipart/form-data` HTTP message, you can determine the approximate size of the file by checking the value of the `CGI.content_length` variable. This variable includes the file length plus the length of any other request content.*

The following file upload status parameters are available after an upload:

Parameter	Description
<code>attemptedServerFile</code>	Initial name ColdFusion used when attempting to save a file
<code>clientDirectory</code>	Directory location of the file uploaded from the client's system
<code>clientFile</code>	Name of the file uploaded from the client's system
<code>clientFileExt</code>	Extension of the uploaded file on the client system (without a period)
<code>clientFileName</code>	Name of the uploaded file on the client system (without an extension)
<code>contentSubType</code>	MIME content subtype of the saved file

Parameter	Description
contentType	MIME content type of the saved file
dateLastAccessed	Date and time the uploaded file was last accessed
fileExisted	Whether the file existed with the same path (yes or no)
fileSize	Size of the uploaded file
fileWasAppended	Whether ColdFusion appended uploaded file to a file (yes or no)
fileWasOverwritten	Whether ColdFusion overwrote a file (yes or no)
fileWasRenamed	Whether uploaded file renamed to avoid a name conflict (yes or no)
fileWasSaved	Whether ColdFusion saves a file (yes or no)
oldFileSize	Size of a file that was overwritten in the file upload operation
serverDirectory	Directory of the file saved on the server
serverFile	Filename of the file saved on the server
serverFileExt	Extension of the uploaded file on the server (without a period)
serverFileName	Name of the uploaded file on the server (without an extension)
timeCreated	Time the uploaded file was created
timeLastModified	Date and time of the last modification to the uploaded file

**Note:** File status parameters are read-only. They are set to the results of the most recent `cffile` operation. If two `cffile` tags execute, the results of the second overwrite the first, unless you have specified a different result variable in the `result` attribute.

### Example

The following example creates a unique filename, if there is a name conflict when the file is uploaded on Windows:

```
<!--- Windows Example --->
<!--- Check to see if the Form variable exists. --->
<cfif isDefined("Form.FileContents") >
    <!--- If TRUE, upload the file. --->
    <cffile action = "upload"
        fileField = "FileContents"
        destination = "c:\files\upload\"
        accept = "text/html"
        nameConflict = "MakeUnique">
<cfelse>
    <!--- If FALSE, show the Form. --->
    <form method="post" action=<cfoutput>#cgi.script_name#</cfoutput>
        name="uploadForm" enctype="multipart/form-data">
        <input name="FileContents" type="file">
        <br>
        <input name="submit" type="submit" value="Upload File">
    </form>
</cfif>
```

## cffile action = "uploadAll"

### Description

Copies all files sent to the page in an HTTP request to a directory on the server.

### Syntax

```
<cffile
    action = "uploadAll"
    destination = "full pathname"
    accept = "list of MIME types"
    attributes = "file attribute or list"
    mode = "permission"
    nameConflict = "behavior"
    result = "result name">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

`cffile action = "upload", cfdirectory`

### History

See the History section of the main `cffile` tag page.

### Attributes

Attribute	Req/Opt	Default	Description
action	Required		Type of file manipulation that the tag performs.
destination	Required		Pathname of directory in which to upload the file. If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <code>GetTempDirectory</code> function.
accept	Optional		Limits the MIME types to accept. Comma-delimited list. For example, the following code permits JPEG and Microsoft Word file uploads:  accept="image/jpeg, application/msword"  The browser uses the file extension to determine file type.
attributes	Optional		Applies to Windows. A comma-delimited list of attributes to set on the file.  If omitted, the file's attributes are maintained.  Each value must be specified explicitly. For example, if you specify attributes="readOnly", all other attributes are overwritten.  <ul style="list-style-type: none"> <li>readOnly</li> <li>hidden</li> <li>normal (if you use this option with other attributes, it is overridden by them)</li> </ul>

Attribute	Req/Opt	Default	Description
mode	Optional		Applies only to UNIX and Linux. Permissions. Octal values of <code>chmod</code> command. Assigned to owner, group, and other, respectively, for example: <ul style="list-style-type: none"><li>• 644: assigns read/write permission to owner; read permission to group and other.</li><li>• 777: assigns read/write/execute permission to all.</li></ul>
nameConflict	Optional	Error	Action to take if filename is the same as that of a file in the directory. <ul style="list-style-type: none"><li>• Error: file is not saved. ColdFusion stops processing the page and returns an error.</li><li>• Skip: file is not saved. This option permits custom behavior based on file properties.</li><li>• Overwrite: replaces file.</li><li>• MakeUnique: forms a unique filename for the upload. The name is stored in the <code>serverFile</code> field of the result structure for the file.</li></ul>
result	Optional		Lets you specify a name for the variable in which <code>cffile</code> returns the result (or status) parameters. If you do not specify a value for this attribute, <code>cffile</code> uses the prefix <code>cffile</code> . For more information, see Usage.

### Usage

Unlike `cffile action="upload"`, which uploads only one file at a time `cf fileaction="uploadall"` uploads multiple files thereby eliminating the need to code multiple `cffile action="upload"` statements.

Use this tag in the page specified by the `action` attribute of a `cffileupload` control. This tag uploads save the files that the `cffileupload` control sends when the user clicks the Save File button.

After a file upload is completed, this tag creates an array of structures specified by the `result` parameter. Each structure in the array contains upload result information for one file. For information on the result structure contents, see `cffile action = "upload"`.

**Note:** You can control the maximum file size of the upload by specifying the server Request Throttle Threshold or the Settings page of the Administrator Server Settings section.

### Example

The following example copies files uploaded by a `cffileupload` tag to a temp directory.

```
<cfif isdefined("form.submit")>
    <cffile action="uploadall" destination="#expandpath('./upload')#">
</cfif>
<cfform action="#cgi.script_name#" enctype="multipart/form-data">
    <cfinput type="file" name="attachment1"><br>
    <cfinput type="file" name="attachment2"><br>
    <cfinput type="file" name="attachment3"><br>
    <cfinput type="submit" name="submit" value="submit">
</cfform>
```

## cffile action = "write"

### Description

Writes a text file on the server, based on dynamic content. You can create static HTML files from the content, or log actions in a text file.

## Syntax

```
<cffile
    action = "write"
    file = "full pathname"
    output = "content"
    addNewLine = "yes|no"
    attributes = "file attributes list"
    charset = "character set option"
    fixnewline = "yes|no"
    mode = "permission">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfdirectory](#)

## History

See the History section of the main [cffile](#) tag page.

## Attributes

Attribute	Req/Opt	Default	Description
action	Required		Type of file manipulation that the tag performs.
file	Required		Pathname of the file to write.  If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.
output	Required		Content of the file to be created.
addNewLine	Optional	yes	<ul style="list-style-type: none"> <li>yes: appends newline character to text written to file.</li> <li>no</li> </ul>
attributes	Optional		<p>Applies to Windows. A comma-delimited list of attributes to set on the file.</p> <p>If omitted, the file's attributes are maintained.</p> <p>Each value must be specified explicitly. For example, if you specify <code>attributes="readOnly"</code>, all other attributes are overwritten.</p> <ul style="list-style-type: none"> <li>readOnly</li> <li>hidden</li> <li>normal</li> </ul>

Attribute	Req/Opt	Default	Description
charset	Optional	JVM default file character set	<p>The character encoding in which the file contents is encoded. The following list includes commonly used values:</p> <ul style="list-style-type: none"> <li>• utf-8</li> <li>• iso-8859-1</li> <li>• windows-1252</li> <li>• us-ascii</li> <li>• shift_jis</li> <li>• iso-2022-jp</li> <li>• euc-jp</li> <li>• euc-kr</li> <li>• big5</li> <li>• euc-cn</li> <li>• utf-16</li> </ul> <p>For more information character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>.</p>
fixnewline	Optional	no	<ul style="list-style-type: none"> <li>• yes: changes embedded line-ending characters in string variables to operating-system specific line endings.</li> <li>• no: does not change embedded line-ending characters in string variables.</li> </ul>
mode	Optional		<p>Applies only to UNIX and Linux. Permissions. Octal values of UNIX chmod command. Assigned to owner, group, and other, respectively; for example:</p> <ul style="list-style-type: none"> <li>• 644: assigns read/write permission to owner; read permission to group and other.</li> <li>• 777: assigns read/write/execute permission to all.</li> </ul>

### Example

This example creates a file with information a user entered in an HTML insert form:

```
<cffile action = "write"
    file = "c:\files\updates\#Form.UpdateTitle#.txt"
    output = "Created By: #Form.FullName#
    Date: #Form.Date#
    #Form.Content#">
```

If the user submitted a form with the following:

```
UpdateTitle = "FieldWork"
FullName = "World B. Frueh"
Date = "10/30/01"
Content = "We had a wonderful time in Cambridgeport."
```

ColdFusion would create a file named FieldWork.txt in the c:\files\updates\ directory and the file would contain the following text:

```
Created By: World B. Frueh
Date: 10/30/01
    We had a wonderful time in Cambridgeport.
```

This example shows the use of the `mode` attribute for UNIX. It creates the file `/tmp/foo` with permissions `rw-r--r--` (owner = read/write, group = read, other = read):

```
<cffile action = "write"
      file = "/tmp/foo"
      mode = 644>
```

This example appends to the file and sets permissions to read/write (rw) for all:

```
<cffile action = "append"
      destination = "/home/tomj/testing.txt"
      mode = 666
      output = "Is this a test?">
```

This example uploads a file and gives it the permissions owner/group/other = read/write/execute):

```
cffile action = "upload"
      fileField = "fieldname"
      destination = "/tmp/program.exe"
      mode = 777>
```

This example uses the `fixnewline` attribute to changes embedded line-ending characters in `xmlString`, which is derived from `xmlData`, to operating-system specific line endings.

```
<cfxml variable="xmlData">
  <docroot>
    <payload type="string">This is some plain text</payload>
  </docroot>
</cfxml>
<cfset xmlString = toString(xmlData)>

<cfset key = createUUID()>
<cfset encString=encrypt(xmlString, key)>
<cffile action="write" addnewline="yes"
      file="C:\ColdFusion9\wwwroot\test\store.dat"
      output="#encString#" fixnewline="yes">
<cffile action="read" file="C:\ColdFusion9\wwwroot\test\store.dat"
      variable="retrievedString">
<cfset decString=decrypt(retrievedString, key)>
<cfdump var="#decString#">
<cfset newXML = xmlParse(decString)>
<cfdump var="#newXML#">
```

ColdFusion supports using `cffile` to write an image, for example:

```
<!--- Create a new cimage. --->
<cfset myImage=ImageNew("",200,200)>
<!--- Draw a square on the image. --->
<cfset ImageDrawRect(myImage,10,10,100,100)>
<!--- Use cffile to write the cimage to a JPG. --->
<cffile action="write" output="#myImage#" file="c:\cfpix\square.jpg">
```

## cffileupload

### Description

Displays a dialog for uploading multiple files from the user's system.

The enhanced dialog includes the following features:

- You can specify the maximum number of files and the maximum file size for the upload.
- A progress bar to visually indicate the overall progress of the file upload task, and another progress bar to indicate the upload progress of each individual file.
- A success or failure message appears for each file upload and the overall upload task.
- At any point during the upload task, you can cancel the upload.

### Category

[File management tags](#), [Forms tags](#)

### Syntax

```
<cffileupload>
  addbuttonlabel= "label"
  align = align="center|left|right"
  bgcolor = "color"
  clearbuttonlabel = "label"
  deletebuttonlabel = "label"
  extensionfilter = "none|jpg,jpeg,png"
  height= "number of pixels"
  hideUploadButton = "true|false"
  maxfilesselect = "number of files"
  maxuploadsize = "file size in mega bytes"
  name = "File uploader name"
  oncomplete = "JavaScript function name"
  onerror = "JavaScript function name"
  onUploadComplete = "JavaScript function name"
  progressbar = "true|false"
  stoponerror = "true|false"
  style = "style specification"
  title = "Title panel name"
  uploadbuttonlabel = "label"
  url = "URL"
  width = "number of pixels"
  wmode = "window|opaque|transparent"
</cffileupload>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

`cffile action = "uploadAll"`

### History

ColdFusion 9: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
addbuttonlabel	Optional	Add Files	Label of the Add button.
align	Optional	left	Specifies the default alignment.  The following values are valid: <ul style="list-style-type: none"> <li>center</li> <li>left</li> <li>right</li> </ul>
bgcolor	Optional		The background color for the file upload control. A hexadecimal value without “#” prefixed or a recognized color name, for example <code>red</code> .
clearbuttonlabel	Optional	Clear All	Label of the Clear button
deletebuttonlabel	Optional	Delete	Label of the Delete button
extensionfilter	Optional	none	Use this attribute to specify the type of file that you will allow to be uploaded. For example, to let only image files to be uploaded, you can specify file extensions such as <code>.jpg</code> , <code>.jpeg</code> , or <code>.png</code> .  If set to <code>none</code> , files are uploaded without any extension filter.
height	Optional	300	Height of the file upload control, in pixels.
hideUploadButton	Optional	false	A Boolean value that specifies if the Upload button should appear in the file upload dialog: <ul style="list-style-type: none"> <li>true</li> <li>false</li> </ul>
maxfileselect	Optional		The maximum number of files allowed for upload.
maxuploadsize	Optional	10MB	The maximum file size, in Megabytes, allowed for upload in an operation.  In ColdFusion 9.0.1, ColdFusion throws an error if the value of the attribute <code>maxuploadsize</code> exceeds the <code>throttle/ post data size</code> settings specified in the ColdFusion Administrator.
name	Optional		Name of the file upload component.
onComplete	Optional		The JavaScript function to run when a file has finished uploading.  By default, ColdFusion passes a JavaScript object as a parameter to this function with the following properties: <ul style="list-style-type: none"> <li><code>STATUS</code> - numeric value that is based on the HTTP status code</li> <li><code>MESSAGE</code> - Passed or Failed</li> <li><code>FILENAME</code> - Name of the file selected for upload</li> </ul> You can also pass the JavaScript object by creating a struct with parameters <code>"status"</code> and <code>"message"</code> and call <code>serializeJSON()</code> on the JavaScript object.

Attribute	Req/Opt	Default	Description
onError	Optional		<p>The JavaScript function to run if the uploading of a file fails. The error can be a network error or server-side error.</p> <p>By default, ColdFusion passes a JavaScript object as a parameter to this function with the following properties:</p> <ul style="list-style-type: none"><li>• STATUS - numeric value that is based on the HTTP status code</li><li>• MESSAGE - Passed or Failed</li><li>• FILENAME - Name of the file selected for upload</li></ul> <p>You can also pass the JavaScript object by creating a struct with parameters "status" and "message" and call <code>serializeJSON()</code> on the JavaScript object.</p>
onUploadComplete	Optional		The JavaScript function to run after uploading all the files.
progressbar	Optional	true	<p>Whether to display a progress bar while the files upload:</p> <ul style="list-style-type: none"><li>• true</li><li>• false</li></ul>
stoponerror	Optional	true	<p>Specifies whether to ignore the exceptions for this operation.</p> <ul style="list-style-type: none"><li>• true - Stops uploading and displays an appropriate error.</li><li>• false - Continues uploading and displays an appropriate error.</li></ul>
style	Optional		A CSS style specification that defines layout styles.
title	Optional		Title for the upload dialog.
uploadbuttonlabel	Optional	Upload	Label of the Upload button.
url	Required in ColdFusion 9	Optional in ColdFusion 9.0.1	<p>The URL to the server where the files are uploaded.</p> <p>In ColdFusion 9.0.1, this attribute is optional and it defaults to <code>cgi.script_name</code>.</p>
width	Optional	420	Width of the file upload control, in pixels.
wmode	Optional	window	<p>Specifies the absolute positioning and layering capabilities in your browser:</p> <ul style="list-style-type: none"><li>• window: Plays the media player in its own rectangular window on a web page</li><li>• opaque: Hides everything behind the media player on the web page</li><li>• transparent: Lets the background of the web page show through the transparent portions of the media player</li></ul>

### Usage

Use this tag to create a SWF file-based file upload control that lets a user upload multiple files to a server.

To upload files to the server, define a server-side template. The template that you define reads the upload request and uploads the selected files to the server.

### Enhancement in ColdFusion 9.0.1

In ColdFusion 9.0.1, the fileupload control passes the session information implicitly to the target page if session management is turned on either in `Application.cfc` or `Application.cfm`.

Assume that fileupload control is defined without a URL attribute. In this case, if the user chooses to upload data using the upload button, the control comes back to the same page. Users can check for `form.fieldnames` to perform the upload as shown in the following example:

Upload.cfm

```
<cfif isdefined("form.FIELDNAMES")>
    <cffile action = "upload" destination = "#ExpandPath('.')#" nameconflict="makeunique">
</cfif>
<cffileupload name="myuploader">
```

In this case, `url` defaults to `CGI.script_name`.

To maintain sessions between the fileupload control and the URL, users must turn on session management. You can do this by setting the `this.sessionmanagement=true` in `Application.cfc`. The setting ensures that CFID and CFToken are passed as part of the URL if Enable J2EE Session Variables (ColdFusion Administrator > Server Settings > Memory Variables) is not selected. If it is selected, then JsessionID is passed as part of the URL.

### Supported Styles

The following are the supported styles:

Style	Description
headercolors	Format: color; colors of the band at the top of the DateChooser control. Specify two values, separated by a comma. For a solid band, use the same color for both values. The default value is ##E6EEEE,##FFFFFF.
textcolor	Color of text. Can be a hexadecimal value or a named color. For a hexadecimal value, use the form "##xxxxxx", where x = 0-9 or A-F; use two number signs or none.
titletextalign	Aligns the title text. The recognized values are left, right, and center. The default value is right.
titletextcolor	Color of the title text.
bgcolor	The background color for the file upload control. A hexadecimal value without "#" prefixed or a recognized color name, for example <code>red</code> .
rollovercolor	Displays values on mouse-over.
selectcolor	Background color for a selected item. Can be a hexadecimal value or a named color. For a hexadecimal value, use the form "##xxxxxx", where x = 0-9 or A-F; use two number signs or none. For a list of the supported named colors, see <a href="#">cfchart</a> .

### Example

```
<h3>Instructions</h3>
<p>Create a folder Upload in your C: drive
<br>Try uploading files using the file upload component and check if the files have been
appropriately saved in the Upload folder.</p>
<script>
    var foo = function(result)
    {
        alert (ColdFusion.JSON.encode(result));
    }
</script>
<cffileupload
    url="uploadFiles.cfm"
    progressbar="true"
    name="myupload"
    addButtonLabel = "Add File"
    clearButtonLabel = "Clear it"
    hideUploadButton = "true"
    width=600
    height=400
    title = "File Upload"
    maxuploadsize="30"
    extensionfilter="*.jpg, *.png, *.flv, *.txt"
    BGCOLOR="####FFFFFF"
    MAXFILESELECT=10
    UPLOADBUTTONLABEL="Upload now"/>
```

uploadfiles.cfm is given below:

```
<cffile action="upload" destination="#expandpath('./upload')#" nameconflict="makeunique">
<cfoutput>#serializeJSON({STATUS=200,MESSAGE='Passed'})#</cfoutput>
```

This example sends user-specified files to the server-side template - uploadfiles.cfm. The template file that you define can use the "upload" or "uploadall" action defined in the cffile tag.

**Note:** The *filefield* attribute of the upload action is optional.

Use the destination attribute in the cffile tag to define the location to save the files. For the uploadfiles.cfm code, see `cffile action = "uploadAll"`.

## cffinally

### Description

Used inside a `cftry` tag. Code in the `cffinally` block is processed after the main `cftry` code and, if an exception occurs, the `cfcatch` code. The `cffinally` block code always executes, whether or not there is an exception.

### Category

[Exception handling tags](#)

### Syntax

```
<cftry>
    try code<cfcatch>
        catch code<cfcatch>
        ...
    <cffinally>
        final code</cffinally>
</cftry>
```

### See also

[cftry](#), [cfcatch](#), [cferror](#), [cfrethrow](#), [cfthrow](#), [onError](#); Handling Errors in the *Developing ColdFusion Applications*

### History

ColdFusion 9: Added the tag

### Usage

The `cffinally` tag is optional in a `cftry` block, and the block can have only one `cffinally` tag. Put the `cffinally` tag at the end of all `cftry` block, after any `cfcatch` blocks. This tag requires an end tag. You can nest `cftry/cfcatch/cffinally` blocks.

Use the `cffinally` tag for code that should execute whether or not an exception occurs. For example, use it to free up resources.

### Example

```
<h3>cffinally Example</h3>
<!--- Open a cftry block. --->
<cftry>
    ....
    <cfcatch type = "Database">
        ....
    </cfcatch>
    <cffinally>
        ....
        <!--- Do some cleanup here before leaving cftry block --->
        ....
    </cffinally>
</cftry>
```

## cfflush

### Description

Flushes currently available data to the client.

### Category

[Data output tags](#), [Page processing tags](#)

### Syntax

```
<cfflush
    interval = "integer number of bytes">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

#### See also

`cfcache`, `cfheader`, `cfinclude`, `cfsetting`, `cfsilent`

#### Attributes

Attribute	Req/Opt	Default	Description
<code>interval</code>	Optional		Integer. Flushes output each time this number of bytes becomes available. HTML headers, and data that is already available when the tag is executed, are omitted from the count.

#### Usage

The first occurrence of this tag on a page sends back the HTML headers and any other available HTML. Subsequent `cfflush` tags on the page send only the output that was generated after the previous flush.

When you flush data, ensure that enough information is available, as some browsers might not respond if you flush only a small amount. Similarly, set the `interval` attribute for a few hundred bytes or more, but not thousands of bytes.

Use the `interval` attribute only when a large amount of output is sent to the client, such as in a `cfloop` or a `cfoutput` of a large query. Using this form globally (such as in the `Application.cfm` file) might cause unexpected errors when CFML tags that modify HTML headers are executed.

Because the `cfflush` tag sends data to the browser when it executes, it has several limitations, including the following:

- Using any of the following tags or functions on a page anywhere after the `cfflush` tag can cause errors or unexpected results: `cfcontent`, `cfcookie`, `cfform`, `cfheader`, `cfhtmlhead`, `cflocation`, and `SetLocale`. Similarly, do not use any tags that use AJAX features, including `cfdiv`, `cflayout`, `cflayoutarea`, `cfpod`, `cfspdydataset`, `cftooltip`, `cfwindow`, or HTML format `cfgrid`, `cftree`, `cftextarea`, or `cfinput` (using `autosuggest` or `datefield` attributes) tags. All of the preceding tags and functions normally modify the HTML header, but cannot do so after a `cfflush` tag, because the `cfflush` sends the header.
- Using the `cfset` tag to set a cookie anywhere on a page that has a `cfflush` tag does not set the cookie in the browser.
- Using the `cfflush` tag in the body of several tags, including `cfsavecontent`, `cfquery`, and custom tags, causes errors.
- If you save Client variables as cookies, any client variables that you set after a `cfflush` tag are not saved in the browser.

**Note:** Normally, the `cferror` tag discards the current output buffer and replaces it with the contents of the error page. The `cfflush` tag discards the current buffer. As a result, the `Error.GeneratedContent` variable resulting from a `cferror` tag after a `cfflush` contains any contents of the output buffer that has not been flushed. This content is not sent to the client. The content of the error page displays to the client after the bytes that have been sent.

#### Example

The following example uses `cfloop` tags and the `rand` random number generating function to delay data display. It simulates a page that is slow to generate data.

**cform**

Builds a form with CFML custom control tags; these provide more functionality than standard HTML form input elements. You can include the resulting form on the client page as HTML or Adobe Flash content, and generate the form by using XML and XSLT.

## Forms tags

## Syntax

```
<cfform
    accessible = "yes|no"
    action = "form action"
    archive = "URL"
    codeBase = "URL"
    format = "HTML|Flash|XML"
    height = "pixels|percent"
    id = "HTML id" method = "POST|GET"
    name = "name"
    onError = "JavaScript function name or ActionScript code"
    onLoad = "load event script" onReset = "reset event script" onSubmit = "JavaScript"
    onSuccess = "JavaScript function name"
    preloader = "yes|no"
    preserveData = "yes|no"
    scriptSrc = "path"
    skin = "Flash skin|XSL skin"
    style = "style specification"
    timeout = "seconds"
    width = "pixels|percent"
    wMode = "window|transparent|opaque">

    ...

</cfform>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfajaximport](#), [cfapplet](#), [cfcalendar](#), [cfformgroup](#), [cfformitem](#), [cfgrid](#), [cfinput](#), [cfselect](#), [cfslider](#), [cftextarea](#), [cftree](#); Requesting and Presenting Information in the *Developing ColdFusion Applications*

## History

ColdFusion 8:

- Added support for adding interactive fields in PDF forms.
- Added the `onSuccess` attribute and support in AJAX controls for the `onError` attribute

ColdFusion MX 7:

- Added ability to set the default value of the `scriptSrc` attribute in the ColdFusion Administrator.
- Deprecated the `passthrough` attribute. The tag now supports all HTML form tag attributes directly.
- Added the `method` attribute and support for the GET method.
- Added support for Flash and XML output, including the `format`, `height`, `width`, `preloader`, `timeout`, `wMode`, `accessible`, and `skin` attributes.
- Added `cfformgroup`, `cfformitem`, and `cftextarea` child tags.
- Added the `onReset` attribute.

ColdFusion MX:

- Deprecated the `enableCAB` attribute. It might not work, and might cause an error, in later releases.
- Changed the `name` and `action` attributes to optional.

- Changed integer validation to require an integer value. In previous releases it would convert a floating point value to an integer.

### Attributes

The following table lists attributes that ColdFusion uses directly. For HTML format forms, this tag also supports the standard HTML `form` tag attributes that are not on this list, and passes them directly to the browser. ColdFusion also includes all supported HTML attributes in the XML.

Attribute	Applies to	Req/Opt	Default	Description
accessible	Flash	Opt	no	Specifies whether to include support screen readers in the Flash form. Screen reader support adds approximately 80 KB to the SWF file sent to the client.
action	Flash HTML XML	Opt	See Description	Name of ColdFusion page to execute when the form is submitted for processing.  If you omit this attribute and the method is get, the form posts to the page identified by the CGI.SCRIPT_NAME variable (the requested page that resulted in displaying the form). If the method is post, the form posts to the page identified by the CGI.QUERY_STRING variables.
archive	applets in HTML and XML	Opt	/CFIDE/classes/cfapplets.jar	URL of downloadable Java classes for <code>cfgrid</code> , <code>cfslider</code> , and <code>cftree</code> applet controls.
codeBase	applets in HTML and XML	Opt	/CFIDE/classes/cf-j2re-win.cab	URL of downloadable JRE plug-in for Internet Explorer; used for <code>cfgrid</code> , <code>cfslider</code> , and <code>cftree</code> Java applet controls.
format	Flash HTML XML	Opt	HTML	<ul style="list-style-type: none"><li>• <b>HTML:</b> generates an HTML form and send it to the client. <code>cfgrid</code> and <code>cftree</code> child controls can be in Flash or applet format.</li><li>• <b>Flash:</b> generates a Flash form and send it to the client. All controls are in Flash format.</li><li>• <b>XML:</b> generates XForms-compliant XML and save the results in a variable specified by the <code>name</code> attribute. By default, ColdFusion also applies an XSL skin and displays the result. For more information, see the <code>skin</code> attribute.</li></ul>
height	Flash XML	Opt	100%	The height of the form. Use a number to specify pixels. In Flash, you can use a percentage value, such as <code>height=60%</code> to specify a percentage of the available width. The displayed height might be less than the specified size.  <b>Note:</b> The <code>width</code> and <code>height</code> attributes are required for Flash forms, if they are used inside of a table.
id			name attribute value	the HTML id of the form.
method	Flash HTML XML	Opt	post	The method the browser uses to send the form data to the server: <ul style="list-style-type: none"><li>• <b>post:</b> sends the data using the HTTP post method. This method sends the data in a separate message to the server.</li><li>• <b>get:</b> sends the data using the HTTP get method, which puts the form field contents in the URL query string.</li></ul>

Attribute	Applies to	Req/Opt	Default	Description
name	Flash HTML XML	Opt	CFForm_ <i>n</i>	<p>A name for the form.</p> <p>In HTML format, if you omit this attribute and specify an <code>id</code> attribute, ColdFusion does not include a name attribute in the HTML sent to the browser; this behavior lets you use the <code>cfform</code> tag to create XHTML-compliant forms. If you omit the <code>name</code> attribute and the <code>id</code> attribute, ColdFusion generates a name of the form <code>CFForm_<i>n</i></code> where <i>n</i> is a number that is assigned serially to the forms on a page.</p>
onError	Flash HTML	Opt		<p>For Flash format forms: Applies only for <code>onSubmit</code> or <code>onBlur</code> validation; has no effect for <code>onServer</code> validation.</p> <p>An <code>ActionScript</code> expression or expressions to execute if the user submits a form with one or more validation errors.</p> <p>For HTML format forms: Applies only to forms inside <code>cfdiv</code>, <code>cflayout</code>, <code>cfpod</code>, or <code>cfwindow</code> controls. The name of a JavaScript function that runs if an asynchronous form submission fails. For more information, see the Usage section.</p>
onLoad	HTML XML	Opt		JavaScript to execute when the form loads.
onReset	HTML XML	Opt		JavaScript to execute when the user clicks a reset button.
onSubmit	Flash HTML XML	Opt		JavaScript or <code>ActionScript</code> function to execute to preprocess data before form is submitted. If any child tags specify <code>onSubmit</code> field validation, ColdFusion does the validation before executing this JavaScript.
onSuccess	HTML	Opt		Applies only to forms inside <code>cfdiv</code> , <code>cflayout</code> , <code>cfpod</code> , or <code>cfwindow</code> controls. The name of a JavaScript function that runs when an asynchronous form submission succeeds. For more information see the Usage section.
preloader	Flash	Opt	yes	Specifies whether to display a progress bar when loading the Flash form.
preserveData	HTML XML	Opt	no	<p>When the <code>cfformaction</code> attribute posts back to the page that contains the form, this attribute determines whether to override the control values with the submitted values.</p> <ul style="list-style-type: none"> <li><code>no</code>: uses values specified in the control tag attributes.</li> <li><code>yes</code>: uses corresponding submitted values.</li> </ul> <p>Applies to these controls:</p> <ul style="list-style-type: none"> <li><code>cfinput</code>, <code>cfslider</code>, <code>cfTextInput</code>: overrides the value attribute value.</li> <li><code>cfselect</code> controls that are populated from queries: overrides the <code>selected</code> attribute. See <a href="#">cfselect</a>.</li> <li><code>cfTree</code> controls: overrides the <code>cfTreeItemExpand</code> attribute. If <code>yes</code>, expands previously-selected elements. The <code>cfTreeCompletePath</code> attribute must be set to <code>yes</code>.</li> <li><code>cfgrid</code> controls: has no effect. (This avoids confusion as to whether data has been resubmitted to the database by the control.)</li> </ul>

Attribute	Applies to	Req/Opt	Default	Description
scriptSrc	Flash HTML XML	Opt	See Description	<p>Specifies the URL, relative to the web root, of the directory that contains ColdFusion JavaScript files, including the cfform.js file with the client-side JavaScript used by this tag and its child tags. For XML format forms, this directory is also the default directory for XSLT skins.</p> <p>When you use this attribute, the specified directory must have the same structure as the /CFIDE/scripts directory. For example, if you specify <code>scriptsrc="/resources/myScripts"</code>, the JavaScript files used by ColdFusion AJAX features must be in the /resources/myScripts/ajax directory.</p> <p>This attribute is useful if the file is not in the default location. This attribute may be required in some hosting environments and configurations that block access to the /CFIDE directory.</p> <p>The location is set in the ColdFusion Administrator; by default, it is /CFIDE/scripts.</p> <p><b>Notes:</b></p> <p>If you specify this attribute, copy the CF_RunActiveContent.js file from the CFIDE/scripts directory to the specified directory.</p> <p>You can have only one <code>scriptsrc</code> attribute on a page, including any <code>cfajaximport</code> tag <code>scriptsrc</code> attribute. If you have multiple <code>cfform</code> tags, you can specify the <code>scriptsrc</code> attribute in a <code>cfajaximport</code> tag and it applies to all HTML format forms.</p>

Attribute	Applies to	Req/Opt	Default	Description
skin	Flash XML	Opt	Flash: haloGreen XML: default.xml	<p><b>Flash:</b> Use a halo color to stylize the output. The skin determines the color used for highlighted and selected elements.</p> <ul style="list-style-type: none"> <li>• haloSilver</li> <li>• haloBlue</li> <li>• haloGreen</li> <li>• haloOrange</li> </ul> <p><b>XML:</b> Specifies whether to apply an XSL skin and display the resulting HTML to the client. Can be any of the following:</p> <ul style="list-style-type: none"> <li>• ColdFusion skin name: applies the specified skin.</li> <li>• XSL file name: applies the skin located in the specified path.</li> <li>• none: does not apply an XSL skin. Your CFML page must process the XML that ColdFusion saves in the variable specified by the <code>name</code> attribute, and display any results.</li> <li>• omitted or default: uses the ColdFusion default skin.</li> </ul> <p>You can specify the following ColdFusion skins (located in the <code>cf_webroot\x</code></p> <ul style="list-style-type: none"> <li>• basic</li> <li>• basiccss</li> <li>• beige</li> <li>• blue</li> <li>• lightgray</li> <li>• red</li> <li>• silver</li> </ul> <p>A filename can be any of the following:</p> <ul style="list-style-type: none"> <li>• absolute URL</li> <li>• URL relative to the web root</li> <li>• absolute file path</li> <li>• name of a file in the scripts folder or a subdirectory of the <code>cf_webroot\CFIDE\scripts</code> directory. In this case, do not specify the .xml suffix.</li> </ul>
style	HTML, Flash, XML	Opt		<p>Styles to apply to the form. In HTML or XML format, ColdFusion passes the style attribute to the browser or XML.</p> <p>In Flash format, must be a style specification in CSS format. For detailed information on specifying Flash styles, see <i>Creating Forms in Flash</i> in the <i>Developing ColdFusion Applications</i>.</p>

Attribute	Applies to	Req/Opt	Default	Description
timeout	Flash	Opt	0	Integer number of seconds for which to keep the form data in the Flash cache on the server. A value of 0 prevents the data from being cached. For more information, see <i>Caching data in Flash forms</i> in the <i>Developing ColdFusion Applications</i> .
width	Flash XML	Opt	100%	The width of the form. Use a number to specify pixels. In Flash, you can use a percentage value, such as "width=60%" to specify a percentage of the available width.  Note: The width and height attributes are required for Flash forms, if they are used inside of a table.
wMode	Flash	Opt	window	Specifies how the Flash form appears relative to other displayable content that occupies the same space on an HTML page. <ul style="list-style-type: none"><li>• <b>window</b>: the Flash form is the topmost layer on the page and obscures anything that would share the space, such as drop-down dynamic HTML lists.</li><li>• <b>transparent</b>: the Flash form honors the z-index of dhtml so you can float items above it. If the Flash form is above any item, transparent regions in the form show the content that is below it.</li><li>• <b>opaque</b>: the Flash form honors the z-index of dhtml so you can float items above it. If the Flash form is above any item, it blocks any content that is below it.</li></ul>

**Note:** Attributes that are not marked as supported in XML are not handled by the skins provided with ColdFusion. They are, however, included in the generated XML as *html* namespace attributes to the *Form* tag.

## Usage

This tag requires an end tag.

You can use the following ColdFusion form control tags in the `cfform` tag:

- `cfapplet`: Used in HTML and XML format only; embeds a registered Java applet.
- `cfformgroup`: Used in Flash and XML format only; groups and arranges child controls.
- `cfformitem`: Used in Flash and XML format only; adds horizontal rules, vertical rules, and text to the form.
- `cfgrid`: Creates a grid control to display tabular data.
- `cfinput`: Creates and an input element.
- `cfselect`: Creates a drop-down list box.
- `cfslider`: Used in HTML and XML format only; creates a slider control.
- `cftextarea`: Creates a multiline text input box.
- `cftree`: Creates a tree control.

In HTML format, all tags, and in Flash format the `cftree` and `cfgrid` tags, require JavaScript support on the browser. The `cfapplet` tag and applet format `cfgrid`, `cfslider`, and `cftree` tags require the client to download a Java applet.

If you specify Flash format in the `cfform` tag, ColdFusion ignores any HTML in the form body. Use ColdFusion tags, such as `cfinput`, for all form controls. You can include individual Flash format `cfgrid` and `cftree` controls in an HTML format `cfform` tag.

In Flash format, if your forms do not request sensitive data (such as credit card numbers), consider setting the `timeout` attribute. This can prevent users from getting "The form data has expired. Please reload this page in your browser" errors if they use the browser back button to return to the form. For more information, see *Caching data in Flash forms* in the *Developing ColdFusion Applications*.

**Note:** In Flash format, if you do not specify `height` and `width` attributes, Flash reserves browser space equal to the area of the browser window. If any other output follows the form, users must scroll to see it. Therefore, if you follow a Flash form with additional output, specify the `height` and `width` values. The `width` and `height` attributes are required for Flash forms, if they are used inside of a table.

If attribute value text must include quotation marks, escape them by doubling them.

### Using the `onError` attribute in Flash forms

If you use `onSubmit` or `onBlur` validation, the `onError` attribute lets you specify ActionScript code to execute if the user tries to submit a Flash form with validation errors, as follows:

- If you specify one or more valid Flash expressions, Flash executes the expressions.
- If you omit the attribute, Flash displays a dialog box with all applicable error messages.
- If you specify `onError=""` (an empty string) Flash does not display any message, but does not submit the form.

Your ActionScript can use the `errors` variable to determine the fields and errors. The `errors` object has the following fields:

Field	Contents
<code>name</code>	The <code>name</code> attribute of the control's CFML tag.
<code>field</code>	The internal name used by Flash for the field name (for example, <code>_level0.field1</code> ).
<code>value</code>	The value in the field.
<code>message</code>	The <code>message</code> attribute of the control's CFML tag.

The following example shows `cfform` tags with an `onError` attribute that selects the tab in an accordion or tab navigator that contains a `lastName` field with an invalid entry:

```
<cfform name="form1" format="flash" width="800" height="500"
    onError="if (errors['lastName'] != undefined
        ){tabA.selectedIndex=0; _root.lastName.setFocus();}">
```

### Incorporating HTML form tags and attributes

In HTML format, the `cfform` tag lets you incorporate the following standard HTML elements. They are not available in Flash format:

- Standard HTML `form` tag attributes and values. The attributes and values are included in the `form` tag that `cfform` outputs in the page. For example, you can use `form` tag attributes like `target` or `onMouseOver` with `cfform`.
- HTML tags that can ordinarily be put within the HTML `form` tag. For example, you can use the HTML `input` tag to create a submit button in a `cfform`, without the other features of `cfinput`:

```
<cfform>
    <input type = "Submit" value = " update... ">
</cfform>
```

### Using forms in `cfdiv`, `cflayout`, `cffpod`, and `cfwindow` controls

The `cfdiv`, `cflayout`, `cffpod`, and `cfwindow` tags create AJAX-based controls that can serve as containers for interactive forms. When you use such a structure, you do not want submitting form information to cause a new page to be displayed; instead, you want dynamic code to modify the existing page without causing a complete reload. You can do this by using the `onSuccess` and `onError` attributes.

The function specified by the `onSuccess` attribute gets called if the form data is submitted successfully. This function is responsible for updating the pod, layout, or window to reflect the results of the submission, for example, to display additional data or pop up a confirmation window. This function must not take any arguments

The function specified by the `onError` attribute gets called if an error occurs when the form data is submitted. This function is responsible for handling the error, such as displaying an error message. This function must take two arguments: an error number and an error message.

### Incorporating interactive fields in PDF forms

ColdFusion lets you use the `cfform` tag to create PDF forms that contain static and interactive form fields. The `cfform` tag must exist within a `cfdocument` tag (where `format="pdf"`). Only one `cfform` tag can exist within a `cfdocument` tag.

Completed forms can be posted to the server as an HTTP Post, or the entire PDF can be submitted as binary stream. If the PDF is submitted, you can use the `cffile` tag to save completed PDF form to a hard drive:

```
<cffile action="write" file="c:\savedpdf.pdf" output="#PDF.content#">
```

The output can be manipulated and extracted by using the tag.

Only the following `cfform` attributes are supported in generating PDF forms:

- `action`
- `format`
- `method`
- `name`
- `onSubmit`
- `skin`
- `style`

To embed an existing PDF form generated by LiveCycle Designer or Acrobat, use the tag.

## Example

```
<h3>cfform Example</h3>
<!-- If Form.oncethrough exists, the form has been submitted. -->
<cfif IsDefined("Form.oncethrough")>
    <cfif IsDefined("Form.testVal1")>
        <h3>Results of Radio Button Test</h3>
        <cfif Form.testVal1>Your radio button answer was yes
        <cfelse>Your radio button answer was no
        </cfif>
    </cfif>
    <h3>Results of Checkbox Test</h3>
    <cfif IsDefined("Form.chkTest2")>
        Your checkbox answer was yes
    <cfelse>
        Your checkbox answer was no
    </cfif>
    <cfif IsDefined("Form.textSample") AND Form.textSample is not "">
        <h3>Results of Credit Card Input</h3>
        Your credit card number, <cfoutput>#Form.textSample#</cfoutput>,
        was valid under the MOD 10 algorithm.
    </cfif>
    <cfif IsDefined("Form.sampleSlider")>
        <cfoutput>
            <h3>You gave this page a rating of #Form.sampleSlider#</h3>
        </cfoutput>
    </cfif>
    <hr noshade="True">
</cfif>

<!-- Begin by calling the cfform tag. -->
<cfform name="cfformexample">
    <h4>This example displays radio button input type for cfinput.</h4>
    Yes <cfinput type = "Radio" name = "TestVal1" value = "Yes" checked>
    No <cfinput type = "Radio" name = "TestVal1" value = "No">
    <h4>This example displays checkbox input type for cfinput.</h4>
    <cfinput type = "Checkbox" name = "ChkTest2" value = "Yes">
    <h4>This shows client-side validation for cfinput text boxes.</h4>
    (<i>This item is optional</i>)<br>
    Please enter a credit card number:
    <cfinput type = "Text" name = "TextSample"
        message = "Please enter a Credit Card Number"
        validate = "creditcard" required = "No">
    <h4>This example shows the use of the cfslider tag.</h4>
    Rate your approval of this example from 1 to 10 by sliding control.<br>
    1 <cfslider name = "sampleSlider" width="100"
        label = "Page Value: " range = "1,10"
        message = "Please enter a value from 1 to 10"> 10
    <p><cfinput type = "submit" name = "submit" value = "show me the result">
    <cfinput type = "hidden" name = "oncethrough" value = "Yes"></p>
</cfform>
```

## A simple XML form

The following example shows a simple XML-format form. It uses the default.xml transform that is supplied with ColdFusion to generate the HTML output for display:

```
<cfform name="testXForm" format="XML" skin="basic">
<!-- Use cfformgroup to put the first and last names on a single line. -->
  <cfformgroup type="horizontal">
    <cfinput type="text" name="firstname" label="First Name:" value="Robert">
    <cfinput type="text" name="lastname" label="Last Name:" value="Smith">
  </cfformgroup>
  <cfinput type="password" name="password" label="Password:" value="">
  <cfinput type="hidden" name="hidden" label="hidden:" value="">
  <cfselect name="state" style="width:200" label="State">
    <option>California</option>
    <option selected>Utah</option>
    <option>Iowa</option>
    <option selected>New York</option>
  </cfselect>
  <cftextarea name="description" label="Description:" rows="5" cols="40">
    this is sample text.</cftextarea>
</cfform>
```

### A simple PDF form

```
<cfdocument format="pdf">
  <cfdocumentsection ../>
  ...
  ...
  <cfform type="html/xform">
    <cfinput type="text" name="employeeName" value="#fullName#" readonly="true">
    <cfinput type="text" name="employeeID" value="#id#" readonly>
    <cfselect name="contributionPercentage" options="#optionsStruct#" required="true">
    <cfinput type="submit" name="SubmitAsHTTPPost">
    <cfinput type="submit" name="SubmitAsPDF" submitType="PDF">
  </cfform>
  ...
  ...
  <cfdocumentsection ../>
</cfdocument>
```

## cfformgroup

### Description

Creates a container control for multiple form controls. Used in the `cfform` tag body of Adobe Flash and XML forms. Ignored in HTML forms.

### Category

[Forms tags](#)

## Syntax

```
<cfformgroup
    type = "group type"
    label = "label"
    style = "style specification"
    selectedIndex = "page number">
    width = "pixels"
    height = "pixels"
    enabled = "yes|no"
    visible = "yes|no"
    onChange = "ActionScript expression"
    tooltip = "text"
    id = "unique identifier">
    ...ColdFusion forms controls...
</cfformgroup>
```

OR

```
<cfformgroup
    type = "repeater"
    query = "query object"
    maxrows = "integer">
    startrow = "row number"
    ...ColdFusion forms controls
</cfformgroup>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## History

ColdFusion MX 7: Added this tag.

## Attributes

The following table lists the attributes and their behavior in Flash forms. For XML, if not otherwise noted, the attribute is passed to the XML but is not interpreted by the basic XSL style sheet provided with ColdFusion.

**Note:** Attributes that are not marked as supported in XML are not handled by the skins provided with ColdFusion. They are, however, included in the generated XML.

Attribute	Req/Opt; formats	Default	Description
type	Required; Flash and XML		<p><b>XML:</b> Can be any XForms group type defined in the XSLT. The XSL skins provided with ColdFusion support the following types:</p> <ul style="list-style-type: none"> <li>• <code>horizontal</code>: align child tags horizontally within a form and put this tag's <code>label</code> attribute to the left of the children.</li> <li>• <code>vertical</code>: align child tags vertically within a form and put this tag's <code>label</code> attribute to the left of the children.</li> <li>• <code>fieldset</code>: corresponds to the HTML <code>fieldset</code> tag, which groups its children, typically by drawing a box around them and replacing part of the top line with legend text. To specify the legend, use the <code>label</code> attribute. To specify the box dimensions, use the <code>style</code> attribute with <code>height</code> and <code>width</code> values. Explicitly use <code>cfformgroup type="vertical"</code> inside this formgroup to align its child tags vertically.</li> </ul> <p><b>Flash:</b> Must be one of the following:</p> <ul style="list-style-type: none"> <li>• <code>repeater</code>: dynamically creates an instance of the <code>cfformgroup</code>'s child tag or tags for each row of a query object, without requiring ColdFusion to recompile the Flash SWF file when the number of rows changes.</li> <li>• <code>horizontal</code>: aligns child tags horizontally within a form and put this tag's <code>label</code> attribute to the left of the children. Use this tag to arrange individual controls horizontally.</li> <li>• <code>vertical</code>: aligns child tags vertically within a form and puts this tag's <code>label</code> attribute to the left of the children. Use this tag to arrange individual controls vertically.</li> <li>• <code>hbox</code>: aligns children horizontally. Use this type to arrange groups of form controls horizontally. Do not use this attribute to align individual controls horizontally, because the child controls do not align properly; use the <code>horizontal</code> type instead.</li> <li>• <code>vbox</code>: aligns children vertically. Use this type to arrange groups of controls vertically. Do not use this attribute to align individual controls vertically, because the child controls do not align properly; use the <code>vertical</code> type instead.</li> <li>• <code>hdividedbox</code>: aligns children horizontally. Each child is in a box with a border, and there are dividers between the boxes that users can move to change the relative sizes of the children. Use a tag with this attribute to arrange groups of form controls horizontally. You cannot use this attribute to align individual controls horizontally.</li> <li>• <code>vdividedbox</code>: aligns children vertically. Each child is in a box with a border, and there are dividers between the boxes that users can move to change the relative sizes of the children. Use this type to group form controls, for example as a unit in an <code>hbox</code> form group. Do not use this attribute to align individual tags vertically.</li> <li>• <code>panel</code>: a container consisting of a title bar containing the <code>label</code> attribute text, a border, and a content area with vertically arranged children.</li> <li>• <code>tile</code>: places the children in a rectangular grid.</li> <li>• <code>accordion</code>: places each child in a pleat of an expanding and contracting accordion. Define each pleat using a <code>cfformgroup type="page"</code> tag.</li> <li>• <code>tabnavigator</code>: places the children in a tabbed dialog box. Define each tab by using a <code>cfformgroup type="page"</code> tag.</li> <li>• <code>page</code>: places the children tags, aligned vertically, in a single tab of a parent <code>tabnavigator</code> or pleat of an accordion container.</li> </ul>

Attribute	Req/Opt; formats	Default	Description
query	Required for type= repeater, ignored otherwise; Flash		The query to use with the repeater. Flash creates an instance of each of the <code>cfformgroup</code> tag's child tags for each row in the query. You can use the <code>bind</code> attribute in the child tags to use data from the query row for the instance.
enabled	Optional; Flash	yes	Boolean value that specifies whether the controls in the form group are enabled. Disabled controls appear in light gray.
height	Optional; Flash		Height of the group container, in pixels. If you omit this attribute, Flash automatically sizes the container height. Ignored for Flash repeater type.
id	Optional; Flash		Unique identifier for the form group.  When using the tabnavigator or accordion type, specify the <code>id</code> attribute to reference the controls through custom <code>ActionScript</code> .
label	Optional; Flash and XML		Label to apply to the form group.  In Flash, does the following: <ul style="list-style-type: none"> <li>For a page or panel form group, determines the label to put on the corresponding accordion pleat, the tabnavigator tab, or the panel title bar. For a Flash horizontal or vertical form group, specifies the label to put to the left of the group.</li> <li>Ignored in Flash for repeater, hbox, hdividedbox, vbox, vdividedbox, tile, accordion, and tabnavigator types.</li> </ul>
maxrows	Optional; Flash		Used only for the <code>repeater</code> type; ignored otherwise.  Specifies the maximum number of query rows to use in the Flash form repeater. If the query has more rows than the sum of the <code>startrow</code> attribute and this value, the repeater does not use the remaining rows.
onChange	Optional; Flash		Tabnavigator and accordion types only: <code>ActionScript</code> expression or expressions to execute when a new tab or accordion page is selected.  <b>Note:</b> The <code>onChange</code> event occurs when the form first appears.
selectedIndex	Optional; Flash only		Used only for accordion and tabnavigator types; ignored otherwise. Specifies the page control to display as open, where 0 (not 1) specifies the first page control defined in the group.
startrow	Optional; Flash	0	Used only for the <code>repeater</code> type; ignored otherwise.  Specifies the row number of the first row of the query to use in the Flash form repeater. This attribute is zero-based: the first row is row 0, not row 1 (as in most ColdFusion tags).
style	Optional; Flash and XML		<b>Flash:</b> a Flash style specification in CSS format. For detailed information on specifying Flash styles, see <i>Creating Forms in Flash</i> in the <i>Developing ColdFusion Applications</i> .  <b>XML:</b> an inline CSS style specification.
tooltip	Optional; Flash		Text to display when the mouse pointer hovers in the form group area. If a control in the form group also specifies a tooltip, Flash displays the control's tooltip when the mouse pointer hovers over the control.
visible	Optional; Flash	yes	Boolean value specifying whether the controls in the form group are visible. If the controls are invisible, the space that would be occupied by visible controls is blank.
width	Optional; Flash and XML		Width of the group container, in pixels. If you omit this attribute, Flash automatically sizes the container width. Ignored for Flash repeater type.

## Usage

This tag requires an end tag. This tag is ignored if the `cfform` type is HTML; any tag body's contents are interpreted as if the surrounding `cfformgroup` does not exist.

In Flash format forms, this tag organizes the contents of the form. It groups and arranges child tags. The body of this tag can contain the following tags; all other tags and text are ignored:

- `cfformgroup`
- `cfformitem`
- `cfcalendar`
- `cfgrid`
- `cfinput`
- `cfselect`
- `cftextarea`
- `cftree`

For more information on using this tag in Flash forms, see *Creating Forms in Flash* in the *Developing ColdFusion Applications*.

In XML format, ColdFusion passes the tag and its attributes to the XML; it is the responsibility of the skin XSLT to handle the XML. The ColdFusion basic skin supports the `horizontal`, `vertical`, and `dualselectlist` styles only. For more information on using this tag in XML forms, see *Creating Forms in Flash* in the *Developing ColdFusion Applications*.

## Example

For a simple example of an XML form that uses a single `cfformgroup` tag, see [cfform](#).

The following example shows how to use the `cfformgroup` tag to arrange elements on a Flash form. It creates an `hdividedbox` container that has a `vbox` container on each side. The left box has heading text and two radio buttons. The right box has heading text and three check boxes.

```
<h3>Simple cfformgroup Example</h3>
<cfform name="myform" height="450" width="500" format="Flash" >
  <cfformgroup type="hdividedbox" >
    <cfformgroup type="VBox">
      <cfformitem type="text" height="20">
        Pets:
      </cfformitem>
      <cfinput type="Radio" name="pets" label="Dogs" value="Dogs" checked>
      <cfinput type="Radio" name="pets" label="Cats" value="Cats">
    </cfformgroup>

    <cfformgroup type="VBox">
      <cfformitem type="text" height="20">
        Fruits:
      </cfformitem>
      <cfinput type="Checkbox" name="chk1" Label="Apples" value="Apples">
      <cfinput type="Checkbox" name="chk2" Label="Bananas" value="Bananas">
      <cfinput type="Checkbox" name="chk3" Label="Pears" value="Pears">
    </cfformgroup>
  </cfformgroup>
</cfform>
```

The following more complex example shows more fully how you can use `cfformgroup` tags to arrange controls in a Flash form. It also shows many of the text formatting features that you can use in a text `cfformgroup` body. When you submit the form, the page dumps the contents of the Forms scope, to show you the submitted data.

```
<h2>cfformgroup Example</h2>
<cfif IsDefined("form.onscethrough")>
    <h3>The form submitted the following information to ColdFusion:</h3>
    <cfdump var="#form#"><br><br><br>
</cfif>

<h3>A Flash form using cfformgroup tags</h3>
<cfform name="myform" height="450" width="500" format="Flash">

<!-- The following formgroup shows how you can present formatted text. -->
    <cfformitem type="html">
        <b><font color="#FF0000" size="+4" face="serif">
            This form has two tabs, asking for the following:</font></b><br>
            <li>contact information</li>
            <li><i>preferences</i></li>
            <b>Try entering information on both tabs</b><br>
            Submit the form and see what ColdFusion gets in the Forms scope.</b><br>
            <a href="http://www..com/" target="_blank">
                <font color="#0000FF"><u>
                    This link displays the home page in a new browser window
                </u></font></a><br>
            &nbsp;<br>
    </cfformitem>

<!-- Use a tabnavigator with two tabs for user input. -->
    <cfformgroup type="tabnavigator" height="220">
        <cfformgroup type="page" label="Contact Information">
            <!-- Align the first and last name fields horizontally -->
            <cfformgroup type="horizontal" label="Your Name">
                <cfinput type="text" required="Yes" name="firstName" label="First"
                    value="" width="100"/>
                <cfinput type="text" required="Yes" name="lastName" label="Last"
                    value="" width="100"/>
            </cfformgroup>
            <cfformitem type="html"><textformat indent="95"><font size="-2">
                Flash fills the email field in automatically.
                You can replace any of the text.
            </font></textformat>
        </cfformitem>
        <!-- The bind attribute gets the field contents from the firstName and lastName
            fields as they get filled in. -->
        <cfinput type="text" name="email" label="email"
            bind="{firstName.text}.{lastName.text}@mm.com">

        <cfinput type="text" name="phone" validate="telephone" required="Yes"
            label="Phone Number">
    </cfformgroup>

    <cfformgroup type="page" label="Preferences">
        <cfformitem type="text" height="30">
            <b>Tell us your preferences</b>
        </cfformitem>
        <!-- Put the pet selectors to the left of the fruit selectors. -->
```

```
<cfformgroup type="hbox">
<!-- Group the pet selector box contents, aligned vertically. -->
  <cfformgroup type="vbox">
    <cfformitem type="text" height="20">
      Pets:
    </cfformitem>
    <cfformgroup type="vertical">
      <cfinput type="Radio" name="pets" label="Dogs" value="Dogs"
        checked>
      <cfinput type="Radio" name="pets" label="Cats" value="Cats">
    </cfformgroup>
  </cfformgroup>
<!-- Group the fruit selector box contents, aligned vertically. -->
  <cfformgroup type="vbox">
    <cfformitem type="text" height="20">
      Fruits:
    </cfformitem>
    <cfformgroup type="tile" width="200" label="Tile box">
      <!-- Flash requires unique names for all controls -->
      <cfinput type="Checkbox" name="chk1" Label="Apples"
        value="Apples">
      <cfinput type="Checkbox" name="chk2" Label="Bananas"
        value="Bananas">
      <cfinput type="Checkbox" name="chk3" Label="Pears"
        value="Pears">
      <cfinput type="Checkbox" name="chk4" Label="Oranges"
        value="Oranges">
      <cfinput type="Checkbox" name="chk5" Label="Grapes"
        value="Grapes">
      <cfinput type="Checkbox" name="chk6" Label="Cumquats"
        value="Cumquats">
    </cfformgroup>
  </cfformgroup>
</cfformgroup>

<cfformgroup type="horizontal">
  <cfinput type="submit" name="submit" width="100" value="Show Results">

  <cfinput type="hidden" name="oncethrough" value="Yes">
</cfformgroup>
</cfform>
```

## cfformitem

### Description

Inserts a horizontal line, a vertical line, a spacer, or text in a Flash form. Used in the `cfform` or `cfformgroup` tag body for Flash and XML forms. Ignored in HTML forms.

### Category

[Forms tags](#)

## Syntax

```
<cfformitem  
    type = "hrule|vrule|spacer"  
    height = "pixels"  
    style = "style specification"  
    visible = "yes|no"  
    width = "pixels"/>
```

OR

```
<cfformitem  
    type = "html|text|script"  
    bind = "bind expression"  
    enabled = "yes|no"  
    height = "pixels"  
    style = "style specification"  
    tooltip = "text"  
    visible = "yes|no"  
    width = "pixels">  
    ...text</cfformitem>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## History

ColdFusion MX 7.01: Added the "script" value for type attribute.

ColdFusion MX 7: Added tag

## Attributes

The following table lists the attributes and their behavior in Flash forms. For XML format, if not otherwise noted, the attribute is passed to the XML but is not interpreted by the basic XSL style sheet provided with ColdFusion.

**Note:** Attributes that are marked as *Flash only* are not handled by the skins provided with ColdFusion. They are, however, included in the generated XML in all controls except text and html types.

Attribute	Req/Opt; formats	Default	Description
type	Required;  Flash and XML		<p><b>Flash:</b></p> <ul style="list-style-type: none"> <li><code>html</code>: place the text in the body of this tag on the form. For Flash forms, you can use the following text formatting tags, most of which correspond to HTML tags, in the text: <code>a</code>, <code>b</code>, <code>br</code>, <code>font</code>, <code>i</code>, <code>img</code>, <code>li</code>, <code>p</code>, <code>textformat</code>, and <code>u</code>. For details on using these formatting tags, see the Flash documentation. The <code>style</code> attribute has no effect on the format of the text in <code>type</code>.</li> <li><code>text</code>: place the text in the body of this tag on the form verbatim, without interpreting any markup. You can control the overall appearance of the text by using the <code>style</code> attribute.</li> <li><code>spacer</code>: places an invisible spacer of the specified height and width on the form. Used to place space between form controls. This tag must not have any children.</li> <li><code>hrule</code>: places a horizontal rule on the form. This tag must not have any children.</li> <li><code>vrule</code>: places a vertical rule on the form. This tag must not have any children.</li> <li><code>script</code>: lets you create functions in Flash forms, which reduces the possibility of reaching the 64 KB limit.</li> </ul>
			<p><b>XML:</b></p> <ul style="list-style-type: none"> <li><code>html</code>: puts the CFML tag's body text in a CDATA section in an XML <code>xf:output</code> element.</li> <li><code>text</code>: XML-formats (escapes characters such as <code>&lt;</code>) the CFML tag's body text and puts it in a CDATA section in an XML <code>xf:output</code> element.</li> <li><code>hrule</code>: puts an <code>hr</code> tag in the output. Use the <code>style</code> attribute to specify all rule characteristics, including height and width. This tag must not have any children.</li> </ul> <p>Any other string: generates an XML <code>xf:group</code> element with the type name as the appearance attribute. The CFML tag body is put in a CDATA section in a <code>cf:attributename="body"</code> element. The XSL transforms provided with ColdFusion ignore these elements.</p>
bind	Optional;  Flash		<p>A Flash bind expression that populates the field with information from other form fields. If you use this attribute, ColdFusion ignores any text that you specify in the body of the <code>cf:textitem</code> tag. This attribute can be useful if the <code>cf:formitem</code> tag is in a <code>cf:formgroup type="repeater"</code> tag.</p> <p>For more information, see Flash form data binding in the <code>cf:input</code> tag description.</p>
enabled	Optional;  Flash	yes	Boolean value that specifies whether the control is enabled. Disabled text appear in light gray. Has no effect on spacers and rules.
height	Optional;  Flash		Height of the item, in pixels. If you omit this attribute, Flash automatically sizes the height. In ColdFusion XSL skins, use the <code>style</code> attribute, instead.
style	Optional;  Flash and XML		<p><b>Flash:</b></p> <ul style="list-style-type: none"> <li>Must be a style specification in CSS format.</li> <li>Ignored if the <code>type</code> attribute is <code>html</code>.</li> </ul> <p>For detailed information on specifying Flash styles, see <i>Creating Forms in Flash</i> in the <i>Developing ColdFusion Applications</i>. Not used with the <code>spacer</code> type.</p> <p><b>XML:</b></p> <ul style="list-style-type: none"> <li>ColdFusion passes the <code>style</code> attribute to the XML. ColdFusion skins include the <code>style</code> attribute in the generated HTML.</li> </ul>

Attribute	Req/Opt; formats	Default	Description
tooltip	Optional; Flash		Text to display when the mouse pointer hovers over the control. Has no effect on spacers.
visible	Optional; Flash	yes	Boolean value that specifies whether to show the control. Space that would be occupied by an invisible control is blank. Has no effect on spacers.
width	Optional; Flash		Width of the item, in pixels. If you omit this attribute, Flash automatically sizes the width. In ColdFusion XSL skins, use the <code>style</code> attribute, instead.

### Usage

This tag requires an end tag or a slash before the closing end character of the opening tag, as the following example shows:

```
<cfformitem type="hrule" />
```

For more information on using this tag in Flash forms, see *Creating Forms in Flash* in the *Developing ColdFusion Applications*.

### Example

The following example shows a simple Flash form by using horizontal rules and text:

```
<h3>cfformitem Example</h3>
<cfform name="myform" height="450" width="500" format="Flash" >
  <cfformitem type="hrule" />
  <cfformitem type="text">
    This simple form has two hrule cfformitem tags around the cfformitem tag that
    contains this text.
  </cfformitem>
  <cfformitem type="hrule" />
</cfform>
```

For a more complex form, see [cfformgroup](#).

## cfftp

### Description

Lets users implement File Transfer Protocol (FTP) operations.

### Category

[File management tags](#), [Internet protocol tags](#)

### Syntax

The tag syntax depends on the `action` attribute value. See the following sections:

### See also

[cfhttp](#), [cfldap](#), [cfmail](#), [cfpop](#); Performing file operations with `cfftp` in *Interacting with Remote Servers* in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added the `fingerprint`, `key`, `paraphrase`, and `secure` attributes to support secure FTP. Added the values `"quote"`, `"site"`, `"allo"`, and `"acct"` to the `action` attribute.

ColdFusion MX 7: Added the `result` attribute for file and directory operations.

ColdFusion MX: Deprecated the `agentname` attribute. It might not work, and might cause an error, in later releases.

### Usage

Use this tag to move files between a ColdFusion server and an FTP server.

This tag does not move files between a ColdFusion server and a client browser. You do this as follows:

- To transfer files from a client to a ColdFusion server: `cffile` `action` = "upload"
- To transfer files from a ColdFusion server to a client: the `cfcontent` tag

### Security settings

ColdFusion security settings can prevent the `cffftp` tag from executing. If you run ColdFusion applications on a server that is used by multiple customers, consider the security of the files that the customer can move. For more information, see the Administering Security section of *Configuring and Administering ColdFusion*.

## cffftp: Opening and closing FTP server connections

### Description

To establish a connection with an FTP server, use the `open` action with a `connection` attribute.

### Syntax

```
<cffftp
  action = "open|close|quote|site|allo|acct"
  actionparam = "command or account information"
  buffersize = "number"
  connection = "name"
  passive = "yes|no"
  password = "password"
  port = "port"
  proxyServer = "proxy server"
  retryCount = "number"
  server = "server"
  stopOnError = "yes|no"
  timeout = "time-out in seconds"
  username = "name">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfhttp](#), [cfldap](#), [cfmail](#), [cfpop](#)

## Attributes

Attribute	Req/Opt	Default	Description
action	Required		FTP operation to perform. <ul style="list-style-type: none"> <li>• open: creates an FTP connection.</li> <li>• close: terminates an FTP connection.</li> <li>• quote: sends a command verbatim to the FTP server.</li> <li>• site: executes a site-specific command.</li> <li>• allo: allocates memory for operations, such as putting large files, on the server.</li> <li>• acct: sends account information on systems that require it.</li> </ul>
actionparam	Optional		Used only when action is quote, site, or acct. Specifies the command when action is quote or site; specifies account information when action is acct.
bufferSize	Optional		Buffer size in bytes.
connection	Optional, but always used with open or close		Name of the FTP connection. If you specify the username, password, and server attributes, and if no connection exists for them, ColdFusion creates one. Calls to cffftp with the same connection name reuse the connection.
passive	Optional	no	<ul style="list-style-type: none"> <li>• yes: enables passive mode.</li> <li>• no</li> </ul>
password	Required if action = "open"		Password to log in the user.
port	Optional	21	Remote port to which to connect.
proxyServer	Optional		String. Name of proxy server (or servers) to use, if proxy access is specified.
retryCount	Optional	1	Number of retries until failure is reported.
server	Required if action = "open"		FTP server to which to connect; for example, ftp.myserver.com.
stopOnError	Optional	yes	<ul style="list-style-type: none"> <li>• yes: halts processing, displays an appropriate error.</li> <li>• no: if secure="no", populates these variables:</li> <li>• cffftp.succeeded: yes or no.</li> <li>• cffftp.errorCode: error number. See the IETF Network Working Group RFC 959: File Transfer Protocol (FTP) at <a href="http://www.ietf.org/rfc/rfc0959.txt">www.ietf.org/rfc/rfc0959.txt</a>.</li> <li>• cffftp.errorText: Message text.</li> </ul> <p>For conditional operations, use cffftp.errorCode. Do not use cffftp.errorText for this purpose.</p>
timeout	Optional	30	Value in seconds for the time-out of all operations, including individual data request operations.
username	Required if action = "open"		User name to pass in the FTP operation.

## Usage

When you establish a connection with `cfftp action="open"` and specify a name in the `connection` attribute, ColdFusion caches the connection so that you can reuse it to perform additional FTP operations. When you use a cached connection for subsequent FTP operations, you do not have to specify the `username`, `password`, or `server` connection attributes. The FTP operations that use the same `connection` name automatically use the information stored in the cached connection. Using a cached connection helps save connection time and improves file transfer performance.

You do not need to open a connection for single, simple, FTP operations, such as `GetFile` or `PutFile`.

With any action except `close`, you can set the internal buffer size by specifying `bufferSize`. If you specify `quote`, `site`, `allo`, or `acct` as the action and set `secure="yes"` an error is generated. You specify the command to send to the FTP server in the `actionparam` attribute when you specify `site` or `quote` as the action. When `site` is the action, you use the `actionparam` attribute to specify the site-specific information.

To keep a connection open throughout a session or longer, put the connection name in the Session or Application scope; for example, specify `connection="Session.FTPConnection"`. However, if you do this, you must specify the full variable name in all FTP operations, and you must use the `close` action when you are finished. Keeping a connection open prevents others from using the FTP server; so close a connection as soon as possible. If you do not assign the connection name to Session or Application variable, the connection remains open for the current page only, and you do not have to close it manually.

Changes to a cached connection, such as changing `retryCount` or `timeout` values, might require reestablishing the connection.

### Example

```
<p>cfftp lets users implement File Transfer Protocol operations. By default, cfftp caches
  an open connection to an FTP server.</p>
<p>cfftp operations are usually of two types:</p>
<ul>
  <li>Establishing a connection
  <li>Performing file and directory operations
</ul>
<p>This example opens and verifies a connection, lists the files in a directory, and closes
  the connection.</p>
<p>Open a connection</p>
<cfftp action = "open"
  username = "anonymous"
  connection = "My_query"
  password = "youremail@email.com"
  server = "ftp.tucows.com"
  stopOnError = "Yes">
<p>Did it succeed? <cfoutput>#cfftp.succeeded#</cfoutput>
<p>List the files in a directory:
<cfftp action = "LISTDIR"
  stopOnError = "Yes"
  name = "ListFiles"
  directory = "/"
  connection = "my_query">
<cfoutput query = "ListFiles">
  #name#<br>
</cfoutput>

<p>Close the connection:</p>
<cfftp action = "close"
  connection = "My_query"
  stopOnError = "Yes">
<p>Did it succeed? <cfoutput>#cfftp.succeeded#</cfoutput>
```

## cfftp: Opening and closing secure FTP server connections

### Description

To establish a connection with a secure FTP server, use the open action with a connection attribute, specify that secure = "yes", and specify the key, passphrase, and fingerprint as appropriate.

```
<cfftp
    action = "open|close"
    connection = "name"
    fingerprint = "ssh-dss.ssh-rsa"
    key = "private key"
    passive = "yes|no">
    passphrase = "passphrase"
    password = "password"
    port = "port"
    proxyServer = "proxy server"
    retryCount = "number"
    secure = "yes|no"
    server = "server"
    stopOnError = "yes|no"
    timeout = "time-out in seconds"
    username = "name">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

#### Attributes

Attribute	Req/Opt	Default	Description
action	Required		FTP operation to perform. <ul style="list-style-type: none"><li>• open: creates an FTP connection.</li><li>• close: terminates an FTP connection.</li></ul>
connection	Optional, but always used with open or close		Name of the FTP connection. If you specify the username, password, and server attributes, and if no connection exists for them, ColdFusion creates one. Calls to <code>cfftp</code> with the same connection name reuse the connection.
fingerprint	Optional. Used only when server, username, and password are supplied		Fingerprint of the host key in the form <code>ssh-dss.ssh-rsa</code> , which is a 16-byte unique identifier for the server attribute that you specify. The fingerprint consists of eight pairs of hexadecimal values in the form <code>hh:hh:hh:hh: :hh:hh:hh:hh</code> . ColdFusion checks the fingerprint of the remote server only if the fingerprint value is specified.
key	Required if action="open" (When secure="yes", either password or key is required.)		Public-key-based authentication. Refers to the absolute path to the private key of the user. Possession of a private key provides authentication by sending a signature created with a private key. The server must ensure that the key is a valid authentication for the user and that the signature is valid. Both must be valid to accept the authentication.
passive	Optional	no	Valid only if secure="no". <ul style="list-style-type: none"><li>• yes: enables passive mode.</li><li>• no</li></ul>
passphrase	Optional. Used when key is specified		Because private keys are stored in an encrypted form on the client host, the user must supply a passphrase to enable generating the signature.

Attribute	Req/Opt	Default	Description
password	Required if action="open" (When secure="yes", either password or key is required.)		Password to log in the user.
port	Optional	21	Remote port to which to connect.
proxyServer	Optional		String. Name of proxy server (or servers) to use, if proxy access is specified.
retryCount	Optional	1	Number of retries until failure is reported.
secure	Optional	no	<ul style="list-style-type: none"> <li>yes: enables secure FTP</li> <li>no</li> </ul>
server	Required if action="open"		FTP server to which to connect; for example, ftp.myserver.com.
stopOnError	Optional	no	<ul style="list-style-type: none"> <li>yes: halts processing, displays an appropriate error.</li> <li>no: if secure="yes", populates the following variables:</li> <li>If ColdFusion fails to connect to the secure FTP server, it halts processing and displays the appropriate error message</li> <li>cffftp.succeeded: yes or no</li> <li>cffftp.errorCode: error number</li> <li>cffftp.errorText: message text</li> <li>For all file operations, returns the following error codes: SSH-CONNECT 25 SSH_MSG_USERAUTH_FAILURE 51 SSH_MSG_USERAUTH_SUCCESS 52 SSH_MSG_REQUEST_SUCCESS 81 SSH_MSG_REQUEST_FAILURE 82 For conditional operations, use cffftp.errorCode. Do not use cffftp.errorText for this purpose.</li> </ul>
timeout	Optional	30	Value in seconds for the time-out of all operations, including individual data request operations.
username	Required if action="open"		User name to pass in the FTP operation.

## Usage

The `cfftp` tag lets you open a connection to a Secure Shell (SSH) server by using either symmetric or asymmetric encryption. To use symmetric encryption, you specify `secure="yes"`, the user name, password, connection, and fingerprint. To use asymmetric encryption, first generate private-public key pairs for each user authorized to have access to the server. Each authorized user's public key is stored on the server; each user's private key is encrypted and stored on that user's computer. To open a connection to the SSH server, you specify `secure="yes"`, the user name, the password, or the private key and the passphrase that the server uses to decrypt the private key, connection, and fingerprint. After you open the connection to the SSH server, you can use that connection for any action supported by the `cfftp` tag.

To keep a connection open throughout a session or longer, put the connection name in the Session or Application scope; for example, specify `connection="Session.FTPConnection"`. However, if you do this, specify the full variable name in all FTP operations, and use the `close` action when you are finished. Keeping a connection open prevents others from using the FTP server; so close a connection as soon as possible. If you do not assign the connection name to Session or Application variable, the connection remains open for the current page only, and you do not have to close it manually.

Changes to a cached connection, such as changing `retryCount` or `timeout` values, might require reestablishing the connection.

## Example

```
<!--- This example uses symmetric encryption. --->

<!--- Open the secure connection. --->
<cfftp action = "open"
    username = "myusername"
    connection = "My_query"
    password = "mypassword"
    fingerprint = "12:34:56:78:AB:CD:EF:FE:DC:BA:87:65:43:21"
    server = "ftp.tucows.com"
    secure = "yes">
<p>Did it succeed? <cfoutput>#cfftp.succeeded#</cfoutput>
<cfdump var = "#My_query# label="connection">

<!--- Transfer files to the remote server. --->
<cfset absolutePathToLocalFile="C:\one\two\myfile.htm">
    <cfif FileExists(absolutePathToLocalFile)>
        <cfftp action = "putFile"
            connection="My_query"
            localFile="#variables.absolutePathToLocalFile#"
            remoteFile="/home/myname/sftptest/myfile.htm">
    <cfelse>
        <!--- Put error handling code here. --->
    </cfif>
<p>Did it succeed? <cfoutput>#cfftp.succeeded#</cfoutput>

<!--- Close the connection. --->
<cfftp action="close" connection="My_query">
```

### Example

```
<!--- This example uses asymmetric encryption. --->

<!--- Open the secure connection. --->
<cffftp action = "open"
    username = "myusername"
    connection = "My_query"
    key="C:\mykeys\myprivatekey"
    passphrase = "zHx628Fg"
    fingerprint = "12:34:56:78:AB:CD:EF:FE:DC:BA:87:65:43:21"
    server = "ftp.tucows.com"
    secure = "yes">
<p>Did it succeed? <cfoutput>#cffftp.succeeded#</cfoutput>
<cfdump var = "#My_query# label="connection">

<!--- List files on the remote server. --->
<cftry>
    <!--- List the files in a directory. --->
    <cffftp action = "listDir"
        connection="My_query"
        stopOnError="yes"
        name="ListFiles"
        directory="/">
    <cfcatch>
        <!--- Close the connection. --->
        <cffftp action="close" connection="My_query" stopOnError="no">
    </cfcatch>
</cftry>
```

## **cffftp: Connection: file and directory operations**

### Description

To perform file and directory operations with `cffftp`, use this form of the `cffftp` tag.

## Syntax

```
<cffftp
    action = "action"
    ASCIIExtensionList = "extensions"
    connection = "connection name"
    directory = "directory name"
    existing = "file or directory name"
    failIfExists = "yes|no"
    item = "directory or file"
    localFile = "filename"
    name = "query name"
    new = "file or directory name"
    passive = "yes|no"
    password = "password"
    proxyServer = "proxy server"
    remoteFile = "filename"
    result = "result name"
    server = "server"
    timeout = "time-out in seconds"
    transferMode = "ASCII FTP|Binary FTP|Auto FTP"
    username = "name">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## Attributes

Attribute	Req/Opt	Default	Description
action	Required if connection is not cached		FTP operation to perform: <ul style="list-style-type: none"> <li>• <code>changedir</code></li> <li>• <code>createDir</code></li> <li>• <code>listDir</code></li> <li>• <code>removeDir</code></li> <li>• <code>getFile</code></li> <li>• <code>putFile</code></li> <li>• <code>rename</code></li> <li>• <code>remove</code></li> <li>• <code>getCurrentDir</code></li> <li>• <code>getCurrentURL</code></li> <li>• <code>existsDir</code></li> <li>• <code>existsFile</code></li> <li>• <code>exists</code></li> </ul>
ASCIIExtensionList	Optional	<code>txt;htm;html;</code> <code>cfm;cfml;shtm;</code> <code>shtml;css;asp;</code> <code>asa</code>	Delimited list of file extensions that force ASCII transfer mode, if <code>transferMode="auto"</code> .
connection	Required if <code>action="open"</code> or <code>"closed"</code>		The name of the FTP connection.  Used to cache a new FTP connection or to reuse an existing connection.
directory	Required if <code>action="changedir"</code> , <code>"createDir"</code> , <code>"listDir"</code> , or <code>"existsDir"</code>		Directory on which to perform an operation.
existing	Required if <code>action="rename"</code>		Current name of the file or directory on the remote server.
failIfExists	Optional	<code>yes</code>	<ul style="list-style-type: none"> <li>• <code>yes</code>: If a local file with same name exists, the <code>getFile</code> action fails.</li> <li>• <code>no</code></li> </ul>
item	Required if <code>action="exists"</code> or <code>"remove"</code>		Object of these actions: file or directory.
localFile	Required if <code>action="getFile"</code> or <code>"putFile"</code>		Name of the file on the local file system. For more information, see Usage.
name	Required if <code>action="listDir"</code>		Query name of directory listing.

Attribute	Req/Opt	Default	Description
new	Required if action = "rename"		New name of file or directory on the remote server.
passive	Optional	no	<ul style="list-style-type: none"> <li>yes: enables passive mode.</li> <li>no</li> </ul>
password	Required if action = "open"		Password to log in the user.
proxyServer	Optional		String. Name of the proxy servers to use, if proxy access is specified.
remoteFile	Required if action = "getFile", "putFile", or "existsFile"		Name of the file on the FTP server file system.
result	Optional		Specifies a name for the structure in which <code>cffftp</code> stores the <code>returnValue</code> variable. If set, this value replaces <code>cffftp</code> as the prefix to use when accessing <code>returnVariable</code> . For more information, see Usage.
server	Required if FTP connection is not cached		FTP server to which to connect; for example, <code>ftp.myserver.com</code> .
timeout	Optional	30 seconds	<p>The length of time, in seconds, that ColdFusion waits for a response from the FTP server.</p> <p>Used with action = "open" for a cached connection.</p>
transferMode	Optional	auto	<ul style="list-style-type: none"> <li>ASCII FTP transfer mode</li> <li>Binary FTP transfer mode</li> <li>Auto FTP transfer mode</li> </ul>
username	Required if connection is not cached		User name to pass in the FTP operation.

### Usage

If you use connection caching to an active FTP connection, you do not have to respecify the `username`, `password`, or `server` connection attributes.

Changing a cached connection, such as changing `retryCount` or `timeout` values, might require reestablishing the connection.

If action = "listDir", the `attributes` column returns `directory` or `normal`. Other platform-specific values, such as `hidden` and `system`, are no longer supported.

If action = "listDir", a `mode` column is returned. The column contains an octal string representation of UNIX permissions; for example, "777."

The `cffftp.returnValue` variable provides the return value for these actions:

- `getCurrentDir`
- `getCurrentURL`
- `existsDir`

- `existsFile`
- `exists`

For more information, see the *Developing ColdFusion Applications*.

For more information, see the section [Performing file operations with `cfftp`](#) in *Developing ColdFusion Applications*.

#### localFile attribute

Use the following syntax to specify an in-memory file, which is not written to disk, as the local file. In-memory files speed processing of transient data.

```
ram:///filepath
```

The filepath can include directories, for example `ram:///petStore/images/poodle.jpg`. Create the directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files* in the *Developing ColdFusion Applications*.

#### Action (`cfftp.returnValue` variable)

The results of an action determine the value of the `returnValue` variable, as the following table shows:

cfftp action	Value of <code>cfftp.returnValue</code>
<code>getCurrentDir</code>	String. Current directory.
<code>getCurrentURL</code>	String. Current URL.
<code>existsDir</code>	yes or no.
<code>existsFile</code>	yes or no.
<code>exists</code>	yes or no.

To access the `returnValue` variable, you must prefix it with either `cfftp` or the value specified by the `result` attribute, if it is set. The `result` attribute provides a way for `cfftp` calls from multiple pages, possibly at the same time, to avoid overwriting the results of one with another. If you set the `result` attribute to `myResult`, for example, you would access the `returnValue` variable as `myResult.returnValue`. Otherwise, you would access it as `cfftp.returnValue`.

#### Example

The following example opens a connection and gets a file that lists file or directory name, path, URL, length, and modification date:

```
<p>Open a connection
<cffftp connection = "myConnection"
    username = "myUserName"
    password = "myUserName@allaire.com"
    server = "ftp.allaire.com"
    action = "open"
    stopOnError = "Yes">

<p>Did it succeed? <cfoutput>#cffftp.succeeded#</cfoutput>
<cffftp connection = "myConnection"
    action = "LISTDIR"
    stopOnError = "Yes"
    name = "ListDirs"
    directory = "/">

<p>FTP Directory Listing:<br>
<cftable query = "ListDirs" HTMLTable = "Yes" colHeaders = "Yes">
    <cfcol header = "<b>Name</b>" text = "#name#">
    <cfcol header = "<b>Path</b>" text = "#path#">
    <cfcol header = "<b>URL</b>" text = "#url#">
    <cfcol header = "<b>Length</b>" text = "#length#">
    <cfcol header = "<b>LastModified</b>"
        text = "#DateFormat(lastmodified)#">
    <cfcol header = "<b>IsDirectory</b>" text = "#isdirectory#">
</cftable>

<p>Move Image File to Remote Server:<br></p>
<!-- The image will be put into the root directory of the FTP server unless
    otherwise noted, i.e., remoteFile = "somewhere_put.jpg" vs remoteFile =
"/support/somewhere_put.jpg"
-->
<cffftp
    connection = "myConnection"
    action = "putFile"
    name = "uploadFile"
    transferMode = "binary"
    localFile = "C:\files\upload\somewhere.jpg"
    remoteFile = "somewhere_put.jpg">
<p>Did it succeed? <cfoutput>#cffftp.succeeded#</cfoutput>

<p>Close the connection:
<cffftp connection = "myConnection"
    action = "close"
    stopOnError = "Yes">
<p>Did it succeed? <cfoutput>#cffftp.succeeded#</cfoutput>
```

## **cffftp action = "listDir"**

### **Description**

To access the columns in a query object, use this tag with `action = "listDir"`.

### Usage

When you use this action, specify a value for the `name` attribute. This value holds the results of the `listDir` action in a query object. The query object consists of columns that you can reference, in the form `queryname.columnname[row]`, where `queryname` is the name of the query, specified in the `name` attribute; and `columnname` is a column returned in the query object. The value `row` is the row number of each file/directory entry returned by the `listDir` operation. A separate row is created for each entry:

cftp query object column	Description
Name	Filename of the current element.
Path	File path (without drive designation) of the current element.
URL	Complete URL for the current element (file or directory).
Length	File size of the current element.
LastModified	Unformatted date/time value of the current element.
Attributes	String. Attributes of the current element: normal or Directory.
IsDirectory	Boolean. Whether object is a file or directory.
Mode	Applies only to UNIX and Linux. Permissions. Octal string.

**Note:** Previously supported query column values that pertain to system-specific information are not supported; for example, `hidden` and `system`.

## cffunction

### Description

Defines a function that you can call in CFML. Required to define ColdFusion component methods.

### History

ColdFusion 8:

- Added `returnformat`, `secureJSON`, and `verifyClient` attributes
- Added `component` as a valid value for the `ReturnType` attribute.

ColdFusion MX 7: Added the `description` attribute, and added the `XML` value to the `returntype` attribute.

ColdFusion MX: Added this tag.

### Category

[Extensibility tags](#)

## Syntax

```
<cffunction
    name = "method name"
    access = "method access"
    description = "function description"
    displayName = "name"
    hint = "hint text"
    output = "yes|no"
    returnFormat = "not specified|JSON|plain|WDDX"
    returnType = "data type"
    roles = "securityRoles"
    secureJSON = "yes|no"
    verifyClient = "no|yes">
```

## Attributes

Attribute	Req/Opt	Default	Description
name	Required		A string; a component method that is used in the <code>cfcomponent</code> tag.
access	Optional	public	<p>The client security context from which the method can be invoked.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> <li>• <code>private</code>: available only to the component that declares the method and any components that extend the component in which it is defined.</li> <li>• <code>package</code>: available only to the component that declares the method, components that extend the component, or any other components in the package.</li> <li>• <code>public</code>: available to a locally executing page or component method.</li> <li>• <code>remote</code>: available to a locally or remotely executing page or component method, or a remote client through a URL, Flash, or a web service. To publish the function as a web service, this option is required.</li> </ul>
description	Optional		Supplies a short text description of the function.
displayname	Optional		Meaningful only for CFC method parameters. A value to be displayed in parentheses following the function name when using introspection to show information about the CFC.
hint	Optional		Meaningful only for CFC method parameters. Text to be displayed when using introspection to show information about the CFC. The <code>hint</code> attribute value follows the syntax line in the function description.
output	Optional	Function body is processed as standard CFML	<p>Specifies under which conditions the function can generate HTML output.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> <li>• <code>yes</code>: the entire function body is processed as if it were in a <code>cfoutput</code> tag. Variables names surrounded by number signs (#) are automatically replaced with their values.</li> <li>• <code>no</code>: the function is processed as if it were within a <code>cfsilent</code> tag.</li> </ul> <p>If you do not specify this attribute, the function body is processed as standard CFML. Any variables must be in <code>cfoutput</code> tags.</p>

Attribute	Req/Opt	Default	Description
returnformat		Return as WDDX or XML; see description.	<p>The format in which to return values to a remote caller. This attribute has no effect on values returned to a local caller.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"><li>• <code>json</code>: serialize the return value into JSON format before returning it remotely.</li><li>• <code>wddx</code>: serialize the return value into WDDX format before returning it remotely.</li><li>• <code>plain</code>: ensure that the return value is a type that ColdFusion can convert directly to a string, and return the string value without serialization. Valid types include all simple types, such as numbers, and XML objects. If the return value is a complex type, such as an array, or a binary value, ColdFusion generates an error. If you specify a <code>returntype</code> attribute, its value must be <code>any</code>, <code>boolean</code>, <code>date</code>, <code>guid</code>, <code>numeric</code>, <code>string</code>, <code>uuid</code>, <code>variablename</code>, or <code>XML</code>; otherwise, ColdFusion generates an error.</li></ul> <p>By default, ColdFusion serializes all return types (including simple return types), except XML, into WDDX format, and returns XML data as XML text.</p> <p>You can also use <code>returnformat</code> as an HTTP request parameter when calling a remote CFC function. This parameter has the same effect as the <code>returnformat</code> attribute and overrides any <code>returnformat</code> attribute value specified in the <code>cffunction</code> tag.</p>

Attribute	Req/Opt	Default	Description
returnType	Required for a web service; Optional, otherwise.	any	<p>String; a type name; data type of the function return value:</p> <ul style="list-style-type: none"> <li>any</li> <li>array</li> <li>binary</li> <li>boolean</li> <li>component: the return value must be a ColdFusion component.</li> <li>date</li> <li>guid: the argument must be a UUID or GUID of the form xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxx where each x is a character that represents a hexadecimal number (0-9A-F).</li> <li>numeric</li> <li>query</li> <li>string</li> <li>struct</li> <li>uuid: the argument must be a ColdFusion UUID of the form xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxxxxxx where each x is a character that represents a hexadecimal number (0-9A-F).</li> <li>variableName: a string formatted according to ColdFusion variable naming conventions.</li> <li>void: does not return a value.</li> <li>xml: allows web service functions to return CFML XML objects and XML strings.</li> </ul> <p>A component name: If the type attribute value is not one of the preceding items, ColdFusion treats it as the name of a ColdFusion component. When the function executes, it generates an error if the argument that is passed in is not a CFC with the specified name.</p> <p><b>Note:</b> If a function does not return a value and the returnType value is string, ColdFusion generates an error; ColdFusion does not generate an error for other types.</p>
roles	Optional	"" (empty)	<p>A comma-delimited list of ColdFusion security roles that can invoke the method. Only users who are logged in with the specified roles can execute the function. If this attribute is omitted, all users can invoke the method.</p>
secureJSON	Optional	See Description	<p>A Boolean value that specifies whether to add a security prefix in front of any value that the function returns in JSON-format in response to a remote call.</p> <p>The default value is the value of any <code>This.secureJSON</code> variable in the <code>Application.cfc</code> file or the <code>secureJSON</code> attribute of the <code>cfapplication</code> tag, or if there is no <code>secureJSON</code> application setting, the Prefix Serialized JSON setting in the Administrator Server Settings &gt; Settings page, which defaults to <code>false</code>.</p> <p>For more information see Improving security in the <i>Developing ColdFusion Applications</i>.</p>
verifyClient	Optional	no	<p>A Boolean value that specifies whether to require remote function calls to include an encrypted security token. For use with ColdFusion AJAX applications only.</p> <p>For more information see Improving security in the <i>Developing ColdFusion Applications</i>.</p>

## Usage

The `cffunction` tag can define a function that you call in the same manner as a ColdFusion built-in function.

To define a ColdFusion component (CFC) method, use a `cffunction` tag.

The following example shows `cffunction` tag attributes for a simple CFC method that returns a ColdFusion Query object.

```
<cffunction
    name="getEmployees"
    access="remote"
    returnType="query"
    hint="This query returns all records in the employee database. It candrill-down or narrow
the search, based on optional input parameters.">
```

For detailed information on using the `cffunction` tag for ColdFusion components, see *Building and Using ColdFusion Components* in the *Developing ColdFusion Applications*.

If you specify `returnformat="json"` and the function returns a query, ColdFusion serializes the query into a JSON Object with two entries, and array of column names, and an array of column data arrays. For more information see [SerializeJSON](#).

If you specify a `roles` attribute, the function executes only if a user is logged in and belongs to one of the specified roles.

If you specify `variableName` for the `returnType` attribute, the function must return a string that is in ColdFusion variable name format; that is, the function must return a string that starts with a letter, underscore, or Unicode currency symbol, and consist of letters, numbers, and underscores (`_`), periods, and Unicode currency symbols, only. ColdFusion does not check whether the value corresponds to an existing ColdFusion variable.

## Example

```
<cfcomponent>
    <cffunction name="getEmp">
        <cfquery
            name="empQuery" datasource="ExampleApps" >
            SELECT FIRSTNAME, LASTNAME, EMAIL
            FROM tblEmployees
        </cfquery>
        <cfreturn empQuery>
    </cffunction>
    <cffunction name="getDept">
        <cfquery name="deptQuery" datasource="ExampleApps" >
            SELECT *
            FROM tblDepartments
        </cfquery>
        <cfreturn deptQuery>
    </cffunction>
</cfcomponent>
```

## Tags g-h

### cfgraph

#### Description

This tag is deprecated. Use the [cfchart](#), [cfchartdata](#), and [cfchartseries](#) tags instead.

Displays data graphically.

#### History

ColdFusion MX: Deprecated this tag. It works differently than it did in ColdFusion 5, and it might not work in later releases.

The incompatibilities between the ColdFusion MX implementation and earlier implementations of this tag are as follows:

cfgraph tag attribute	ColdFusion MX functionality
Title	Ignored.
Titlefont	Ignored.
Barspacing	Ignored.
Bordercolor	Color used for border, gridlines, and text displays.
Colorlist	List of colors to use for each data point for bar, pyramid, area, horizontalbar, cone, cylinder, step, and pie charts.
Valuelabelfont	Sets value label text font. If the <code>Valuelabelfont</code> , <code>Itemlabelfont</code> , and <code>Legendfont</code> values differ, ColdFusion uses the last value that you specify in the tag.  Arial is not supported; it is mapped to Dialog.
Itemlabelfont	Sets item label text font. If the <code>Valuelabelfont</code> , <code>Itemlabelfont</code> , and <code>Legendfont</code> values differ, ColdFusion uses the last value that you specify in the tag.  Arial is not supported; it is mapped to Dialog.
Legendfont	Sets legend text font. If the <code>Valuelabelfont</code> , <code>Itemlabelfont</code> , and <code>Legendfont</code> values differ, ColdFusion uses the last value that you specify in the tag.  Arial is not supported; it is mapped to Dialog.
ShowLegend	<ul style="list-style-type: none"> <li>above, below, left, right: these options cause the legend to display, but have no effect on its location.</li> <li>none: prevents display of a legend.</li> </ul>
Valuelabelsize	Sets value label text size. If the <code>Valuelabelsize</code> and <code>Itemlabelsize</code> values differ, ColdFusion uses the last value that you specify in the tag.
Itemlabelsize	Sets item label text size.
Itemlabelorientation	Ignored. ColdFusion calculates best orientation based on label and graph size.
Borderwidth	<ul style="list-style-type: none"> <li>a nonzero number: default-width border, regardless of number value.</li> <li>0: no border.</li> </ul>
Depth	<ul style="list-style-type: none"> <li>0: displays graph with two-dimensional appearance.</li> <li>any other value: displays graph with three-dimensional appearance.</li> </ul>

cfgraph tag attribute	ColdFusion MX functionality
Linewidth	Ignored.
ShowvalueLabel	<ul style="list-style-type: none"> <li>• yes: displays values on mouse-click.</li> <li>• no: suppresses value displays.</li> <li>• rollover: displays values on mouse-over.</li> </ul>
ValueLocation	Ignored.
url	<p>URL of page to open if any item in the graph is clicked.</p> <p>The following variables may be used within the URL; they are substituted with real values before the URL is accessed:</p> <ul style="list-style-type: none"> <li>• "\$value\$": selected row/column value or an empty string.</li> <li>• "\$itemLabel\$": selected item (column) value or an empty string.</li> <li>• "\$seriesLabel\$": selected series (row) value or an empty string.</li> <li>• "javascript:...": executes client side scripts.</li> </ul>
Urlcolumn	Ignored.
Type="HorizontalBar"	The (0,0) coordinate is located at the lower left.
ScaleFrom	If the smallest value in the data is less than <code>scaleFrom</code> or the largest value in the data is greater than <code>scaleTo</code> , the respective data value is used as the minimum or maximum on the Y scale. Therefore, regardless of the <code>scaleFrom</code> or <code>scaleTo</code> value, all data values display.

## cfgraphdata

### Description

This tag is deprecated. Use the [cfchart](#), [cfchartdata](#), and [cfchartseries](#) tags instead.

Displays a data point in a graph. Used within the [cfgraph](#) tag.

### History

ColdFusion MX: Deprecated this tag. It works differently than in ColdFusion 5 and might not work in later releases.

## cfgrid

### Description

Used in the `cfform` tag. Puts a grid control (a table of data) in a ColdFusion form. To specify grid columns and row data, use the `cfgridcolumn` and `cfgridrow` tags, or use the `query` attribute, with or without `cfgridcolumn` tags.

For CFC methods that returns numeric data with a leading zero, for example, zip code 02674, the zero is interpreted by the bind expression as an octal number and its decimal equivalent (in this case 1468) even if you set `returnformat="string"`. To resolve this issue, for URL binds or binds routed by way of a JavaScript function (for example, using `cfajaxproxy`), you can set `returnformat=plain` to retain the numeric value. Also, leading zeros are stripped from the suggestion list for autosuggest controls.

### History

ColdFusion9.0.1: Added the attribute `multirowselect`, supported only in HTML grids.

ColdFusion 9:

- Added `collapsible`, `groupfield`, `onLoad`, and `title` attributes, supported in HTML grids only.
- Added ability to use the `insert` attribute in HTML grids.

ColdFusion 8: Added support for HTML format grids, including the `html` value of the `format` attribute and the following attributes: `bind`, `bindOnLoad`, `pageSize`, `preservePageOnSort`, `stripeRows`, `stripeRowColor`.

ColdFusion MX 7.01: Added support for the `onBlur` and `onFocus` events.

ColdFusion MX 7:

- Added the `format` attribute and support for Flash and XML output.
- Added `enabled`, `onChange`, `style`, `tooltip`, and `visible` attributes (Flash format only).

ColdFusion MX: Changed the `rowHeaderWidth` attribute: ColdFusion does not use the `rowHeaderWidth` attribute. You can omit it.

### Attributes

**Note:** In XML format, ColdFusion passes all attributes to the XML. The supplied XSLT skins do not handle or display XML format grids, but do display applet and Flash format grids.

Attribute	Req/Opt; formats	Default	Description
name	Required; all		Name of the grid control.
align	Optional; applet		Alignment of the grid cell contents: <ul style="list-style-type: none"> <li>• Top</li> <li>• Left</li> <li>• Bottom</li> <li>• Baseline</li> <li>• Texttop</li> <li>• Absbottom</li> <li>• Middle</li> <li>• Absmiddle</li> <li>• Right</li> </ul>
appendKey	Optional; HTML, applet	yes	<ul style="list-style-type: none"> <li>• yes: when used with href, appends "CFGRIDKEY=" and information about the selected items. For details, see the section <i>Using the href attribute</i>.</li> <li>• no</li> </ul>
autoWidth	Optional; HTML, applet	no	<ul style="list-style-type: none"> <li>• yes: sets column widths so that all columns display within the grid width. Widths are equal or the proportions are determined by the relative cfgridcolumnwidth attribute values. Horizontal scroll bars are not available.</li> <li>• no: sets columns to equal widths or the values specified in the cfgridcolumnwidth attributes.</li> </ul>
bgColor	Optional; all		<p>Background color of the control.</p> <p>For most formats, can be a hexa-decimal format or a named color. For a hexadecimal value, use the form "##xxxxxx", where x = 0-9 or A-F; use two number signs or none. For a list of the supported named colors, see <a href="#">cfchart</a>.</p> <ul style="list-style-type: none"> <li>• Limitations: for HTML format, must be a valid web color; for Flash format, must be a hexadecimal value.</li> <li>• Flash format only: to specify background colors for alternating rows, separate the two colors with a comma.</li> </ul>
bind	Optional; HTML		<p>A bind expression used to fill the contents of the grid. Cannot be used with the query attribute.</p> <p>For more information, see <i>Binding data to form fields in Using Ajax Data and Development Features</i> in the <i>Developing ColdFusion Applications</i>.</p>
bindOnLoad	Optional; HTML	yes	<ul style="list-style-type: none"> <li>• yes: executes the bind attribute expression when first loading the form.</li> <li>• no: does not execute the bind attribute expression until the first bound event.</li> </ul> <p>Ignored if there is no bind attribute.</p> <p>For more information, see <i>Using the bindOnLoad attribute in the Developing ColdFusion Applications</i>.</p>

Attribute	Req/Opt; formats	Default	Description
<code>bold</code>	Optional; all	no	<ul style="list-style-type: none"> <li>• <code>yes</code>: displays text in bold.</li> <li>• <code>no</code></li> </ul>
<code>colHeaderAlign</code>	Optional; applet	left	<ul style="list-style-type: none"> <li>• <code>left</code>: left-aligns the column header text.</li> <li>• <code>right</code>: right-aligns the column header text.</li> <li>• <code>center</code>: centers the column header text.</li> </ul>
<code>colHeaderBold</code>	Optional; all	no	<ul style="list-style-type: none"> <li>• <code>yes</code>: displays column headers in bold.</li> <li>• <code>no</code></li> </ul>
<code>colHeaderFont</code>	Optional; all		Font of column header.
<code>colHeaderFontSize</code>	Optional; all		Size of column header text, in points.
<code>colHeaderItalic</code>	Optional; all	no	<ul style="list-style-type: none"> <li>• <code>yes</code>: displays column headers in italic.</li> <li>• <code>no</code></li> </ul>
<code>colHeaders</code>	Optional; Applet, Flash	yes	<ul style="list-style-type: none"> <li>• <code>yes</code>: displays column headers.</li> <li>• <code>no</code></li> </ul>
<code>colHeaderTextColor</code>	Optional; all		Color of column headers. <ul style="list-style-type: none"> <li>• Options: same as for <code>textColor</code> attribute.</li> </ul>
<code>collapsible</code>	Optional; HTML	False	A Boolean value specifying whether the user can collapse the entire grid by clicking an arrow on the title bar. Specifying this attribute adds a title bar to the grid.
<code>delete</code>	Optional; HTML, applet	no	<ul style="list-style-type: none"> <li>• <code>yes</code>: users can delete row data from the grid; takes effect only if <code>selectmode="edit"</code>.</li> <li>• <code>no</code></li> </ul>
<code>deleteButton</code>	Optional; HTML, applet	Delete	Text for the Delete button; takes effect only if <code>selectmode="edit"</code> .
<code>enabled</code>	Optional; Flash	yes	Flash format only: Boolean value that specifies whether the control is enabled. A disabled control appears in light gray.
<code>font</code>	Optional; all		Font of text.
<code>fontSize</code>	Optional; all		Size of text, in points.
<code>format</code>	Optional; all	applet	<ul style="list-style-type: none"> <li>• <code>applet</code>: generates a Java applet.</li> <li>• <code>Flash</code>: generates a Flash grid control.</li> <li>• <code>html</code>: generates an AJAX-based HTML grid control that supports data binding.</li> <li>• <code>xml</code>: generates an XML representation of the grid.</li> </ul> <p>In XML format forms, includes the generated XML in the form.</p> <p>In HTML format forms, puts the XML in a string variable with the name specified by the <code>name</code> attribute.</p>

Attribute	Req/Opt; formats	Default	Description
gridDataAlign	Optional; applet	left	<ul style="list-style-type: none"> <li>• left: left-aligns data within the column.</li> <li>• right: right-aligns data within the column.</li> <li>• center: centers data within the column.</li> </ul>
gridLines	Optional; applet, Flash	yes	<ul style="list-style-type: none"> <li>• yes: enables row and column rules.</li> <li>• no</li> </ul>
groupField	Optional; HTML	Don't group	<p>Puts the grid rows into groups, organized by the column specified in this attribute. Each group is collapsible and has a header with the column name, group field value, and number of entries in the group.</p> <p>If you set this option, the column pull-down menu shows two grouping options: The show in Groups option turns column grouping on and off. The Group By This Field option sets the grouping to use the selected column. Users display the pull-down menu by moving the mouse over a column head and clicking the down arrow that appears</p> <p>You can use this attribute with static grids only, do not use it with dynamic grids that get their data using bind expressions.</p>
height	Optional; all	300 (applet only)	<p>Height of the control, in pixels.</p> <p>If you omit the attribute in Flash format, the grid sizes automatically.</p>
highlightHref	Optional; applet	yes	<ul style="list-style-type: none"> <li>• yes: highlights links associated with an href attribute value.</li> <li>• no</li> </ul>
href	Optional; HTML, applet		URL or name of a query column that contains URLs to hyperlink each grid cell with.
hrefKey	Optional; HTML, applet		A query column to use for the value appended to the href URL of each cell, if appendKey="True". If you use cfgridcolumn tags, the column must be specified in one of these tags.
hSpace	Optional; applet		Horizontal space to the left and right of the control, in pixels.
insert	Optional; applet, HTML	no	<ul style="list-style-type: none"> <li>• yes: users can insert row data in the grid; takes effect only if selectmode="edit".</li> <li>• no</li> </ul>
insertButton	Optional; applet	Insert	Text for the Insert button; takes effect only if selectmode="edit".
italic	Optional; all	no	<ul style="list-style-type: none"> <li>• yes: displays text in italic.</li> <li>• no</li> </ul>
maxRows	Optional; all		Maximum number of rows to display in the grid.

Attribute	Req/Opt; formats	Default	Description
multirowselect Added in ColdFusion 9.0.1	Optional; HTML	no	<p>Allows selection of multiple rows. This is particularly useful in the cases where batch processing is required, for example, moving multiple records at a time.</p> <p>If yes, a check box appears as the first column of the grid, enabling selection of multiple records. A Select All/Deselect All option also appears.</p> <p><b>Note:</b> If <code>multirowselect="yes"</code>, then row data is sent as an array of structs as opposed to a struct if <code>multirowselect="no"</code>. Also, if the grid data is manipulated by the user, for example, using JavaScript, to move records when a button is clicked, set the method to POST. This is required as a GET method imposes restrictions on the amount of data that can be sent.</p>
notSupported	Optional; applet	See Description	<p>Text to display if the browser does not support Java or has Java support disabled.</p> <p>Default: "&lt;b&gt; Browser must support Java to view ColdFusion Java Applets&lt;/b&gt;"</p>
onBlur	Optional, Flash		ActionScript that runs when the grid loses focus.
onChange	Optional; HTML, Flash		<p><b>Flash format:</b> ActionScript to run when the control changes due to user action in the control.</p> <p><b>HTML format:</b> Required for HTML format grids that specify a <code>bind</code> attribute and a <code>selectMode</code> value of <code>edit</code>. A bind expression that calls a CFC method, JavaScript function, or URL to update the data source.</p> <p>If a URL is called, since the data is passed in JSON format to the URL page, use the function <code>DeserializeJSON</code>.</p> <p>The arguments <code>cfgridrow</code> and <code>cfgridchanged</code> must be serialized to JSON strings if a JavaScript bind is used to pass these arguments to a URL.</p>
onError	Optional; HTML, applet		<p>In HTML format grids, name of a JavaScript function to execute if an error occurs.</p> <p>In applet format grids, name of a JavaScript function to execute if validation fails.</p>
onFocus	Optional, Flash		ActionScript that runs when the grid gets focus.
onLoad	Optional		A custom JavaScript function to execute when the grid is loaded and rendered.
onValidate	Optional; applet		A JavaScript function to validate user input. The form object, input object, and input object value are passed to the function, which must return <code>true</code> if validation succeeds; <code>false</code> otherwise.
pageSize	Optional; HTML	10	<p>The number of rows to display per page for a dynamic grid. If the number of available rows exceeds the page size, the grid displays only the specified number of entries on a single page, and the user navigates between pages to show all data. The grid retrieves data for each page only when it is required for display.</p> <p>This attribute is ignored if you specify a <code>query</code> attribute.</p>
pictureBar	Optional; applet	no	<ul style="list-style-type: none"> <li>yes: puts images (and no text) on the Insert, Delete, and Sort buttons.</li> <li>no: puts text (and no images) on the Insert, Delete, and Sort buttons.</li> </ul>

Attribute	Req/Opt; formats	Default	Description
preservePageOnSort	Optional; HTML	no	Specifies whether to display the page with the current page number, or display page 1, after sorting (or resorting) the grid. If this attribute is <code>yes</code> , selections are preserved when the grid sorts.
query	Optional; all		Name of the query associated with the control. Cannot be used with the <code>bind</code> attribute.
rowHeaderAlign	Optional; applet	left	<ul style="list-style-type: none"> <li><code>left</code>: left-aligns the row header text.</li> <li><code>right</code>: right-aligns the row header text.</li> <li><code>center</code>: centers the row header text.</li> </ul>
rowHeaderBold	Optional; applet	no	<ul style="list-style-type: none"> <li><code>yes</code>: displays row label text in bold.</li> <li><code>no</code></li> </ul>
rowHeaderFont	Optional; applet		Font for the row labels.
rowHeaderFontSize	Optional; applet		Text size of the row labels, in points.
rowHeaderItalic	Optional; applet	no	<ul style="list-style-type: none"> <li><code>yes</code>: displays row label text in italic.</li> <li><code>no</code></li> </ul>
rowHeaders	Optional; applet	yes	<ul style="list-style-type: none"> <li><code>yes</code>: displays a column of numeric row labels.</li> <li><code>no</code></li> </ul>
rowHeaderTextColor	Optional; applet	black	<p>Text color of grid control row headers.</p> <ul style="list-style-type: none"> <li>Options: same as for the <code>textColor</code> attribute.</li> </ul>
rowHeight	Optional; Applet, Flash, XML		Minimum row height, in pixels. Used with <code>cfgridcolumnntype="Image"</code> ; defines space for graphics to display in row.
selectColor	Optional; all		<p>Background color for a selected item.</p> <ul style="list-style-type: none"> <li>Options: same as for <code>textColor</code> attribute</li> </ul>
selectMode	Optional; all	Applet format: Browse; HTML, Flash format: Row	<p>Selection mode for items in the control.</p> <ul style="list-style-type: none"> <li><code>Edit</code>: the user can edit grid data. Selecting a cell lets the user edit the cell.</li> <li><code>Row</code>: user selections automatically extend to the row that contains selected cell.</li> </ul> <p>The following are used in applet format only; HTML and Flash formats interpret these as Row:</p> <ul style="list-style-type: none"> <li><code>Single</code>: user selections are limited to the selected cell.</li> <li><code>Column</code>: user selections automatically extend to the column that contains selected cell.</li> <li><code>Browse</code>: the user can only browse grid data.</li> </ul>
selectOnLoad	Optional; HTML	yes	<ul style="list-style-type: none"> <li><code>yes</code>: selects the first row of the grid when the grid loads.</li> <li><code>no</code>: does not select any rows when the grid loads.</li> </ul>

Attribute	Req/Opt; formats	Default	Description
sort	Optional; applet	no	Adds sort buttons to perform simple text sorts on a user-selected column: <ul style="list-style-type: none"><li>• yes: put sort buttons on the grid control.</li><li>• no</li></ul> Independent of this setting, users can sort columns by clicking the column head. If <code>selectMode="browse"</code> , the table cannot be sorted.
sortAscendingButton	Optional; applet	A > Z	Text for the Sort button.
sortDescendingButton	Optional; applet	Z > A	Text for the Sort button.
stripeRowColor	Optional; HTML		The color to use for one of the alternating stripes. The <code>bgColor</code> setting determines the other color.
stripeRows	Optional; HTML	no	Boolean value that indicates whether to make the rows stripes in alternating colors.
style	Optional; Flash		Must be a style specification in CSS format. Ignored for <code>type="text"</code> .
target	Optional; HTML, applet		The target frame or window in which to display the <code>href</code> URL; for example, <code>"_blank"</code> .
textColor	Optional Flash, applet		Color of text. Can be a hexadecimal value or a named color.  For a hexadecimal value, use the form <code>"#xxxxxx"</code> , where <code>x</code> = 0-9 or A-F; use two number signs or none.  For a list of the supported named colors, see <a href="#">cfchart</a> .
title	Optional; HTML		Text to display as a title at the top of the grid. Specifying this attribute adds a title bar to the grid.
tooltip	Optional; Flash		Flash format only: text to display when the mouse pointer hovers over the control.
visible	Optional; Flash	yes	Flash format only: Boolean value that specifies whether to show the control. Space that would be occupied by an invisible control is blank.
vSpace	Optional; applet		Vertical space above and below the control, in pixels.
width	Optional; all	300 (applet only)	Width of the control.  In Flash and applet format, must be a number of pixels. In HTML format, can be in any valid CSS measurement unit, and a numeric-only value specifies pixels.  If you omit the attribute in Flash or HTML format; the grid sizes automatically.

### Usage

Most of the following paragraphs describe grid features that apply to all, or at least two, grid formats. For information that is specific to Flash forms, see *Creating Forms in Flash* in the *Developing ColdFusion Applications*. For information that is specific to HTML format grids, see *Using HTML grids* in the *Developing ColdFusion Applications*.

This tag must be in a `cfform` tag block.

An applet format grid requires the client to download a Java applet. Also, if the client does not have an up-to-date Java plug-in installed, the system might also have to download an updated Java plug-in to display an applet format grid. A Flash format grid generates a Flash control, and can be embedded in an HTML format `cfform` tag. For this tag to work properly in either Flash or applet format, the browser must also be JavaScript-enabled.

**Note:** If you specify Flash format for this tag in an HTML format form, and you do not specify `height` and `width` attributes, Flash takes up more than the remaining visible area on the screen. If any other output follows the grid, including any form controls, users must scroll to see it. Therefore, if you follow a Flash grid in an HTML form with additional output, specify `height` and `width` values.

You can populate a `cfgrid` with data from a `cfquery`. If you do not specify any `cfgridcolumn` tags in the `cfgrid` body, ColdFusion generates a grid with the following:

- A column for each column in the query.
- A default header for each column, created by replacing hyphen or underscore characters in the table column name with spaces. The first character, and any character after a space, are changed to uppercase; all other characters are lowercase.

This tag requires an end tag.

**Note:** Clicking the submit button while editing a grid cell occasionally causes the cell changes to be lost. To ensure that changes are submitted properly, Adobe recommends that after user updates data in a cell, they click another cell before submitting the form.

### Returning `cfgrid` data to the action page

The following information applies to all `cfgrid` formats. Also, HTML format grids can dynamically get data by using a bind expression. For more information, see Using HTML grids in the *Developing ColdFusion Applications*.

When a user submits a form, the `cfgrid` tag sends information about user actions by setting form variables in the data submitted to the form's action page. Because the data can vary, depending on the tag's `SelectMode` attribute value, the form variables that are returned also vary depending on this value.

In general, the data returned falls into one of these categories:

- Simple data, returned from simple select operations
- Complex data, returned from insert, update, and delete operations

### Simple selection data (`SelectMode = Single, Column, or Row`)

The data that form variables return to the `cfform`'s action page contains information about which cells the user selected. In general, ColdFusion makes this data available in the action page, as ColdFusion variables in the Form scope, with the naming convention `form.#GridName#.#ColumnName#`.

Each `SelectMode` returns these form variables:

```
SelectMode="single"
form.#GridName#.#ColumnName# = "SelectedCellValue"
SelectMode="column"
form.#GridName#.#ColumnName# = "ValueOfCellRow1,
ValueOfCellRow2, ValueOfCellRowN"
SelectMode="row"
form.#GridName#.#Column1Name# = "ValueOfCellInSelectedRow"
form.#GridName#.#Column2Name# = "ValueOfCellInSelectedRow"
form.#GridName#.#ColumnNName# = "ValueOfCellInSelectedRow"
```

**Complex update data (SelectMode = Edit)**

The grid returns a large amount of data, to inform the action page of inserts, updates, or deletes that the user made to the grid. In most cases, you can use the `cfgridupdate` tag to automatically gather the data from the form variables; the tag collects data, writes SQL calls, and updates the data source.

If you cannot use `cfgridupdate` (if, for example, you must distribute the returned data to more than one data source), write code to read form variables. In this mode, ColdFusion creates the following array variables in the Form scope for each `cfgrid`:

```
form.#GridName#.#ColumnName#  
form.#GridName#.original.#ColumnName#  
form.#GridName#.RowStatus.Action
```

Each table row that contains an update, insert, or deletion has a parallel entry in each of these arrays. To view all the information for all the changes, you can traverse the arrays, as in this example. To make it work with a `cfgrid` on a submitted `cfform`, set the `GridName` variable to the name of the grid and the `ColNameList` to a list of the grid columns.

```
<cfloop index="ColName" list="#ColNameList#">  
  <cfif IsDefined("form.#GridName#.#ColName#")>  
    <cfoutput><br>form.#GridName#.#ColName#:<br></cfoutput>  
  
    <cfset Array_New = form[#GridName#][#ColName#]>  
    <cfset Array_Orig = form[#GridName#]['original'][#ColName#]>  
    <cfset Array_Action = form[#GridName#].RowStatus.Action>  
  
    <cfif NOT IsArray(Array_New)>  
      <b>The form variable is not an array!</b><br>  
    <cfelse>  
      <cfset size = ArrayLen(Array_New)>  
      <cfoutput>  
        Result Array Size is #size#.<br>  
        Contents:<br>  
      </cfoutput>  
  
      <cfif size IS 0>  
        <b>The array is empty.</b><br>  
      <cfelse>  
        <table BORDER="yes">  
          <tr>  
            <th>Loop Index</TH>  
            <th>Action</TH>  
            <th>Old Value</TH>  
            <th>New Value</TH>  
          </tr>  
          <cfloop index="LoopCount" from="1" to=#size#>
```

```
<cfset Val_Orig = Array_Orig[#LoopCount#]>
<cfset Val_New = Array_New[#LoopCount#]>
<cfset Val_Action = Array_Action[#LoopCount#]>
<cfoutput>
<tr>
    <td>#LoopCount#</td>
    <td>#Val_Action#</td>
    <td>#Val_Orig#</td>
    <td>#Val_New#</td>
</tr>
</cfoutput>
</cfloop>
</table>
</cfif>
</cfif>

<cfelse>
    <cfoutput>form.#GridName#.#ColName#: NotSet!</cfoutput><br>
</cfif>
</cfloop>
```

### Using the href attribute

When specifying a URL with grid items using the `href` attribute, the `selectMode` attribute value determines whether the appended key value is limited to one grid item or extends to a grid column or row. When a user clicks a linked grid item, a `cfgridkey` variable is appended to the URL, in this form:

```
http://myserver.com?cfgridkey=selection
```

If the `appendKey` attribute is set to `no`, no grid values are appended to the URL.

The value of *selection* is determined by the value of the `selectMode` and attribute:

- If you specify a `hrefKey` attribute, *selection* is the field value of the column specified by the attribute. Otherwise, it is one of the following:
- If `selectMode="Single"`, *selection* is the value of the column clicked.
- If `selectMode="Row"`, *selection* is a comma-delimited list of column values in the clicked row, beginning with the value of the first cell in the row.
- If `selectMode="Column"`, *selection* is a comma-delimited list of row values in the clicked column, beginning with the value of the first cell in the column.

When you use an `href` attribute, you can also specify a `target` attribute with any of the standard HTML target specifiers, `_blank`, `_parent`, `_self`, and `_top`, or with a specific frame name.

### Enhancements in ColdFusion 9.0.1

- In ColdFusion 9, data for the first row is available on form submission in a form with dynamic grid. In ColdFusion 9.0.1, the data is not available.
- If the type is `Boolean` and `selectmode` is `browse`, or `select=false`, the column is shown as a check box where click does not take effect.

### Example

The following example creates a Flash form that displays a set of available courses from the `CourseList` table in the `cfdocexamples` database. For more complex examples that use the `cfgrid` tag, see [cfgridcolumn](#), [cfgridrow](#), and [cfgridupdate](#).

```
<!--- Query the database to fill up the grid. --->
<cfquery name = "GetCourses" dataSource = "cfdocexamples">
    SELECT Course_ID, Dept_ID, CorNumber,
    CorName, CorLevel
    FROM CourseList
    ORDER by Dept_ID ASC, CorNumber ASC
</cfquery>

<h3>cfgrid Example</h3>
<i>Currently available courses</i>
<!--- cfgrid must be inside a cfform tag. --->
<cfform>
    <cfgrid name = "FirstGrid" format="Flash"
        height="320" width="580"
        font="Tahoma" fontsize="12"
        query = "GetCourses">
    </cfgrid>
</cfform>
```

## cfgridcolumn

### Description

Used with the [cfgrid](#) tag in a [cfform](#). Formats a column and optionally populates the column from a query. The `font` and `alignment` attributes used in `cfgridcolumn` override global font or alignment settings defined in `cfgrid`.

### Category

[Forms tags](#)

## Syntax

```
<cfgridcolumn
    autoExpand = "yes|no"
    name = "column name"
    bgColor = "web color|expression"
    bold = "yes|no"
    dataAlign = "left|right|center"
    display = "yes|no"
    font = "column font"
    fontSize = "size"
    header = "header"
    headerAlign = "left|right|center"
    headerBold = "yes|no"
    headerFont = "font name"
    headerFontSize = "size"
    headerIcon = "icon path"
    headerItalic = "yes|no"
    headerMenu = "yes|no"
    headerTextColor = "web color"
    href = "URL"
    hrefKey = "column name"
    italic = "yes|no"
    mask = "format mask"
    numberFormat = "format"
    select = "yes|no"
    target = "URL target"
    textColor = "web color|expression"
    type = "type"
    values = "comma-separated strings and/or numeric range"
    valuesDelimiter = "delimiter character"
    valuesDisplay = "comma-separated strings and/or numeric range"
    width = "column width">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## History

ColdFusion 9.0.1: Added the attributes `autoExpand` and `headerMenu` supported only in HTML grids.

ColdFusion 9: Added `boolean`, `date`, `numeric`, and `string_noCase` to the `type` attribute values supported in HTML grids.

ColdFusion MX 7: Added the `mask` attribute, and the `currency` type attribute value.

ColdFusion MX: Changed behavior if `select="no"`: a user cannot select and edit the cell data, regardless of the `cfgrid selectmode` attribute value. When clicked, the cell border (and, depending on the `selectColor` value, the cell background) changes color, but the cell data cannot be edited.

## Attributes

**Note:** In XML format, ColdFusion passes all attributes to the XML. The supplied XSLT skins do not handle or display XML format grids, but do display applet and Flash format grids.

Attribute	Req/Opt; formats	Default	Description
autoExpand  Added in ColdFusion 9.0.1	Optional;HTML	yes for first column and no for remaining columns	On a particular column, it lets you expand the specified column.  Setting autoExpand="yes" for multiple columns results in error. Also, if the attribute display is set to no, then autoExpand cannot be yes; else, it results in error.
name	Required; all		Name of the grid column element. If the grid uses a query, this attribute must be the name of the query column that populates the grid column.
bgColor	Optional; all		Color of background of grid column.  • Options: same as for the textColor attribute.
bold	Optional; all	As specified by cfgrid	<ul style="list-style-type: none"> <li>yes: displays grid control text in bold.</li> <li>no</li> </ul>
dataAlign	Optional; applet, Flash, HTML (in ColdFusion 9.0.1)	As specified by cfgrid	Column data alignment: <ul style="list-style-type: none"> <li>left</li> <li>right</li> <li>center</li> </ul>
display	Optional; all	yes	<ul style="list-style-type: none"> <li>yes</li> <li>no: hides the column.</li> </ul>
font	Optional; all	As specified by cfgrid	Font of data in column.
fontSize	Optional; all	As specified by cfgrid	Size of text in column.
header	Optional; all	yes	Text for the column header. Used only if the cfgridcolHeaders attribute is yes. The default value is yes.
headerAlign	Optional; applet	As specified by cfgrid	Column header text alignment: <ul style="list-style-type: none"> <li>left</li> <li>right</li> <li>center</li> </ul>
headerBold	Optional; HTML, applet	As specified by cfgrid	<ul style="list-style-type: none"> <li>yes: displays header in bold.</li> <li>no</li> </ul>
headerFont	Optional; HTML, applet	As specified by cfgrid	Font for the column header.
headerFontSize	Optional; HTML, applet	As specified by cfgrid	Size of text for the column header, in pixels.
headerIcon	Optional		Location of an image file to use as the icon for header column of the grid.

Attribute	Req/Opt; formats	Default	Description
headerMenu Added in ColdFusion 9.0.1	Optional;HTML	no	Lets you turn on/off the header menu of the grid column.  Header menu is the drop-down list that appears on grid header columns on mouse hover. The attribute is helpful when you have images for grid headers.
headerItalic	Optional; HTML, applet	As specified by cfgrid	<ul style="list-style-type: none"> <li>• yes: displays column header in italic.</li> <li>• no</li> </ul>
headerTextColor	Optional; HTML, applet		Color of grid control column header text.  • Options: same as for the <code>textColor</code> attribute.
href	Optional; HTML, applet		URL or query column name that contains a URL to hyperlink each grid column with.
hrefKey	Optional; HTML, applet		The query column to use for the value appended to the <code>href</code> URL of each column, instead of the column's value.
italic	Optional; all	As specified by cfgrid	<ul style="list-style-type: none"> <li>• yes: displays grid control text in italic.</li> <li>• no</li> </ul>
mask	Optional; Flash, HTML (in ColdFusion 9.0.1)		<p>A mask pattern that controls the character pattern that the form displays or allows users to input and sends to ColdFusion.</p> <p>For columns with the <code>currency</code> <code>type</code> attribute, the <code>mask</code> specifies the currency symbol. ColdFusion automatically inserts the character before the numeric value.</p> <p>For columns with text or numeric values, <code>mask</code> specifies the format to display or allow users to input, as follows:</p> <ul style="list-style-type: none"> <li>• A = [A-Za-z]</li> <li>• X = [A-Za-z0-9]</li> <li>• 9 = [0-9]</li> <li>• ? = Any character</li> <li>• All other characters = ColdFusion inserts the literal character.</li> </ul> <p>If the column values are dates or timestamps, ColdFusion uses the mask pattern to format the selected date.</p> <p>For details of the date/time mask format, see the section <i>date/time formats in mask attribute</i>.</p> <p>In ColdFusion 9.0.1, support has been extended for HTML grids. The default format is <code>m/d/y</code>, for example 05/06/75. where <code>m</code> is month with leading zeros, <code>d</code> is day with leading zeros, and <code>y</code> is two-digit representation of year. For further details, go to the following URL:  <a href="http://www.extjs.com/deploy/dev/docs/output/Date.html">http://www.extjs.com/deploy/dev/docs/output/Date.html</a></p>
numberFormat	Optional; Applet		Format for displaying numeric data in the grid. See the following table of <code>numberFormat</code> attribute mask characters.

Attribute	Req/Opt; formats	Default	Description
select	Optional; all	yes	<p>Determines selection behavior if the <code>cfgridselectmode</code> attribute value is <code>column</code>, <code>edit</code>, or <code>single</code>; ignored for <code>row</code> or <code>browse</code> values.</p> <ul style="list-style-type: none"> <li>• <b>yes:</b> users can select the column or select or edit cells in the column, as specified by the <code>selectmode</code> attribute.</li> <li>• <b>no:</b> users cannot select the column or select or edit cells in the column.</li> </ul>
target	Optional; HTML, Applet		<p>Frame or standard HTML target in which to open link specified in <code>href</code>.</p>
textColor	Optional; Applet, Flash, HTML		<p>Color of grid element text in column as a hexadecimal number or text name.</p> <p>To enter a hexadecimal value, use the form "<code>###xxxxx</code>", where <code>x</code> = 0-9 or A-F; use two number signs or none.</p> <p>Limitations: In HTML format, must specify a valid HTML color. In Applet format, must be one of the following:</p> <ul style="list-style-type: none"> <li>• Any color, in hexadecimal format</li> <li>• Black</li> <li>• Red</li> <li>• Blue</li> <li>• Magenta</li> <li>• Cyan</li> <li>• Orange</li> <li>• Darkgray</li> <li>• Pink</li> <li>• Gray</li> <li>• White</li> <li>• Lightgray</li> <li>• Yellow</li> </ul>

Attribute	Req/Opt; formats	Default	Description
type	Optional; all		<p>You can specify the following values in all formats:</p> <ul style="list-style-type: none"> <li><b>boolean:</b> column displays as check box; if cell is editable, user can change the check mark. In an onchange event, for static and dynamic grids, the data that is passed is converted to the format in which the boolean values are represented in the database.</li> <li><b>combobox:</b> displays a drop-down list with the values you specify for the attributes values and valuedisplay as options.</li> <li><b>numeric:</b> user can sort grid data numerically. In HTML format, if the cell is editable, the user can enter numeric values</li> <li><b>string_noCase:</b> user can sort grid data as case-insensitive text. In HTML format, if the cell is editable, the user can enter text values.</li> </ul> <p>You can specify the following value in applet and Flash formats; it does not work in HTML format:</p> <ul style="list-style-type: none"> <li><b>image:</b> grid displays the image specified by the URL in the column. If you use a relative URL, the image must be in the CFIDE\classes directory or a subdirectory. If the image is larger than the column cell, it is clipped to fit. Flash images must be JPEG files. Applet images can be JPEG or GIF files.</li> </ul> <p>You can specify the following value in applet format; it does not work in Flash or HTML format.</p> <ul style="list-style-type: none"> <li><b>image:</b> you can use the following built-in ColdFusion image names, in addition to paths to image files, in the column values: cd, computer, document, element, folder, floppy, fixed, remote.</li> </ul> <p>You can specify the following value in Flash format; it does not work in applet or HTML format:</p> <ul style="list-style-type: none"> <li><b>currency:</b> formats the column data as currency, aligning it around the decimal point. If users sort the grid by using this column, it sorts correctly for the currency. Use the mask attribute to specify a currency symbol; the default value is the dollar sign (\$).</li> </ul> <p>You can specify the following value in HTML format; it does not work in applet or Flash format:</p> <ul style="list-style-type: none"> <li><b>date:</b> The column contains date values. If the grid selectMode attribute value is edit, the cell is editable. When you click an editable cell, an icon appears that you can click to open a date picker and select a date.</li> </ul>
values	Optional; HTML, applet		<p>Formats cells in column as drop-down list boxes; specify items in drop-down list, for example:</p> <pre>values = "arthur, scott, charles, 1-20, mabel"</pre>
valuesDelimiter	Optional; HTML, applet	, (comma)	Delimiter in values and valuesDisplay attributes.
valuesDisplay	Optional; HTML, applet		Maps elements in the values attribute to string to display in the drop-down list. Delimited strings and/or numeric ranges.
width	Optional; all	Column head width	Column width, in pixels.

The following matrix describes the behavior of type="boolean".

Before	After
Y	N
T	F
1	0
true (for static grids)	false (for static grids)
true (for dynamic grids)	NO (for dynamic grids)
For non-boolean or null	Y

In applet format only, you can use the following `numberFormat` attribute mask characters to format output in U.S. numeric and currency styles. For more information on using these mask characters, see “[NumberFormat](#)” on page 1114. (The `cfgridcolumn` tag does not support international number formatting.)

Character	Meaning
_	(Underscore) Digit placeholder.
9	Digit placeholder.
.	(Period) Location of mandatory decimal point.
0	Located to left or right of mandatory decimal point; pads with zeros.
()	Puts parentheses around mask if number is less than 0.
+	Puts plus sign before positive numbers, minus sign before negative numbers.
-	Puts space before positive numbers, minus sign before negative numbers.
,	(Comma) Separates every third decimal-place with a comma.
L,C	Left-justify or center-justify number within width of mask column. First character of mask must be L or C. Default: right-justified.
\$	Puts dollar sign before formatted number. Must be the first character of mask.
^	(Caret) Separates left from right formatting.

#### date/time formats in mask attribute

By default, Flash displays date/time values in grid columns with a format that shows values such as Oct 29 2004 11:03:21. Use the `mask` attribute to display the date or time in a different format, as described in the following table:

Pattern letter	Description
Y	<p>Year. If the number of pattern letters is two, the year is truncated to two digits; otherwise, it appears as four digits. The year can be zero-padded, as the third example shows in the following set of examples:</p> <p>Examples:</p> <p>YY = 03</p> <p>YYYY = 2003</p> <p>YYYYY = 02003</p>
M	<p>Month in year. The format depends on the following criteria:</p> <ul style="list-style-type: none"> <li>• If the number of pattern letters is one, the format is interpreted as numeric in one or two digits.</li> <li>• If the number of pattern letters is two, the format is interpreted as numeric in two digits.</li> <li>• If the number of pattern letters is three, the format is interpreted as short text.</li> <li>• If the number of pattern letters is four, the format is interpreted as full text.</li> </ul> <p>Examples:</p> <p>M = 7</p> <p>MM = 07</p> <p>MMM = Jul</p> <p>MMMM = July</p>
D	<p>Day in month.</p> <p>Examples:</p> <p>D = 4</p> <p>DD = 04</p> <p>DD = 10</p>
E	<p>Day in week. The format depends on the following criteria:</p> <ul style="list-style-type: none"> <li>• If the number of pattern letters is one, the format is interpreted as numeric in one or two digits.</li> <li>• If the number of pattern letters is two, the format is interpreted as numeric in two digits.</li> <li>• If the number of pattern letters is three, the format is interpreted as short text.</li> <li>• If the number of pattern letters is four, the format is interpreted as full text.</li> </ul> <p>Examples:</p> <p>E = 1</p> <p>EE = 01</p> <p>EEE = Mon</p> <p>EEEE = Monday</p>
A	AM/PM indicator.
J	Hour in day (0-23).
H	Hour in day (1-24).
K	Hour in am/pm (0-11).
L	Hour in am/pm (1-12).

Pattern letter	Description
N	Minute in hour.  Examples:  N = 3  NN = 03
S	Second in minute.
Other text	You can add other text into the pattern string to further format the string. You can use punctuation, numbers, and all lowercase letters. Avoid upper case letters because they may be interpreted as pattern letters.  Example:  EEEE, MMM. D, YYYY at H:NN A = Tuesday, Sept. 8, 2003 at 1:26 PM

### Example

The following example lets you update certain fields of the CourseList table in the cfdocexamples database. It uses cfgridcolumn tags to structure the table.

```
<!--- If the gridEntered field exists, the form has been submitted.
      Update the database. --->
<cfif IsDefined("form.gridEntered")>
    <cfgridupdate grid = "FirstGrid" dataSource = "cfdocexamples"
        tableName = "CourseList" keyOnly = "Yes">
</cfif>

<!--- Query the database to fill up the grid. --->
<cfquery name = "GetCourses" dataSource = "cfdocexamples">
    SELECT Course_ID, Dept_ID, CorNumber,CorName, CorLevel, CorDesc
    FROM CourseList
    ORDER by Dept_ID ASC, CorNumber ASC
</cfquery>

<html>
<head>
<title>cfgrid Example</title>
</head>
<body>
<h3>cfgrid Example</h3>
<i>You can update the Name, Level, and Description information for courses.</i>
<!--- The cform tag must surround a cfgrid control. --->
<cform action = "#CGI.SCRIPT_NAME#">
```

```
<cfgrid name = "FirstGrid" width = "500"
    query = "GetCourses" colheaderbold="Yes"
    font = "Tahoma" rowHeaders = "No"
    selectColor = "Red" selectMode = "Edit" >
    <!--- cfgridcolumn tags arrange the table and control the display. --->
    <!--- Hide the primary key, required for update --->
    <cfgridcolumn name = "Course_ID" display = "No">
    <!--- select="No" does not seem to have any effect!!! --->
    <cfgridcolumn name = "Dept_ID" header = "Department" Select="No" width="75"
        textcolor="blue" bold="Yes">
    <cfgridcolumn name = "CorNumber" header = "Course ##" Select="No" width="65">
    <cfgridcolumn name = "CorName" header = "Name" width="125">
    <cfgridcolumn name = "CorLevel" header = "Level" width="85">
    <cfgridcolumn name = "CorDesc" header = "Description" width="125">
</cfgrid>
<br>
<cfinput type="submit" name="gridEntered">
</cform>
</body>
</html>
```

## cfgridrow

### Description

Lets you define a [cfgrid](#) control that does not use a query as source for row data. If a query attribute is specified in the [cfgrid](#) tag, the [cfgridrow](#) tags are ignored.

### Category

[Forms tags](#)

### Syntax

```
<cfgridrow
    data = "col1, col2, ..."
    delimiter = "delimiter character">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfgrid](#), [cfgridcolumn](#), [cfgridupdate](#), [cform](#), [cfinput](#), [cfselect](#), [cfslider](#), [cftextarea](#), [cftree](#)

### Attributes

Attribute	Req/Opt	Default	Description
data	Required		Delimited list of column values. If a value contains a delimiter character, it must be escaped with another delimiter character.
delimiter	Optional	, (comma)	Separator between column values.

### Example

The following example shows how you use the [cfgridrow](#) tag can populate a [cfgrid](#) tag from list data:

```
<!--- Set two lists, each with the data for a grid column. --->
<cfset cities = "Rome,Athens,Canberra,Brasilia,Paris">
<cfset countries = "Italy,Greece,Australia,Brazil,France">

<cfform name = "cities">
    <cfgrid name="GeoGrid" autowidth = "yes" vspace = "4" height = "120"
        font="tahoma" rowheaders="no">
        <cfgridcolumn name="City" header="City">
        <cfgridcolumn name="Country" header="Country">
        <!--- Loop through the lists using cfgridrow to populate the grid. --->
        <cfloop index="i" from="1" to="#ListLen(cities)#">
            <cfgridrow data = "#ListGetAt(cities, i)#,#ListGetAt(countries, i)#">
        </cfloop>
    </cfgrid><br><br>
</cfform>
```

## cfgridupdate

### Description

Used with a [cfgrid](#) tag. Updates data sources directly from edited grid data. This tag provides a direct interface with your data source.

This tag applies delete row actions first, then insert row actions, then update row actions. If it encounters an error, it stops processing rows.

### Category

[Forms tags](#)

### Syntax

```
<cfgridupdate
    grid = "grid name"
    dataSource = "data source name"
    tableName = "table name"
    keyOnly = "yes|no">
    password = "data source password"
    tableOwner = "table owner"
    tableQualifier = "qualifier"
    username = "data source user name">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfgrid](#), [cfgridcolumn](#), [cfgridrow](#), [cfform](#), [cfapplet](#), [cfinput](#), [cfselect](#), [cfslider](#), [cftextinput](#), [cftree](#)

### History

ColdFusion MX: Deprecated the `connectString`, `dbName`, `dbServer`, `dbtype`, `provider`, and `providerDSN` attributes. They do not work, and might cause an error, in releases later than ColdFusion 5.

### Attributes

Attribute	Req/Opt	Default	Description
grid	Required		Name of the <code>cfgrid</code> form element that is the source for the update action.
dataSource	Required		Name of the data source for the update action.
tableName	Required		Name of the table to update. For ORACLE drivers, entry must be upper-case. For Sybase driver, entry is case sensitive; must be same case as used when table was created.
keyOnly		no	Applies to the <code>update</code> action: <ul style="list-style-type: none"> <li>• <code>yes</code>: the WHERE criteria are limited to the key values.</li> <li>• <code>no</code>: the WHERE criteria include key values and the original values of changed fields.</li> </ul>
password	Optional		Overrides <code>password</code> value specified in ODBC setup.
tableOwner	Optional		Table owner, if supported.
tableQualifier	Optional		Table qualifier, if supported. Purpose: <ul style="list-style-type: none"> <li>• SQL Server and Oracle driver: name of database that contains the table.</li> <li>• Intersolv dBASE driver: directory of DBF files.</li> </ul>
username	Optional		Overrides <code>username</code> value specified in ODBC setup.

### Example

The following example lets you update a database by using a `cfgrid` tag to add and delete entire records or to update the data in individual cells. The `cfgridupdate` tag processes the data from the submitted form and updates the database.

```
<!--- If the gridEntered form field exists, the form was submitted. Perform gridupdate. --->
<cfif IsDefined("form.gridEntered") is True>
    <cfgridupdate grid = "FirstGrid" dataSource = "cfdocexamples" Keyonly="true"
        tableName = "CourseList">
    </cfif>

<!--- Query the database to fill up the grid. --->
<cfquery name = "GetCourses" dataSource = "cfdocexamples">
    SELECT Course_ID, Dept_ID, CorNumber, CorName, CorLevel, CorDesc
    FROM CourseList
    ORDER by Dept_ID ASC, CorNumber ASC
</cfquery>

<h3>cfgrid Example</h3>
<i>Try adding a course to the database, and then deleting it.</i>
<cfform>
<cfgrid name = "FirstGrid" width = "450"
    query = "GetCourses" insert = "Yes" delete = "Yes"
    font = "Tahoma" rowHeaders = "No"
    colHeaderBold = "Yes"
    selectMode = "EDIT"
    insertButton = "Insert a Row" deleteButton = "Delete selected row" >
</cfgrid><br>
<cfinput type="submit" name="gridEntered">
</cfform>...
```

## cfheader

### Description

Generates custom HTTP response headers to return to the client.

### Category

[Data output tags](#), [Page processing tags](#)

### Syntax

```
<cfheader
    charset="character set"
    name = "header name"
    value = "header value">
```

OR

```
<cfheader
    statusCode = "status code"
    statusText = "status text">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfcache](#), [cfflush](#), [cfhtmlhead](#), [cfinclude](#), [cfsetting](#), [cfsilent](#), [cfcontent](#)

## History

ColdFusion MX 6.1: Changed behavior for the name attribute: **cfheader name="Content-Disposition"** uses the default file character encoding to encode this header's value, so the name of a file can include characters in the character encoding used in the file.

## Attributes

Attribute	Req/Opt	Default	Description
charset	Optional	UTF-8	The character encoding in which to encode the header value. The following list includes commonly used values: <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> For more information about character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a> .
name	Required if statusCode not specified		Header name.
statusCode	Required if name not specified		Number. HTTP status code.
statusText	Optional		Explains the status code.
value	Optional		HTTP header value.

## Usage

If you use this tag after the `cfflush` tag on a page, an error is thrown.

## Example

```
<h3>cfheader Example</h3>
```

```
<p>cfheader generates custom HTTP response headers to return to the client.  
<p>This example forces browser client to purge its cache of requested file.  
<cfheader name="Expires" value="#GetHttpTimeString(Now())#">
```

## cfhtmlhead

### Description

Writes text to the head section of a generated HTML page.

## Category

[Page processing tags](#)

## Syntax

```
<cfhtmlhead  
    text = "text">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfcache](#), [cfflush](#), [cfheader](#), [cfinclude](#), [cfsetting](#), [cfsilent](#)

## Attributes

Attribute	Req/Opt	Default	Description
text	Required		Text to add to the <head> area of an HTML page.

## Usage

Use this tag for embedding JavaScript code, or putting other HTML tags, such as `meta`, `link`, `title`, or `base` in an HTML page header.

If you use this tag after the `cfflush` tag on a page, an error is thrown.

## Example

```
<!--- This example adds a favicon to the HTML Head of every page view. The extra CRLF at  
    the end cleans up view source. Note the embedded tag uses double quotes and the cfhtmlhead  
    text attribute uses single quotes, but it could be the other way around too.  
--->
```

```
<cfhtmlhead  
    text='<link href="/blog/custom/img/favicon.ico" rel="shortcut icon" type="image/x-  
icon">#chr(13)##chr(10) #'>
```

# cfhttp

## Description

Generates an HTTP request and handles the response from the server.

## Category

[Internet protocol tags](#)

## Syntax

```
<cfhttp
    url = "server URL"
    charset = "character encoding"
    clientCert = "filename"
    clientCertPassword = "password"
    columns = "query columns"
    delimiter = "character"
    file = "filename"
    firstrowasheaders = "yes|no"
    getAsBinary = "auto|yes|no|never"
    method = "method name"
    multipart = "yes|no"
    name = "query name"
    password = "password"
    path = "path"
    port = "port number"
    proxyServer = "host name"
    proxyPort = "port number"
    proxyUser = "username"
    proxyPassword = "password"
    redirect = "yes|no"
    resolveURL = "yes|no"
    result = "result name"
    textQualifier = "character"
    throwOnError = "yes|no"
    timeout = "time-out period in seconds"
    username = "username"
    userAgent = "user agent">

    cfhttpparam tags [optional for some methods]

</cfhttp>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfhttpparam](#), [GetHttpRequestData](#), [cftp](#), [cfldap](#), [cfmail](#), [cfpop](#)

## History

ColdFusion 8: Added the `clientCert` and `clientCertPassword` attributes.

ColdFusion MX 7.01: Added the “never” value of the `getAsBinary` attribute.

ColdFusion MX 7: Added the `result` attribute.

ColdFusion MX 6.1:

- Added support for the following methods: HEAD, PUT, DELETE, OPTIONS, TRACE.
- Added `multipart`, `getAsBinary`, `proxyUser`, and `proxyPassword` attributes.
- Changed `httpparam` behavior: all operations can have `httpparam` tags.
- Added the `cfhttp.errorDetail` return variable.
- Modified response body content types considered to be text.

- Changed behavior for multiple headers: multiple headers of the same type are returned in an array.
- Added support for HTTPS proxy tunneling.
- Fixed bugs in code and documentation.

#### ColdFusion MX:

- Added the `charset` and `firstrowasheaders` attributes.
- Changed Secure Sockets Layer (SSL) support: ColdFusion uses the Sun JSSE library, which supports 128-bit encryption, to support SSL.

### Attributes

The following attributes control the HTTP transaction and can be used for all HTTP methods:

Attribute	Req/Opt	Default	Description
<code>url</code>	Required	Uses the http protocol	<p>Address of the resource on the server that handles the request. The URL must include the hostname or IP address.</p> <p>If you do not specify the transaction protocol (<code>http://</code> or <code>https://</code>), ColdFusion uses the default protocol, <code>http</code>.</p> <p>If you specify a port number in this attribute, it overrides any <code>port</code> attribute value.</p> <p>The <code>cfhttpparam</code> tag <code>URL</code> attribute appends query string attribute-value pairs to the URL.</p>
<code>charset</code>	Optional	<p>For request: UTF-8</p> <p>For response: charset specified by response Content-Type header, or UTF-8 if response does not specify charset.</p>	<p>The character encoding of the request, including the URL query string and form or file data, and the response. The following list includes commonly used values:</p> <ul style="list-style-type: none"> <li>• <code>utf-8</code></li> <li>• <code>iso-8859-1</code></li> <li>• <code>windows-1252</code></li> <li>• <code>us-ascii</code></li> <li>• <code>shift_jis</code></li> <li>• <code>iso-2022-jp</code></li> <li>• <code>euc-jp</code></li> <li>• <code>euc-kr</code></li> <li>• <code>big5</code></li> <li>• <code>euc-cn</code></li> <li>• <code>utf-16</code></li> </ul> <p>For more information character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>.</p>
<code>clientCert</code>	Optional		The full path to a PKCS12 format file that contains the client certificate for the request.
<code>clientCertPassword</code>	Optional		Password used to decrypt the client certificate.
<code>compression</code>	Optional		The target webserver's compression status. The only supported value is <code>none</code> . If the target website runs on IIS with HTTP compression enabled, use this attribute to avoid a connection failure while performing GET or POST operations.

Attribute	Req/Opt	Default	Description
getAsBinary	Optional	no	<ul style="list-style-type: none"> <li>no: if ColdFusion does not recognize the response body type as text, converts it to a ColdFusion object.</li> <li>auto: if ColdFusion does not recognize the response body type as text, converts it to ColdFusion Binary type data.</li> <li>yes: always converts the response body content into ColdFusion Binary type data, even if ColdFusion recognizes the response body type as text.</li> <li>never: prevents the automatic conversion of certain MIME types to the ColdFusion Binary type data; treats the returned content as text.</li> </ul> <p>ColdFusion recognizes the response body as text if:</p> <ul style="list-style-type: none"> <li>the header does not specify a content type.</li> <li>the content type starts with "text".</li> <li>the content type starts with "message".</li> <li>the content type is "application/octet-stream".</li> </ul> <p>If ColdFusion does not recognize the body as text and converts it to an object, but the body consists of text, the <code>cfoutput</code> tag can display it. The <code>cfoutput</code> tag cannot display Binary type data. (To convert binary data to text, use the <a href="#">ToString</a> function.)</p>
method	Optional	GET	<ul style="list-style-type: none"> <li>GET: requests information from the server. Any data that the server requires to identify the requested information must be in the URL or in <code>cfhttptype="URL"</code> tags.</li> <li>POST: sends information to the server for processing. Requires one or more <code>cfhttpparam</code> tags. Often used for submitting form-like data.</li> <li>PUT: requests the server to store the message body at the specified URL. Use this method to send files to the server.</li> <li>DELETE: requests the server to delete the specified URL.</li> <li>HEAD: identical to the GET method, but the server does not send a message body in the response. Use this method for testing hypertext links for validity and accessibility, determining the type or modification time of a document, or determining the type of server.</li> <li>TRACE: requests that the server echo the received HTTP headers back to the sender in the response body. Trace requests cannot have bodies. This method enables the ColdFusion application to see what is being received at the server, and use that data for testing or diagnostic information.</li> <li>OPTIONS: a request for information about the communication options available for the server or the specified URL. This method enables the ColdFusion application to determine the options and requirements associated with a URL, or the capabilities of a server, without requesting any additional activity by the server.</li> </ul>
password	Optional		Use to pass a password to the target URL for Basic Authentication. Combined with <code>username</code> to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerberos authentication.
port	Optional	80 for http 443 for https	Port number on the server to which to send the request. A port value in the <code>url</code> attribute overrides this value.
proxyServer	Optional		Host name or IP address of a proxy server to which to send the request.

Attribute	Req/Opt	Default	Description
proxyPort	Optional	80	Port number to use on the proxy server.
proxyUser	Optional		User name to provide to the proxy server.
proxyPassword	Optional		Password to provide to the proxy server.
redirect	Optional	yes	<p>If the response header includes a Location field AND ColdFusion receives a 300-series (redirection) status code, specifies whether to redirect execution to the URL specified in the field:</p> <ul style="list-style-type: none"> <li>• <b>yes:</b> redirects execution to the specified page.</li> <li>• <b>no:</b> stops execution and returns the response information in the <code>cfhttp</code> variable, or throws an error if the <code>throwOnError</code> attribute is True.</li> </ul> <p>The <code>cfhttp.responseHeader.Location</code> variable contains the redirection path. ColdFusion follows a maximum of four redirects on a request. If there are more, ColdFusion functions as if <code>redirect = "no"</code>.</p> <p><b>Note:</b> The <code>cflocation</code> tag generates an HTTP 302 response with the <code>url</code> attribute as the Location header value.</p>
resolveURL	Optional	no	<ul style="list-style-type: none"> <li>• <b>no:</b> does not resolve URLs in the response body. As a result, any relative URL links in the response body do not work.</li> <li>• <b>yes:</b> resolves URLs in the response body to absolute URLs, including the port number, so that links in a retrieved page remain functional. Applies to these HTML tags: <ul style="list-style-type: none"> <li>• <code>img</code></li> <li>• <code>src</code></li> <li>• <code>a href</code></li> <li>• <code>form action</code></li> <li>• <code>applet code</code></li> <li>• <code>script src</code></li> <li>• <code>embed src</code></li> <li>• <code>embed pluginspace</code></li> <li>• <code>body background</code></li> <li>• <code>frame src</code></li> <li>• <code>bgsound src</code></li> <li>• <code>object data</code></li> <li>• <code>object classid</code></li> <li>• <code>object codebase</code></li> <li>• <code>object usemap</code></li> </ul> </li> </ul> <p>Does not resolve URLs if the <code>file</code> and <code>path</code> attributes are used.</p>
result	Optional		Lets you specify an alternate variable in which to receive a result.

Attribute	Req/Opt	Default	Description
throwOnError	Optional	no	<ul style="list-style-type: none"> <li>• <b>yes</b>: if the server returns an error response code, throws an exception that can be caught using the <code>cftry</code> and <code>cfcatch</code> or ColdFusion error pages.</li> <li>• <b>no</b>: does not throw an exception if an error response is returned. In this case, your application can use the <code>cfhttp.StatusCode</code> variable to determine if there was an error and its cause.</li> </ul>
timeout	Optional		<p>Value, in seconds, that is the maximum time the request can take. If the time-out passes without a response, ColdFusion considers the request to have failed.</p> <p>If the client specifies a time-out in the URL search parameter (for example, <code>?RequestTime=120</code>) ColdFusion uses the lesser of the URL time-out and the <code>timeout</code> attribute value; this ensures that the request times out before, or at the same time as, the page.</p> <p>If the URL does not specify a time-out, ColdFusion uses the lesser of the Administrator time-out and the <code>timeout</code> attribute value.</p> <p>If the time-out is not set in any of these, ColdFusion waits indefinitely for the <code>cfhttp</code> request to process.</p>
userAgent	Optional	ColdFusion	Text to put in the user agent request header. Used to identify the request client software. Can make the ColdFusion application appear to be a browser.
username	Optional		Use to pass a user name to the target URL for Basic Authentication. Combined with <code>password</code> to form a base64 encoded string that is passed in the <code>Authenticate</code> header. Does not provide support for Integrated Windows, NTLM, or Kerberos authentication.

The following attribute is used with the PUT method to determine how to send data specified with `httpparam type="formField"`:

Attribute	Req/Opt	Default	Description
multipart	Optional	no (Sends as multipart only if request includes File type data.)	<p>Tells ColdFusion to send all data specified by <code>cfhttpparam type="formField"</code> tags as multipart form data, with a Content-Type of <code>multipart/form-data</code>. By default, ColdFusion sends <code>cfhttp</code> requests that contain only <code>formField</code> data with a Content Type of <code>application/x-www-form-urlencoded</code>. (If the request also includes File type data, ColdFusion uses the <code>multipart/form-data</code> content type for all parts.)</p> <p>If <b>yes</b>, ColdFusion also sends the request's charset in each Content-Type description. All form field data must be encoded in this character encoding, and ColdFusion does not URLEncode the data. (The field name must be in ISO-88591-1 or ASCII.) Some http parsers, including the one used by previous versions of ColdFusion, ignore the multipart form field character encoding description.</p>

The following attribute sets a multipart header field and is used, for example, for uploading videos on YouTube.

Attribute	Req/Opt	Default	Description
multipartType	Optional	form-data	Allows you to set the multipart header field to <code>related</code> or <code>form-data</code> . By default, the value is <code>form-data</code> .

**Example:**

```
<!--- Get Video --->
<cfset videoName = "<vedio path>\hello.wmv">
<cfset videoFileName = "hello.wmv">
<cfoutput>
<!--- Set User Account Data --->
<cfset clientKey = "client key from google"/>
<cfset devKey = "<dev key from google>"/>
<cfset youTubeUploadURL =
"http://uploads.gdata.youtube.com/feeds/api/users/default/uploads"/>
<!--- Authenticate with Google / YouTube --->
<cfhttp url="https://www.google.com/accounts/ClientLogin" method="post" result="result"
charset="utf-8">
    <cfhttpparam type="formfield" name="accountType" value="HOSTED_OR_GOOGLE">
    <cfhttpparam type="formfield" name="Email" value="<gmail id>">
    <cfhttpparam type="formfield" name="Passwd" value="<password>">
    <cfhttpparam type="formfield" name="service" value="youtube">
    <cfhttpparam type="formfield" name="source" value="youtubecode">
</cfhttp>
<!--- Create Auth Token --->
<cfset content = result.filecontent>
<cfset authdata = structNew()>
<cfloop index="line" list="#content#" delimiters="#chr(10)#">
<cfset dtype = listFirst(line, "=")>
<cfset value = listRest(line, "=")>
<cfset authdata[dtype] = value></cfloop>
<!--- Create ATOM XML and save to a file to be sent with video --->
<cfsavecontent variable="meta"><cfoutput>
<entry xmlns="http://www.w3.org/2005/Atom"
xmlns:media="http://search.yahoo.com/mrss/"
xmlns:yt="http://gdata.youtube.com/schemas/2007">
<media:group>
<media:title type="plain">WithOutQuotes</media:title>

    scheme="http://gdata.youtube.com/schemas/2007/categories.cat">People
</media:category>
<media:keywords>yourvideo</media:keywords>
</media:group>
</entry>
```

```
</cfoutput>
</cfsavecontent>
<cfset tmpfile = expandPath("./meta.xml")/>
<cffile action="write" file="#tmpfile#" output="#trim(meta)#" />

<!--- Upload video --->
<cfhttp url="#youtubeUploadURL#" result="result" method="POST" timeout="450"
multipartType="related">
<cfhttpparam type="header" name="Authorization" value="GoogleLogin auth=#authdata.auth#">
<cfhttpparam type="header" name="X-GData-Client" value="#variables.clientkey#">
<cfhttpparam type="header" name="X-GData-Key" value="key=#variables.devkey#">
<cfhttpparam type="header" name="Slug" value="#videoFileName#">
    <!---<CFHTTTPARAM type="HEADER" name="Connection" value="Keep-Alive"> --->
    <!--- Send 2 files --->
    <cfhttpparam type="file" name="API_XML_Request" file="#tmpfile#"
        mimeType="application/atom+xml">
<cfhttpparam type="file" name="file" file="#videoName#" mimeType="video/*">
</cfhttp>
<cfdump var="#result#" />
</cfoutput>
```

The following attribute allows you to specify the name of the variable in which you would like the results of the operation returned. The name you specify replaces `cfhttp` as the prefix by which you access the returned variables. For example, if you set the `result` attribute to `myResult`, you would access `FileContent` as `#myResult.FileContent#`.

The `result` attribute allows functions or CFCs that are called from multiple pages at the same time to avoid overwriting the results of one call with another. For information about the variables returned by a `cfhttp` get operation, see the section *Variables returned by a cfhttp get operation* in the Usage section.

Attribute	Req/Opt	Default	Description
result	Optional		Specifies the name of the variable in which you want the result returned.

The following attributes tell ColdFusion to put the HTTP response body in a file. You can put the response body in a file for GET, POST, PUT, DELETE, OPTIONS, and TRACE methods, but it is generally not useful with the DELETE or OPTIONS method.

Attribute	Req/Opt	Default	Description
file	Required if path is specified and not a GET method	See Description	Name of the file in which to store the response body.  For a GET operation, the default is the file requested in the URL, if there is one. For example, if the URL in a GET method is <code>http://www.myco.com/test.htm</code> , the default file is <code>test.htm</code> .  Do not specify the path to the directory in this attribute; use the <code>path</code> attribute.
path	Required if file is specified.		Tells ColdFusion to save the HTTP response body in a file. Contains the absolute path to the directory in which to store the file.

Use the following syntax in the `path` attribute to specify an in-memory directory for your files. In-memory files speed processing of transient data.

```
ram:///filepath
```

The filepath can include multiple directories, for example `ram:///petStore/images`. Create the directories in the path before you can use them. For more information on using in-memory files, see *Working with in-memory files in the Developing ColdFusion Applications*.

The following attributes tell ColdFusion to convert the HTTP response body into a ColdFusion query object. They can be used with the GET and POST methods only.

Attribute	Req/Opt	Default	Description
<code>columns</code>	Optional	First row of response contains column names.	<p>The column names for the query, separated by commas, with no spaces. Column names must start with a letter. The remaining characters can be letters, numbers, or underscore characters (<code>_</code>).</p> <p>If there are no column name headers in the response, specify this attribute to identify the column names.</p> <p>If you specify this attribute, and the <code>firstrowasHeader</code> attribute is <code>True</code> (the default), the column names specified by this attribute replace the first line of the response. You can use this behavior to replace the column names retrieved by the request with your own names.</p> <p>If a duplicate column heading is encountered in either this attribute or in the column names from the response, ColdFusion appends an underscore to the name to make it unique.</p> <p>If the number of columns specified by this attribute does not equal the number of columns in the HTTP response body, ColdFusion generates an error.</p>
<code>delimiter</code>	Optional	, (comma)	A character that separates query columns. The response body must use this character to separate the query columns.
<code>firstrowasheaders</code>	Optional	yes	<p>Determines how ColdFusion processes the first row of the query record set:</p> <ul style="list-style-type: none"><li>• <b>yes:</b> processes the first row as column heads. If you specify a <code>columns</code> attribute, ColdFusion ignores the first row of the file.</li><li>• <b>no:</b> processes the first row as data. If you do not specify a <code>columns</code> attribute, ColdFusion generates column names by appending numbers to the word "column"; for example, "column_1".</li></ul>
<code>name</code>	Optional		Tells ColdFusion to create a query object with the given name from the returned HTTP response body.
<code>textQualifier</code>	Optional	" [double-quotation mark]	<p>A character that, optionally, specifies the start and end of a text column. This character must surround any text fields in the response body that contain the delimiter character as part of the field value.</p> <p>To include this character in column text, escape it by using two characters in place of one. For example, if the qualifier is a double-quotation mark, escape it as <code>" "</code>.</p>

## Usage

The `cfhttp` tag is a general-purpose tool for creating HTTP requests and handling the returned results. It enables you to generate most standard HTTP request types. You use embedded `cfhttpparam` tags to specify request headers and body content.

When ColdFusion receives a response to a `cfhttp` request, it can put the response body (if any) in a file or the `cfhttp.FileContent` string variable. If the body text is structured as a result set, ColdFusion can put the body text in query object. You can also access the values of all returned headers and specify how to handle error status and redirections, and specify a time-out to prevent requests from hanging.

The HTTP protocol is the backbone of the World Wide Web and is used for every web transaction. Because the `cfhttp` tag can generate most types of requests, it provides significant flexibility. Possible uses include:

- Interacting with dynamic web sites and services that are not available as web services. (Use the `cfinvoke` tag to access SOAP web services.)
- Getting the contents of an HTML page or other file such as an image on a web server for use in your CFML page or storage in a file.
- Sending a secure request to a server by specifying the https protocol in the `url` attribute.
- Using the POST method to send a multipart/form-data style post to any URL that can handle such data and return results, including CGI executables or even other ColdFusion pages.
- Using the PUT method to upload files to a server that does not accept FTP requests.

This tag can, and for PUT and POST requests must, have a body that contains `cfhttpparam` tags. If this tag has `cfhttpparam` tags, it must have a `</cfhttp>` end tag.

To use HTTPS with the `cfhttp` tag, you might need to manually import the certificate for each web server into the keystore for the JRE that ColdFusion uses. This procedure should not be necessary if the certificate is signed (issued) by an authority that the JSSE (Java Secure Sockets Extension) recognizes (for example, Verisign); that is, if the signing authority is in the `cacerts` already. However, you might need to use the procedure if you are issuing SSL (secure sockets layer) certificates yourself.

#### Manually import a certificate

- 1 Go to a page on the SSL server in question.
- 2 Double-click the lock icon.
- 3 Click the Details tab.
- 4 Click Copy To File.
- 5 Select the base64 option and save the file.
- 6 Copy the CER file into `C:\ColdFusion9\runtime\jre\lib\security` (or whichever JRE ColdFusion is using).
- 7 Run the following command in the same directory (`keytool.exe` is located in `C:\ColdFusion9\runtime\jre\bin`):

```
keytool -import -keystore cacerts -alias giveUniqueName -file filename.cer
```

#### Variables returned by a `cfhttp` get operation

The `cfhttp` tag returns the following variables. If you set the `result` attribute, the name you assign replaces `cfhttp` as the prefix. For additional information, see the `result` attribute.

Name	Description
<code>cfhttp.charset</code>	Response character character set (character encoding) specified by the response Content-Type header.
<code>cfhttp.errorDetail</code>	If the connection to the HTTP server fails, contains details about the failure. For instance: "Unknown host: my.co.com"; otherwise, the empty string. recommends that you check this variable for an error condition before checking other variables.
<code>cfhttp.fileContent</code>	Response body; for example, the contents of an html page retrieved by a GET operation. Empty if you save the response in a file.
<code>cfhttp.header</code>	Raw response header containing all header information in a single string. Contains the same information as the <code>cfhttp.responseHeader</code> variable.
<code>cfhttp.mimeType</code>	MIME type specified by the response Content-Type header; for example, <code>text/html</code> .

Name	Description
<code>cfhttp.responseHeader</code>	The response headers formatted into a structure. Each element key is the header name, such as Content-Type or Status_Code. If there is more than one instance of a header type, the type values are put in an array.  One common technique is to dynamically access the <code>cfhttp.responseHeader</code> structure as a dynamic array; for example, <code>#cfhttp.resonseHeader[fieldVariable]#</code> .
<code>cfhttp.statusCode</code>	The HTTP status_code header value followed by the HTTP Explanation header value; for example, "200 OK".
<code>cfhttp.text</code>	Boolean; <code>true</code> if the response body content type is text. ColdFusion recognizes the response body as text in the following situations: <ul style="list-style-type: none"><li>• if the header does not specify a content type</li><li>• if the content type starts with "text"</li><li>• if the content type starts with "message"</li><li>• if the content type is "application/octet-stream"</li></ul>

### Building a query from a delimited text file

The `cfhttp` tag can create a ColdFusion query object from the response body. To do so, the response body must consist of lines of text, with each line having fields that are delimited by a character that identifies the column breaks. The default delimiter is a comma (,). The response data can also use a text qualifier; the default is a double-quotation mark ("). If you surround a string field in the text qualifier, the field can contain the delimiter character. To include the text qualifier in field text, escape it by using a double character. The following line shows a two-line request body that is converted into a query. It has three comma-delimited fields:

```
Field1,Field2,Field3
"A comma, in text","A quote: ""Oh My!""",Plain text
```

Run the following code to show how ColdFusion treats this data:

```
<cfhttp method="Get"
    url="127.0.0.1:8500/tests/escapetest.txt"
    name="onerow">
<cfdump var="#onerow#"><br>
```

Column names can be specified in three ways:

- By default, ColdFusion uses the first row of the response as the column names.
- If you specify a comma-delimited `columns` attribute, ColdFusion uses the names specified in the attribute as the column names. Set `firstRowAsHeaders="no"` if the first row of the response contains data. Otherwise, ColdFusion ignores the first row.
- If you do not specify a `columns` attribute and set `firstrowasheaders="no"`, ColdFusion generates column names of the form `Column_1`, `Column2`, etc.

The `cfhttp` tag checks to ensure that column names in the data returned by the tag start with a letter and contain only letters, numbers, and underscore characters (\_).

ColdFusion checks for invalid column names. Column names must start with a letter. The remaining characters can be letters, numbers, or underscores (\_). If a column name is not valid, ColdFusion generates an error.

### Notes

- For the ColdFusion Administrator time-out and the URL time-out to take effect, enable the time-out in the ColdFusion Administrator, Server Settings page. For more information, see *Configuring and Administering ColdFusion*.

- The `cfhttp` tag supports Basic Authentication for all operations.
- The `cfhttp` tag uses SSL to negotiate secure transactions.
- If you put the HTTP response body in a file, ColdFusion does not put it in the `CFHTTP.FileContent` variable or generate a query object. If you do not put the response body in a file, ColdFusion puts it in the `CFHTTP.FileContent` variable; if you specify a `name` attribute ColdFusion generates a query object.
- The `cfhttp` tag does not support NTLM or Digest Authentication.
- If you are using Microsoft IIS, there is no HTTP header size limit. To specify an HTTP header size limit, set it in IIS.

### Example

```
<!-- This example displays the information provided by
the Designer & Developer Center XML feed,
http://www.adobe.com/devnet/resources/_resources.xml
See http://www.adobe.com/devnet/articles/xml_resource_feed.html
for more information on this feed. --->

<!-- Set the URL address. --->
<cfset urlAddress="http://www.adobe.com/devnet/resources/_resources.xml">

<!-- Use the CFHTTP tag to get the file content represented by urladdress.
Note that />, not an end tag, terminates this tag. --->
<cfhttp url="#urladdress#" method="GET" resolveurl="Yes" throwOnError="Yes"/>

<!-- Parse the XML and output a list of resources. --->
<cfset xmlDoc = XmlParse(CFHTTP.FileContent)>

<!-- Get the array of resource elements, the xmlChildren of the xmlroot. --->
<cfset resources=xmlDoc.xmlroot.xmlChildren>
<cfset numresources=ArrayLen(resources)>

<cfloop index="i" from="1" to="#numresources#">
    <cfset item=resources[i]>
    <cfoutput>
        <strong><a href=#item.url.xmltext#>#item.title.xmltext#</strong></a><br>
        <strong>Author</strong>&nbsp;&nbsp;&nbsp;#item.author.xmltext#<br>
        <strong>Applies to these products</strong><br>
        <cfloop index="i" from="4" to="#arraylen(item.xmlChildren)#">
            #item.xmlChildren[i].xmlAttributes.Name#<br>
        </cfloop>
    <br>
</cfoutput>
</cfloop>
```

## cfhttpparam

### Description

Allowed inside `cfhttp` tag bodies only. Required for `cfhttp` POST operations. Optional for all others. Specifies parameters to build an HTTP request.

## Category

## Internet protocol tags

## Syntax

```
<cfhttpparam
    type = "transaction type"
    encoded = "yes|no"
    file = "filename"
    mimeType = "MIME type designator"
    name = "data name"
    value = "data value">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfhttp](#), [GetHttpRequestData](#), [cfftp](#), [cfldap](#), [cfmail](#), [cfmailparam](#), [cfpop](#)

## History

ColdFusion MX 6.1:

- Added the header and body types.
- Added the `encoded` and `mimeType` attributes.
- Changed HTTP method behavior: all HTTP methods can have `httpparam` tags.
- Changed the `name` attribute requirements: it is not required for all types.

## Attributes

Attribute	Req/Opt	Default	Description
type	Required		Information type: <ul style="list-style-type: none"><li>• <b>header</b>: specifies an HTTP header. ColdFusion does not URL encode the header.</li><li>• <b>CGI</b>: specifies an HTTP header. ColdFusion URL encodes the header by default.</li><li>• <b>body</b>: specifies the body of the HTTP request. ColdFusion does not automatically set a content-type header or URL encode the body contents. To specify the content-type, use a separate <code>cfhttpparam</code> tag with <code>type=header</code>.</li><li>• <b>XML</b>: identifies the request as having a content-type of text/xml. Specifies that the <code>value</code> attribute contains the body of the HTTP request. Used to send XML to the destination URL. ColdFusion does not URL encode the XML data.</li><li>• <b>file</b>: tells ColdFusion to send the contents of the specified file. ColdFusion does not URL encode the file contents.</li><li>• <b>URL</b>: specifies a URL query string name-value pair to append to the <code>cfhttpurl</code> attribute. ColdFusion URL encodes the query string.</li><li>• <b>formField</b>: specifies a form field to send. ColdFusion URL encodes the Form field by default.</li><li>• <b>cookie</b>: specifies a cookie to send as an HTTP header. ColdFusion URL encodes the cookie.</li></ul>
encoded	Optional	yes	Applies to FormField and CGI types; ignored for all other types. Specifies whether to URL encode the form field or header.
file	Required only if <code>type="File"</code>		Applies to File type; ignored for all other types. The absolute path to the file that is sent in the request body.

Attribute	Req/Opt	Default	Description
contentType	Optional		Applies to File type; invalid for all other types. Specifies the MIME media type of the file contents. The content type can include an identifier for the character encoding of the file; for example, text/html; charset=ISO-8859-1 indicates that the file is HTML text in the ISO Latin-1 character encoding.
name	Required. Optional (and ignored) for Body and XML types		Variable name for data that is passed. Ignored for Body and XML types. For File type, specifies the filename to send in the request.
value	Required. Optional (and ignored) for File type		Value of the data that is sent. Ignored for File type. The value must contain string data or data that ColdFusion can convert to a string for all type attributes except Body. Body types can have string or binary values.

### Usage

Specifies header or body data to send in the HTTP request. The `type` attribute identifies the information that the parameter specifies. A `cfhttp` tag can have multiple `cfhttpparam` tags, subject to the following limitations:

- An `XMLtype` attribute cannot be used with additional `XMLtype` attributes, or with `body`, `file`, or `formFieldType` attributes.
- A `bodytype` attribute cannot be used with additional `bodytype` attributes, or with `XML`, `file`, or `formFieldType` attributes.
- The `XML` and `bodytype` attributes cannot be used with the `cfhttp` tag TRACE method.
- The `filetype` attribute is only meaningful with the `cfhttp` tag POST and PUT methods.
- The `formField type` attribute is only meaningful with the `cfhttp` tag POST and GET methods.

If you send an HTTP request to a ColdFusion page, all HTTP headers, not just those sent using the CGI type, are available as CGI scope variables. However, any custom variables (such as "myVar") do not appear in a dump of the CGI scope.

When you send a file using the `type="file"` attribute, the file content is sent in the body of a multipart/form-data request. If you send the file to a ColdFusion page, the Form scope of the receiving page contains an entry with the name you specified in the `cfhttpparam` tag `name` attribute as the key. The value of this variable is the path to a temporary file containing the file that you sent. If you also send Form field data, the location of the filename in the `form.fieldnames` key list depends on the position of the `cfhttpparam` tag with the file relative to the `cfhttp` tags with the form data.

URL-encoding preserves special characters (such as the ampersand) when they are passed to the server. For more information, see the function "[URLEncodedFormat](#)" on page 1287.

To send arbitrary data in a "raw" HTTP message, use a `cfhttpparam` tag with a `type="body"` attribute to specify the body content and use `cfhttpparam` tags with a `type="header"` attributes to specify the headers.

## Example

```
<!--- This example consists of two CFML pages.
      The first page posts to the second. --->

<!--- The first, posting page.
      This page posts variables to another page and displays the body of the response from
      the second page. Change the URL and port as necessary for your environment. --->

<cfhttp
    method="post"
    url="http://127.0.0.1/tests/http/cfhttpparamexample.cfm"
    port="8500"
    throwonerror="Yes">
    <cfhttpparam name="form_test" type="FormField" value="This is a form variable">
    <cfhttpparam name="url_test" type="URL" value="This is a URL variable">
    <cfhttpparam name="cgi_test" type="CGI" value="This is a CGI variable">
    <cfhttpparam name="cookie_test" type="Cookie" value="This is a cookie">
</cfhttp>

<!--- Output the results returned by the posted-to page. --->
<cfoutput>
    #cfhttp.fileContent#
</cfoutput>

<!--- This is the cfhttpparamexample.cfm page that receives and processes the Post request.
Its response body is the generated HTML output. --->

<h3>Output the passed variables</h3>
<cfoutput>
    Form variable: #form.form_test#
    <br>URL variable: #URL.url_test#
    <br>Cookie variable: #Cookie.cookie_test#
    <br>CGI variable: #CGI.cgi_test#<br>
    <br>Note that the CGI variable is URL encoded.
</cfoutput>
```

# Tags i

## cfif

### Description

Creates simple and compound conditional statements in CFML. Tests an expression, variable, function return value, or string. Used, optionally, with the [cfelse](#) and [cfelseif](#) tags.

### Category

[Flow-control tags](#)

### Syntax

```
<cfif expression>
    HTML and CFML tags<cfelseif expression>
    HTML and CFML tags
    <cfelse>
    HTML and CFML tags
</cfif>
```

### See also

[cfelse](#), [cfelseif](#), [cfabort](#), [cfbreak](#), [cfexecute](#), [cfexit](#), [cflocation](#), [cfloop](#), [cfswitch](#), [cfthrow](#), [cftry](#)

### Usage

If the value of the expression in the `cfif` tag is `true`, ColdFusion processes all the code that follows, up to any `cfelseif` or `cfelse` tag, and then skips to the `cfif` end tag. Otherwise, ColdFusion does not process the code that immediately follows the `cfif` tag, and continues processing at any `cfelseif` or `cfelse` tag, or with the code that follows the `cfif` end tag.

When testing the return value of a function that returns a Boolean, you do not have to define the `True` condition explicitly. This example uses the `isArray` function:

```
<cfif isArray(myarray)>
```

If successful, `isArray` evaluates to `yes`, the string equivalent of the Boolean `True`. This is preferred over explicitly defining the `True` condition this way:

```
<cfif isArray(myarray) IS True>
```

This tag requires an end tag.

### Example

In this example, variables are shown within number signs. This is not required.

```
<!--- This example shows the interaction of cfif, cfelse, and cfelseif. --->
<!--- First, perform a query to get some data. ----->
<cfquery name="getCenters" datasource="cfdocexamples">
    SELECT Center_ID, Name, Address1, Address2, City, State, Country, PostalCode,
           Phone, Contact
    FROM Centers
    ORDER by City, State, Name
</cfquery>
<p>CFIF gives us the ability to perform conditional logic based on a condition
    or set of conditions.</p>
<p>For example, we can output the list of Centers from the snippets datasource
    by group and only display them <b>IF</b> City = San Diego.</p>
<hr>
<!--- Use CFIF to test a condition when outputting a query. ----->
<p>The following centers are in San Diego:</p>
<cfoutput query="getCenters">
    <cfif Trim(City) is "San Diego">
        <br><b>Name/Address:</b>#Name#, #Address1#, #City#, #State#
        <br><b>Contact:</b> #Contact#
        <br>
    </cfif>
</cfoutput>
<hr>
<p>If we would like more than one condition to be the case, we can ask for a list of the
```

```
centers in San Diego <b>OR</b> Santa Ana. If the center does not follow this condition, we
can use CFELSE to show only the names and cities of the other centers.</p>
<p>Notice how a nested CFIF is used to specify the location of the
    featured site (Santa Ana or San Diego).</p>
<!-- Use CFIF to specify a conditional choice for multiple options;
    also note the nested CFIF. --->
<p>Complete information is shown for centers in San Diego or Santa Ana.
    All other centers are listed in italic:</p>
<cfoutput query="getCenters">
    <cfif Trim(City) is "San Diego" OR Trim(City) is "Santa Ana">
        <h4>Featured Center in
            <cfif Trim(City) is "San Diego">
                San Diego
            <cfelse>
                Santa Ana
            </cfif>
        </h4> <b>Name/Address:</b>#Name#, #Address1#, #City#, #State#
        <br><b>Contact:</b> #Contact#<br>
    <cfelse>
        <br><i>#Name#, #City#</i>
    </cfif>
</cfoutput>
<hr>
<p>Finally, we can use CFELSEIF to cycle through a number of conditions and
produce varying output. Note that you can use CFCASE and CFSWITCH for a more
elegant representation of this behavior.
<!-- Use CFIF in conjunction with CFELSEIF to specify more than one
    branch in a conditional situation. --->
<cfoutput query="getCenters">
    <cfif Trim(City) is "San Diego" OR Trim(City) is "Santa Ana">
        <br><i>#Name#, #City#</i> (this one is in
            <cfif Trim(City) is "San Diego">San Diego
            <cfelse>Santa Ana
            </cfif>)
        <cfelseif Trim(City) is "San Francisco">
            <br><i>#Name#, #City#</i> (this one is in San Francisco)
        <cfelseif Trim(City) is "Suisun">
            <br><i>#Name#, #City#</i> (this one is in Suisun)
        <cfelse> <br><i>#Name#</i>
            <br><b>Not in a city we track</b>
        </cfif>
    </cfoutput>
```

## cfimage

### Description

Creates a ColdFusion image. You can use the `cfimage` tag to perform common image manipulation operations as a shortcut to `Image` functions. You can use the `cfimage` tag independently or in conjunction with `Image` functions.

### History

ColdFusion 8: Added this tag.

## Category

Other tag

## Syntax

### Add a border to an image

```
<cfimage
    required
    action = "border"
    source = "absolute pathname|pathname relative to the web root|URL|#cfimage variable#"
    optional
    color = "hexadecimal value|web color"
    destination = "absolute pathname|pathname relative to the web root"
    isBase64 = "yes|no"
    name = "cfimage variable"
    overwrite = "yes|no"
    thickness = "number of pixels">
```

### Create a CAPTCHA image

```
<cfimage
    required
    action = "captcha"
    height = "number of pixels"
    text = "text string"
    width = "number of pixels"
    optional
    destination = "absolute pathname|pathname relative to the web root"
    difficulty = "high|medium|low"
    overwrite = "yes|no"
    fonts = "comma-separated list of font names"
    fontSize = "point size">
```

### Convert an image file format

```
<cfimage
    required
    action = "convert"
    destination = "absolute pathname|pathname relative to the web root"
    source = "absolute pathname|pathname relative to the web root|URL|#cfimage variable#"
    optional
    isBase64 = "yes|no"
    name = "cfimage variable"
    overwrite = "yes|no">
```

### Retrieve information about an image

```
<cfimage
    required
    action = "info"
    source = "absolute pathname|pathname relative to the web root|URL|#cfimage variable#"
    structname = "structure name"
    optional
    isBase64 = "yes|no">
```

### Read an image into memory

```
<cfimage
    required
    name = "cfimage variable"
    source = "absolute pathname|pathname relative to the web root|URL|#cfimage variable#">
```

```
optional
action = "read"
isBase64 = "yes|no">
```

#### Resize an image

```
<cfimage
  required
  action = "resize"
  height = "number of pixels|percent%"
  source = "absolute pathname|pathname relative to the web root|URL|#cfimage variable#"
  width = "number of pixels|percent%"
  optional
  destination = "absolute pathname|pathname relative to the web root"
  isBase64 = "yes|no"
  name = "cfimage variable"
  overwrite = "yes|no">
```

#### Rotate an image

```
<cfimage
  required
  action = "rotate"
  angle = "angle in degrees"
  source = "absolute pathname|pathname relative to the web root|URL|#cfimage variable#"
  optional
  destination = "absolute pathname|pathname relative to the web root"
  isBase64 = "yes|no"
  name = "cfimage variable"
  overwrite = "yes|no">
```

#### Write an image to a file

```
<cfimage
  required
  action = "write"
  destination = "absolute pathname|pathname relative to the web root"
  source = "absolute or relative pathname|URL|#cfimage variable#"
  optional
  isBase64 = "yes|no"
  overwrite = "yes|no"
  quality = "JPEG image quality">
```

#### Write an image to the browser

```
<cfimage
  required
  action = "writeToBrowser"
  source = "absolute pathname|pathname relative to the web root|URL|#cfimage variable#"
  optional
  format = "png|jpg|jpeg"
  isBase64 = "yes|no">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## Attributes

Attribute	Action	Req/Opt	Default	Description
action	N/A	Optional	read	<p>Action to take. Must be one of the following:</p> <ul style="list-style-type: none"> <li>• border</li> <li>• captcha</li> <li>• convert</li> <li>• info</li> <li>• read</li> <li>• resize</li> <li>• rotate</li> <li>• write</li> <li>• writeToBrowser</li> </ul> <p>The default action is <code>read</code>, which you do not need to specify explicitly.</p>
angle	rotate	Required		<p>Angle in degrees to rotate the image.</p> <p>Specify an integer for the value.</p>
color	border	Optional	black	<p>Border color.</p> <p>Hexadecimal value or supported named color; see the name list in Valid HTML named colors section. For a hexadecimal value, use the form <code>"#xxxxxxx"</code> or <code>"xxxxxx"</code>, where x = 0-9 or A-F; use two number signs or none.</p>
destination	border captcha convert resize rotate write	Optional (see Description)		<p>Absolute or relative pathname where the image output is written. The image format is determined by the file extension.</p> <p>The <code>convert</code> and <code>write</code> actions require a <code>destination</code> attribute. The <code>border</code>, <code>captcha</code>, <code>resize</code>, and <code>rotate</code> actions require a <code>name</code> attribute or a <code>destination</code> attribute. You can specify both. ColdFusion supports only CAPTCHA images in PNG format.</p> <p>If you do not enter a <code>destination</code>, the CAPTCHA image is placed inline in the HTML output and displayed in the web browser.</p>
difficulty	captcha	Optional	low	<p>Level of complexity of the CAPTCHA text. Specify one of the following levels of text distortion:</p> <ul style="list-style-type: none"> <li>• low</li> <li>• medium</li> <li>• high</li> </ul>
fonts	captcha	Optional		<p>One or more valid fonts to use for the CAPTCHA text. Separate multiple fonts with commas. ColdFusion supports only the system fonts that the JDK can recognize. For example, TTF fonts in the Windows directory are supported on Windows.</p>
fontSize	captcha	Optional	24	<p>Font size of the text in the CAPTCHA image.</p> <p>The value must be an integer.</p>

Attribute	Action	Req/Opt	Default	Description
format	writeToBrowser	Optional	PNG	Format of the image displayed in the browser. If you do not specify a format, the image is displayed in PNG format.  You cannot display a GIF image in a browser. GIF images are displayed in PNG format.
height	captcha resize	Required		Height in pixels of the image.  For the <code>resize</code> attribute, you also can specify the height as a percentage (an integer followed by the percent (%) symbol).  When you resize an image, if you specify a value for the width, you can let ColdFusion calculate the aspect ratio by specifying "" as the height.  If specified, the value must be an integer.
isBase64	border convert info read resize rotate write writeToBrowser	Optional	no	Specifies whether the source is a Base64 string: <ul style="list-style-type: none"><li>• <code>yes</code>: the source is a Base64 string.</li><li>• <code>no</code>: the source is not a Base64 string.</li></ul>
name	border convert read resize rotate	Optional (see Description)		Name of the ColdFusion image variable to create.  The <code>read</code> action requires a <code>name</code> attribute.  The <code>border</code> , <code>resize</code> , and <code>rotate</code> actions require a <code>name</code> attribute or a <code>destination</code> attribute. You can specify both.
overwrite	border captcha convert read resize rotate write	Optional	no	Valid only if the <code>destination</code> attribute is specified. The <code>overwrite</code> values are: <ul style="list-style-type: none"><li>• <code>yes</code>: overwrites the destination file.</li><li>• <code>no</code>: does not overwrite the destination file.</li></ul> If the destination file exists, ColdFusion generates an error if the <code>overwrite</code> action is not set to <code>yes</code> .
quality	write	Optional	0.75	Quality of the JPEG destination file. Applies only to files with an extension of JPG or JPEG. Valid values are fractions that range from 0 through 1 (the lower the number, the lower the quality).

Attribute	Action	Req/Opt	Default	Description
source	border convert info read resize rotate write writeToBrowser	Required		<ul style="list-style-type: none"><li>URL of the source image; for example, "http://www.google.com/images/logo.gif"</li><li>Absolute pathname or a pathname relative to the web root; for example: "c:\images\logo.jpg"</li><li>ColdFusion image variable containing another image, BLOB, or byte array; for example, "#myImage#"</li><li>Base64 string; for example, "....."</li></ul>
structName	info	Required		Name of the ColdFusion structure to be created.
text	captcha	Required		Text string displayed in the CAPTCHA image. Use capital letters for better readability. Do not include spaces because users cannot detect them in the resulting CAPTCHA image.
thickness	border	Optional	1	Border thickness in pixels. The border is added to the outside edge of the source image, increasing the image area accordingly.  The value must be an integer.
width	captcha resize	Required		Width in pixels of the image.  For <code>resize</code> , you also can specify the width as a percentage (an integer followed by the % symbol).  When you resize an image, if you specify a value for the height, you can let ColdFusion calculate the aspect ratio by specifying "" as the width.  If specified, the value must be an integer.

## Usage

ColdFusion provides the `cfimage` tag and the ColdFusion image, a construct native to ColdFusion that contains image data. You can manipulate ColdFusion images in memory and write them to a file, a database, or directly to a browser. You use the `cfimage` tag to create ColdFusion images from existing image files and perform simple image actions, such as rotating or resizing. Alternatively, you can use the [ImageNew](#) function to create a ColdFusion image from the beginning or from an existing image. You can use the `Image` functions to perform complex image manipulation operations on ColdFusion images that you create with the `cfimage` tag or with the `ImageNew` function.

You can perform the following tasks with ColdFusion images:

- Convert an image from one file format to another. For example, you can convert a BMP file to a JPEG file or a Base64 string to a GIF.
- Enforce consistent sizes on files uploaded to the server.
- Enforce size limits on JPEG images (by changing the quality of the image).
- Save a ColdFusion image to a file or write the image directly to a browser.
- Use the `ImageGetBlob` function within the `cfquery` tag to insert a ColdFusion image as a Binary Large Object Bitmap (BLOB) in a database. Also, you can extract a BLOB from a database and generate a ColdFusion image from it.
- Create watermark images.
- Create thumbnail images.

- Create a Completely Automated Public Turing test to tell Computers and Humans Apart (CAPTCHA) image, a distorted text image that is human-readable, but not machine-readable, used in a challenge-response test for preventing spam.

For more detailed examples, see *Creating and Manipulating ColdFusion Images* in the *Developing ColdFusion Applications*.

### File attributes

Use the following syntax to specify an in-memory file, which is not written to disk in the `destination` and `source` attributes. In-memory files speed processing of transient data.

```
ram:///filepath
```

The filepath can include directories, for example `ram:///petStore/images/poodle.jpg`. Create the directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files* in the *Developing ColdFusion Applications*.

### Supported image file formats

The `cfimage` tag operates on a number of different file formats. To list the formats that are supported on the server where the ColdFusion application is deployed, use the `GetReadableImageFormats` function and the `GetWriteableImageFormats` function.

ColdFusion supports the following default image formats on Macintosh, Windows, and Unix operating systems:

- JPEG
- GIF
- TIFF
- PNG
- BMP

ColdFusion does not support the following image formats:

- Animated GIF
- Multipage TIFF
- PSD
- AI

### CMYK support

The `cfimage` tag supports reading and writing CMYK images, but does not support actions that require converting the images. For example, you can use CMYK images with the `read`, `write`, `writeToBrowser`, `resize`, `rotate`, and `info` actions. You cannot use CMYK images with the `convert`, `captcha`, and `border` actions. The same rule applies to image functions. For example, the `ImageNew`, `ImageRead`, and `ImageWrite` functions support CMYK images, but the `ImageAddBorder` function does not.

### Valid HTML named colors

The following table lists the W3C HTML 4 named color value or hexadecimal values that the `color` attribute accepts:

Color name	RGB value
Black	##000000
Blue	##0000FF
Red	##FF0000
Gray	##808080
LightGray	##D3D3D3
DarkGray	##A9A9A9
Green	##008000
Pink	##FFC0CB
Cyan	##00FFFF
Magenta	##FF00FF
Orange	##FFA500
White	##FFFFFF
Yellow	##FFFF00

For all other color values, enter the hexadecimal value. Enter a six-digit value, which specifies the RGB value. Values between 00 and FF are allowed.

### Image quality

By default, the `cfimage` tag generates images with antialiasing turned on (to remove the appearance of jagged edges). The interpolation method is set to `highestQuality`; this produces a high-quality image, but decreases processing speed. To turn off antialiasing, use the [ImageSetAntialiasing](#) function. To change the interpolation method or for more control over image attributes, use the following functions:

- [ImageResize](#)
- [ImageRotate](#)
- [ImageScaleToFit](#)
- [ImageShear](#)
- [ImageTranslate](#)

**border action** Use the `border` action to create a rectangular border around the outer edge of an image. You can control the thickness of the border and its color. For more control, use the [ImageAddBorder](#) function. The following example shows how to set the thickness and color of a border:

```
<!-- This example shows how to create a ColdFusion image from an existing JPEG file, add a
      five-pixel-wide red border to the image, and save it to a new JPEG file. -->
<cfimage source="../../../cfdocs/images/artgallery/jeff05.jpg" action="border" thickness="5"
         destination="jeff05.jpg" color="red" overwrite="yes">
```

**captcha action** Use the `captcha` action to create a distorted text image that is human-readable but not machine-readable. When you create a CAPTCHA image, you specify the text that is displayed in the CAPTCHA image; ColdFusion randomly distorts the text. You can specify the height and width of the text area, which affects the spacing between letters, the font size, the fonts used for the CAPTCHA text, and the level of difficulty, which affects readability. The following example shows how to write a CAPTCHA image directly to the browser:

```
<cfimage action="captcha" fontSize="25" width="400" height="150" text="rEadMe"
        fonts="Arial,Verdana,Courier New">
```

**Note:** For the CAPTCHA image to display, the `width` value must be greater than: `fontSize` times the number of characters specified in `text` times 1.08. In this example, the minimum width is 162.

ColdFusion supports CAPTCHA images in PNG format only.

**Note:** Use unique names for the CAPTCHA image files so that when multiple users access the CAPTCHA images, the files are not overwritten.

The following example shows how to create CAPTCHA images with a medium level of difficulty that are written to files:

```
<!--- Use the GetTickCount function to generate unique names for the CAPTCHA files. --->
<cfset tc = GetTickCount()>
<cfimage action="captcha" fontSize="15" width="180" height="50" text="rEadMe"
        destination="images/rEadMe#tc#.png" difficulty="medium">
```

For a detailed example, see the Creating and Manipulating ColdFusion Images in the *Developing ColdFusion Applications*.

**convert action** Use the `convert` action to convert an image from one file format to another. For more information on file formats, see the section Supported image file formats. The following example shows how to convert a JPEG file to a PNG file:

```
<!--- This example shows how to convert a JPEG image to a PNG image. --->
<cfimage source="../../cfdocs/images/artgallery/aiden02.jpg" action="convert"
        destination="aiden02.png">
```

**Note:** Converting images between one file format to another is time-consuming. Also, image quality can degrade; for example, PNG images support 24-bit color, but GIF images support only 256 colors. Converting transparent images (images with alpha) can degrade image quality.

**info action** Use the `info` action to create a ColdFusion structure that contains information about the image, including the color model, height, width, and source of the image. The structure is the same as returned by the [ImageInfo](#) function. The following example shows how to retrieve all of the information about an image:

```
<!--- This example shows how to retrieve and display image information. --->
<cfimage source="../../cfdocs/images/artgallery/viata03.jpg" action="info"
        structName="viatoInfo">
<cfdump var="#viatoInfo#">
```

<!--- Alternatively, you can use the `cfoutput` tag to display specific image information, as shown in the following example. --->

```
<cfoutput>
    <p>height: #viatoInfo.height# pixels</p>
    <p>width: #viatoInfo.width# pixels</p>
    <p>source: #viatoInfo.source#</p>
    <p>transparency: #viatoInfo.colormodel.transparency#</p>
    <p>pixel size: #viatoInfo.colormodel.pixel_size#</p>
    <p>color model: #viatoInfo.colormodel.colormodel_type#</p>
    <p>alpha channel support: #viatoInfo.colormodel.alpha_channel_support#</p>
    <p>color space: #viatoInfo.colormodel.colorsapce#</p>
</cfoutput>
```

**read action** Use the `read` action to read an image from the specified local file pathname or URL, and create a ColdFusion image in memory. You can use the ColdFusion image variable as the source for another `cfimage` tag or for `Image` functions. The `read` action performs the same operation as the [ImageRead](#) function. The following

example shows how to create a ColdFusion image from a JPEG file and manipulate it using the `ImageGrayscale` function:

```
<!--- This code shows how to create a ColdFusion image from a JPEG file.
--->
<cfimage source="../../../cfdocs/images/artgallery/jeff01.jpg" name="myImage">
<!--- This code shows how to convert the image to grayscale. --->
<cfset ImageGrayscale(myImage)>
<!--- This code shows how to write the grayscale image to a JPEG file. --->
<cfimage source="#myImage#" action="write" destination="myGrayscaleImage.jpg"
overwrite="yes">
```

**resize action** Use the `resize` action to resize an image to the specified height and width. You can specify the height and width in pixels or as a percentage:

```
<!--- This example shows how to specify the height and width of an image in pixels. --->
<cfimage source="../../../cfdocs/images/artgallery/jeff01.jpg" action="resize" width="100"
height="100" destination="jeff01_thumbnail.jpg" overwrite="yes">
<!--- This example shows how to specify the height and width of an image as percentages. --->
<cfimage source="../../../cfdocs/images/artgallery/jeff02.jpg" action="resize"
width="50%" height="50%" destination="jeff02_thumbnail.jpg" overwrite="yes">
<!--- This example shows how to specify the height of an image in pixels and its width as a
percentage. --->
<cfimage source="../../../cfdocs/images/artgallery/jeff03.jpg" action="resize"
width="50%" height="100" destination="jeff03_thumbnail.jpg" overwrite="yes">
```

For more control of resize attributes, use the [ImageResize](#) function.

**rotate action** Use the `rotate` action to rotate an image by degrees:

```
<!--- This example shows how to rotate an image by 30 degrees. --->
<cfimage source="../../../cfdocs/images/artgallery/maxwell01.jpg" action="rotate" angle="30"
name="maxwellAngle">
<!--- Display the rotated image in a browser. --->
<cfimage source="#maxwellAngle#" action="writeToBrowser">
```

For more control of the rotate attributes, use the [ImageRotate](#) function.

**write action** Use the `write` action to write an image to the specified path. The new image is converted to the file type specified in the destination attribute. The `write` action performs the same operation as the [ImageWrite](#) function. When you write an image to a JPEG file, the image quality is set to 75% of the original image by default. To control the image size, use the `quality` attribute of the `write` action.

You can use the `write` action to change the quality of a JPEG image to reduce file size. The following example shows how to change image quality to .5:

```
<!--- This example shows how to create a PNG file from a JPEG file by using the write action.
--->
<cfimage source="../../../cfdocs/images/artgallery/aiden01.jpg" action="write"
destination="aiden01.png">
<!--- This example shows how to create a low-quality JPEG image. --->
<cfimage source="../../../cfdocs/images/artgallery/jeff05.jpg" action="write"
destination="jeff05_lq.jpg" quality=".5">
<!--- This example shows how to write a JPEG file to a new location. --->
<cfimage source="../../../cfdocs/images/artgallery/jeff05.jpg" action="write"
destination="jeff05.jpg">
```

**writeToBrowser action** Use the `writeToBrowser` action to display one or more ColdFusion images directly to the browser without writing them to files. Images are displayed in PNG format. The following example shows how to reduce the size of an image and display it in the browser:

```
<!--- This example shows how to create a ColdFusion image from a JPEG file, resize it, and
      then display it in the browser as a PNG image. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" action="resize"
      width="50%" height="50%" name="smLogo">
<cfimage source="#smLogo#" action="writeToBrowser">
```

### Example

This example shows how to create a ColdFusion image and manipulate it by using Image functions:

```
<!--- Create the ColdFusion image variable "myImage" from a JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<!--- Pass the ColdFusion image to the Image functions to blur the image by a radius of 5,
      flip the image 90 degrees, and convert the image to grayscale. --->
<cfset ImageBlur(myImage,5)>
<cfset ImageFlip(myImage,"90")>
<cfset ImageGrayscale(myImage)>
<!--- Write the transformed image to a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## cfimap

### Description

Queries an IMAP server to retrieve and manage mails within multiple folders.

### Category

[Communications tags](#), [Internet protocol tags](#)

### Syntax

```
<cfimap
    action = "DELETE|DELETEDFOLDER|CREATEFOLDER|OPEN|CLOSE|RENAMEFOLDER|LISTALLFOLDERS|
MARKREAD|MOVEMAIL|GETALL|GETHEADERONLY"
    attachmentpath = "string"
    connection = "string"
    folder = "string"
    generateuniquefilenames = "yes|no"
    maxrows = "integer"
    messagenumber = "integer"
    name = "string"
    newfolder = "string"
    password = "string"
    port = "integer"
    recurse = "true|false"
    secure = "yes|no"
    server = "IMAP server address"
    startrow = "integer"
    secure = "yes|no"
    stoponerror = "true|false"
    uid = "integer or comma-delimited list of integers"
    username = "SMTP user ID">
```

in Sending and Receiving E-Mail in the *Developing ColdFusion Applications*

## History

New tag introduced in ColdFusion 9.

## Attributes

Attribute	Req/Opt	Default	Description
action	Optional	GetHeaderOnly	<p>Returns the message header information for all retrieved mail. Other values for this attribute are:</p> <p><b>GetAll:</b> Returns mail. The information includes the message header information, message text, and any attachments. Set the AttachmentPath attribute to retrieve attachments.</p> <p><b>Delete:</b> Deletes messages from a folder.</p> <p><b>Open:</b> Initiates an open session or connection with the IMAP server.</p> <p><b>Close:</b> Terminates the open session or connection with the IMAP server.</p> <p><b>MarkRead:</b> Marks all messages read from a folder.</p> <p><b>CreateFolder:</b> Creates a folder in the Mailbox.</p> <p><b>DeleteFolder:</b> Deletes a folder in the Mailbox.</p> <p><b>RenameFolder:</b> Renames an existing user-defined folder.</p> <p><b>ListAllFolders:</b> Displays a list of all existing folders in the mailbox or under the folder name defined by the Folder attribute.</p> <p><b>MoveMail:</b> Moves mail from one folder to another.</p>
attachment path	Optional for GetAll action		<p>Specifies the name of the folder where ColdFusion retrieves attachments. If this folder does not exist, ColdFusion creates. If you do not specify the folder, then the attachment is not saved.</p> <p><b>Note:</b> If you specify a relative path, then attachments are saved in a temporary folder. This folder is same as one returned by the GetTempDirectory function.</p>
Connection	Required for the following actions: Open and Close		Specifies the variable name for the connection/session. If the server attribute has an invalid IP address or invalid domain name, then the connection fails and ColdFusion returns an error message.
Folder	<p>Required for the following actions: DeleteFolder, CreateFolder, and RenameFolder</p> <p>Optional for LISTALLFOLDERS, MOVEMAIL, MARKREAD, GETALL, GETHEADERONLY, DELETE.</p>	INBOX (For ListAllFolders action, the default folder is mailbox)	<p>For mail actions: Specifies the folder name where messages are retrieved, moved, or deleted. If folder name is invalid, ColdFusion defaults to INBOX.</p> <p>For folder actions: Specifies the folder name that is deleted (DeleteFolder) or created (CreateFolder) or renamed (RenameFolder).</p> <p>When selecting a subfolder, use the period (.) character as appropriate. For example, when deleting mail in folder 'Module' in folder 'Product.Version.Module', define the Folder attribute as 'Product.Version.Module'.</p>
GenerateUniqueFileNames	Optional		Ensures that unique file names are generated for each attachment file. The goal is to avoid name conflicts for attachments that have the same filename.
MaxRows	Optional		Specifies the number of rows to be marked as read, deleted, or moved across folders. When the value is 1, it signals the row determined by StartRow. Any incremental value marks rows starting from the StartRow. If you have specified the UID or MessageNumber attribute, then MaxRows is ignored.

Attribute	Req/Opt	Default	Description
MessageNumber	Optional		Specifies the message number or a comma delimited list of message numbers for retrieval, deletion, marking mail as read, or moving mails.  If you set an invalid message number, then the IMAP operation is ignored. For example, if you specify that cfimap deletes a specified message number, and if that message number does not exist, then the operation is ignored.  If you have specified the UID attribute, then MessageNumber attribute is ignored.
Name	Optional  Required for the following actions: GetAll, GetHeaderOnly, and ListAllFolders		Specifies the name for the query object that contains the retrieved message information.
NewFolder	Optional  Required for the following actions: RenameFolder, MoveMail		Specifies the name of the new folder when you rename a folder or the name of the destination folder where all mails move.
Password	Optional  Required when action="open" username and password must be specified.		Specifies the password for assessing the users' e-mail account.
Port	Optional	143 or 993	Specifies the IMAP port number. Use 143 for non-secure connections and 993 for secured connections.
Recurse	Optional	False	Specifies whether ColdFusion runs the CFIMAP command in subfolders.  Recurse works for action="ListAllFolders". When recurse is set to "true", ColdFusion parses through all folders and subfolders and returns folder/subfolder names and mail information.
Secure	Optional	False	Specifies whether the IMAP server uses a Secure Sockets Layer.
Server	Optional  Required for the Open action		Specifies the IMAP server identifier. You can assign a host name or an IP address as the IMAP server identifier.
StartRow	Optional		Defines the first row number for reading or deleting. If you have specified the UID or MessageNumber attribute, then StartRow is ignored. You can also specify StartRow for moving mails.
StopOnError	Optional	True	Specifies whether to ignore the exceptions for this operation. When the value is true, it stops processing, displays an appropriate error.
Timeout	Optional	60	Specifies the number of seconds to wait before timing out connection to IMAP server. An error message is displayed when timeout occurs.
Uid	Optional		Specifies the unique ID or a comma-delimited list of Uids to retrieve, delete, and move mails. If you set invalid Uids, then they are ignored.
Username	Optional		Specifies the user name. Typically, the user name is same the e-mail login.

## Usage

Open a session or connection with an IMAP server. To open a session, define the server, user name, and password attributes. You can open a connection with an IMAP server by specifying values for the server, user name, password, and connection attributes. For a secure connection, specify `secure="true"`. You can reuse the connection attribute in subsequent CFIMAP tags, without having to specify the server, user name, or password attributes. Once you have established a connection, you can perform the following actions:

- Retrieve mail: Retrieve mail using the `GetHeaderOnly` or `GetAll` attributes and store the information in a query object. Use the `cfdump` command to display the content of the query object. You can also download attachments in temporary ColdFusion folder or a new folder as defined by the `AttachmentPath` attribute.
- Delete any unnecessary mail or delete folders. You can delete any user-created folders. Standard folders, such as INBOX, OUTBOX, SEND, cannot be deleted.
- Mark multiple mail as read.
- Manage mail folders by creating folders, renaming them or moving mail across folders. If you are using sub folders, then use periods (.) to specify the exact path.

Once you have performed all actions, close the session or connection with the IMAP server. For example, mail from your e-mail account in Gmail can be retrieved by setting a connection to the Gmail IMAP server. You can define the login (user name) and set a secure connection. Next, you can quickly retrieve a top-level snapshot of e-mails using the `GetHeaderOnly` attribute or access full information about e-mails using the `GetAll` attribute.

**Note:** *Gmail is not a complete IMAP implementation so some of the features of a regular IMAP server may not work with Gmail.*

The following table lists the query information (column names) returned by various cfimap attributes.

Values for "action" attribute	Columns
GetHeaderOnly	ANSWERED, CC, DELETED, DRAFT, FLAGGED, FROM, HEADER, LINES, MESSAGEID, MESSAGENUMBER, RECENT, REPLYTO, RXDDATE, SEEN, SENTDATE, SIZE, SUBJECT, TO, UID
GetAll	ANSWERED, ATTACHMENTFILES, ATTACHMENTS, BODY, CC, CIDS, DELETED, DRAFT, FLAGGED, FROM, HEADER, HTMLBODY, LINES, MESSAGEID, MESSAGENUMBER, RECENT, REPLYTO, RXDDATE, SEEN, SENTDATE, SIZE, SUBJECT, TEXTBODY, TO, UID.  CID is used to find the correct place of an image in an HTML e-mail message that the CFIMAP tag retrieves. If the e-mail message contains more than one embedded image, only the last embedded image is available.
ListAllFolders	FULLNAME (specifies the entire directory structure), NAME, NEW, TOTALMESSAGES, and UNREAD

**Note:** *The cfimap command works best on IMAP4 revision1. IMAP4 revision1 is backwards compatible with IMAP2 and IMAP2bis versions. Any previous versions are no more actively used.*

You can get errors in following scenarios:

- Accessing an invalid server connection is established. Check the network conditions and whether you are using appropriate server IP address and domain names. Use valid e-mail user names and passwords.
- Accessing non-existent folders: Check whether the folder you are accessing exists. Create or rename folders with valid names. You cannot rename core folders. Move mail within existing folders.
- Slow network: Verify if the timeout attribute needs a higher value. Actions such as `CreateFolder` may need longer time to execute. In such cases, adjust the value of the timeout attribute.

- Incorrect usage of cfimap attributes: Check if you are using the correct attribute. For example, if you have 15 e-mails in a folder and if the startrow or maxrow attribute has value of 18 then ColdFusion returns an error.
- The e-mail client does not recognize IMAP access. Verify whether your e-mail is set up to allow IMAP access. Complete the necessary IMAP access in connection settings section of your e-mail client.
- Using incorrect syntax for attributes: Verify that all attributes are defined per syntax.

**Example: 1**

```
<!--- Retrieving e-mails from a folder --->
<html >
  <head>
    <title>IMAP Mail Client</title>
  </head>
  <body>
    <!--- Replace your username and password with valid IMAP email account name and password.
    Replace "server address" with your IMAP server address--->
    <cfimap
      server = "server address" <!------->
      username = "yourname"
      action="open"
      secure="yes"
      password = "yourpassword"
      connection = "test.cf.gmail">
    <!--- Retrieve header information from the mailbox. --->
    <cfimap
      action="getHeaderOnly"
      connection="test.cf.gmail"
      name="queryname">
    <cfdump var="#queryname#">
    <cfimap
      action="close"
      connection = "test.cf.gmail">
  </body>
</html>
```

### Example: 2

```
<!--- Create a folder; copy mail from Inbox and list all folder info--->
<html >
  <head>
    <title>IMAP Mail Client</title>
  </head>
  <body>
    <!--- Replace yourname and yourpassword with valid IMAP email account name and password.
    Replace "server address" with your IMAP server address--->
    <cfimap
      server = "server address"
      username = "yourname"
      action="open"
      secure="yes"
      password = "yourpassword"
      connection = "test.cf.gmail">
    <!--- Create a new folder, named Folder1 --->
    <cfimap
      action="CreateFolder"
      folder="Folder1"
      connection="test.cf.gmail">
    <!--- Move first 2 mails from INBOX to Folder1. --->
    <cfimap
      action="MoveMail"
      newfolder="Folder1"
      messagenumber="1,2"
      stoponerror="true"
      connection="test.cf.gmail">
    <!--- List all folders and get the information in a query. --->
    <cfimap action="listallfolders"
      connection="test.cf.gmail"
      name="queryname">
    <!--- Display query containing all folders information. --->
    <cfdump var="#queryname#">
    <cfimap
      action="close"
      connection = "test.cf.gmail">
  </body>
</html>
```

**Example: 3**

```
<!--- Use form-based entry to access cfimap mail account. Save the form with name login.cfm.
--->
<html>
<head>
<title>IMAP Mail Client</title>
</head>
<body>
<cfif IsDefined("form.server")>
    <!--- Make sure server, username are not empty. --->
    <cfif form.server is not "" and form.username is not "">
        <cfimap
            server = "#form.server#"
            username = "#form.username#"
            action="open"
            Secure="yes"
            password = "#form.pwd#"
            connection = "#form.server#">
        <cfimap
            action="ListAllFolders"
            connection="#form.server#"
            name="queryname">
        <h3>Folders in your Inbox <cfoutput>#form.username#</cfoutput></h3>
        <ol>
            <cfoutput query = "queryname">
                <li>#NAME# - #TOTALMESSAGES# <b>(#UNREAD#)</b></li>
            </cfoutput>
        </ol>
        <!---<cfdump var="#queryname#">--->
        <cfimap action="close" connection = "#form.server#">
    </cfif>
<cfelse>
    <form action = "login.cfm " method = "post">
        <table>
            <tr>
                <td>Enter IMAP mail server</td><td><input type = "Text" name = "server"></td>
            </tr>
            <tr>
                <td>Enter your username</td><td><input type = "Text" name = "username"></td>
            </tr>
            <tr>
                <td>Enter your password</td><td><input type = "password" name = "pwd"></td>
            </tr>
            <tr>
                <td colspan="2"><input type="Submit" value="Get Folder List"
name="getFolderList"></td>
            </tr>
        </table>
    </form>
</cfif>
</body>
</html>
```

## cfimpersonate

### Description

This tag is obsolete. Use the newer security tools; see “[Conversion functions](#)” on page 689 and *Securing Applications* in the *Developing ColdFusion Applications*.

### History

ColdFusion MX: This tag is obsolete. It does not work in ColdFusion MX and later releases.

## cfimport

### Description

You can use the `cfimport` tag to import either of the following:

- All ColdFusion pages in a directory, as a tag custom tag library.
- A Java Server Page (JSP) tag library. A JSP tag library is a packaged set of tag handlers that conform to the JSP 1.1 tag extension API.

### Category

[Application framework tags](#)

### Syntax

```
<cfimport  
    prefix = "custom"  
    taglib = "tag library location">
```

### See also

[cfapplication](#)

### History

ColdFusion MX: Added this tag.

### Attributes

Attribute	Req/Opt	Default	Description
taglib	Required		<p>Tag library URI. The path must be relative to the web root (and start with /), the current page location, or a directory specified in the Administrator ColdFusion mappings page.</p> <ul style="list-style-type: none"><li>• A directory in which custom ColdFusion tags are stored. In this case, all the cfm pages in this directory are treated as custom tags in a tag library.</li><li>• A path to a JAR in a web-application, for example, "/WEB-INF/lib/sometags.jar"</li><li>• A path to a tag library descriptor, for example, "/sometags.tld"</li></ul> <p><b>Note:</b> You must put JSP custom tag libraries in the /WEB-INF/lib directory. This limitation does not apply to ColdFusion pages.</p>
prefix	Required		<p>Prefix by which to access the imported custom CFML tags JSP tags.</p> <p>If you import a CFML custom tag directory and specify an empty value, "", for this attribute, you can call the custom tags without using a prefix. Specify and use a prefix for a JSP tag library.</p>

## Usage

The following example imports the tags from the directory myCustomTags:

```
<cfimport
    prefix="mytags"
    taglib="myCustomTags">
```

You can import multiple tag libraries using one prefix. If there are duplicate tags in a library, the first one takes precedence.

JSP tags have fixed attributes; however, if the tag supports runtime attribute expressions, most tag libraries support the use of the syntax `#expressions#`.

To reference a JSP tag in a CFML page, use the syntax `<prefix:tagname>`. Set the prefix value in the `prefix` attribute.

## Use JSP custom tags in a ColdFusion page

- 1 Put a JSP tag library JAR file (for example, `mysptags.jar`) into the ColdFusion server directory `wwwroot/WEB-INF/lib`. If the tag library has a separate TLD file, put it in the same directory as the JAR file.
- 2 At the top of a CFML page, insert code such as the following:

```
<cfimport
    prefix="mytags"
    taglib="/WEB-INF/lib/mysptags.jar">
```

To reference a JSP tag from a JAR file, use the following syntax:

```
<cfoutput>
    <mytags:helloTag message="#mymessage#" />
</cfoutput>
```

The `cfimport` tag must be on the page that uses the imported tags. For example, if you use a `cfimport` tag on a page that you include with the `cfinclude` call, you cannot use the imported tags on the page that has the `cfinclude` tag. Similarly, if you have a `cfimport` tag on your `Application.cfm` page, the imported tags are available on the `Application.cfm` page only, not on the other pages in the application. ColdFusion does not throw an error in these situations, but the imported tags do not run.

You cannot use the `cfimport` tag to suppress output from a tag library.

For more information, see the Java Server Page 1.1 specification.

## Example

```
<h3>cfimport example</h3>
<p>This example uses the random JSP tag library that is available from the
    Jakarta Taglibs project, at http://jakarta.apache.org/taglibs/</p>

<cfimport taglib="/WEB-INF/lib/taglibs-random.jar" prefix="randomnum">

<randomnum:number id="randPass" range="000000-999999" algorithm="SHA1PRNG" provider="SUN"/>
<cfset myPassword = randPass.random>
<cfoutput>
    Your password is #myPassword#<br>
</cfoutput>
```

## cfinclude

### Description

Embeds references to ColdFusion pages in CFML. You can embed `cfinclude` tags recursively. For another way to encapsulate CFML, see “[cfmessagebox](#)” on page 425. (A ColdFusion page was formerly sometimes called a ColdFusion template or a template.)

### Category

[Flow-control tags](#), [Page processing tags](#)

### Syntax

```
<cfinclude  
    template = "template name">
```

**Note:** You can specify this tag’s attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag’s attribute names as structure keys.

### See also

[cfcache](#), [cfflush](#), [cfheader](#), [cfhtmlhead](#), [cfsetting](#), [cfsilent](#)

### History

ColdFusion MX: Changed error behavior: if you use this tag to include a CFML page whose length is zero bytes, you do not get an error.

### Attributes

Attribute	Req/Opt	Default	Description
template	Required		A logical path to a ColdFusion page.

### Usage

ColdFusion searches for included files in the following locations:

- 1 In the directory of the current page or a directory relative to the current page
- 2 In directories mapped in the ColdFusion Administrator

You cannot specify an absolute URL or file system path for the file to include. You can only use paths relative to the directory of the including page or a directory that is registered in the ColdFusion Administrator Mappings. The following `cfinclude` statements work, assuming that the `myinclude.cfm` file exists in the specified directory:

```
<cfinclude template="myinclude.cfm">  
<cfinclude template="../myinclude.cfm">  
<cfinclude template="/CFIDE/debug/myinclude.cfm">
```

But the following do not work:

```
<cfinclude template="C:\ColdFusion\wwwroot\doccomments\myinclude.cfm">  
<cfinclude template="http://localhost:8500/doccomments/myinclude.cfm">
```

The included file must be a syntactically correct and complete CFML page. For example, to output data from within the included page, you must have a `cfoutput` tag, including the end tag, on the included page, not the referring page. Similarly, you cannot span a `cfif` tag across the referring page and the included page; it must be complete within the included page.

You can specify a variable for the `template` attribute, as the following example shows:

```
<cfset templatetouse="../header/header.cfm">
<cfinclude template="#templatetouse#">
```

### Example

```
<!--- This example shows the use of cfinclude to paste CFML or HTML code into another page
      dynamically. --->

<h4>This example includes the dohome.htm page from the CFDOCS directory. The images do not
      display, because they are located in a separate directory. However, the page appears
      fully rendered within the contents of this page.</h4>
<cfinclude template = "../cfdocs/dohome.htm">
```

## cfindex

### Description

Populates a search engine collection with metadata and creates indexes for searching it. You can use both Verity and Solr search engines. The engines can search physical files of various types or a database query. Indexing database columns that result from a query lets users search the query data much faster than they could if you used multiple SQL queries to return the same data.

You must define a collection using the ColdFusion Administrator or the `cfcollection` tag before creating indexes for the collection.

You also can index a collection using the ColdFusion Administrator. For Verity collections, you can also use a native Verity indexing tool, such as Vspider or MKVDK. These options, however, limit you to indexing a collection of files in a directory path.

For more information on creating, indexing, and searching a collection, see *Building a Search Interface* in the *Developing ColdFusion Applications*.

### Category

[Extensibility tags](#)

## Syntax

```
<cfindex  
    action = "update|delete|purge|refresh"  
    collection = "collection name"  
    body = "body"  
    category = "category name"  
    categoryTree = "category tree"  
    custom1 = "custom value"  
    custom2 = "custom value"  
    custom3 = "custom value"  
    custom4 = "custom value"  
    extensions = "file extensions"  
    key = "ID"  
    language = "language"  
    prefix = "location of documents"  
    query = "query name"  
    recurse = "yes|no"  
    status = "status"  
    title = "title"  
    type = "type"  
    URLpath = "URL">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

## History

ColdFusion 9: Added Solr search engine support.

ColdFusion MX 7.0.1: Added the `prefix` attribute.

ColdFusion MX 7:

- Added the `category`, `categoryTree`, `custom3`, and `custom4` attributes for the `update` and `refresh` actions.
- Added the `status` attribute for the `update`, `refresh`, `delete`, and `purge` actions.
- Removed reference to external collections.
- Removed suggested `cflock` usage.

ColdFusion MX:

- The `action` attribute value `optimize` is obsolete. It does not work, and might cause an error, in ColdFusion MX.
- Changed the `external` attribute behavior: it is not necessary to specify the `external` attribute. (ColdFusion automatically detects whether a collection is internal or external.)
- Changed Verity operations behavior: ColdFusion supports Verity operations on Acrobat PDF files.
- Changed thrown exceptions: this tag can throw the `SEARCHENGINE` exception.
- Changed acceptable collection naming: this tag accepts collection names that include spaces.
- Changed query result behavior: the `cfindex` tag can index the query results from a `cfsearch` tag.

## Attributes

**Note:** Some attributes can be used only with Verity collections. The Req/Opt column indicates these options.

Attribute	Req/Opt	Default	Description
action	Required		<ul style="list-style-type: none"> <li>• update: updates a collection and adds <code>key</code> to the index.</li> <li>• delete: removes collection documents as specified by the <code>key</code> attribute.</li> <li>• purge: deletes all of the documents in a collection. Causes the collection to be taken offline, preventing searches.</li> <li>• refresh: deletes all of the documents in a collection, and then performs an update.</li> </ul>
collection	Required		Name of a collection that is registered by ColdFusion; for example, "personnel".
body	Required if <code>type=custom</code>		<ul style="list-style-type: none"> <li>• ASCII text to index.</li> <li>• Query column names, if name is specified in query.</li> </ul> <p>You can specify columns in a delimited list, for example: "emp_name, dept_name, location".</p> <p>This attribute is ignored if <code>type</code> is <code>file</code> or <code>path</code>, and is invalid if <code>action</code> is <code>delete</code>.</p>
category	Optional		A string value that specifies one or more search categories for which to index the data. You can define multiple categories, separated by commas, for a single index.
categoryTree	Optional		A string value that specifies a hierarchical category or category tree for searching. It is a series of categories separated by forward slashes ("/"). You can specify only one category tree.
custom1	Optional		<p>Use to index discrete values in collection records, which lets you search for specific records using the Verity MATCHES operator. By contrast, values specified in the <code>body</code> attribute are concatenated and searched as a body of text using the specified criteria.</p> <p>If <code>type = custom</code>, a query column name. If <code>type</code> is <code>file</code> or <code>path</code>, a string.</p>
custom2	Optional		Usage is the same as for <code>custom1</code> .
custom3	Optional		Usage is the same as for <code>custom1</code> .
<b>custom4</b>	Optional		Usage is the same as for <code>custom1</code> .
extensions	Optional	htm, html, cfm, cfml, dbm, dbml	<p>Delimited list of file extensions that ColdFusion uses to index files, if <code>type="Path"</code>.  <code>"*."</code> returns files with no extension. <code>"*"</code> returns all files.</p> <p>For example, the following code returns files with a listed extension or no extension:</p> <pre>extensions = ".htm, .html, .cfm, .cfml, '*.'</pre>
key	Required	(empty string)	<p>The value specified for <code>key</code> depends on the <code>type</code> attribute:</p> <ul style="list-style-type: none"> <li>• If <code>type="file"</code>, the directory path and filename for the file,</li> <li>• If <code>type="path"</code>, the directory path for the location of the files.</li> <li>• If <code>type="custom"</code>, a unique identifier that specifies the location of the data, For a query, the name of the column that holds the primary key, for example. If not a query, an identifier such as the URL for a web page, for example.</li> </ul>
language	Optional	English	For options, see <a href="#">cfcollection</a> . For Verity, requires the appropriate Locales language pack (Western Europe, Asia, Multi-language, Eastern Europe/Middle Eastern).

Attribute	Req/Opt	Default	Description
prefix	Optional		Specifies the location of files to index when the computer that contains the K2 Search Service is not the computer on which you installed ColdFusion, and when you index files with the <code>type</code> attribute set to <code>path</code> .
query	Optional.		The name of the query against which the collection is generated.
recurse	Optional	no	<ul style="list-style-type: none"><li>• <code>yes</code>: If <code>type="path"</code>, indexes qualified files in directories below the path specified in the <code>key</code> attribute.</li><li>• <code>no</code></li></ul>
status	Optional		The name of the structure into which ColdFusion returns status information.
title	Optional		Provides a title for the document if one cannot be extracted from the document.
type	Optional	custom, if query attribute is specified. Otherwise, file.	<ul style="list-style-type: none"><li>• <code>file</code>: applies <code>action</code> value to filename, including path. Expects a filename in the <code>key</code> attribute.</li><li>• <code>path</code>: applies <code>action</code> to files in a directory path that pass the <code>extensions</code> filter. Expects a directory name in the <code>key</code> attribute.</li><li>• <code>custom</code>: applies <code>action</code> to custom data; for example, to data from a query.</li></ul>
URLpath	Optional		If <code>type</code> is <code>file</code> or <code>path</code> , specifies the URL path. During indexing, this pathname is prefixed to filenames and returned from a search as the <code>url</code> .

### Usage

The attributes settings that the `cfindex` tag requires depend on whether you set the `query` attribute. If you set the `query` attribute to a valid query name, it specifies that `cfindex` is to index the data in the query rather than indexing documents on a disk. If you do *not* set the `query` attribute, `cfindex` assumes that it is indexing a file (`type = file`), a set of files in a directory path (`type = path`), or text that you provide in the `body` attribute (`type = custom`).

If you set the `query` attribute to a valid query name, the `cfindex` tag creates indexes as specified by the following attributes and their values:

Type	Attribute values
File	The <code>key</code> attribute is the name of a column in the query that contains a full filename (including path).
Path	The <code>key</code> attribute is the name of a column in the query that contains a directory pathname.
	The <code>extensions</code> and <code>recurse</code> attributes, if specified, elaborate on which files are included. If the <code>action</code> is <code>delete</code> , <code>cfindex</code> deletes keys for the collection.
Custom	The <code>key</code> attribute specifies a column name that contains anything you want; for example, the primary key value in the database. It must be unique because this is the primary key in the collection. If the <code>action</code> is <code>delete</code> , the <code>key</code> attribute is the name of a column in the query that contains the keys to delete.
	The <code>body</code> attribute is required and is a comma-delimited list of the names of the columns that contain the text data to be indexed.

If you do *not* set the `query` attribute, the `cfindex` tag creates indexes as specified by the following attributes and their values:

Type	Attribute values
File	The <code>key</code> attribute is required and is a full pathname to a file.
Path	The <code>key</code> attribute is required and it is a directory pathname.
	The <code>extensions</code> and <code>recurse</code> attributes, if specified, designate which types of files are included. If the action is <code>delete</code> , both the keys and the document files are deleted.
Custom	The <code>key</code> attribute is an identifier that specifies the key. If the action is <code>delete</code> , the <code>key</code> attribute is the document key to delete.
	The <code>body</code> attribute is required and is the text to be indexed.

If `type` is not specified but `query` is set, ColdFusion sets the `type` to the default value of `custom`.

If neither `type` nor `query` is set, ColdFusion sets `type` to the default value of `file`.

If `type` equals `custom`, all attributes except for `key` and `body` can specify a literal value, not only a column name. This allows you to change a field to empty in the collection.

### Status attribute

The `status` attribute provides the following information and diagnostics about the result of a `cfindex` operation:

Key	Type	Description
BADKEYS	Struct	A structure of keys with diagnostic messages about the indexing of these keys. If there are no bad keys, this key does not exist.
DELETED	Number	The number of keys deleted.
MESSAGES	Array	An array of diagnostic messages, including nonfatal errors and warnings, returned from the Verity K2 Index server. If there are no messages, this key does not exist.
INSERTED	Number	The number of keys inserted into the collection.
UPDATED	Number	The number of keys updated in the collection.

### Example

```
<!--- EXAMPLE #1 Index a file, type = "file". ----->
<!--- Example dumps content of status variable (info). ----->
<cfindex collection="CodeColl"
    action="refresh"
    type="file"
    key="C:\ColdFusion\wwwroot\vw_files\cfindex.htm"
    urlpath="http://localhost:8500/vw_files/"
    language="English"
    title="Cfindex Reference page"
    status="info">

<!--- Search for Attributes. --->
<cfsearch
    name = "mySearch"
    collection = "CodeColl"
    criteria = "Attributes"
    contextpassages = "1"
    maxrows = "100">
<cfoutput>
    key=#mySearch.key#<br />
    title=#mySearch.title#<br />
```

```
        context=#mySearch.context#<br />
        url=#mySearch.url#<br />
    </cfoutput>

    <cfdump var="#info#">

    <!--- EXAMPLE #2 Index a path (type = "path"). ----->
    <cfindex collection="CodeColl"
        action="refresh"
        type="path"
        key="C:\inetpub\wwwroot\vw_files\newspaper\sports"
        urlpath="http://localhost/vw_files/newspaper/sports"
        extensions = ".htm, .html"
        recurse="no"
        language="English"
        categoryTree="vw_files/newspaper/sports"
        category="Giants">

    <!--- Search for any references to criteria. --->
    <cfsearch
        name = "mySearch"
        collection = "CodeColl"
        categoryTree="vw_files/newspaper/sports"
        category="Giants"
        criteria = "Williams"
        contextpassages = "1"
        maxrows = "100">
    <cfoutput>
        key=#mySearch.key#<br />
        title=#mySearch.title#<br />
        context=#mySearch.context#<br />
        url=#mySearch.url#<br />
    </cfoutput>

    <!---EXAMPLE #3: Index a QUERY (type = "custom") using custom1. ----->
    <!--- Retrieve data from the table. --->
    <cfquery name="getCourses" datasource="cfdocexamples">
        SELECT * FROM COURSES
    </cfquery>

    <!--- Update the collection with the above query results. --->
    <!--- key is Course_ID in the Courses table. ---->
    <!--- body specifies the columns to be indexed for searching. --->
    <!--- custom1 specifies the value of the Course_Number column. --->

    <cfindex
        query="getCourses"
        collection="CodeColl"
        action="Update"
        type="Custom"
        key="Course_ID"
        title="Courses"
        body="Course_ID,Descript"
        custom1="Course_Number"
    >
    <h2>Indexing Complete</h2>
    <!--- cno supplies value for searching custom1; could be form input instead. --->
```

```
<cfset cno = "540">
<cfsearch
    name = "mySearch"
    collection = "CodeColl"
    criteria = "CF_CUSTOM1 <MATCHES> #cno#"

```

Some attributes apply to only specific display formats. For details, see the Attributes table.

In HTML format forms, standard HTML input control attributes not listed above are passed to the HTML and have their normal effect.

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### History

#### ColdFusion 8

- Added `autosuggest`, `autosuggestBindDelay`, `autosuggestMinLength`, `delimiter`, `maxResultsDisplayed`, `showAutosuggestLoadingIcon`, and `typeahead` attributes.
- Added support for the `bind` attribute in HTML forms and the `bindAttribute` and `bindOnload`, and `onBindError` attributes.
- Added the `sourceForTooltip` attribute
- Added support for `datefield` value of the `type` attribute in HTML forms.

#### ColdFusion MX 7:

- Added support for `button`, `file`, `hidden`, `image`, `reset`, and `submit` controls.
- Added support for generating Flash and XML controls (specified in the `cform` tag).
- Added `datefield` type (Flash forms only) and the supporting `dayNames` and `monthNames` attributes.
- Added `bind`, `enabled`, `height`, `label`, `tooltip`, `visible`, and `width` attributes for use in Flash forms.
- Added support for `onBlur` and `onServer` validation, including the `validateAt` attribute.
- Added `USdate`, `range`, `boolean`, `email`, `URL`, `uuid`, `guid`, `maxlength`, `noblanks`, and `submitOnce` `validate` attribute values.
- Added support for preventing multiple submissions.
- Added the `mask` attribute.
- Deprecated the `passthrough` attribute. The tag now supports all HTML input tag attributes directly.

ColdFusion MX: Changed the `cform` tag `preserveData` attribute behavior: if it is set to `True`, ColdFusion checks radio and check box values only if their value matches the posted value for the control. (In earlier releases, if the posted value did not match any of the `cfinput` check boxes or radio buttons for the control, the `checked` attribute was used.

### Attributes

The following table lists attributes that ColdFusion uses directly. The tag also supports all HTML `form` tag attributes that are not on this list, and passes them directly to the browser.

**Note:** Attributes that are not marked as supported in *All* or *XML* are not handled by the skins provided with ColdFusion. They are, however, included in the generated XML.

Attribute	Req/Opt; formats	Default	Description
name	Required; all		Name for form input element.
autosuggest	Optional, HTML		<p>Specifies entry completion suggestions to display as the user types into a text input. The user can select a suggestion to complete the text entry.</p> <p>The valid value can be either of the following:</p> <ul style="list-style-type: none"> <li>A string that consists of the suggestion values separated by the delimiter specified by the <code>delimiter</code> attribute.</li> <li>A bind expression that gets the suggestion values based on the current input text. The bind expression must pass a <code>cfautosuggestvalue</code> bind parameter to represent the user input.</li> </ul> <p>Valid only for <code>cfinput type="text"</code>.</p> <p>For more information, see <i>Using autosuggest text input fields in the Developing ColdFusion Applications</i></p>
autosuggestBindDelay	Optional, HTML	0.5 seconds	<p>A nonzero integer that specifies the minimum time between <code>autosuggest</code> bind expression invocations, in seconds. This value also specifies the delay from when the user first enters a minimum-length entry in the field until the suggestion box appears. Use this attribute to limit the number of requests that are sent to the server when a user types.</p> <p>Valid only for <code>cfinput type="text"</code>.</p> <p><b>Note:</b> The only way to get the default behavior is to omit the attribute. Otherwise, the delay must be a nonzero integer value.</p>
autosuggestMinLength	Optional, HTML	1	<p>The minimum number of characters required in the text box before invoking a bind expression to return items for suggestion.</p> <p>Valid only for <code>cfinput type="text"</code>.</p>
bind	Optional; HTML, Flash		A bind expression that dynamically sets an attribute of the control. For details, see Usage.
bindAttribute	Optional; HTML	value	<p>Specifies the HTML tag attribute whose value is set by the <code>bind</code> attribute. You can only specify attributes in the browser's HTML DOM tree, not ColdFusion-specific attributes.</p> <p>Ignored if there is no <code>bind</code> attribute.</p> <p>Valid only for <code>cfinput type="text"</code>.</p>
bindOnLoad	Optional; HTML	no	<p>A Boolean value that specifies whether to execute the <code>bind</code> attribute expression when first loading the form.</p> <p>Ignored if there is no <code>bind</code> attribute.</p> <p>Valid only for <code>cfinput type="text"</code>.</p>
checked	Optional; all	no	<p>Selects a radio button or check box control:</p> <ul style="list-style-type: none"> <li>yes</li> <li>no</li> </ul> <p>For HTML format, you can indicate that the item is selected by specifying the value as <code>checked</code> or specifying the attribute with no value.</p>

Attribute	Req/Opt; formats	Default	Description
dayNames	Optional; all	S, M, T, W, T, F, S	Applies to <code>datefield</code> type only. A comma-delimited list that sets the names of the weekdays displayed in the calendar. Sunday is the first day; the rest of the weekday names follow in the normal order.
delimiter	Optional, HTML	comma (,)	The delimiter to use to separate entries in a static auto-suggest list. This attribute is meaningful only if the <code>autosuggest</code> attribute is a string of delimited values.
disabled	Optional; all	not disabled	Disables user input, making the control read-only. The attribute behavior depends on the format of the form as follows: <ul style="list-style-type: none"> <li>HTML format forms: ColdFusion passes this attribute directly to the HTML. To disable input, specify <code>disabled</code> without a value (HTML format) or with the value <code>disabled</code> (XHTML compliant). To enable input, omit this attribute.</li> <li>Flash format forms: To disable input, specify <code>disabled</code> without an attribute, or <code>disabled="yes"</code> (or any ColdFusion positive Boolean value, such as <code>true</code>). To enable input, omit the attribute or specify <code>disabled="no"</code> (or any ColdFusion negative Boolean value, such as <code>false</code>).</li> </ul>
<b>enabled</b>	Optional; Flash	yes	Boolean value that specifies whether the control is enabled. A disabled control appears in light gray. The inverse of the <code>disabled</code> attribute.
firstDayOfWeek	Optional; all	0	Applies to <code>datefield</code> type only. Integer in the range 0-6 that specifies the first day of the week in the calendar: 0 indicates Sunday; 6 indicates Saturday.
height	Optional; see Description		Applies to most Flash types, HTML image type on some browsers. The height of the control, in pixels. The displayed height might be less than the specified size.
id	Optional; HTML	name attribute value	The HTML ID of the form.
label	Optional; Flash, XML		Label to put next to the control on a Flash form. Not used for button, hidden, image, reset, or submit types.

Attribute	Req/Opt; formats	Default	Description
mask	Optional; Flash, HTML		<p>For tags with <code>type="text"</code>. A mask pattern that controls the character pattern that users can enter, or that the form sends to ColdFusion. Mask characters and the corresponding valid input characters are:</p> <ul style="list-style-type: none"> <li>• A = [A-Za-z]</li> <li>• X = [A-Za-z0-9]</li> <li>• 9 = [0-9]</li> <li>• ? = Any character</li> <li>• All other characters = insert the literal character</li> </ul> <p>For tags with <code>type="datefield"</code>, a pattern that controls the format of dates that the user selects in the calendar. Mask characters are:</p> <ul style="list-style-type: none"> <li>• D = day; can use 0-2 mask characters.</li> <li>• M = month; can use 0-4 mask characters.</li> <li>• Y = year; can use 0, 2, or 4 characters.</li> <li>• E = day in week; can use 0-4 characters.</li> </ul> <p>For more information, see the Usage section.</p>
matchContains	Optional	false	If true, the match returned <i>contains</i> the query string. By default, the results that <i>start with</i> the query string are returned.
maxLength	Optional; all		Maximum length of text entered, if <code>type="Text"</code> or <code>"password"</code> . For complete length validation, specify <code>maxLength</code> validation in a <code>validate</code> attribute; otherwise, this attribute prevents users from typing beyond the specified length, but does not prevent them from pasting in a longer value.
maxResultsDisplayed	Optional; HTML	10	The maximum number suggestions to display in the auto-suggest list.  Valid only for <code>cfinput type="text"</code> .
message	Optional; all		Message text to display if validation fails.
monthNames	Optional; all	January, February, March, April, May, June, July, August, September, October, November, December	Applies to <code>datefield</code> type only. A comma-delimited list of the month names that display at the top of the calendar.
onBindError	Optional; HTML	See Description	<p>The name of a JavaScript function to execute if evaluating a bind expression, including an auto-suggest bind expression, results in an error. The function must take two attributes: an HTTP status code and a message.</p> <p>If you omit this attribute, and have specified a global error handler (by using the <code>ColdFusion.setGlobalErrorHandler</code> function), it displays the error message; otherwise a default error pop-up displays.</p>

Attribute	Req/Opt; formats	Default	Description
onChange	Optional; all		JavaScript (HTML/XML) or ActionScript (Flash) to run when the control changes due to user action. In Flash, applies to datefield, password, and text types only.
onClick	Optional; all		JavaScript (HTML/XML) or ActionScript (Flash) to run when the user clicks the control. In Flash, applies to button, checkbox, image, radio, reset, and submit types only.
onError	Optional; HTML, XML		Name of a custom JavaScript function to execute if validation fails.
onKeyDown	Optional; all		JavaScript (HTML/XML) or ActionScript (Flash) ActionScript to run when the user presses a keyboard key in the control.
onKeyUp	Optional; all		JavaScript (HTML/XML) or ActionScript (Flash) to run when the user releases a keyboard key in the control.
onMouseDown	Optional; all		JavaScript (HTML/XML) or ActionScript (Flash) to run when the user releases a mouse button in the control.
onMouseUp	Optional; all		JavaScript (HTML/XML) or ActionScript (Flash) to run when the user presses a mouse button in the control.
onValidate	Optional; HTML, XML		Name of a custom JavaScript function to validate user input. The form object, input object, and input object values are passed to the routine, which should return <code>true</code> if validation succeeds, and <code>false</code> otherwise. If used, the <code>validate</code> attribute is ignored.
pattern	Required if <code>validate=</code> <code>"regex";</code> HTML, XML		JavaScript regular expression pattern to validate input. ColdFusion uses this attribute only if you specify <i>regex</i> in the <code>validate</code> attribute.  Omit leading and trailing slashes. For examples and syntax, see Building Dynamic Forms with cform Tags in the <i>Developing ColdFusion Applications</i> .
range	Optional; all		Minimum and maximum allowed numeric values. ColdFusion uses this attribute only if you specify <i>range</i> in the <code>validate</code> attribute.  If you specify a single number or a single number followed by a comma, it is treated as a minimum, with no maximum. If you specify a comma followed by a number, the maximum is set to the specified number, with no minimum.  <b>Note:</b> ColdFusion does not process the <code>range</code> attribute when you use <code>onsubmit</code> or <code>onBlur</code> validation in XML format forms.
readonly	Optional; Flash, HTML		Applies to HTML and Flash forms. Valid only for <code>cinput type="text"</code> . ColdFusion ignores this attribute for all other input types.
required	Optional; all	no	<ul style="list-style-type: none"> <li>yes: the field must contain data.</li> <li>no: allows an empty field.</li> </ul>
showAutosuggestLoadingIcon	Optional; HTML	true	A Boolean value that specifies whether to display an animated icon when loading an auto-suggest value for a text input.
size	Optional; all		Size of input control. Ignored, if <code>type="radio"</code> or <code>"checkbox"</code> .  If specified in a Flash form, ColdFusion sets the control width pixel value to 10 times the specified size and ignores the <code>width</code> attribute.

Attribute	Req/Opt; formats	Default	Description
sourceForTooltip	Optional; HTML		The URL of a page to display as a tool tip. The page can include HTML markup to control the format, and the tip can include images.  If you specify this attribute, an animated icon appears with the text "Loading..." while the tip is being loaded.
src	Optional; Flash, HTML		Applies to Flash button, reset, submit, and image types, and the HTML image type. URL of an image to use on the button.
style	Optional; all		In HTML or XML format, ColdFusion passes the style attribute to the browser or XML.  In Flash format, must be a style specification in CSS format. For detailed information on specifying Flash styles, see <i>Creating Forms in Flash</i> in the <i>Developing ColdFusion Applications</i> .  In XML format, ColdFusion passes the style attribute to the XML.
tooltip	Optional; Flash, HTML		Text to display when the mouse pointer hovers over the control.  Ignored if you specify a sourceForTooltip attribute.
type	Optional; all	text	The input control type to create: <ul style="list-style-type: none"> <li>• <b>button</b>: push button.</li> <li>• <b>checkbox</b>: check box.</li> <li>• <b>datefield</b>: HTML and Flash only; date entry field with an expanding calendar from which users select the date or dates. In HTML format only, users can also enter the date by typing in the field.</li> <li>• <b>file</b>: file selector; not supported in Flash. Not supported when you use Ajax form submission to submit the form asynchronously from the page.</li> <li>• <b>hidden</b>: invisible control.</li> <li>• <b>image</b>: clickable button with an image.</li> <li>• <b>password</b>: password entry control; hides input values.</li> <li>• <b>radio</b>: radio button.</li> <li>• <b>reset</b>: form reset button.</li> <li>• <b>submit</b>: form submission button.</li> <li>• <b>text</b>: text entry box.</li> </ul>
typeahead	Optional; HTML	no	A Boolean value that specifies whether the auto-suggest feature should automatically complete a user's entry with the first result in the suggestion list.  Valid only for <code>cfinput type="text"</code> .
validate	Optional; all		The type or types of validation to do. Available validation types and algorithms depend on the format. For details, see Usage.

Attribute	Req/Opt; formats	Default	Description
validateAt	Optional; all	onSubmit	How to do the validation; one or more of the following values: <ul style="list-style-type: none"><li>• onSubmit</li><li>• onServer</li><li>• onBlur</li></ul> The onBlur and onSubmit values are identical in Flash forms. For multiple values, use a comma-delimited list. For details, see Usage.
value	depends on type setting; all		HTML: corresponds to the HTML value attribute. Its use depends on control type. Flash: optional; specifies text for button type inputs: button, submit, and image.
visible	Optional; Flash	yes	Boolean value that specifies whether to show the control. Space that would be occupied by an invisible control is blank.
width	Optional; see Description		Applies to most Flash types, and HTML image type on some browsers. The width of the control, in pixels. For Flash forms, ColdFusion ignores this attribute if you also specify a size attribute value.

**Note:** Attributes that are marked as not supported in XML are not handled by the skins provided with ColdFusion. They are, however, included in the generated XML.

### Usage

For this tag to work properly, the browser must be JavaScript-enabled.

If the `cfformpreserveData` attribute is true and the form posts back to the same page, the posted value of the `cfinput` control is used, instead of its Value or Checked attribute.

You can use the keyboard to access and select dates from a `datefield` Flash input: press Tab to go to the field and press the Spacebar to open the menu. Use the Up, Down, Left, and Right Arrow keys to change the selected date. Use the Home and End keys to reach the first and last enabled date in a month, respectively. Use the Page Up and Page Down keys to reach the previous and next month, respectively.

**Note:** To clear a `datefield` entry in Flash format forms, select the field to open the menu, and click the selected date.

For more information, see [cfform](#). For information on using JavaScript regular expressions with this tag, see Building Dynamic Forms with `cfform` Tags in the *Developing ColdFusion Applications*.

### Validation

The following sections describe how to do validation in `cfinput` tags.

**Validation methods** ColdFusion provides four methods of validation of `cfinputtext` and `password` fields.

You can specify one or a combination of the following in the `validateAt` attribute:

- `onSubmit` The form page on the browser includes JavaScript functions that perform validation before the form is submitted to the server. In Flash format forms, this option is identical to `onBlur`.
- `onBlur` In HTML format the form page on the browser includes JavaScript functions that perform validation when the field loses the focus. In Flash format, the attribute is equivalent to `onSubmit`. `onBlur` validation uses the same algorithms as `onSubmit` validation. `onBlur` validation was added in ColdFusion MX 7.

- **onServer** ColdFusion performs the validation on the server. Some onServer algorithms vary from the onSubmit algorithms. OnServer Date and Time validation allow more patterns than onSubmit validation. OnServer validation was added in ColdFusion MX 7, and automatically generates hidden fields to support the validation.

You can also omit a `validate` attribute and specify the type of validation for the field in a separate hidden form field. This form of validation is equivalent to onServer validation, but it lets you specify separate messages for each validation that you do on the field. It is backward compatible with previous ColdFusion releases. For more information on hidden form field validation, see [cform](#) and Validating form data using hidden fields in Validating form data using hidden fields in the *Developing ColdFusion Applications*.

**Validation types** Use the following values in the `validate` attribute to specify input validation for all validation methods. Most attributes apply only to password or text fields. You can specify multiple validation types in a comma-delimited list, but only some combinations are meaningful.

Type	Description
date	If <code>validateAt="onServer"</code> , allows any date format that returns <code>true</code> in the <code>IsDate</code> function; otherwise, same as <code>USdate</code> .
USdate	A US date of the format <code>mm/dd/yy</code> <code>mm-dd-yy</code> or <code>mm.dd.yy</code> , with 1-2 digit days and months, 1-4 digit years.
eurodate	A date of the format <code>dd/mm/yy</code> , with 1-2 digit days and months, 1-4 digit years. The format can use <code>/</code> , <code>-</code> , or <code>.</code> characters as delimiters.
time	Time format <code>hh:mm:ss</code>
floatOrnumeric	A number; allows integers.
integer	An integer.
range	A numeric range.
boolean	A value that can be converted to a Boolean value: Yes, No, True, False, or a number.
telephone	Standard U.S. telephone formats. Allows an initial 1 long-distance designator and up to 5-digit extensions, optionally starting with <code>x</code> .
zipcode	U.S. 5- or 9-digit ZIP code format <code>#####-####</code> . The separator can be a hyphen ( <code>-</code> ) or a space.
creditcard	Strips blanks and dashes; verifies number using mod10 algorithm. Number must have 13-16 digits.
ssnOrsocial_security_number	US. Social Security number format, <code>###-##-####</code> . The separator can be a hyphen ( <code>-</code> ) or a space.
email	A valid e-mail address of the form <code>name@server.domain</code> . ColdFusion validates the format only; it does not check that entry is a valid active e-mail address.
URL	A valid URL pattern; supports <code>http</code> , <code>https</code> , <code>ftp</code> file, <code>mailto</code> , and <code>news</code> URLs.
guid	A unique identifier that follows the Microsoft/DCE format, <code>xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxx</code> , where <code>x</code> is a hexadecimal number.
uuid	A universally unique identifier (UUID) that follows the ColdFusion format, <code>xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxx</code> , where <code>x</code> is a hexadecimal number.
maxlength	Limits the input to a maximum number of characters.
noblanks	Does not allow fields that consist only of blanks.
regexOrregular_expression	Matches input against the <code>pattern</code> attribute. Valid in HTML and XML format only; ignored in Flash format.
SubmitOnce	Used only with <code>submit</code> and <code>image</code> types; prevents the user from submitting the same form multiple times before until the next page loads (for example, submitting an order a second time before getting the first order confirmation). Valid in HTML and XML format only; ignored in Flash format.

**Validation differences** The preceding table describes the general validation behavior. The underlying validation code must differ depending on the validation method and the form type. As a result, the algorithms used vary in some instances, including the following:

- The validation algorithms used for date/time values varies between onSubmit/OnBlur and OnServer.
- The algorithms used for onSubmit/OnBlur validation in Flash vary from those used for HTML/XML format, and generally follow simpler rules.

The table describes the onSubmit/OnBlur behavior in HTML format. For detailed information on the OnServer validation algorithms, see Data validation types in Data validation types in the *Developing ColdFusion Applications*.

For more information on validation, including discussions of the advantages and disadvantages of different validation types, see Validating Data in the *Developing ColdFusion Applications*.

### Masking input data

In HTML and Flash forms, the `mask` attribute controls the format of data that can be entered into a text field or that is selected in a datefield input control calendar. In HTML format, it does *not* prevent users from typing a date that does not follow the mask into a datefield input control. You can combine masking and validation on a field.

In text fields, ColdFusion automatically inserts any literal mask characters, such as hyphen (-) characters in telephone numbers. Users type only the variable part of the field.

The following pattern enforces entry of a part number of the format EB-1234-c1-098765, where the user starts the entry by typing the first numeric character, such as 3. ColdFusion fills in the preceding EB prefix and all - characters. The user must enter four numbers, followed by two alphanumeric characters, followed by six numbers.

```
<cfinput type="text" name="newPart" mask="EB-9999-XX-999999"/>
```

**Note:** To force a pattern to be all-uppercase or all-lowercase, use the ColdFusion `UCASE` or `LCASE` functions in the action page.

For tags with `type="datefield"` (and `cfcalendar` tags), the number of pattern characters determines the format of the output when the user selects a date in the calendar, as follows:

Mask	Pattern
D	Single- or double-digit day of month, such as 1 or 28
DD	Double-digit day of month, such as 01 or 28
M	Single- or double-digit month, such as 1 or 12
MM	Double-digit month, such as 01 or 12
MMM	Abbreviated month name, such as Jan or Dec
MMMM	Full month name, such as January or December
YY	Two-character year, such as 05
YYYY	Four-character year, such as 2005
E	Single-digit day of week, such as 1 or 7
EEE	Abbreviated day of week name, such as Mon or Sun
EEEE	Full month day of week name, such as Monday or Sunday

The following pattern specifies that the Flash forms sends the date selected by using a `datefield` input control to ColdFusion as text in the format 04/29/2004:

```
<cfinput name="stDate" type="datefield" label="date:" mask="mm/dd/yyyy"/>
```

### Flash form data binding

The `bind` attribute lets you populate form fields by using the contents of other form fields. To specify text from another field in a Flash format `cfinput` tag `bind` attribute, use the following format:

```
{sourceTagName.text}
```

For example, the following line uses the values from the `firstName` and `lastName` fields to construct an e-mail address. (The user can change or replace this value with a typed entry.)

```
<cfinput type="text" name="email" label="email"
        bind="{firstName.text}.{lastName.text}@mm.com">
```

### HTML form data binding

The `bind` attribute lets you set `cfinput` attributes dynamically. For example, you can automatically fill an email field text-input value based on name and domain field values.

In HTML format, the `bind` attribute specifies a *bind expression*, which can have any for the following forms:

- A *Bind parameter* or string that contains one or more bind parameters. A bind parameter specifies a form control value or other attribute and, optionally, an event. In its most basic form, a bind parameter consists of the `name` or `id` attribute of the control to which you are binding in braces (`{ }`). The value of the control attributes specified in the bind parameters determine the value of the `cfinput` control attribute.
- A CFC or JavaScript function, or URL, typically using one or more bind parameters as function parameters. The data returned by the function or URL sets the `cfinput` attribute value.

For details of using HTML form data binding, see *Binding data to form fields* in the *Developing ColdFusion Applications*.

**Note:** To bind to a `cfinput` control with `type` attribute of `button`, specify a bind event setting such as `click` in the bind expression of the control that binds to the button. The default event, `onChange`, has no effect.

### Example: without binding

```
<!--- This example shows the use of cfinput within a cfform to ensure simple
validation of text items. --->
<cfform action = "cfinput.cfm">
<!--- Phone number validation. --->
Phone Number Validation (enter a properly formatted phone number): <br>
<cfinput
    type = "Text" name = "MyPhone"
    message = "Enter telephone number, formatted xxx-xxx-xxxx (e.g. 617-761-2000)"
    validate = "telephone" required = "yes">
    <font size = -1 color = red>Required</font>
<!--- Zip code validation. --->
<p>Zip Code Validation (enter a properly formatted zip code):<br>
<cfinput
    type = "Text" name = "MyZip"
    message = "Enter zip code, formatted xxxxx or xxxxx-xxxx"
    validate = "zipcode" required = "yes">
    <font size = -1 color = red>Required</font>
<!--- Range validation. --->
<p>Range Validation (enter an integer from 1 to 5): <br>
<cfinput
    type = "Text" name = "MyRange" range = "1,5"
    message = "You must enter an integer from 1 to 5"
    validate = "integer" required = "no">
<!--- Date validation. --->
<p>Date Validation (enter a properly formatted date):<br>
<cfinput
    type = "Text" name = "MyDate"
    message = "Enter a correctly formatted date (dd/mm/yy)"
    validate = "date" required = "no">
<input
    type = "Submit" name = ""
    value = "send my information">
</cfform>
```

### Example: with binding

The following example uses binding to generate a default e-mail address based on input controls with a first, last and domain names, and fills in the e-mail text-input field with the result.

The CFML page contains the following code:

```
<h3>CFC bind using onkeyup() event</h3>
<ul>
    <li>When you type in the First Name field, the first initial appears in
        the Email control.</li>
    <li>Each key you enter in the Last Name and Domain fields appears in the
        Email control.</li>
</ul>

<cform name="mycform">
    First Name<font color="#FF0000">*</font>:&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&~
    <cfinput type="text" name="firstname" required="yes"><br>
    Last Name<font color="#FF0000">*</font>:&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&~
    <cfinput type="text" name="lastname" required="yes"><br>
    Domain<font color="#FF0000">*~
    </font>:&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&nbsp;&~
    <cfinput type="text" name="domain" required="yes"><br>
<br>
    <cfinput type="text" name="email1"
        bind="cfc:bindFcns.getEmailId({firstname@keyup},{lastname@keyup},
            {domain@keyup})">
<br><br>
<font color="#FF0000">*</font> indicates the field is required.
</cform>
```

The bindFcns CFC contains the following code:

```
<cfcomponent>
  <cffunction name="getEmailId" access="remote">
    <cfargument name="firstname">
    <cfargument name="lastname">
    <cfargument name="domain">
    <cfreturn "#left(firstname,1)#.##lcase(arguments.lastname)##lcase(domain)#">
  </cffunction>
</cfcomponent>
```

## cinsert

### Description

Inserts records in data sources from data in a ColdFusion form or form Scope.

## Category

## Database manipulation tags

## Syntax

```
<cfinset
    dataSource = "data source name"
    tableName = "table name"
    formFields = "formfield1, formfield2, ..."
    password = "password"
    tableOwner = "owner"
    tableQualifier = "table qualifier"
    username = "user name">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

#### See also

#### History

ColdFusion MX: Deprecated the `connectString`, `dbName`, `dbServer`, `dbtype`, `provider`, and `providerDSN` attributes. They do not work, and might cause an error, in releases later than ColdFusion 5.

#### Attributes

Attribute	Req/Opt	Default	Description
<code>dataSource</code>	Required		Data source; contains table.
<code>tableName</code>	Required		Table in which to insert form fields.  ORACLE drivers: must be uppercase.  Sybase driver: case-sensitive. Must be the same case used when table was created
<code>formFields</code>	Optional	(all on form, except keys)	Comma-delimited list of form fields to insert. If not specified, all fields in the form are included.  If a form field is not matched by a column name in the database, ColdFusion throws an error.  The database table key field must be present in the form. It may be hidden.
<code>password</code>	Optional		Overrides password specified in ODBC setup.
<code>tableOwner</code>	Optional		For data sources that support table ownership (such as SQL Server, Oracle, and Sybase SQL Anywhere), use this field to specify the owner of the table.
<code>tableQualifier</code>	Optional		For data sources that support table qualifiers, use this field to specify qualifier for table. The purpose of table qualifiers varies among drivers. For SQL Server and Oracle, qualifier refers to name of database that contains table. For Intersolv dBASE driver, qualifier refers to directory where DBF files are located.
<code>username</code>	Optional		Overrides username specified in ODBC setup.

## Example

```
<!--- This example shows how to use cfinsert instead of cfquery to put data in a
datasource. --->
<!--- If form.POSTED exists, we insert new record, so begin cfinsert tag. --->
<cfif IsDefined ("form.posted")>
    <cfinsert dataSource = "cfdocexamples"
        tableName = "COMMENTS"
        formFields = "Email,FromUser,Subject,MessText,Posted">
        <h3><i>Your record was added to the database.</i></h3>
</cfif>

<cfif IsDefined ("form.posted")>
    <cfif Server.OS.Name IS "Windows NT">
        <cfinsert dataSource="cfdocexamples" tablename="COMMENTS"
            formFields="EMail,FromUser,Subject,MessText,Posted">
    <cfelse>
        <cfinsert dataSource="cfdocexamples" tablename="COMMENTS"
            formFields="CommentID,EMail,FromUser,Subject,MessText,Posted">
    </cfif>
    <h3><i>Your record was added to the database.</i></h3> </cfif>

<!--- Use a query to show the existing state of the database. --->
<cfquery name = "GetComments" dataSource = "cfdocexamples">
    SELECT
        CommentID, EMail, FromUser, Subject, CommntType, MessText, Posted, Processed
    FROM
        COMMENTS
</cfquery>

<html>
<head></head>
<h3>cfinsert Example</h3>
<p>First, show a list of the comments in the cfdocexamples datasource.
<!--- Show all the comments in the db. --->
<table>
    <tr>
        <td>From User</td><td>Subject</td><td>Comment Type</td>
        <td>Message</td><td>Date Posted</td>
    </tr>
    <cfoutput query = "GetComments">
        <tr>
            <td valign = top><a href = "mailto:#Email#">#FromUser#</A></td>
            <td valign = top>#Subject#</td>
            <td valign = top>#CommntType#</td>
            <td valign = top><font size = "-2">#Left (MessText, 125)#</font></td>
```

```
        <td valign = top>#Posted#</td>
    </tr>
</cfoutput>
</table>
<p>Next, we'll offer the opportunity to enter a comment:
<!-- Make a form for input. -->
<form action = "cfinsert.cfm" method = "post">
    <pre>
    Email:  <input type = "Text" name = "email">
    From:   <input type = "Text" name = "fromUser">
    Subject: <input type = "Text" name = "subject">
    Message: <textarea name = "MessText" COLS = "40" ROWS = "6"></textarea>
    Date Posted: <cfoutput>#DateFormat(Now())#</cfoutput>
    <!-- Dynamically determine today's date. -->
    <input type = "hidden"
        name = "posted" value = "<cfoutput>#Now()#</cfoutput>">
    </pre>
    <input type = "Submit"
        name = "" value = "insert my comment">
</form>
```

**Note:** The `cfinsert` tag internally uses parameterized queries.

## cfinterface

### Description

Defines an interface that consists of a set of signatures for functions. The interface does not include the full function definitions; instead, you implement the functions in a ColdFusion component (CFC). The interfaces that you define by using this tag can make up the structure of a reusable application framework.

### History

ColdFusion 8: Added this tag.

### Category

[Application framework tags](#), [Extensibility tags](#)

### Syntax

```
<cfinterface
    displayName = "descriptive name"
    extends = "interfaceName1[,interfaceName2]..."
    Hint = "hint text">
        <cffunction ...>
            <cfargument ... >
            <cfargument ... >
            ...
        </cffunction>
        <cffunction ...>
            ...
        </cffunction>
        ...
</cfinterface>
```

**See also**[cfargument](#), [cfcomponent](#), [cffunction](#), [GetComponentMetaData](#), [IsInstanceOf](#)**Attributes**

Attribute	Req/Opt	Default	Description
displayName	Optional		A value to be displayed when using introspection to show a descriptive name for the interface.
extends	Optional		<p>A comma-delimited list of one or more interfaces that this interface extends. Any CFC that implements an interface must also implement all the functions in the interfaces specified by this property.</p> <p>If an interface extends another interface, and the child interface specifies a function with the same name as one in the parent interface, both functions must have the same attributes; otherwise ColdFusion generates an error.</p>
hint	Optional		Text to be displayed when using introspection to show information about the interface. The <code>hint</code> attribute value follows the syntax line in the function description.

**Usage**

The `cfinterface` tag declares a set of related functions that any ColdFusion component (CFC) that implements the interface must define. The interface specifies function signatures, but does not implement the functions; instead, the CFC that implements the interface must contain the full function definitions.

For example, you could create a create, read, update, and delete (CRUD) interface that defines the basic signatures of the four operations. All components that implement the interface must then conform to the interface signatures. You can then implement the interface in different components to manage different types of data sources. Because all the components implement the same interface, you can ensure that you can easily replace one component with another, depending on the specific data source that an individual application requires.

You define an interface by creating a ColdFusion file with a `.cfc` extension and specifying the `cfinterface` tag as the first and only top-level tag in the file. The filename determines the interface name, so `myInterface.cfc` defines the `myInterface` interface. You can specify any attributes in the `cfinterface` tag; however, only the names listed in the Attributes table are meaningful to ColdFusion. The filename must not contain commas, or any periods except for the separator before the `.cfc` extension.

Inside the `cfinterface` tag body, you specify the interface by declaring the functions of the interface. The interface definition must follow these basic rules:

- The `cfinterface` tag body can contain only `cffunction` tags and comments.
- The `cffunction` tag bodies can contain only `cfargument` tags, which declare the function arguments, and comments.
- The `cffunction` tag body is optional.

The following example shows the general format of an interface definition:

```
<cfinterface extends="IBasicInterface">
    <cffunction name="hello" description="Should print a greeting containing the input
        argument or 'world'.">
        <cfargument name="whom" type="string" default="world">
    </cffunction>
    <cffunction name="calculateTwo" returnType="numeric" output="no"
        description="calculates a result using two numbers and returns the result">
        <cfargument name="first" type="numeric" required="yes"/>
        <cfargument name="second" type="numeric" required="no" default="0"/>
    </cffunction>
    <cffunction name="disclaimer"/>
</cfinterface>
```

This interface extends the `IBasicInterface` interface, so any component that implements this interface must also implement the methods of the `IBasicInterface` interface. This interface requires the component to implement the following three functions:

- A `hello` function that can optionally take a single string argument, which has a default value of `"world"`.
- A `calculateTwo` function that takes one required numeric argument, has an optional numeric argument with a default value of 0, and must return a number.
- A `disclaimer` function that takes no arguments and returns any type.

The CFC that implements an interface specifies the interface name in the `cfcomponent` tag's `implements` attribute. It must implement all of the interface's methods as specified in the interface `cffunction` tags. The order of function arguments in the interface definition and the component definition must be identical.

The following table lists the attributes that you can use in the `cffunction` and `cfargument` tags, and describes the requirements and limitations on how you can use them in the interface definition and the component implementation:

Attribute	Interface requirements	Implementation requirements
<b>cffunction</b>		
<code>access</code>	Optional; only <code>public</code> is allowed	Optional; can be <code>public</code> or <code>remote</code> .
<code>description</code>	Optional	Can differ from value in interface.
<code>displayName</code>	Optional	Can differ from value in interface.
<code>hint</code>	Optional	Can differ from value in interface.
<code>name</code>	Required	Must be identical to value in interface.
<code>output</code>	Optional	Must be identical to value in interface.  If you omit this attribute in the interface, you must omit it in the implementation.
<code>returnType</code>	Optional	Must be identical to value in interface; however, an omitted <code>type</code> option and an option value of <code>any</code> are equivalent and ColdFusion treats them as a match.
<code>roles</code>	Not allowed	Can be any valid value.
<b>cfargument</b>		
<code>default</code>	Optional	Must be identical to value in interface.  If you omit this attribute in the interface, you can specify any value in the implementation.
<code>displayName</code>	Optional	Can differ from value in interface

Attribute	Interface requirements	Implementation requirements
hint	Optional	Can differ from value in interface
name	Required	Must be identical to value in interface.
required	Optional	If the interface specifies <code>yes</code> , this attribute must also specify <code>yes</code> . If the interface specifies <code>no</code> or omits this attribute, you can specify <code>no</code> or omit the attribute.
type	Optional	Must be identical to value in interface; however, an omitted <code>type</code> option and an option value of <code>any</code> are equivalent and ColdFusion treats them as a match.

A CFC can implement multiple interfaces.

**Note:** If a CFC implements multiple interfaces and two or more of the interfaces define functions with identical names, the signatures of these functions must be the same in all the interfaces; ColdFusion does not support function overloading.

ColdFusion uses the same rules to locate interfaces as it does to locate components. You can use the [GetComponentMetaData](#) function to get information about an interface.

Adobe recommends that you use a consistent technique for identifying interface names, for example, by always starting the file (and therefore interface) name with a capital I. Any component that implements only that single interface could have a similar name, for example the same root prefixed by a capital C. You could have an `IresourceInfo.cfc` interface file and a corresponding `CresourceInfo.cfc` component file, for example.

### Example

The following example defines an `IBasicMath` interface with `add`, `subtract`, `multiply`, and `divide` operations. The `integerMath` CFC implements this interface by defining integer arithmetic versions of the operations. The `testMath.cfm` application uses the `integerMath` functions to do arithmetic calculations on two decimal numbers (using the values of `pi` and `e`).

As an exercise, consider modifying the interface definition to take and return values of any type, and then implement a second CFC that uses the `PrecisionEvaluate` function to calculate arbitrary precision arithmetic and return the results. (These versions are omitted for brevity.)

The `IBasicMath.cfc` file defines the interface as follows:

```
<cfinterface>
    <cffunction name = add returnType = "numeric" output = "no"
        description = "Add two values">
        <cfargument name = "first" type="numeric" required = "no" default = "0">
        <cfargument name = "second" type = "numeric" required = "no" default = "0">
    </cffunction>
    <cffunction name = subtract returnType = "numeric" output = "no"
        description = "Subtract two values">
        <cfargument name = "first" type = "numeric" required = "no" default = "0">
        <cfargument name = "second" type = "numeric" required = "no" default = "0">
    </cffunction>
    <cffunction name = multiply returnType = "numeric" output = "no"
        description = "Multiply two values">
        <cfargument name = "first" type = "numeric" required = "no" default = "0">
        <cfargument name = "second" type = "numeric" required = "no" default = "0">
    </cffunction>
    <cffunction name = divide returnType = "numeric" output = "no"
        description = "Divide two values">
        <cfargument name = "first" type = "numeric" required = "no" default="0">
        <cfargument name = "second" type="numeric" required = "no" default="1">
    </cffunction>
</cfinterface>
```

The integerMath.cfc file defines the integerMath component, which implements the IBasicMath interface, as follows:

```
<cfcomponent implements = "IBasicMath" >
    <cffunction name = add returnType = "numeric" output = "no"
        description = "Add two values">
        <cfargument name = "first" type = "numeric" required = "no" default = "0">
        <cfargument name = "second" type = "numeric" required = "no" default = "0">
        <cfreturn Round(first + second)>
    </cffunction>
    <cffunction name = subtract returnType = "numeric" output = "no"
        description = "Subtract two values">
        <cfargument name = "first" type = "numeric" required = "no" default = "0">
        <cfargument name = "second" type = "numeric" required = "no" default = "0">
        <cfreturn Round(first - second)>
    </cffunction>
    <cffunction name = multiply returnType = "numeric" output = "no"
        description = "Multiply two values">
        <cfargument name = "first" type = "numeric" required = "no" default = "0">
        <cfargument name = "second" type = "numeric" required = "no" default = "0">
        <cfreturn Round(first * second)>
    </cffunction>
    <cffunction name = divide returnType = "numeric" output = "no"
description = "Divide two values">
        <cfargument name = "first" type = "numeric" required = "no" default = "0">
        <cfargument name = "second" type = "numeric" required = "no" default = "1">
        <cfreturn Round(first / second)>
    </cffunction>
</cfcomponent>
```

The testMath.cfm file uses the integerMath component methods to calculate integer values, as follows:

```
<cfscript>
    arguments = StructNew();
    arguments.first = pi();
    arguments.second = "2.718281828459045235360287471352";
</cfscript>

<cfobject name = "iMathObj" component = "integerMath">
<cfoutput>
<h3>Function Arguments</h3>
argument 1: #arguments.first#<br>
argument 2: #arguments.second#<br>

<h3>Addition</h3>
#iMathObj.add(argumentCollection = arguments)#
<h3>Subtraction</h3>
#iMathObj.subtract(argumentCollection = arguments)#
<h3>Multiplication</h3>
#iMathObj.multiply(argumentCollection = arguments)#
<h3>Division</h3>
#iMathObj.divide(argumentCollection = arguments)#
</cfoutput>
```

## cfinvoke

### Description

Does either of the following:

- Invokes a component method from within a ColdFusion page or component.
- Invokes a web service.

This tag works as follows:

- Transiently instantiates a component or web service and invokes a method on it.
- Invokes a method on an instantiated component or web service.

This tag can pass parameters to a method in the following ways:

- With the `cfinvokeargument` tag
- As named attribute-value pairs, one attribute per parameter
- As a structure, in the `argumentCollection` attribute

### Category

#### History

ColdFusion 8: Added the following attributes: `refreshWSDL`, `wsdl2javaArgs` attributes.

ColdFusion MX 7: Added the `servicePort` attribute.

ColdFusion MX 6.1: Added the following attributes: `timeout`, `proxyServer`, `proxyPort`, `proxyUser`, and `proxyPassword`.

ColdFusion MX: Added this tag.

#### Attributes

Attribute	Req/Opt	Default	Description
<code>argumentCollection</code>	Optional		Name of a structure; associative array of arguments to pass to the method.
<code>component</code>	See Usage.		String or component object; a reference to a component, or component to instantiate.
<code>input_params ...</code>			Input parameters. For each named input parameter specify <code>paramName=paramValue</code> .
<code>method</code>	See Usage.		Name of a method. For a web service, the name of an operation.
<code>password</code>	Optional	Password set in the Administrator, if any	The password to use to access the web service. If the <code>webservice</code> attribute specifies a web service name configured in the Administrator, overrides any user name specified in the Administrator entry.

Attribute	Req/Opt	Default	Description
proxyPassword	Optional	http.proxyPassword system property, if any	The user's password on the proxy server.
proxyPort	Optional	http.proxyPort system property, if any.	The port to use on the proxy server.
proxyServer	Optional	http.proxyHost system property, if any.	The proxy server required to access the webservice URL.
proxyUser	Optional	http.proxyUser system property, if any	The user ID to send to the proxy server.
refreshWSDL	Optional	no	<ul style="list-style-type: none"> <li>yes: reload the WSDL file and regenerate the artifacts used to consume the web service</li> <li>no</li> </ul>
returnVariable	Optional		Name of a variable for the invocation result.
servicePort	Optional	First port found in the WSDL	<p>The port name for the web service. This value is case sensitive and corresponds to the port element's name attribute under the service element.</p> <p>Specify this attribute if the web service contains multiple ports.</p>
timeout	Optional	0 (no timeout)	The time-out for the web service request, in seconds.
username	Optional	User name set in the Administrator, if any	The user name to use to access the web service. If the webservice attribute specifies a web service name configured in the Administrator, overrides any user name specified in the Administrator entry.
webservice	See Usage		<p>One of the following:</p> <ul style="list-style-type: none"> <li>The absolute URL of the web service WSDL.</li> <li>The Name (string) assigned in the ColdFusion Administrator to the web service.</li> </ul>
wsdl2javaArgs	See Usage		<p>A string that contains a space-delimited list of arguments to pass to the WSDL2Java tool that generates Java stubs for the web services. Useful arguments include the following:</p> <ul style="list-style-type: none"> <li>-w or --noWrapped: Turns off the special treatment of wrapped document/literal style operations.</li> <li>-a or --all: Generates code for all elements in the WSDL, even unreferenced ones.</li> <li>-w or --wrapArrays: Prefers building beans to straight arrays for wrapped XML array types. This switch is not included in the Axis documentation.</li> </ul> <p>For detailed information on valid arguments, see the <a href="#">Apache Axis WSDL2Java Reference</a>.</p>

**Note:** If you do not specify any attributes of the proxy server, and a corresponding system property is set (typically in the JVM startup arguments) ColdFusion uses the system property value.

### Usage

The following table shows when you can use each attribute:

This attribute is required, optional, ignored, or invalid:	For this cfinvoke tag syntax:				
	Syntax 1	Syntax 2	Syntax 3	Syntax 4A	Syntax 4B
argumentCollection	Optional	Optional	Optional	Optional	Optional
component	Required	Optional	Invalid	Required	Invalid
<i>input_params ...</i>	Optional	Optional	Optional	Optional	Optional
method	Required	Required	Required	Required	Required
password	Ignored	Ignored	Optional	Ignored	Optional
proxyPassword	Invalid	Invalid	Optional	Invalid	Optional
proxyPort	Invalid	Invalid	Optional	Invalid	Optional
proxyServer	Invalid	Invalid	Optional	Invalid	Optional
proxyUser	Invalid	Invalid	Optional	Invalid	Optional
returnVariable	Optional	Optional	Optional	Optional	Optional
servicePort	Invalid	Invalid	Optional	Invalid	Optional
timeout	Invalid	Invalid	Optional	Invalid	Optional
username	Ignored	Ignored	Optional	Ignored	Optional
webservice	Invalid	Invalid	Required	Invalid	Required
wsdl2javaArgs	Invalid	Invalid	Optional	Invalid	Optional

If the `component` attribute specifies a component name, the component with the corresponding name is instantiated, the requested method is invoked, and then the component instance is immediately destroyed. If the attribute contains a reference to an instantiated component object, no instantiation or destruction of the component occurs.

On UNIX systems, ColdFusion searches first for a file with a name that matches the specified component name, but is all lower case. If it does not find the file, it looks for a file name that matches the component name exactly, with the identical character casing.

Method arguments can be passed in any of the following ways. If an argument is passed in more than one way with the same name, this order of precedence applies:

- 1 Using the `cfinvokeargument` tag
- 2 Passing directly as attributes of the `cfinvoke` tag (they cannot have the same name as a registered `cfinvoke` attribute: `method`, `component`, `webservice`, `returnVariable`)
- 3 Passing as struct keys, using the `argumentCollection` attribute

For example, the `params` struct contains three keys: `a=1`, `b=1`, `c=1`. The following call is evaluated as if the arguments were passed to the method in the order `a=3`, `b=2`, `c=1`:

```
<cfinvoke ... a=2 b=2 argumentCollection=params>
  <cfinvokeargument name="a" value="3">
</cfinvoke>
```

**Note:** The following `cfinvoke` tag attribute names are reserved; they cannot be used for argument names: `component`, `method`, `argumentCollection`, and `result`.

### Example1

This example uses Syntax 1.

```
<!--- Immediate instantiation and destruction. --->
<cfinvoke
    component="nasdaq.quote"
    method="getLastTradePrice"
    returnVariable="res">
    <cfinvokeargument
        name="symbol"
        value="macr">
</cfinvoke>
<cfoutput>#res#</cfoutput>
```

### Example2

This example uses Syntax 1.

```
<!--- Passing the arguments using argumentCollection. --->
<cfset args = StructNew()>
<cfset args.symbol = "macr">
<cfinvoke
    component="nasdaq.quote"
    method="getLastTradePrice"
    argumentCollection="#args#"
    returnVariable="res">
<cfoutput>#res#</cfoutput>
```

### Example3

This example uses Syntax 2.

```
<!--- Called only from within a component, MyComponent. --->
<cfinvoke
    method = "a method name of MyComponent"
    returnVariable = "variable name">
```

### Example4

This example uses Syntax 3.

```
<!--- Using cfinvoke to consume a web service using a ColdFusion component. --->
<cfinvoke
    webservice="http://www.xmethods.net/sd/2001/TemperatureService.wsdl"
    method="getTemp"
    returnvariable="aTemp">
<cfinvokeargument name="zipcode" value="55987"/>
</cfinvoke>
<cfoutput>The temperature at zip code 55987 is #aTemp#</cfoutput>
```

For more information on web services, see Using Web Services in the *Developing ColdFusion Applications*.

### Example5

This example uses Syntax 4A.

```
<!--- Separate instantiation and method invocation; useful for multiple invocations using
different methods or values. --->
<cfobject
    name="quoteService"
    component="nasdaq.quote">
<cfinvoke
    component="#quoteService#"
    method="getLastTradePrice"
    symbol="macr"
    returnVariable="res_macr">
<cfoutput>#res#</cfoutput>
<cfinvoke
    component="#quoteService#"
    method="getLastTradePrice"
    symbol="mot"
    returnVariable="res_mot">
<cfoutput>#res#</cfoutput>
```

## cfinvokeargument

### Description

Passes the name and value of a parameter to a component method or a web service. This tag is used in the [cfinvoke](#) tag.

### Category

[Extensibility tags](#)

### Syntax

```
<cfinvokeargument
    name="argument name"
    value="argument value"
    omit = "yes|no">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfargument](#), [cfcomponent](#), [cffunction](#), [cfinvoke](#), [cfobject](#), [cfproperty](#), [cfreturn](#)

### History

ColdFusion MX 7: Added the `omit` attribute.

ColdFusion MX: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
name	Required		Argument name.
value	Required		Argument value.
omit	Optional	no	Enables you to omit a parameter when invoking a web service. It is an error to specify omit="yes" if the cfinvokewebservice attribute is not specified.  yes: omit this parameter when invoking a web service.  no: do not omit this parameter when invoking a web service.

## Usage

You can have multiple cfinvokeargument tags in a cfinvoke tag body.

You can use cfinvokeargument tag to dynamically determine the arguments to be passed. For example, you can use conditional processing to determine the argument name, or you can use a cfif tag to determine whether to execute the cfinvokeargument tag.

If you are invoking a web service, you can omit a parameter by setting the omit attribute to "yes". If the WSDL specifies that the argument is nillable, ColdFusion MX sets the associated argument to null. If the WSDL specifies minOccurs=0, ColdFusion omits the argument from the WSDL.

### Example1

```
<cfinvoke
  component="nasdaq.quote"
  method="getLastTradePrice"
  returnVariable="res">
  <cfinvokeargument name="symbol" value="mot">
  <cfinvokeargument name="symbol" value="macr">
</cfinvoke>

<cfoutput>#res#</cfoutput>
```

### Example2

```
<!--- Using cfinvoke to consume a web service using a ColdFusion component. --->
<cfinvoke
  webservice="http://www.xmethods.net/sd/2001/TemperatureService.wsdl"
  method="getTemp"
  returnvariable="aTemp">
  <cfinvokeargument name="zipcode" value="55987"/>
</cfinvoke>
<cfoutput>The temperature at zip code 55987 is #aTemp#</cfoutput>
```

# Tags j-l

## cflayout

### Description

Creates a region of its container (such as the browser window or a `cflayoutarea` tag) with a specific layout behavior: a bordered area, a horizontal or vertically arranged box, or a tabbed navigator.

### Category

[Display management tags](#)

### Syntax

```
<cflayout
  type="accordion|border|hbox|tab|vbox"
  activeOnTop="false|true"
  align="center|justify|left|right"
  fillHeight="true|false"
  fitToWindow="true|false"
  height="integer"
  name="string"
  padding="integer"
  style="CSS style specification"
  tabHeight="measurement"
  tabPosition="top|bottom"
  tabStrip="true|false"
  titleCollapse="true|false"
  width="integer">
```

*cflayoutarea tags*

```
</cflayout>
```

**Note:** You can specify this tag's attribute in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute name as structure key.

### History

ColdFusion 9:

- Added `accordion` value of the `type` attribute and the `activeOnTop`, `fillHeight`, and `titleCollapse` attributes.
- The attributes, `height` and `width` are supported for the types `hbox` and `vbox`.

ColdFusion 8: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Applies to	Description
type	Required		all	<p>The type of layout. The following values are valid:</p> <ul style="list-style-type: none"> <li><b>accordion:</b> a container with multiple layout areas that display no more than one area at a time. Each layout area has a title bar that is always displayed. The user can expand or collapse each layout area by clicking + or - button on the layout area title bar</li> <li><b>border:</b> a box with a border and up to five layout areas, each with a border. For more information, see Usage.</li> <li><b>hbox:</b> a horizontal box where all immediate child <code>cflayoutarea</code> controls are arranged horizontally.</li> <li><b>tab:</b> a tabbed display where the current child <code>cflayoutarea</code> tag occupies the display area of the layout, and each layout area has a tab that the user can select to display its contents.</li> <li><b>vbox:</b> a vertical box where all immediate child <code>cflayoutarea</code> controls are arranged vertically.</li> </ul>
activeOnTop	Optional	false	accordion	Specifies whether the active panel moves to the top of the layout, becoming the first panel.
align	Optional	Determined by browser layout direction	all	<p>Specifies the default alignment of the content of child layout areas. Each <code>cflayoutarea</code> tag can specify an <code>alignment</code> attribute to override this value.</p> <p>The following values are valid:</p> <ul style="list-style-type: none"> <li><code>center</code></li> <li><code>justify</code></li> <li><code>left</code></li> <li><code>right</code></li> </ul>
fillHeight	Optional	true	accordion	<p>A Boolean value that specifies whether to adjust the active layout area's height to fill the available space in the layout control container:</p> <ul style="list-style-type: none"> <li><code>true</code></li> <li><code>false</code></li> </ul> <p>If you specify <code>fillHeight</code> as <code>false</code>, then ColdFusion sets <code>overflow</code> to <code>hidden</code>.</p>
fitToWindow	Optional	false	border	<p>A Boolean value that specifies whether the border layout must occupy 100% of the width and height of the window:</p> <ul style="list-style-type: none"> <li><code>true</code></li> <li><code>false</code></li> </ul> <p>The underlying implementation uses a viewport, hence, any content outside the layout is not accommodated in the layout.</p> <p>When using nested border layouts, if you specify <code>fitToWindow</code> as <code>true</code>, the layouts nested within the border layout may not automatically fit into the available space. Hence, for nested layouts, it is recommended to use <code>width</code> or <code>size</code> instead of <code>fitToWindow</code>.</p>

Attribute	Req/Opt	Default	Applies to	Description
height	Optional	600 for border layout; autoheight for others	all	Height of the layout in pixels.  For the tab layout, the <code>height</code> attribute has the same functionality as the <code>tabheight</code> attribute. If you specify both <code>height</code> and <code>tabheight</code> attributes, <code>height</code> takes priority over <code>tabheight</code> . The height value specified here takes priority over the height value specified using the <code>style</code> attribute.
name	Optional		all	The name of the layout region. Should be unique on a page.
padding	Optional	0	hbox, vbox	<ul style="list-style-type: none"><li>For <code>hbox</code> layouts, specifies the padding on the right side of each child layout area.</li><li>For <code>vbox</code> layouts, specifies the padding at the bottom of each child layout area.</li></ul> <p>You can use any valid CSS length or percent format, such as 10, 10% 10px, or 10em, for this attribute.</p> <p>The padding is included in the child layout area and takes the style of the layout area.</p>
style	Optional		all	A CSS style specification that defines layout styles.
tabHeight	Optional		tab	Specifies the height of the content area of all child layout areas. You can override this setting by specifying a height setting in a individual <code>cflayoutarea</code> tag style attributes.
tabPosition	Optional	top	tab	Specifies the location of the tabs relative to the tab region contents. <ul style="list-style-type: none"><li><code>bottom</code>: the tabs appear at the bottom of the layout.</li><li><code>top</code>: the tabs appear at the top of the layout.</li></ul>
tabStrip	Optional	true	tab	If <code>true</code> , a background tab strip is displayed.
titleCollapse	Optional	true	accordion	Specifies whether clicking anywhere on each layout area's title bar expands and collapses the layout area. If <code>false</code> , the user must click the title bar +/- button to expand or collapse a layout area.
width	Optional		all	Width of the layout in pixels. This value takes priority over the width defined using the <code>style</code> attribute. If no value is specified, <code>autoWidth</code> is applied and therefore, content fills the entire screen.

## Usage

The immediate children of a `cflayout` tag must be `cflayoutarea` tags or `nondisplay` tags whose bodies contain one or more `cflayoutarea` tags at the top level. For example, a `cflayout` tag could have a tag such as `cfloop` or `cfquery` as a child, and these tags would have `cflayoutarea` tags in their bodies.

The `border` type layout has the following characteristics:

- The layout control and each of its immediate layout area children is surrounded by a border.
- The control can have up to five children positioned at the left, right, center, top, and bottom of the layout.
- You can configure the child layout areas, except for the center area, to have splitters so that users can expand and collapse them or close them completely.
- The center child layout area occupies all available space in the layout that is not used by any of the other layout areas.
- To specify layout height, use the `height` setting of the `style` attribute.

**Note:** If you specify a border layout on a page that has a `DOCTYPE` declaration, the layout cannot properly determine its height and you must specify the height in a `cflayout` tag `style` attribute.

You can use the following JavaScript functions to access the underlying Ext JS - JavaScript Library objects for border and tab type `cflayout` controls.

Function	Description
<code>ColdFusion.Layout.getBorderLayout</code>	Gets the underlying Ext JS - JavaScript Library object for the specified border type <code>cflayout</code> control.
<code>ColdFusion.Layout.getTabLayout</code>	Gets the underlying Ext JS - JavaScript Library object for the specified tab type <code>cflayout</code> control.
<code>ColdFusion.Layout.getAccordionLayout</code>	Gets the underlying Ext JS - JavaScript Library object for the specified accordion type <code>cflayout</code> control.

For more information on configuring layout areas, see [cflayoutarea](#).

### Example

The following example shows a set of nested layouts. The outer layout is a `vbox`, with two layout areas. The top layout area has a border layout, the bottom layout area contains a form with buttons to control the display of the border layout areas.

```
<html>
<head>
</head>
<body>
<cflayout name="outerlayout" type="vbox">
  <cflayoutarea style="height:400;">
    <cflayout name="thelayout" type="border">
      <!-- The 100% height style ensures that the background color fills
           the area. -->
      <cflayoutarea position="top" size="100" splitter="true"
        style="background-color:##00FFFF; height:100%">
        This is text in layout area 1: top
      </cflayoutarea>
      <cflayoutarea title="Left layout area" position="left"
        closable="true"
        collapsible="true" name="left" splitter="true"
        style="background-color:##FF00FF; height:100%">
        This is text in layout area 2: left<br />
        You can close and collapse this area.
      </cflayoutarea>
      <cflayoutarea position="center"
        style="background-color:##FFFF00; height:100%">
        This is text in layout area 3: center<br />
      </cflayoutarea>
      <cflayoutarea position="right" collapsible="true"
        title="Right Layout Area" initcollapsed="true"
        style="background-color:##FF00FF; height:100%" >
        This is text in layout area 4: right<br />
        You can collapse this, but not close it.<br />
        It is initially collapsed.
      </cflayoutarea>
      <cflayoutarea position="bottom" size="100" splitter="true"
        style="background-color:##00FFFF; height:100%">
        This is text in layout area 5: bottom
```

```
        </cflayoutarea>
    </cflayout>
</cflayoutarea>

<cflayoutarea style="height:100; ; background-color:##FFCCFF">
    <h3>Change the state of Area 2</h3>
    <cfform>
        <cfinput name="expand2" width="100" value="Expand Area 2" type="button"
            onClick="ColdFusion.Layout.expandArea('thelayout', 'left');">
        <cfinput name="collapse2" width="100" value="Collapse Area 2" type="button"
            onClick="ColdFusion.Layout.collapseArea('thelayout', 'left');">
        <cfinput name="show2" width="100" value="Show Area 2" type="button"
            onClick="ColdFusion.Layout.showArea('thelayout', 'left');">
        <cfinput name="hide2" width="100" value="Hide Area 2" type="button"
            onClick="ColdFusion.Layout.hideArea('thelayout', 'left');">
    </cfform>
</cflayoutarea>
</cflayout>
</body>
</html>
```

## cflayoutarea

### Description

Defines a region within a `cflayout` tag body, such as an individual tab of a tabbed layout.

### Category

[Display management tags](#)

### Syntax

#### In a border layout

```
<cflayoutarea
    required
    position="bottom|center|left|right|top"
    optional
    align="left|center|justify|right"
    collapsible="false|true"
    initcollapsed="false|true"
    inithide="false|true"
    maxSize="number of pixels"
    minSize="number of pixels"
    name="string"
    onBindError = "JavaScript function name"
    overflow = "auto|hidden"
    size="number of pixels"
    source="URL"
    splitter="false|true"
    style="CSS style specification"
    title="string">

    area elements

</cflayoutarea>
```

**In a hbox or vbox layout**

```
<cflayoutarea
    optional
    name="string"
    onBindError = "JavaScript function name"
    overflow = "auto|hidden|scroll|visble"
    size="number of pixels"
    source="URL"
    style="CSS style specification">

    area elements

</layoutarea>
```

**In a tab layout**

```
<cflayoutarea
    optional
    bindonload="false|true"
    closable="false|true"
    disabled="false|true"
    inithide="false|true"
    name="string"
    onBindError = "JavaScript function name"
    overflow = "auto|hidden|scroll|visble"
    refreshOnActivate = "false|true"
    selected="false|true"
    source="URL"
    style="CSS style specification"
    tabTip="text"
    title="string">

    area elements

</layoutarea>
```

**In an accordion layout**

```
<cflayoutarea
    optional
    bindonload="false|true"
    closable="false|true"
    name="string"
    onBindError = "JavaScript function name"
    overflow = "auto|hidden|scroll|visble"
    refreshOnActivate = "false|true"
    selected="false|true"
    source="URL"
    style="CSS style specification"
    title="string"
    titleicon="icon location">

    area elements
```

If you specify a `source` attribute, all child tags are ignored. If you do not have child tags, close the tag with `/>`.

**Note:** You can specify this tag's attribute in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute name as structure key.

## History

ColdFusion 8: Added this tag

## Attributes

Attribute	Req/Opt	Default	Applies to	Description
align	Optional	The <code>cflayout</code> tag <code>align</code> attribute value	all	Specifies how to align child controls within the layout area. The following values are valid: <ul style="list-style-type: none"> <li>center</li> <li>justify</li> <li>left</li> <li>right</li> </ul>
bindLoad	Optional	true	tab, accordion	A Boolean value that specifies whether to execute the source attribute expression when the layoutarea is first loaded.
closable	Optional	false	tab	A Boolean value that specifies whether the area can close. Specifying this attribute adds an x icon on the tab or title bar that a user can click to close the area.
collapsible	Optional	false	border, accordion	A Boolean value that specifies whether the area can collapse. Specifying this attribute adds a >> or << icon on the title bar that a user can click to collapse the area.  You cannot use this attribute for border layout areas with a <code>position</code> attribute value of <code>center</code> .
disabled	Optional	false	tab	A Boolean value that specifies whether the tab is disabled, that is, whether a user can select the tab to display its contents. Disabled tabs are greyed out.  Ignored if the <code>selected</code> attribute value is <code>true</code> .
initCollapsed	Optional	false	border	A Boolean value that specifies whether the area is initially collapsed.  You cannot use this attribute for border layout areas with a <code>position</code> attribute value of <code>center</code> .  Ignored if the <code>collapsible</code> attribute value is <code>false</code> .
initHide	Optional	false	border, tab, accordion	A Boolean value that specifies whether the area is initially hidden. To show an initially hidden area, use the <code>ColdFusion.Layout.showArea</code> or <code>ColdFusion.Layout.showTab</code> function.  You cannot use this attribute for border layout areas with a <code>position</code> attribute value of <code>center</code> .
maxSize	Optional	-1 (no maximum size)	border	If the <code>position</code> attribute value is <code>top</code> or <code>bottom</code> , the maximum height of the area, in pixels, that you can set by dragging a splitter.  If the <code>position</code> attribute value is <code>left</code> or <code>right</code> , the maximum width of the area.  You cannot use this attribute for border layout areas with a <code>position</code> attribute value of <code>center</code> .

Attribute	Req/Opt	Default	Applies to	Description
minSize	Optional	-1 (no minimum size)	border	<p>If the <code>position</code> attribute value is <code>top</code> or <code>bottom</code>, the minimum height of the area, in pixels, that you can set by dragging a splitter.</p> <p>If the <code>position</code> attribute value is <code>left</code> or <code>right</code>, the minimum width of the area.</p> <p>You cannot use this attribute for border layout areas with a <code>position</code> attribute value of <code>center</code>.</p>
name	Optional		all	The name of the layout area.
onBindError	Optional	See Description	all	<p>The name of a JavaScript function to execute if evaluating a bind expression results in an error. The function must take two attributes: an HTTP status code and a message.</p> <p>If you omit this attribute, and have specified a global error handler (by using the <code>ColdFusion.setGlobalErrorHandler</code> function), it displays the error message; otherwise a default error pop-up displays.</p>
overflow	Optional	auto  For accordion, if <code>fillHeight</code> attribute of the <code>cflayout</code> tag is false, default value is hidden.	all	<p>Specifies how to display child content whose size would cause the control to overflow the window boundaries. The following values are valid:</p> <ul style="list-style-type: none"> <li><code>auto</code>: show scroll bars when necessary.</li> <li><code>hidden</code>: do not allow access to overflowing content.</li> <li><code>scroll</code>: always show horizontal and vertical scroll bars, even if they are not needed.</li> <li><code>visible</code>: content can display outside the bounds of the layout area.</li> </ul> <p><b>Notes:</b></p> <ul style="list-style-type: none"> <li>You cannot use <code>visible</code> or <code>scroll</code> for layout areas in border layouts.</li> <li>In Internet Explorer, layout areas with the <code>visible</code> setting expand to fit the size of the contents, rather than having the contents extend beyond the layout area.</li> </ul>
position	Required if the <code>cflayout</code> type is <code>border</code>		border	<p>The position of the area in the layout. Must be one of the following values:</p> <ul style="list-style-type: none"> <li><code>top</code>: Position the area across the top of the full layout.</li> <li><code>bottom</code>: Position the area across the bottom of the full layout.</li> <li><code>left</code>: Position the area on the left side of the layout, between any visible top and bottom areas.</li> <li><code>right</code>: Position the area on the right side of the layout, between any visible top and bottom areas.</li> <li><code>center</code>: Position the area in the space not taken by the top, bottom, left, and right areas.</li> </ul> <p>Border style layouts can have at most one layout area of each type.</p>

Attribute	Req/Opt	Default	Applies to	Description
refreshOnActivate	Optional	false	tab, accordion	<ul style="list-style-type: none"> <li>• <b>true:</b> Refresh the contents of the tab/accordion panel by running the <code>source</code> bind expression whenever the tab/panel display region shows (for example, when the user selects the tab), in addition to when bind events occur.</li> <li>• <b>false:</b> Refresh the tab/accordion panel display region only when the bind expression is triggered by its bind event.</li> </ul> <p>To use this attribute, also specify a <code>source</code> attribute.</p>
selected	Optional	first tab is selected	tab, accordion	A Boolean value that specifies whether this tab is initially selected so that its contents appears in the layout.
size	Optional	-1  calculate initial size dynamically	border, hbox, vbox	<p>For hbox layouts and border layouts with <code>position</code> attribute values of <code>top</code> or <code>bottom</code>, the initial height of the area.</p> <p>For vbox layouts and border layouts with <code>position</code> attribute values of <code>left</code> or <code>right</code>, the initial width of the area.</p> <p>For hbox and vbox layouts, you can use any valid CSS length or percent format (such as 10, 10% 10px, or 10em) for this attribute.</p> <p>For border layouts, this attribute value must be an integer number of pixels.</p> <p>You cannot use this attribute for border layout areas with a <code>position</code> attribute value of <code>center</code>. ColdFusion automatically determines the center size based on the size of all other layout areas.</p> <p><b>Note:</b> If a layout area in a border layout contains only AJAX controls such as HTML format <code>cftree</code> tags, specify a <code>size</code> attribute. Otherwise, the AJAX components may not be visible until the layout area is resized.</p>
source	Optional		all	<p>A URL that returns the layout area contents. ColdFusion uses standard page path resolution rules. You can use a bind expression with dependencies in this attribute.</p> <p>If a file specified in this attribute includes tags that use AJAX features, such as <code>cform</code>, <code>cfgrid</code>, and <code>cfpod</code>, use the <code>cfajaximport</code> tag on the page that includes the <code>cflayoutarea</code> tag. For more information, see <a href="#">cfajaximport</a>.</p> <p>For more information on the <code>source</code> attribute, see Usage.</p>
splitter	Optional	false	border	<p>A Boolean value that specifies whether the layout area has a divider between it and the adjacent <code>layoutarea</code> control. Users can drag the splitter to change the relative sizes of the areas.</p> <p>If this attribute is set to <code>true</code> on a <code>left</code> or <code>right</code> position layout area, the splitter resizes the area and its adjacent area horizontally. If this attribute is set to <code>true</code> on a <code>top</code> or <code>bottom</code> position layout area, the splitter resizes the layout vertically.</p> <p>You cannot use this attribute for border layout areas with a <code>position</code> attribute value of <code>center</code>.</p>
style	Optional		all	A CSS style specification that controls the appearance of the area.

Attribute	Req/Opt	Default	Applies to	Description
tabTip	Optional		tab	If defined, a tab tip is displayed.
title	Optional; required for tab layouts		border, tab, accordion	For tab layouts, the text to display on the tab.  For border layouts, if you specify this attribute, ColdFusion creates a title bar for the layout area with the specified text as the title. By default, border layouts that are not closable or collapsible do not have a title bar.  You cannot use this attribute for border layout areas with a position attribute value of center.
titleicon	Optional		accordion	Specifies the location of the icon to display with the title.

### Usage

All `cflayoutarea` tags must be children of `cflayout` tags and cannot have `cflayoutarea` tags as immediate children, but they can contain `cflayout` tags. However, the `cflayoutarea` tags do not have to be direct children of the `cflayout` tag; instead, the `cflayout` tag could have a tag such as `cfloop` or `cfquery` as a child, and the `cflayoutarea` tags could be in the body of the `cfloop` or `cfquery` tag. These rules let you create arbitrarily complex combinations of different layouts.

**Note:** You cannot put a layout of type *border* inside a layout of type *tab*.

If you do not specify a `size` attribute value, ColdFusion attempts to determine the required size for the layout area contents. However, in some cases, such as when the layout area contains AJAX controls, ColdFusion might not be able to determine the required size, and you must specify the `size` attribute to make the AJAX control appear. In these cases, a scroll bar appears for the layout area.

You can use a `source` attribute or a tag body to specify the layout area contents; if you specify both, ColdFusion uses the contents specified by the `source` attribute and ignores the tag body. If you use a `source` attribute, an animated icon and the text "Loading..." appears while the contents is being fetched.

If the `source` attribute specifies a page that defines JavaScript functions, the function definitions on that page must have the following format:

```
functionName = function(arguments) {function body}
```

Function definitions that use the following format may not work:

```
function functionName (arguments) {function body}
```

However, Adobe recommends that you include all custom JavaScript in external JavaScript files and import them on the application's main page, and not write them inline in code that you get using the `source` attribute. Imported pages do not have this function definition format restriction.

If you use the `source` attribute, you can use a *bind expression* to include form field values or other form control attributes as part of the source specification. You can bind to HTML format form controls only. For detailed information on using bind expressions see Using Ajax Data and Development Features in the *Developing ColdFusion Applications*.

In *border* type layouts, a center layout area always takes up any space that is not used by the other areas, even if you do not specify a `cflayoutarea` tag with a `centerposition` attribute. Therefore, if you want only two layout areas in either direction, one of the two must be the center area, or you must explicitly size the two areas to take up the full layout area.

When you nest layouts, set the inner layout area initial sizes appropriately to ensure that they appear.

Use the following JavaScript functions to enable, disable, show, hide, expand, collapse, and select layout areas:

Function	Description
<a href="#">ColdFusion.Layout.createTab</a>	Creates a tab in an existing tabbed layout.
<a href="#">ColdFusion.Layout.disableTab</a>	Disables the specified tab so it cannot be selected.
<a href="#">ColdFusion.Layout.enableTab</a>	Enables the specified tab so users can select it and display the area contents.
<a href="#">ColdFusion.Layout.hideTab</a>	Hides a tab.
<a href="#">ColdFusion.Layout.selectTab</a>	Selects a tab and displays the layout area contents.
<a href="#">ColdFusion.Layout.showTab</a>	Shows a tab that was hidden using the <code>inithide</code> attribute or the <code>hideTab()</code> function.
<a href="#">ColdFusion.Layout.collapseArea</a>	Collapses an area of a border layout.
<a href="#">ColdFusion.Layout.expandArea</a>	Expands a collapsed area of a border layout.
<a href="#">ColdFusion.Layout.getTabLayout</a>	Hides an area of a border layout.
<a href="#">ColdFusion.Layout.hideArea</a>	Hides an area of a border layout.
<a href="#">ColdFusion.Layout.showArea</a>	Shows an area of a border layout that was hidden using the <code>inithide</code> attribute or the <code>hideArea()</code> function.
<a href="#">ColdFusion.Layout.hideAccordion</a>	Hides an accordion.
<a href="#">ColdFusion.Layout.showAccordion</a>	Shows an accordion that was hidden using the <code>inithide</code> attribute or the <code>hideArea()</code> function.
<a href="#">ColdFusion.Layout.selectAccordion</a>	Selects an accordion and displays the layout area contents.
<a href="#">ColdFusion.Layout.collapseAccordion</a>	Collapses an area of an accordion layout.
<a href="#">ColdFusion.Layout.expandAccordion</a>	Expands a collapsed area of an accordion layout.

**Note:** When you use the `style` attribute to specify the background color of a border layout area, specify a `height` style of 100% to make the background color cover the entire layout area. This is because the style specification applies to an inner content area of the layout area, not the layout area itself, and the 100% specification ensures that the content area takes up all available space in the layout area.

### Example

The following example creates a three-tabbed layout and lets you use buttons to dynamically control the second tab.

```
<html>
<head>
<meta http-equiv="Content-Type" content="text/html; charset=utf-8"/>
</head>
<body>
<h3>Atab</h3>
<cflayout type="tab" name="thelayout" tabheight="175" style="background-color:##CCffFF;
    color:red; height:200">
    <cflayoutarea title="Tab 1" style="background-color:##FFAaff;" closable="true">
        This is text in layout area 1
    </cflayoutarea>
    <cflayoutarea name="area2" title="Tab 2" inithide="true"
        style="background-color:##FFCCFF" >
        This is text in layout area 2
    </cflayoutarea>
    <cflayoutarea title="Tab 3" style="background-color:##FF99FF;">
        This is text in layout area 3
    </cflayoutarea>
</cflayout>
<br />
<cfform>
    <cfinput name="show" width="40" value="show tab" type="button"
        onClick="ColdFusion.Layout.showTab('thelayout', 'area2');">
    <cfinput name="hide" width="40" value="hide tab" type="button"
        onClick="ColdFusion.Layout.hideTab('thelayout', 'area2');">
    <cfinput name="enable" width="40" value="enable tab" type="button"
        onClick="ColdFusion.Layout.enableTab('thelayout', 'area2');">
    <cfinput name="disable" width="40" value="disable tab" type="button"
        onClick="ColdFusion.Layout.disableTab('thelayout', 'area2');">
    <cfinput name="select" width="40" value="select tab" type="button"
        onClick="ColdFusion.Layout.selectTab('thelayout', 'area2');">
</cfform>
</body>
</html>
```

## cfdap

### Description

Provides an interface to a Lightweight Directory Access Protocol (LDAP) directory server, such as the Netscape Directory Server.

### Category

[Internet protocol tags](#)

## Syntax

```
<cldap
    action = "action"
    server = "server name"
    attributes = "attribute, attribute"
    delimiter = "delimiter character"
    dn = "distinguished name"
    filter = "filter"
    maxRows = "number"
    modifyType = "replace|add|delete"
    name = "name"
    password = "password"
    port = "port number"
    rebind = "yes|no"
    referral = "number of allowed hops"
    returnAsBinary = "column name, column name"
    scope = "scope"
    secure = "multifield security string"
    separator = "separator character"
    sort = "attribute[, attribute]..."
    sortControl = "nocase|desc|asc"
    start = "distinguished name"
    startRow = "row number"
    timeout = "milliseconds"
    username = "user name">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## History

ColdFusion 8: Added the ability to use a comma as a delimiter when specifying a list of variables in the `returnAsBinary` attribute, for example, `returnAsBinary="objectGUID,objectSID"`. Previously, the allowed delimiter was a space.

ColdFusion MX 7: Added the `returnAsBinary` attribute. Added SSL V2 client based authentication; this means that ColdFusion supports the CFSSL\_CLIENT\_AUTH option. If CFSSL\_CLIENT\_AUTH is selected, ColdFusion assumes that the first certificate in the cacerts (or the certificate database) contains the Client Certificate.

ColdFusion MX:

- Changed the `name` attribute behavior: this tag validates the query name in the `name` attribute.
- Changed sorting behavior: this tag does not support client-side sorting of query results. (It supports server-side sorting; use the `sort` and `sortControl` attributes.)
- Changed how results are sorted: server-side sorting results might be sorted slightly differently than in ColdFusion 5. If you attempt a sort against a server that does not support it, ColdFusion MX throws an error.
- Deprecated the `filterConfig` and `filterFile` attributes. They might not work, and might cause an error, in later releases.

## Attributes

Attribute	Req/Opt	Default	Description
action	Required	query	<ul style="list-style-type: none"> <li>query: returns LDAP entry information only. Requires name, start, and attributes attributes.</li> <li>add: adds LDAP entries to LDAP server. Requires attributes attribute.</li> <li>modify: modifies LDAP entries, except distinguished name dn attribute, on LDAP server. Requires dn. See modifyType attribute.</li> <li>modifyDN: modifies distinguished name attribute for LDAP entries on LDAP server. Requires dn.</li> <li>delete: deletes LDAP entries on an LDAP server. Requires dn.</li> </ul>
server	Required		Host name or IP address of LDAP server.
attributes	Required if action="Query", "Add", "ModifyDN", or "Modify"		<p>For queries: comma-delimited list of attributes to return. For queries, to get all attributes, specify "*" .</p> <p>If action="add" or "modify", you can specify a list of update columns. Separate attributes with a semicolon.</p> <p>If action="ModifyDN", ColdFusion passes attributes to the LDAP server without syntax checking.</p>
delimiter	Optional	; (semicolon)	<p>Separator between attribute name-value pairs. Use this attribute if either of these situations exist:</p> <ul style="list-style-type: none"> <li>The attributes attribute specifies more than one item.</li> <li>An attribute contains the default delimiter (semicolon), for example: mgrpmsgrejecttext;lang-en</li> </ul> <p>Used by query, add, and modify actions, and by cfldap to output multi-value attributes.</p> <p>For example, if \$ (dollar sign), you could specify "cn=DoubleTreeInn\$street=1111Elm;Suite100, where the semicolon is part of the street value.</p>
dn	Required if action="Add", "Modify", "ModifyDN", or "delete"		Distinguished name, for update action, for example, "cn=BobJensen,o=AceIndustry,c=US"
filter	Optional	"objectclass = *"	<p>Search criteria for action="query".</p> <p>List attributes in the form: " (attributeoperatorvalue) " For example: " (sn=Smith) "</p>
maxRows	Optional		Maximum number of entries for LDAP queries.
modifyType	Optional	replace	<p>How to process an attribute in a multi-value list:</p> <ul style="list-style-type: none"> <li>add: appends it to any attributes.</li> <li>delete: deletes it from the set of attributes.</li> <li>replace: replaces it with specified attributes.</li> </ul> <p>You cannot add an attribute that is already present or that is empty.</p>

Attribute	Req/Opt	Default	Description
name	Required if action="Query"		Name of LDAP query. The tag validates the value.
password	Required if secure="CFSSL_ BASIC"		Password that corresponds to user name.  If secure = "CFSSL_BASIC", V2 encrypts the password before transmission.
port	Optional	389	Port.
rebind	Optional	no	<ul style="list-style-type: none"> <li>yes: attempts to rebind referral callback and reissue query by referred address using original credentials.</li> <li>no: referred connections are anonymous.</li> </ul>
referral	Optional		Integer. Number of hops allowed in a referral. A value of 0 disables referred addresses for LDAP; no data is returned.
returnAsBinary	Optional		A space-delimited list of columns that are to be returned as binary values.
scope	Optional	oneLevel	<p>Scope of search, from entry specified in start attribute for action="Query".</p> <ul style="list-style-type: none"> <li>oneLevel: entries one level below entry.</li> <li>base: only the entry.</li> <li>subtree: entry and all levels below it.</li> </ul>
secure	Optional		Security to employ, and required information. If you specify this attribute, its value must be CFSSL_BASIC, which provides V2 SSL encryption and server authentication.
separator	Optional	, (comma)	<p>Delimiter to separate attribute values of multi-value attributes. Used by query, add, and modify actions, and by cfldap to output multi-value attributes.</p> <p>For example, if \$ (dollar sign), the attributes attribute could be "objectclass=top\$person", where the first value of objectclass is top, and the second value is person. This avoids confusion if values include commas.</p>
sort	Optional		Attributes by which to sort query results. Use a comma delimiter.
sortControl	Optional	asc	<ul style="list-style-type: none"> <li>nocase: case-insensitive sort.</li> <li>asc: ascending (a to z) case-sensitive sort.</li> <li>desc: descending (z to a) case-sensitive sort.</li> </ul> <p>You can enter a combination of sort types; for example, sortControl="nocase,asc".</p>
start	Required if action="Query"		Distinguished name of entry to be used to start a search.
startRow	Optional	1	Used with action="query". First row of LDAP query to insert into a ColdFusion query.
timeout	Optional	60000	Maximum length of time, in milliseconds, to wait for LDAP processing.
username	Required if secure="CFSSL_ BASIC"	(anonymous)	User ID.

## Usage

If you use the query action, `cfldap` creates a query object, allowing access to information in the query variables, as follows:

Variable name	Description
<code>queryname.recordCount</code>	Number of records returned by query
<code>queryname.currentRow</code>	Current row of query that <code>cfoutput</code> is processing
<code>queryname.columnList</code>	Column names in query

If you use the `security="CFSSL_BASIC"` option, ColdFusion determines whether to trust the server by comparing the server's certificate with the information in the `jre/lib/security/cacerts` keystore of the JRE used by ColdFusion. The ColdFusion default `cacerts` file contains information about many certificate granting authorities. If you must update the file with additional information, you can use the `keytool` utility in the ColdFusion `jre/bin` directory to import certificates that are in X.509 format. For example, enter the following:

```
keytool -import -keystore cacerts -alias ldap -file ldap.crt -keypass bl19mq
```

Then restart ColdFusion. The `keytool` utility initial `keypass` password is "change it". For more information on using the `keytool` utility, see the Sun JDK documentation.

Characters that are illegal in ColdFusion can be used in LDAP attribute names. As a result, the `cfldap` tag could create columns in the query result set whose names contain illegal characters and are, therefore, inaccessible in CFML. In ColdFusion, illegal characters are automatically mapped to the underscore character; therefore, column names in the query result set might not exactly match the names of the LDAP attributes.

For usage examples, see the *Developing ColdFusion Applications*.

## Example

```
<h3>cfldap Example</h3>
<p>Provides an interface to LDAP directory servers. The example uses the
University of Connecticut public LDAP server. For more public LDAP servers,
see <a href="http://www.emailman.com">http://www.emailman.com</a>.</p>
<p>Enter a name and search the public LDAP resource.
An asterisk before or after the name acts as a wildcard.</p>
<!-- If form.name exists, the form was submitted; run the query. -->
<cfif IsDefined("form.name")>
  <!-- Check to see that there is a name listed. -->
  <cfif form.name is not "">
    <!-- Make the LDAP query. -->
    <cfldap
      server = "ldap.uconn.edu"
      action = "query"
      name = "results"
      start = "dc=uconn,dc=edu"
      filter = "cn=#name#"
      attributes = "cn,o,title,mail,telephonenumber"
      sort = "cn ASC">
    <!-- Display results. -->
    <center>
    <table border = 0 cellspacing = 2 cellpadding = 2>
      <tr>
        <th colspan = 5>
          <cfoutput>#results.recordCount# matches found </cfoutput></TH>
      </tr>
```

```

        <tr>
            <th><font size = "-2">Name</font></TH>
            <th><font size = "-2">Organization</font></TH>
            <th><font size = "-2">Title</font></TH>
            <th><font size = "-2">E-Mail</font></TH>
            <th><font size = "-2">Phone</font></TH>
        </tr>
        <cfoutput query = "results">
            <tr>
                <td><font size = "-2">#cn#</font></td>
                <td><font size = "-2">#o#</font></td>
                <td><font size = "-2">#title#</font></td>
                <td><font size = "-2">
                    <A href = "mailto:#mail#">#mail#</A></font></td>
                <td><font size = "-2">#telephonenumber#</font></td>
            </tr>
        </cfoutput>
    </table>
</center>
</cfif>
</cfif>

<form action="#cgi.script_name#" method="POST">
    <p>Enter a name to search in the database.</p>
    <input type="Text" name="name">
    <input type="Submit" value="Search" name="">
</form>

```

## cflocation

### Description

Stops execution of the current page and opens a ColdFusion page or HTML file.

### Category

[Flow-control tags](#), [Page processing tags](#)

### Syntax

```

<cflocation
    url = "URL"
    addToken = "yes|no"
    statusCode = "300|301|302|303|304|305|307">

```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfabort](#), [cfbreak](#), [cfexecute](#), [cfexit](#), [cfif](#), [cfloop](#), [cfswitch](#), [cfthrow](#), [cftry](#)

### History

ColdFusion 8: Added the `statusCode` attribute.

### Attributes

Attribute	Req/Opt	Default	Description
url	Required		URL of HTML file or CFML page to open.
<i>addToken</i>	Optional		The <code>clientManagement</code> attribute must be enabled (see <code>cfapplication</code> ). <ul style="list-style-type: none"><li>• <i>yes</i>: appends client variable information to URL.</li><li>• <i>no</i></li></ul>
<i>statusCode</i>	Optional		The HTTP status code, as follows: <ul style="list-style-type: none"><li>• 300 HTTP_MULTIPLE_CHOICES: The requested address refers to more than one entity.</li><li>• 301 HTTP_MOVED_PERMANENTLY: The page is assigned a new URI. The change is permanent.</li><li>• 302 HTTP_MOVED_TEMPORARILY: The page is assigned a new URI. The change is temporary.</li><li>• 303 HTTP_SEE_OTHER: The client should try another network address.</li><li>• 304 HTTP_NOT_MODIFIED: The requested resource has not been modified.</li><li>• 305 HTTP_USE_PROXY: The requested resource must be accessed through the proxy given by the Location field.</li><li>• 307 HTTP_TEMPORARY_REDIRECT: The requested data temporarily resides at a new location.</li></ul> The status codes from 304 to 307 do not redirect you to the page specified in a URL, unless you also follow the guidelines specified in the most recent HTTP RFC.

### Usage

You might write a standard message or response in a file, and call it from several applications. Use this tag to redirect the user's browser to the standard file.

This tag has no effect if you use it after the `cfflush` tag on a page.

### Example

```
<h3>cflocation Example</h3>
<p>This tag redirects the browser to a web resource; normally, you would use this tag to go
to a CF page or an HTML file on the same server. The addToken attribute lets you send client
information to the target page.</p>
<p>If you remove the comments, this code redirects you to CFDOCS home page:</p>

<!-- <cflocation url = "http://localhost:8500/cfdocs/dochome.htm" addToken = "no"> -->
```

## cflock

### Description

Ensures the integrity of shared data. Instantiates the following kinds of locks:

- Exclusive - Allows single-thread access to the CFML constructs in its body. The tag body can be executed by one request at a time. No other requests can start executing code within the tag while a request has an exclusive lock. ColdFusion issues exclusive locks on a first-come, first-served basis.

- Read-only - Allows multiple requests to access CFML constructs within the tag body concurrently. Use a read-only lock only when shared data is read and not modified. If another request has an exclusive lock on shared data, the new request waits for the exclusive lock to be released.

### Category

[Application framework tags](#)

### Syntax

```
<cflock
    timeout = "time-out in seconds"
    name = "lock name"
    scope = "Application|Server|Session|Request"
    throwOnTimeout = "yes|no"
    type = "readOnly|exclusive">
    <!--- CFML to be synchronized. --->
</cflock>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfapplication](#), [cfassociate](#), [cfmessagebox](#), Using Persistent Data and Locking in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added `Request` value to `scope` attribute.

### Attributes

Attribute	Req/Opt	Default	Description
timeout	Required		Maximum length of time, in seconds, to wait to obtain a lock. If lock is obtained, tag execution continues. Otherwise, behavior depends on <code>throwOnTimeout</code> attribute value. If you set <code>timeout="0"</code> , the timeout is determined by the "Timeout Requests after x" setting in the ColdFusion Administrator Settings page, if that setting is enabled. However, if the setting is not enabled, and you set <code>timeout="0"</code> , ColdFusion can wait indefinitely to obtain the lock.
name	Optional		Locks name. Mutually exclusive with the <code>scope</code> attribute. Only one request can execute the code within a <code>cflock</code> tag with a given name at a time. Cannot be an empty string.  Permits synchronizing access to resources from different parts of an application. Lock names are global to a ColdFusion server. They are shared among applications and user sessions, but not clustered servers.

Attribute	Req/Opt	Default	Description
scope	Optional		Locks scope. Mutually exclusive with the <code>name</code> attribute. Only one request in the specified scope can execute the code within this tag (or within any other <code>cflock</code> tag with the same lock scope) at a time. <ul style="list-style-type: none"><li>• Application</li><li>• Request</li><li>• Server</li><li>• Session</li></ul>
throwOnTimeout	Optional	yes	How time-out conditions are handled: <ul style="list-style-type: none"><li>• yes: exception is generated for the time-out.</li><li>• no: execution continues past this tag.</li></ul>
type	Optional	exclusive	<ul style="list-style-type: none"><li>• readOnly: lets more than one request read shared data.</li><li>• exclusive: lets one request read or write shared data.</li></ul>

**Note:** Limit the scope of code that updates shared data structures, files, and CFXs. Exclusive locks are required to ensure the integrity of updates, but read-only locks are faster. In a performance-sensitive application, substitute read-only locks for exclusive locks where possible, for example, when reading shared data.

### Usage

ColdFusion is a multi-threaded server; it can process multiple page requests at a time. Use the `cflock` tag for these purposes:

- To ensure that modifications to shared data and objects made in concurrently executing requests occur sequentially.
- Around file manipulation constructs, to ensure that file updates do not fail because files are open for writing by other applications or tags.
- Around CFX invocations, to ensure that ColdFusion can safely invoke CFXs that are not implemented in a thread-safe manner. (This applies only to CFXs developed in C++.)

To work safely with ColdFusion, a C++ CFX that maintains and manipulates shared (global) data structures must be made thread-safe; however, this requires advanced knowledge. You can use a CFML custom tag wrapper around a CFX to make its invocation thread-safe.

When you display, set, or update variables in a shared scope, use the `scope` attribute to identify the scope as Server, Application or Session.

### Deadlocks

A *deadlock* is a state in which no request can execute the locked section of a page. After a deadlock occurs, neither user can break it, because all requests to the protected section of the page are blocked until the deadlock can be resolved by a lock time-out.

The `cflock` tag uses kernel level synchronization objects that are released automatically upon time out and/or the abnormal termination of the thread that owns them. Therefore, while processing a `cflock` tag, ColdFusion never deadlocks for an infinite period. However, large time-outs can block request threads for long periods, and radically decrease throughput. To prevent this, always use the minimum time-out value.

Another cause of blocked request threads is inconsistent nesting of `cflock` tags and inconsistent naming of locks. If you nest locks, everyone accessing the locked variables must consistently nest `cflock` tags in the same order. Otherwise, a deadlock can occur.

These examples show situations that cause deadlocks:

Example deadlock with two users	
User 1	User 2
Locks the session scope.	Locks the Application scope.
Deadlock: Tries to lock the Application scope, but it is already locked by User 2.	Deadlock: Tries to lock the Session scope, but it is already locked by User 1.

The following deadlock could occur if you tried to nest an exclusive lock inside a read lock:

Example deadlock with one user
User 1
Locks the Session scope with a read lock.
Attempts to lock the Session scope with an exclusive lock.
Deadlock: Cannot lock the Session scope with an exclusive lock because the scope is already locked for reading.

The following code shows this scenario:

```
<cflock timeout = "60" scope = "SESSION" type = "readOnly">
    .....
    <cflock timeout = "60" scope = "SESSION" type = "Exclusive">
        .....
    </cflock>
</cflock>
```

To avoid a deadlock, everyone who nests locks must do so in a well-specified order and name the locks consistently. If you must lock access to the Server, Application, and Session scopes, do so in this order:

- 1 Lock the Session scope. In the `cflock` tag, specify `scope = "session"`.
- 2 Lock the Application scope. In the `cflock` tag, specify `scope = "Application"`.
- 3 Lock the Server scope. In the `cflock` tag, specify `scope = "server"`.
- 4 Unlock the Server scope.
- 5 Unlock the Application scope.
- 6 Unlock the Session scope.

**Note:** If you do not have to lock a scope, you can skip any pair of these lock/unlock steps. For example, if you do not have to lock the Server scope, you can skip Steps 3 and 4. Similar rules apply for named locks.

For more information, see the following:

- Using Persistent Data and Locking in the *Developing ColdFusion Applications*.
- Locking thread data and resource access in the *Developing ColdFusion Applications* (for information on locking the Request scope when you use the `cfthread` tag to create multithreaded ColdFusion applications).
- [ColdFusion Locking Best Practices](#), on the Adobe website.

## Example

```
<!---
This example shows how cflock can guarantee consistency of data updates to variables in the
Application, Server, and Session scopes. --->

<!--- Copy the following code into an Application.cfm file in the
application root directory. --->
<!------- Beginning of Application.cfm code ----->
<!--- cfapplication defines scoping for a ColdFusion application and enables or disables
storing of application and session variables. Put this tag in a special file called
Application.cfm. It is run before any other ColdFusion page in its directory. --->

<!--- Enable session management for this application. --->
<cfapplication name = "ETurtle"
    sessionTimeout = #CreateTimeSpan(0,0, 0, 60)#
    sessionManagement = "yes">

<!--- Initialize session and application variables used by E-Turtleneck. Use session scope
for the session variables. --->
<cflock scope = "Session"
    timeout = "30" type = "Exclusive">
    <cfif NOT IsDefined("session.size")>
        <cfset session.size = "">
    </cfif>
    <cfif NOT IsDefined("session.color")>
        <cfset session.color = "">
    </cfif>
</cflock>

<!--- Use an application lock for the application-wide variable that keeps track of the
number of turtlenecks sold. For a more efficient, but more complex, way of handling
Application scope locking, see the "Developing ColdFusion Applications"--->
<cflock scope = "Application" timeout = "30" type = "Exclusive">
    <cfif NOT IsDefined("application.number")>
        <cfset application.number = 0>
    </cfif>
</cflock>

<!------- End of Application.cfm ----->

<h3>cflock Example</h3>

<cfif IsDefined("form.submit")>
<!--- The form has been submitted; process the request. --->
    <cfoutput>
        Thanks for shopping E-Turtleneck. You chose size <b>#form.size#</b>,
        color <b>#form.color#</b>.<br><br>
    </cfoutput>

<!--- Lock the code that assigns values to session variables. ---->
    <cflock scope = "Session" timeout = "30" type = "Exclusive">
        <cfparam name = session.size Default = #form.size#>
        <cfparam name = session.color Default = #form.color#>
    </cflock>

<!--- Lock the code that updates the Application scope number of turtlenecks sold. --->
```

```
<cflock scope = "Application" timeout = "30" type = "Exclusive">
    <cfset application.number = application.number + 1>
<cfoutput>
    E-Turtleneck has now sold #application.number# turtlenecks!
</cfoutput>
</cflock>

<cfelse>
<!-- Show the form only if it has not been submitted. --->
    <cflock scope = "Application" timeout = "30" type = "Readonly">
        <cfoutput>
            E-Turtleneck has sold #application.number# turtlenecks to date.
        </cfoutput>
    </cflock>

    <form method="post" action="cflocktest.cfm">
        <p>Congratulations! You selected the most comfortable turtleneck in the world.
        Please select color and size.</p>
        <table cellpadding = "2" cellspacing = "2" border = "0">
            <tr>
                <td>Select a color.</td>
                <td><select type = "Text" name = "color">
                    <option>red
                    <option>white
                    <option>blue
                    <option>turquoise
                    <option>black
                    <option>forest green
                </select>
            </td>
            </tr>
            <tr>
                <td>Select a size.</td>
                <td><select type = "Text" name = "size" >
                    <option>XXsmall
                    <option>Xsmall
                    <option>small
                    <option>medium
                    <option>large
                    <option>Xlarge
                </select>
            </td>
            </tr>
            <tr>
                <td>Press Submit when you are finished making your selection.</td>
                <td><input type = "Submit" name = "submit" value = "Submit"> </td>
            </tr>
        </table>
    </form>
</cfif>
```

## cflog

### Description

Writes a message to a log file.

## Category

Data output tags

## Syntax

```
<cflog
    text = "text"
    type = "information|warning|error|fatal"
    application = "yes|no"
    file = "filename"
    log = "log type">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfcol](#), [cfcontent](#), [cfoutput](#), [cftable](#)

## History

ColdFusion MX: Deprecated the `thread`, `date`, and `time` attributes. They might not work, and might cause an error, in later releases. (In earlier releases, these attributes determined whether the respective data items were output to the log. In ColdFusion MX, this data is always output.)

## Attributes

Attribute	Req/Opt	Default	Description
<code>text</code>	Required		Message text to log.
<code>application</code>	Optional	<code>yes</code>	<ul style="list-style-type: none"> <li><code>yes</code>: logs the application name, if it is specified in a <code>cfapplication</code> tag or <code>Application.cfc</code> file.</li> <li><code>no</code></li> </ul>
<code>file</code>	Optional		<p>Message file. Specify only the main part of the filename. For example, to log to the <code>Testing.log</code> file, specify "Testing".</p> <p>The file must be located in the default log directory. You cannot specify a directory path. If the file does not exist, it is created automatically, with the extension <code>.log</code>.</p>
<code>log</code>	Optional		<p>If you omit the <code>file</code> attribute, writes messages to standard log file. Ignored, if you specify <code>file</code> attribute.</p> <ul style="list-style-type: none"> <li><code>Application</code>: writes to <code>Application.log</code>, normally used for application-specific messages.</li> <li><code>Scheduler</code>: writes to <code>Scheduler.log</code>, normally used to log the execution of scheduled tasks.</li> </ul>
<code>type</code>	Optional	<code>Information</code>	<p>Type (severity) of the message:</p> <ul style="list-style-type: none"> <li><code>Information</code></li> <li><code>Warning</code></li> <li><code>Error</code></li> <li><code>Fatal</code></li> </ul>

### Usage

This tag logs custom messages to standard or custom log files. You can specify a file for the log message or send messages to the default application or scheduler log. The log message can include ColdFusion expressions. Log files must have the extension .log and must be located in the ColdFusion log directory.

Log entries are written as comma-delimited lists with these fields:

- type
- thread
- date
- time
- application
- text

Values are enclosed in double quotation marks. If you specify `no` for the `application` attribute, the corresponding entry in the list is empty.

You can disable `cflog` tag execution. For more information, see the ColdFusion Administrator Basic Security page.

The following example logs the name of a user that logs on an application. The message is logged to the file `myAppLog.log` in the ColdFusion log directory. It includes the date, time, and thread ID, but not the application name.

```
<cflog file="myAppLog" application="no"
      text="User #Form.username# logged on.">
```

For example, if a user enters "Sang Thornfield" in a form's username field, this entry is added to the `myApplog.log` file entry:

```
"Information","153","02/28/01","14:53:40","User Sang Thornfield logged on."
```

## cflogin

### Description

A container for user login and authentication code. ColdFusion runs the code in this tag if a user is not already logged in. You put code in the tag that authenticates the user and identifies the user with a set of roles. Used with [cfloginuser](#) tag.

### Category

[Security tags](#)

### Syntax

```
<cflogin
  applicationToken = "token"
  cookieDomain = "domain"
  idletimeout = "value">
  ...
  <cfloginuser
    name = "name"
    password = "password"
    roles = "roles">
</cflogin>
```

### See also

[cfloginuser](#), [cflogout](#), [GetAuthUser](#), [GetUserRoles](#), [IsUserInAnyRole](#), [IsUserInRole](#), [IsUserLoggedIn](#),  
Securing Applications in the *Developing ColdFusion Applications*

### History

ColdFusion 8: The `applicationtoken` attribute lets you specify a unique application identifier for each application, or the same value for multiple applications.

ColdFusion MX 6.1: Changed behavior: the `cflogin` variable exists when ColdFusion receives a request with NTLM or Digest (HTTP Negotiated header) authentication information.

ColdFusion MX: Added this tag.

### Attributes

Attribute	Req/Opt	Default	Description
<code>applicationtoken</code>	Optional	The current application name	The login that applies to the application. To let users log in to only one application, specify a unique value for that application. To let users log in to multiple applications, specify the same value for those applications. If you do not set a value for the <code>applicationtoken</code> attribute, the default value is <code>CFAUTHORIZATION_</code> <i>applicationname</i> .
<code>cookiedomain</code>	Optional		Domain of the cookie that is used to mark a user as logged in. Use this attribute to enable a user login cookie to work with multiple clustered servers in the same domain.
<code>idletimeout</code>	Optional	1800	Time interval, in seconds, after which ColdFusion logs off the user.

### Usage

The body of this tag executes only if there is no logged-in user. When using application-based security, you put code in the body of the `cflogin` tag to check the user-provided ID and password against a data source, LDAP directory, or other repository of login identification. The body must include a `cfloginuser` tag to establish the authenticated user's identity in ColdFusion.

You control the data source and are responsible for coding the SQL within the `cflogin` tag; make sure that the associated database has user, password, and role information.

The `cflogin` tag has a built-in `cflogin` structure that contains two variables, `cflogin.name` and `cflogin.password`, if the page is executing in response to any of the following:

- Submission of a form that contains input fields with the names `j_username` and `j_password`.
- A request that uses HTTP Basic authentication and, therefore, includes an Authorization header with the user name and password.
- A request that uses NTLM or Digest authentication. In this case, the username and password are hashed using a one-way algorithm in the Authorization header; ColdFusion gets the username from the web server and sets the `cflogin.password` value to the empty string.

You can use these values in the `cflogin` tag body to authenticate the user, and, in the `cfloginuser` tag, to log the user in. The structure is only available in the `cflogin` tag body.

### Example

The following example shows a simple authentication. This code is typically in the `Application.cfc` `onRequestStart` method or in the `application.cfm` page.

```
<cflogin>
  <cfif NOT IsDefined("cflogin")>
    <cfinclude template="loginform.cfm">
    <cfabort>
  <cfelse>
    <cfif cflogin.name eq "admin">
      <cfset roles = "user,admin">
    <cfelse>
      <cfset roles = "user">
    </cfif>
    <cfloginuser name = "#cflogin.name#" password = "#cflogin.password#"
      roles = "#roles#"/>
  </cfif>
</cflogin>
```

The following view-only example checks the user ID and password against a data source:

```
<cfquery name="qSecurity"
  datasource="UserRolesDb">
  SELECT Roles FROM SecurityRoles
  WHERE username=<cfqueryparam value='#cflogin.name#' CFSQLTYPE="CF_SQL_VARCHAR"
  AND password=<cfqueryparam value='#cflogin.password#' CFSQLTYPE='CF_SQL_VARCHAR'
</cfquery>

<cfif qSecurity.recordcount gt 0>
<cfloginuser name = "#cflogin.name#"
  password = "#cflogin.password#"
  roles = "#trim(qSecurity.Roles)#" >
</cfif>
```

## cfloginuser

### Description

Identifies an authenticated user to ColdFusion. Specifies the user ID and roles. Used within a `cflogin` tag.

### Category

[Security tags](#)

### Syntax

```
<cfloginuser
  name = "name"
  password = "password"
  roles = "roles">
```

### See also

[cflogin](#), [cflogout](#), [GetAuthUser](#), [GetUserRoles](#), [IsUserInAnyRole](#), [IsUserInRole](#), [IsUserLoggedIn](#),  
Securing Applications in the *Developing ColdFusion Applications*

### History

ColdFusion MX 6.1: Changed behavior: if the Session scope is enabled, and the `cfapplication` tag `loginStorage` attribute is set to Session, the login remains in effect until the session expires or the user is logged out by the `cflogout` tag.

ColdFusion MX: Added this tag.

### Attributes

Attribute	Req/Opt	Default	Description
name	Required		A user name.
password	Required		A user password.
roles	Required		A comma-delimited list of role identifiers. ColdFusion processes spaces in a list element as part of the element.

### Usage

Used inside the `cflogin` tag to identify the authenticated user to ColdFusion. After you call this function, the `GetAuthUser` and `IsUserInRole` return the user name and role information.

**Note:** By default, the user information is stored as memory-only cookies. The `cfapplication` tag or the `Application.cfc` `This.loginStorage` variable can specify that login information is stored in the Session scope.

### Example

See `cflogin`.

## cflogout

### Description

Logs the current user out. Removes knowledge of the user ID, password, and roles from the server. If you do not use this tag, the user is automatically logged out when the session ends.

### Category

[Security tags](#)

### Syntax

```
<cflogout>
```

### See also

[cflogin](#), [cfloginuser](#), [GetAuthUser](#), [GetUserRoles](#), [IsUserInAnyRole](#), [IsUserInRole](#), [IsUserLoggedIn](#),  
Securing Applications in *Developing ColdFusion Applications*

### History

ColdFusion MX 6.1: Changed behavior: if the Session scope is enabled, a login remains in effect until the session expires or the user is logged out by the `cflogout` tag.

ColdFusion MX: Added this tag.

### Example

```
<cflogin>
  <cfloginuser
    name = "foo"
    password ="bar"
    roles = "admin">
</cflogin>
<cfoutput>Authorized user: #getAuthUser()#</cfoutput>
<cflogout>
<cfoutput>Authorized user: #getAuthUser()#</cfoutput>
```

## cfloop

### Description

Looping is a programming technique that repeats a set of instructions or displays output repeatedly until one or more conditions are met. This tag supports the following types of loops:

- [cfloop: index loop](#)
- [cfloop: conditional loop](#)
- [cfloop: looping over a date or time range](#)
- [cfloop: looping over a query](#)
- [cfloop: looping over a list, a file, or an array](#)
- [cfloop: looping over a COM collection or structure](#)

For more information, see [cfloop](#) and [cfbreak](#) and [Populating arrays with data](#) in the *Developing ColdFusion Applications*.

### Category

[Flow-control tags](#)

## cfloop: index loop

### Description

An index loop repeats for a number of times that is determined by a numeric value. An index loop is also known as a FOR loop.

### Syntax

```
<cfloop
  index = "parameter name"
  from = "beginning value"
  to = "ending value"
  step = "increment"
  charset "charset to read in a file">
  HTML or CFML code ...
</cfloop>
```

### See also

[cfabort](#), [cfbreak](#), [cfcontinue](#), [cfdirectory](#), [cfexecute](#), [cfexit](#), [cfif](#), [cflocation](#), [cfrethrow](#), [cfswitch](#), [cfthrow](#), [cftry](#); [cfloop](#) and [cfbreak](#) in the *Developing ColdFusion Applications*

### Attributes

Attribute	Req/Opt	Default	Description
index	Required		Index value. ColdFusion sets it to the <code>from</code> value and increments or decrements by <code>step</code> value, until it equals the <code>to</code> value.
from	Required		Beginning value of index.
to	Required		Ending value of index.
step	Optional	1	Step by which to increment or decrement the index value.
charset	optional		Charset to use when reading in a file line-by-line.

### Usage

Using anything other than integer values in the `from` and `to` attributes of an index loop can product unexpected results. For example, if you increment through an index loop from 1 to 2, with a step of 0.1, ColdFusion outputs "1,1.1,1.2,...,1.9", but not "2". This is a programming language problem regarding the internal representation of floating point numbers.

**Note:** The `to` value is evaluated once, when the `cflloop` tag is encountered. Any change to this value within the loop block, or within the expression that evaluates to this value, does not affect the number of times the loop is executed.

### Example

In this example, the code loops five times, displaying the `index` value each time:

```
<cflloop index = "LoopCount" from = "1" to = "5">
    The loop index is <cfoutput>#LoopCount#</cfoutput>.<br>
</cflloop>
```

The output of this loop is as follows:

```
The loop index is 1.
The loop index is 2.
The loop index is 3.
The loop index is 4.
The loop index is 5.
```

In this example, the code loops four times, displaying the `index` value each time. The value of `j` is decreased by one for each iteration. This does not affect the value of `to`, because it is a copy of `j` that is made before entering the loop.

```
<cfset j = 4>
<cflloop index = "LoopCount" from = "1" to = #j#>
    <cfoutput>The loop index is #LoopCount#</cfoutput>.<br>
    <cfset j = j - 1>
</cflloop>
```

The output of this loop is as follows:

```
The loop index is 1.
The loop index is 2.
The loop index is 3.
The loop index is 4.
```

As before, the value of `j` is decremented by one for each iteration, but this does not affect the value of `to`, because its value is a copy of `j` that is made before the loop is entered.

In this example, `step` has the default value, 1. The code decrements the index:

```
<cfloop index = "LoopCount"
  from = "5"
  to = "1"
  step = "-1">
The loop index is <cfoutput>#LoopCount#</cfoutput>.<br>
</cfloop>
```

The output of this loop is as follows:

```
The loop index is 5.
The loop index is 4.
The loop index is 3.
The loop index is 2.
The loop index is 1.
```

## cfloop: conditional loop

### Description

A conditional loop iterates over a set of instructions as long as a condition is True. To use this type of loop correctly, the instructions must change the condition every time the loop iterates, until the condition is False. Conditional loops are known as WHILE loops, as in, "loop WHILE this condition is true."

### Syntax

```
<cfloop
  condition = "expression">
  ...
</cfloop>
```

### See also

[cfabort](#), [cfbreak](#), [cfcontinue](#), [cfexecute](#), [cfexit](#), [cfif](#), [cflocation](#), [cfswitch](#), [cfthrow](#), [cftry](#); [cfloop](#) and [cfbreak](#) in the *Developing ColdFusion Applications*

### Attributes

Attribute	Req/Opt	Default	Description
condition	Required		Condition that controls the loop.

### Example

The following example increments CountVar from 1 to 5.

```
<!--- Set the variable CountVar to 0. --->
<cfset CountVar = 0>
<!--- Loop until CountVar = 5. --->
<cfloop condition = "CountVar LESS THAN 5">
  <cfset CountVar = CountVar + 1>
  The loop index is <cfoutput>#CountVar#</cfoutput>.<br>
</cfloop>
```

The output of this loop is as follows:

```
The loop index is 1.
The loop index is 2.
The loop index is 3.
The loop index is 4.
The loop index is 5.
```

## cfloop: looping over a date or time range

### Description

Loops over the date or time range specified by the `from` and `to` attributes. By default, the step is 1 day, but you can change the step by creating a timespan. The `cfloop` tag loops over tags that cannot be used within a `cfoutput` tag.

### Syntax

```
<cfloop
    from = "start time"
    to = "end time"
    index = "current value"
    step = "increment">
</cfloop>
```

### See also

[cfabort](#), [cfbreak](#), [cfcontinue](#), [cfdirectory](#), [cfexecute](#), [cfexit](#), [cfif](#), [cflocation](#), [cfrethrow](#), [cfswitch](#), [cfthrow](#), [cftry](#); `cfloop` and `cfbreak` in the *Developing ColdFusion Applications*

### Attributes

Attribute	Req/Opt	Default	Description
<code>from</code>	Required		The beginning of the date or time range.
<code>to</code>	Required		The end of the date or time range.
<code>index</code>	Required	1 day	Index value. ColdFusion sets it to the <code>from</code> value and increments by the <code>step</code> value, until it equals the <code>to</code> value.
<code>step</code>	Optional		Step, expressed as a timespan, by which the index increments.

### Example

The following example loops from today's date to today's date plus 30 days, stepping by 7 days at a time and displaying the date:

```
<cfset startDate = Now()>
<cfset endDate = Now() + 30>
<cfloop from="#startDate#" to="#endDate#" index="i" step="#CreateTimeSpan(7,0,0,0)#">
<cfoutput>#dateFormat(i, "mm/dd/yyyy")#<br /></cfoutput>
</cfloop>
```

The following example displays the time in 30-minute increments, starting from midnight and ending 23 hours, 59 minutes, and 59 seconds later:

```
<cfset startTime = CreateTime(0,0,0)>
<cfset endTime = CreateTime(23,59,59)>
<cfloop from="#startTime#" to="#endTime#" index="i" step="#CreateTimeSpan(0,0,30,0)#">
    <cfoutput>#TimeFormat(i, "hh:mm tt")#<br /></cfoutput>
</cfloop>
```

## cfloop: looping over a query

### Description

A loop over a query executes for each record in a query record set. The results are similar to those of the `cfoutput` tag. During each iteration, the columns of the current row are available for output. The `cfloop` tag loops over tags that cannot be used within a `cfoutput` tag.

### Syntax

```
<cfloop
    query = "query name"
    startRow = "row number"
    endRow = "row number">
</cfloop>
```

### See also

[cfabort](#), [cfbreak](#), [cfcontinue](#), [cfexecute](#), [cfexit](#), [cfif](#), [cflocation](#), [cfoutput](#), [cfswitch](#), [cfthrow](#), [cftry](#); For more information, see `cfloop` and `cfbreak` in the *Developing ColdFusion Applications*

### Attributes

Attribute	Req/Opt	Default	Description
query	Required		Query that controls the loop.
startRow	Optional		First row of query that is included in the loop.
endRow	Optional		Last row of query that is included in the loop.

### Example

```
<cfquery name = "MessageRecords" dataSource = "cfdocexamples">
    SELECT * FROM Messages
</cfquery>
<cfloop query = "MessageRecords">
<cfoutput>#Message_ID#</cfoutput><br>
</cfloop>
```

The `cfloop` tag also iterates over a record set with dynamic start and stop points. This gets the next *n* sets of records from a query. This example loops from the fifth through the tenth record returned by the `MessageRecords` query:

```
<cfset Start = 5>
<cfset End = 10>
<cfloop query = "MessageRecords"
    startRow = "#Start#"
    endRow = "#End#">
<cfoutput>#MessageRecords.Message_ID#</cfoutput><br>
</cfloop>
```

The loop stops when there are no more records, or when the current record index is greater than the value of the `endRow` attribute. The following example combines the pages that are returned by a query of a list of page names into one document, using the `cfinclude` tag:

```
<cfquery name = "GetTemplate" dataSource = "Library" maxRows = "5">
    SELECT TemplateName
    FROM Templates
</cfquery>
<cfloop query = "GetTemplate">
    <cfinclude template = "#TemplateName#">
</cfloop>
```

## cfloop: looping over a list, a file, or an array

### Description

Looping over a list steps through elements contained in any of these entities:

- A variable
- A value that is returned from an expression
- An array
- A file

Looping over a file does not open the entire file in memory.

### Syntax

```
<cfloop
    index = "index name"
    array = "array"
    characters = "number of characters"
    delimiters = "item delimiter"
    file = "absolute path and filename">
    list = "list items"
    ...
</cfloop>
```

### See also

### History

ColdFusion 8: Added the `characters`, `file`, and `array` attributes.

### Attributes

Attribute	Req/Opt	Default	Description
index	Required		In a list, file, or array loop, the variable to receive the next element.
list	Required unless you specify a filename in the <code>file</code> attribute		A list, variable, or filename; contains a list.
array	Optional		An array.

Attribute	Req/Opt	Default	Description
characters	Optional		The number of characters to read during each iteration of the loop from the file specified in the <code>file</code> attribute. If the value of the <code>characters</code> attribute is more than the number of characters in the file, ColdFusion uses the number of characters in the file.
delimiters	Optional		Characters that separate items in list.
file	Optional		The absolute pathname of the on-disk or in-memory text file to read, one line at a time. This is helpful when reading large text files, because you can reuse the value of the index variable, which contains the current line of the file. When the loop completes, ColdFusion closes the file.

### Example

This loop displays four names:

```
<cfloop index = "ListElement" list = "John,Paul,George,Ringo">
  <cfoutput>#ListElement#</cfoutput><br>
</cfloop>
```

You can put more than one character in the `delimiters` attribute, in any order. For example, this loop processes commas, colons, and slashes as list delimiters:

```
<cfloop index = "ListElement" list = "John/Paul,George::Ringo" delimiters = ",:/">
  <cfoutput>#ListElement#</cfoutput><br>
</cfloop>
```

ColdFusion skips the second and subsequent consecutive delimiters between list elements. Thus, in the example, the two colons between "George" and "Ringo" are processed as one delimiter.

To loop over each line of a file, use the tag as follows:

```
<cfloop file="c:\temp\simplefile.txt" index="line">
  <cfoutput>#line#</cfoutput><br>
</cfloop>
```

To read a specified number of characters from a text file during each iteration of the loop, use the tag as follows:

```
<cfloop file="c:\temp\simplefile.txt" index="chars" characters="12">
  <cfoutput>#chars#</cfoutput><br>
</cfloop>
```

When you read the following text file, ColdFusion reads 12 characters during each iteration of the loop; the result appears as follows:

Text file	Result
This is line 1.	This is line
This is line 2.	1. This is
This is line 3.	line 2. Th
This is line 4.	is is line 3
This is line 5.	. This is l
This is line 6.	ine 4. This
This is line 7.	is line 5.
This is line 8.	This is lin
This is line 9.	e 6. This i
This is line 10.	s line 7. T
This is line 11.	his is line
	8. This is
	line 9. Thi
	s is line 10
	. This is l
	ine 11.

To loop over an array, you can do the following:

```
<cfset x = ["mars","earth", "venus", "jupiter"]>
<cfloop array="#x#" index="name">
    <cfoutput>#name#</cfoutput><br>
</cfloop>
```

## cfloop: looping over a COM collection or structure

### Description

The `cfloopcollection` attribute loops over every object within a COM/DCOM collection object, or every element in a structure:

- A COM/DCOM collection object is a set of similar items referenced as a group. For example, the group of open documents in an application is a collection.
- A structure contains a related set of items, or it can be used as an associative array. Looping is particularly useful when using a structure as an associative array.

In the loop, each item is referenced by the variable name in the `item` attribute. The loop executes until all items have been accessed.

The `collection` attribute is used with the `item` attribute. In the example that follows, `item` is assigned a variable called `file2`, so that with each cycle in the `cfloop`, each item in the collection is referenced. In the `cfoutput` section, the `name` property of the `file2` item is referenced for display.

For more information, see *Integrating COM and CORBA Objects in CFML Applications* in the *Developing ColdFusion Applications*.

### Example

This example uses a COM object to output a list of files. In this example, FFunc is a collection of file2 objects.

```
<cfobject
    class = FileFunctions.files
    name = FFunc
    action = Create>
<cfset FFunc.Path = "c:\">
<cfset FFunc.Mask = "*.*" >
<cfset FFunc.attributes = 16 >
<cfset x = FFunc.GetFileList()>
<cfloop collection = #FFUNC# item = "file2">
    <cfoutput> #file2.name# <br> </cfoutput>
</cfloop>
<!--- Loop through a structure that is used as an associative array: --->
...
<!--- Create a structure and loop through its contents. --->
<cfset Departments = StructNew()>
<cfset val = StructInsert(Departments, "John ", "Sales ")>
<cfset val = StructInsert(Departments, "Tom ", "Finance ")>
<cfset val = StructInsert(Departments, "Mike ", "Education ")>
<!--- Build a table to display the contents --->
<cfoutput>
<table cellpadding = "2 " cellspacing = "2 ">
    <tr>
        <td><b>Employee</b></td>
        <td><b>Dept.</b></td>
    </tr>
    <!--- Use item to create the variable person to hold value of key as loop runs. --->
    <cfloop collection = #Departments# item = "person ">
        <tr>
            <td>#person#</td>
            <td>#StructFind(Departments, person)#</td></tr>
    </cfloop>
</table>
</cfoutput>
```

## Tags m-o

### cfmail

#### Description

Sends an e-mail message that optionally contains query output, using an SMTP server.

#### Category

[Communications tags](#), [Internet protocol tags](#)

## Syntax

```
<cfmail
    from = "e-mail address"
    to = "comma-delimited list"
    bcc = "comma-delimited list"
    cc = "comma-delimited list"
    charset = "character encoding"
    debug = "yes|no"
    failto = "e-mail address"
    group = "query column"
    groupcasesensitive = "yes|no"
    mailerid = "header id"
    maxrows = "integer"
    mimeattach = "path"
    password = "string"
    port = "integer"
    priority = "integer or string priority level"
    query = "query name"
    remove = "yes|no"
    replyto = "e-mail address"
    server = "SMTP server address"
    spoolenable = "yes|no"
    startrow = "query row number"
    subject = "string"
    timeout = "number of seconds"
    type = "mime type"
    username = "SMTP user ID"
    useSSL = "yes|no"
    useTLS = "yes|no"
    wraptext = "column number"
    sign = "true|false"
    keystore = "location of keystore"
    keystorepassword = "password of keystore"
    keyalias = "alias of key"
    keypassword = "password for private key">
```

(Optional) Mail message body and/or cfmailparam tags

```
</cfmail>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfmailparam](#), [cfmailpart](#), [cfpop](#), [cfftpt](#), [cfhttp](#), [cfldap](#), [Wrap](#); Using ColdFusion with mail servers in Sending and Receiving E-Mail in the *Developing ColdFusion Applications*

## History

ColdFusion 8.0.1: Added the attribute `Remove`.

ColdFusion 8: Added `priority`, `useSSL`, and `useTLS` attributes.

ColdFusion MX 7:

- The `cfmail` tag no longer lets you send multipart mail by embedding the entire MIME-encoded message in the tag body. Use the `cfmailpart` tag, instead.

- The `cfmail` tag renders non-proportional fonts proportionately. This is a behavior change from ColdFusion 5. ColdFusion MX 7 uses UTF-8 and sends this in the mail header (Content-Type: text/plain; charset=UTF-8). ColdFusion 5 uses ISO-8859-1 (Latin 1). To avoid this behavior, add the `charset="ISO-8859-1"` attribute to restore the default ColdFusion 5 encoding. Alternatively, you can change the encoding on the Mail page in the ColdFusion Administrator.

ColdFusion MX 6.1:

- Added the following attributes: `charset`, `failto`, `replyto`, `username`, `password` and `wraptext`.
- Added support for multiple mail servers in the `server` attribute.
- Added several configuration options to the ColdFusion Administrator Mail Settings page.

ColdFusion MX: Added the `SpoolEnable` attribute.

ColdFusion 9: Added support for digitally signing the mail. The following are the relevant attributes that are newly added: `sign`, `keystore`, `keystorepassword`, `keyalias`, `keypassword` and `remove`.

### Attributes

Attribute	Req/Opt	Default	Description
<code>bcc</code>	Optional		Addresses to which to copy the message, without listing them in the message header. To specify multiple addresses, separate the addresses with commas.
<code>cc</code>	Optional		Addresses to which to copy the message. To specify multiple addresses, separate the address with commas.
<code>charset</code>	Optional	Character encoding selected in ColdFusion Administrator Mail page;  <code>utf-8</code>	Character encoding of the mail message, including the headers. The following list includes commonly used values: <ul style="list-style-type: none"><li>• <code>utf-8</code></li><li>• <code>iso-8859-1</code></li><li>• <code>windows-1252</code></li><li>• <code>us-ascii</code></li><li>• <code>shift_jis</code></li><li>• <code>iso-2022-jp</code></li><li>• <code>euc-jp</code></li><li>• <code>euc-kr</code></li><li>• <code>big5</code></li><li>• <code>hz-gb-2312</code></li><li>• <code>euc-cn</code></li><li>• <code>utf-16</code></li></ul> For more information on character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a> .

Attribute	Req/Opt	Default	Description
debug	Optional	no	<ul style="list-style-type: none"> <li>yes: sends debugging output to standard output. By default, if the console window is unavailable, ColdFusion sends output to <code>cf_root\runtime\logs\coldfusion-out.log</code> on server configurations. On J2EE configurations, with JRun, the default location is <code>jrun_home/logs/servername-out.log</code>. <i>Caution:</i> If you set this option to <code>yes</code>, ColdFusion writes detailed debugging information to the log, including all message contents, and can generate large logs quickly.</li> <li>no: does not generate debugging output.</li> </ul>
failto	Optional		Address to which mailing systems must send delivery failure notifications. Sets the mail envelope reverse-path value.
from	Required		<p>E-mail message sender:</p> <ul style="list-style-type: none"> <li>A static string; for example, "support@mex.com"</li> <li>A variable; for example, "<code>#GetUser.EmailAddress#</code>".</li> </ul> <p>This attribute does not have to be a valid Internet address; it can be any text string.</p>
to	Required		<p>Message recipient e-mail addresses:</p> <ul style="list-style-type: none"> <li>Static address, for example, "support@.com".</li> <li>Variable that contains an address, for example, "<code>#Form.Email#</code>".</li> <li>Name of a query column that contains an address, for example, "<code>#EMail#</code>". An e-mail message is sent for each returned row.</li> </ul> <p>To specify multiple addresses, separate the addresses with commas.</p>
subject	Required		<p>Message subject. Can be dynamically generated. For example, to send messages that give customers status updates:</p> <p>"<code>StatusofOrderNumber#Order_ID#</code>".</p>
group	Optional	CurrentRow	Query column to use when you group sets of records to send as a message. For example, to send a set of billing statements to a customer, group on " <code>Customer_ID</code> ." Case-sensitive. Eliminates adjacent duplicates when data is sorted by the specified field.
groupcasesensitive	Optional	No	Boolean. Whether to consider case when using the group attribute. To group on case-sensitive records, set this attribute to Yes.
keyalias	Optional		Alias of the key with which the certificate and private key are stored in the keystore. If it is not specified, the first entry in the keystore is chosen as the alias.
keypassword	Optional		Password for your private key. If not specified, the <code>keystorepassword</code> is used.
keystore	Optional		The location of the keystore file, for example, <code>C:\OpenSSL\bin\keystore.jks</code> .
keystorepassword	Optional		The password of the keystore. This is stored in ColdFusion configuration files.
mailerid	Optional	ColdFusion Application Server	Mailer ID to be passed in X-Mailer SMTP header, which identifies the mailer application.
maxrows	Optional		Maximum number of messages to send when looping over a query.
mimeattach	Optional		Path of the on-disk or in-memory file to attach to message. Attached file is MIME-encoded. ColdFusion attempts to determine the MIME type of the file; use the <code>cfmailparam</code> tag to send an attachment and specify the MIME type.

Attribute	Req/Opt	Default	Description
password	Optional		A password to send to SMTP servers that require authentication. Requires a <code>username</code> attribute.
port	Optional		TCP/IP port on which SMTP server listens for requests (normally 25). A value here overrides the Administrator.
priority	Optional	3	The message priority level. Can be one of the following values: <ul style="list-style-type: none"> <li>An integer in the range 1-5; 1 represents the highest priority.</li> <li>One of the following string values, which correspond to the numeric values: <code>highest</code> or <code>urgent</code>, <code>high</code>, <code>normal</code>, <code>low</code>, and <code>lowest</code> or <code>non-urgent</code>.</li> </ul>
query	Optional		Name of <code>cfquery</code> from which to draw data for messages. Use this attribute to send more than one message, or to send query results within a message.
remove	Optional	no	If <code>yes</code> , ColdFusion removes attachment files (if any) after the mail is successfully delivered.
replyto	Optional		Addresses to which the recipient is directed to send replies.
server	Optional		SMTP server address, or (Enterprise edition only) a comma-delimited list of server addresses, to use for sending messages. At least one server must be specified here or in the ColdFusion Administrator. A value here overrides the Administrator. A value that includes a port specification overrides the <code>port</code> attribute. For details, see Usage.
sign			Digitally signs the mail. If set to true, all messages that you send will have digital signature.
spoolenable	Optional		Whether to spool mail or always send it immediately. Overrides the ColdFusion Administrator Spool mail messages to disk for delivery setting. <ul style="list-style-type: none"> <li><code>yes</code>: saves a copy of the message until the sending operation is complete. Pages that use this option might run slower than the ones that use the <code>no</code> option.</li> <li><code>no</code>: queues the message for sending, without storing a copy until the operation is complete. If a delivery error occurs when this option is <code>no</code>, ColdFusion generates an Application exception and logs the error to the <code>mail.log</code> file.</li> </ul>
startrow	Optional	1	Row in a query to start from.
timeout	Optional		Number of seconds to wait before timing out connection to SMTP server. A value here overrides the Administrator.
type	Optional	text/plain	MIME type of the message. Can be a valid MIME media type or one of the following: <ul style="list-style-type: none"> <li><code>text</code>: specifies text/plain type.</li> <li><code>plain</code>: specifies text/plain type.</li> <li><code>html</code>: specifies text/html type.</li> </ul> For a list of all registered MIME media types, see <a href="http://www.iana.org/assignments/media-types/">www.iana.org/assignments/media-types/</a> .
username	Optional		A user name to send to SMTP servers that require authentication. Requires a <code>password</code> attribute.

Attribute	Req/Opt	Default	Description
useSSL	Optional		Whether to use Secure Sockets Layer.
useTLS	Optional		Whether to use Transport Level Security.
wraptext	Optional	Do not wrap text	The maximum line length, in characters of the mail text. If a line has more than the specified number of characters, replaces the last white space character, such as a tab or space, preceding the specified position with a line break. If there are no white space characters, inserts a line break at the specified position. A common value for this attribute is 72.

### Usage

Sends a mail message to the specified address. Mail messages can include attachments. The tag body can include CFML code to generate mail output. The `cfmailparam` and `cfmailpart` tags can only be used in the `cfmail` tag body.

Mail messages can be single or multipart. If you send a multi-part mail message, all message content must be in `cfmailpart` tags; ColdFusion ignores multipart message text that is not in `cfmailpart` tags.

**Note:** The `cfmail` tag does not make copies of attachments when spooling mail to disk. If you use the `cfmail` tag to send a message with an attachment with spooling enabled and you use the `cffile` tag to delete the attachment file, ColdFusion might not send the mail because the mailing process might execute after the file was deleted. (When this happens, the mail log includes a `FileNotFoundException` exception and the e-mail is not sent.) You can prevent this problem by setting `SpoolEnable="No"` in the attribute or disabling spooling in the ColdFusion Administrator. Disabling spooling causes the e-mail to be delivered immediately.

If you set `type="text"`, sometimes whitespace might be compressed in the messages that you send. To resolve this, in the ColdFusion Administrator, go to Server Settings > Settings and then deselect the option Enable Whitespace Management.

### Mail addressing

Mail addresses can have any of the following forms:

Format	Example
<code>user@server</code>	<code>rsmith@company.com</code>
<code>&lt;user@server&gt;</code>	<code>&lt;rsmith@company.com&gt;</code>
<code>DisplayName &lt;user@server&gt;</code>	<code>Rob Smith &lt;rsmith@company.com&gt;</code>
<code>"DisplayName" &lt;user@server&gt;</code>	<code>"Rob Smith" &lt;rsmith@company.com&gt;</code>
<code>user@server (DisplayName)</code>	<code>rsmith@company.com (Rob Smith)</code>

### Specifying mail servers

The `server` attribute can specify one or more mail servers.

**Note:** If you specify multiple mail servers in ColdFusion Standard, the `cfmail` tag uses only the first server in the specification. ColdFusion logs a warning message to the mail log file and ignores the additional servers.

For each server, you can optionally specify a user name, password, and port. These values override the corresponding attributes, if any. The `server` attribute has the following format:

```
[user:password@] server[:port] , [user:password@] server[:port] , . . .
```

For example, the following line specifies one server, `mail.myco.com` that uses the default port and no user or password, and a second server with a user, password, and specific port:

```
server=mail.myco.com,mail_admin:adm2qzf@mail2.myco.com:24
```

When you specify multiple mail servers in ColdFusion Enterprise, ColdFusion tries the available servers in the order they are listed until it connects to a server. ColdFusion does not try to connect to a server that was unavailable in the last 60 seconds.

### Digital Signature

To add digital signature to your mail, specify the attributes `sign`, `keystore`, `keystorepassword`, `keyalias`, and `keypassword` as provided in the following example:

```
<cfmail from="Sender@Company.com" server="sendmail.myCo.com" sign="true"
keystore="C:\OpenSSL\bin\hello.jks" keystorepassword="digital" to="Receipient@Company.com"
keyalias="crypto" keypassword="signature" subject="Mail with Digital Signature">
```

To add digital signature to all the mails you send, instead of adding the attributes to the tag, specify the settings in the **Server Settings > Settings** page of the ColdFusion Administrator.

If you do not specify the attributes in the tag, the Administrator settings are applied. Also, in the tag, if you set `sign = "true"` and do not specify the attributes `keystore`, `keystorepassword`, `keyalias`, and `keypassword`, then the values for these attributes specified using ColdFusion Administrator are applied.

### Example

```
<h3>cfmail Example</h3>

<!-- Delete the surrounding comments to use this example.

<cfif IsDefined("form.mailto")>
    <cfif form.mailto is not "" AND form.mailfrom is not "" AND form.Subject is not "">

```

## cfmailparam

### Description

Attaches a file or adds a header to an e-mail message.

### Category

[Communications tags](#), [Internet protocol tags](#)

### Syntax

```
<cfmail
  to = "recipient"
  subject = "message subject"
  from = "sender"
  more attributes... >
  <cfmailparam
    contentID = "content ID"
    disposition = "disposition type">
    file = "filename"
    type = "media type"
```

OR

```
  <cfmailparam
    name = "header name"
    value = "header value">
    ...
  </cfmail>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfmail](#), [cfmailpart](#), [cfftp](#), [cfhttp](#), [cfdap](#), [cfpop](#); Using the `cfmailparam` tag in Sending and Receiving E-Mail in the *Developing ColdFusion Applications*

### History

ColdFusion 8.0.1: Added the attributes `Content` and `Remove`.

ColdFusion MX 6.x: Added the `Disposition` and `ContentID` attributes.

ColdFusion MX 6.1: Added the `type` attribute.

## Attributes

Attribute	Req/Opt	Default	Description
content			Lets you send the contents of a ColdFusion variable as an attachment. To do so, specify the variable in # signs as the content attribute value, as in the following example:  <pre>&lt;cfmailparam file="anyname" content="#variablename#"&gt;</pre>
contentID	Optional		The Identifier for the attached file. This ID must be globally unique and is used to identify the file in an IMG or other tag in the mail body that references the file content.
disposition	Optional	attachment	How the attached file is to be handled. Can be one of the following: <ul style="list-style-type: none"><li>• attachment: presents the file as an attachment.</li><li>• inline: displays the file contents in the message.</li></ul>
file	Required if you do not specify name attribute		Attaches a file in a message. Mutually exclusive with name attribute. The file is MIME encoded before sending.
name	Required if you do not specify file attribute		Name of header. Case-insensitive. Mutually exclusive with file attribute.
remove	Optional	no	If yes, ColdFusion removes attachment files (if any) after the mail is successfully delivered.
type	Optional		The MIME media type of the file. Not used with the name attribute. Can be a valid MIME media type or one of the following: <ul style="list-style-type: none"><li>• text: specifies text/plain type.</li><li>• plain: specifies text/plain type.</li><li>• html: specifies text/html type.</li></ul> If you specify the type, the value you specify becomes the content type header; otherwise, ColdFusion generates the content type header.  <b>Note:</b> For a list of all registered MIME media types, see <a href="http://www.iana.org/assignments/media-types/">www.iana.org/assignments/media-types/</a> .
value	Optional		Value of the header. Not used with the file attribute.

## Usage

This tag attaches a file or adds a header to an e-mail message. It can only be used in the `cfmail` tag. You can use multiple `cfmailparam` tags within a `cfmail` tag.

You can use this tag to include a file, such as an image, in an HTML mail message. The file can be displayed inline in an HTML message, or as an attachment, as Example 2 shows. To include multiple files, use multiple `cfmailparam` tags.

### Display a file inline in a mail message

- 1 Specify `type="html"` in the `cfmail` tag.
- 2 Specify `disposition="inline"` and a `ContentID` attribute in the `cfmailparam` tag.
- 3 Use a `src="cid:ContentIDValue"` attribute to identify the content to include in the HTML tag such as the `img` tag.

## Example

Example 1: This view-only example uses the `cfmailparam` tag to add a header to a message, attach files, and to return a receipt to the sender.

```
<cfmail from = "peter@domain.com" To = "paul@domain.com"
  Subject = "See Important Attachments and Reply">
  <cfmailparam name = "Importance" value = "High">
  Please review the new logo. Tell us what you think.
  <cfmailparam file = "c:\work\readme.txt" type="text/plain">
  <cfmailparam file = "c:\work\logo.gif" type="image/gif">
  <cfmailparam name="Disposition-Notification-To" value="peter@domain.com">
</cfmail>
```

Example 2: This view-only example displays an image in the body of an HTML message.

```
<cfmail type="HTML"
  to = "#form.mailto#"
  from = "#form.mailFrom#"
  subject = "Sample inline image">
  <cfmailparam file="C:\Inetpub\wwwroot\web.gif"
    disposition="inline"
    contentID="image1">
  <p>There should be an image here</p>
  
  <p>After the picture</p>
</cfmail>
```

## cfmailpart

### Description

Specifies one part of a multipart e-mail message. Can only be used in the `cfmail` tag. You can use more than one `cfmailpart` tag within a `cfmail` tag.

### Category

[Communications tags](#), [Internet protocol tags](#)

### Syntax

```
<cfmail
  ... >
  (Optional cfmailparam entries)
  <cfmailpart
    charset="character encoding"
    type="mime type"
    wraptext="number"
  >
  Mail part contents
</cfmailpart>
  ...
</cfmail>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### History

ColdFusion MX 6.1: Added this tag.

### Attributes

Attribute	Req/Opt	Default	Description
charset	Optional	Character encoding specified by charset attribute of cfmail tag	<p>The character encoding in which the part text is encoded. The following list includes commonly used values:</p> <ul style="list-style-type: none"> <li>• utf-8</li> <li>• iso-8859-1</li> <li>• windows-1252</li> <li>• us-ascii</li> <li>• shift_jis</li> <li>• iso-2022-jp</li> <li>• euc-jp</li> <li>• euc-kr</li> <li>• big5</li> <li>• hz-gb-2312</li> <li>• euc-cn</li> <li>• utf-16</li> </ul> <p>For more information on character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>.</p>
type	Required		<p>The MIME media type of the part. Can be a can be valid MIME media type or one of the following:</p> <ul style="list-style-type: none"> <li>• text: specifies text/plain type.</li> <li>• plain: specifies text/plain type.</li> <li>• html: specifies text/html type.</li> </ul> <p><b>Note:</b> For a list of all registered MIME media types, see <a href="http://www.iana.org/assignments/media-types/">www.iana.org/assignments/media-types/</a>.</p>
wraptext	Optional	Do not wrap text	<p>Specifies the maximum line length, in characters of the mail text. If a line has more than the specified number of characters, replaces the last white space character, such as a tab or space, preceding the specified position with a line break. If there are no white space characters, inserts a line break at the specified position. A common value for this attribute is 72.</p>

## Usage

Use this tag to create mail messages with alternative versions of the message that duplicate the content in multiple formats. The most common use is to send a plain text version of the message that can be read by all mail readers followed by a version formatted in HTML for display by HTML-compatible mail readers. Specify the simplest version first, with more complex versions afterwards. For more information, see [www.ietf.org/rfc/rfc2046.txt](http://www.ietf.org/rfc/rfc2046.txt).

## Example

```
<h3>cfmailpart Example</h3>
<cfmail from = "peter@domain.com" To = "paul@domain.com"
  Subject = "Which version do you see?">
  <cfmailpart type="text" wraptext="74">
    You are reading this message as plain text, because your mail reader does not handle
    HTML text.
  </cfmailpart>
  <cfmailpart type="html">
    <h3>HTML Mail Message</h3>
    <p>You are reading this message as <strong>HTML</strong>.</p>
    <p>Your mail reader handles HTML text.</p>
  </cfmailpart>
</cfmail>
```

## cfmap

### Description

Embeds a geographical map within a ColdFusion web page.

Currently, ColdFusion supports only embedding of Google map. To generate a map, provide a valid Google map API key, and specify the latitude and longitude of the location, or the address of the location.

The Google map API key can be specified in the following ways:

- 1 Using the `cfajaximport` tag. You specify the map API key in the `params` attribute as follows:

```
<cfajaximport params="{googleapikey='Map API Key'}#">
```

- 2 Using `Application.cfc` as follows:

```
<cfset this.googleapikey="Map API Key">
```

- 3 Using the Settings page in the ColdFusion Administrator. Specify the map API key in the Google Map Key field. You can also specify the map API key in `runtime.cfc`

### Category

## History

ColdFusion 9.0.1: Added the attribute `initShow`.

ColdFusion 9: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
centeraddress	Required if centerlatitude and centerlongitude are not specified		The address of the location, which is set as the center of the map.
centerlatitude	Required if centeraddress is not specified		The latitude value for the location, in degrees. This value is set as the center of the map. This attribute must be used with the centerlatitude attribute. In ColdFusion 9.0.1, the valid values for centerlatitude are -90 to +90
centerlongitude	Required if centeraddress is not specified		The longitude value for the location, in degrees. This value is set as the center of the map. This attribute must be used with the centerlongitude attribute. In ColdFusion 9.0.1, the valid values for centerlongitude are -180 to +180.
collapsible	Optional	false	Whether to provide a collapsible property for the surrounding panel: <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> If you set collapsible to true, you cannot set hideborders to true.
continuouszoom	Optional	true	Whether to provide zoom control that enables smooth zooming for the map: <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul>
doubleclickzoom	Optional	true	Whether to enable double-click zoom: <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul>
height	Optional	400 pixels	Height of the map, in pixels.
hideborder	Optional	true	Whether to hide border for surrounding panel: <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> If you set hideborder to true, you cannot set collapsible to true.
initshow Added in ColdFusion 9.0.1	Optional	true	Use to show/hide a map when the page loads. This is useful if you have collapsible divs or collapsible spry regions, where the user has to show the map on click of a link or button
markerbind	Optional		A bind expression to dynamically populate data in the window that is opened when you click the marker icon. The bind expression can specify a CFC function, a JavaScript function, or a URL.
markercolor	Optional		The color of the marker specified as a hexadecimal value. By default, the centermarker is green in color. The attributes markericon and markercolor are mutually exclusive.
markericon	Optional		Location of an image file to use as the marker icon. The attributes markericon and markercolor are mutually exclusive.

Attribute	Req/Opt	Default	Description
markerwindowcontent	Optional		Static content displayed in the marker window. This attribute is mutually exclusive with the <code>markerbind</code> attribute.
name	Required		Name of the map.  The name attribute is required to invoke JavaScript functions.
onerror	Optional		The JavaScript function to run when there is a Google map API error.  The JavaScript function is passed with two parameters, Google map status code and error message.
onload	Optional		Custom JavaScript function that runs after the map loads, for instance, registering an event.
overview	Optional	false	Whether to add an Overview panel to the map: <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul>
showmarkerwindow	Optional	false	If set to true, displays the marker window. If the attribute <code>markerbind</code> is used, unless you set this attribute to true, the marker window is not displayed.  This attribute is ignored if <code>markerwindowcontent</code> is set to true.
scrollwheelzoom	Optional	true	Whether to enable mouse wheel zooming control: <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul>
showallmarkers	Optional	true	Whether to display all markers added to the map: <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> When you specify <code>showallmarkers</code> as true, to display all the markers within the map area, the zoom level specified for the map may be overridden.
showcentermarker	Optional	true	Whether to display the marker icon that identifies the map center: <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul>
showscale	Optional	false	Whether to show scale control: <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul>
tip	Optional		A short description of the center location that appears as a tool tip.
title	Optional		Title of the panel.  You cannot define a title, if you set <code>hideborder</code> to true.

Attribute	Req/Opt	Default	Description
type	Optional	map	Type of the Google map: <ul style="list-style-type: none"> <li>• map</li> <li>• satellite</li> <li>• hybrid</li> <li>• terrain</li> <li>• earth: If you use <code>type="earth"</code>, you are prompted to download Google Earth 3D plug-in.</li> </ul>
typecontrol	Optional	basic	Whether to provide a type control that lets you switch the map: <ul style="list-style-type: none"> <li>• basic: Displays the marker types that provides the options <code>map</code>, <code>satellite</code>, and <code>hybrid</code>.</li> <li>• none</li> <li>• advanced: Displays a drop-down list with five options defined for the attribute <code>type</code>.</li> </ul>
width	Optional	400 pixels	Map width, in pixels.
zoomcontrol	Optional	small	Whether to enable zoom control: <ul style="list-style-type: none"> <li>• none</li> <li>• small</li> <li>• large</li> <li>• large3d</li> <li>• small3d</li> </ul>
zoomlevel	Optional	3	Specifies the starting zoom value.

### Usage

This tag can be used to create a map within an HTML page, a div tag, or in a new window. If you use this tag in a new window, you must use the `cfmap` tag within the `cfwindow` tag.

The `zoomcontrol` attribute lets you change the size of the embedded map. You can increase the zoom value to get a close-up view of the map. Or, decrease the zoom value to view a larger area of the map at a reduced size. Each time you change the zoom value, the entire map does not refresh, but only those portions of the map that change, making the display of data fast.

The `cfmap` tag supports the map display in five formats - `map`, `satellite`, `terrain`, `earth`, and `hybrid`. The `map` format displays a standard road map image. The `satellite` format displays a satellite image of the map. The `hybrid` format displays a combination of the roadmap and the satellite image of the map, with important street names and places marked on the satellite image.

The following attributes do not work if `type="earth"`: `Zoomlevel`, `showScale`, `overview`, `tip`, `zoomControl`, `showCenterMarker`, and `showAllMarkers`.

For `cfmap` tag to work on Safari 3.x and Google Chrome, specify the HTML head tag (`<head></head>`).

## Examples

<h3>cfmap Example using latitude and longitude attributes</h3>

```
<cfmap name="gmap01"
  centerlatitude="71.094224"
  centerlongitude="42.339641"
  doubleclickzoom="true"
  overview="true"
  scrollwheelzoom="true"
  showscale="true"
  tip="My Map"
  zoomlevel="4"/>
```

<h3>cfmap Example using center address</h3>

```
<cfmap name="gmap02"
  centeraddress="345 Park Avenue, san jose, CA 95110-2704, USA"
  doubleclickzoom="true"
  scrollwheelzoom="true"
  showscale="false"
  tip="My Map"/>
```

## cfmapitem

### Description

The `cfmapitem` tag is a child tag of the `cfmap` tag. This tag creates markers on the map. You can specify the marker in a map using either the `cfmapitem` tag or using the `ColdFusion.Map.AddMapMarker` JavaScript API. See [“ColdFusion.Map.addMarker”](#) on page 1351 for details.

### Category

[Display management tags](#)

### Syntax

```
<cfmapitem
  address="address"
  latitude="latitude in degrees"
  longitude="longitude in degrees"
  markercolor="marker color"
  markericon="icon path"
  markerwindowcontent="content"
  name="name of the map"
  showmarkerwinodw="true|false"
  tip="marker tip" />
```

### See also

### History

ColdFusion 9: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
address	Required, if latitude and longitude are not specified		The address of the location to set the map marker.
latitude	Required, if address is not specified		The latitude value for the marker, in degrees.  In ColdFusion 9.0.1, the valid values for latitude are -90 to + 90.
longitude	Required, if address is not specified		The longitude value for the marker, in degrees.  In ColdFusion 9.0.1, the valid values for longitude are -180 to + 180.
markercolor	Optional	green	The color of the marker specified as a hexadecimal value.  By default, the centermarker is green in color.  The attributes <code>markericon</code> and <code>markercolor</code> are mutually exclusive.
markericon	Optional		Location of an image file to use as the marker icon. The attributes <code>markericon</code> and <code>markercolor</code> are mutually exclusive.
markerwindowcontent	Optional		Static content displayed in the marker window. This attribute ignores the <code>markerbind</code> attribute defined in the tag <code>cfmap</code> .
name	Optional		The name of the map.
showmarkerwindow	Optional	Inherits parent <code>cfmap</code> setting	If set to <code>true</code> , displays the marker window. If the attribute <code>markerbind</code> is used, unless you set this attribute to <code>true</code> , the marker window is not displayed.
tip	Optional		A short description of the marker location that appears as a tool tip.

## Usage

This tag must be used within the `cfmap` tag.

The following inheritance rules apply:

- The value specified for the attribute `showmarkerwindow` in the `cfmap` tag is inherited by all `cfmapitem` tags.
- A child `cfmapitem` tag can override the attribute `showmarkerwindow` in the `cfmap` tag by changing the value.
- Any bind expression defined using the `markerbind` is ignored if the `cfmapitem` tag defines the attribute `markerwindowcontent`.

### Examples

```
<h3>cfmapitem example using latitude and longitude attributes</h3>
<cfmap name="gmap01"
    centerlatitude="71.094224"
    centerlongitude="42.339641"
    doubleclickzoom="true"
    overview="true"
    scrollwheelzoom="true"
    showscale="true"
    tip="My Map"
    zoomlevel="4">
<cfmapitem name="marker01"
    latitude="70.50"
    longitude="42.50"
    tip="New marker"/>

<h3>cfmap Example using address address</h3>
<cfmap name="gmap02"
    centerlatitude="71.094224"
    centerlongitude="42.339641"
    doubleclickzoom="true"
    overview="true"
    scrollwheelzoom="true"
    showscale="true"
    tip="My Map"
    zoomlevel="4">
<cfmapitem name="marker02"
    address="345 Park Avenue, san jose, CA 95110-2704, USA"
    tip="New marker"/>
```

## cfmediaplayer

### Description

Creates an in-built media player that lets you play FLV, MPEG-3, and MPEG-4 files.

FLV files can be played from any web server. You can play MPEG-3/MPEG-4 only from Flash Media Server using RTMP.

### Category

[Display management tags](#)

## Syntax

```
<cfmediaplayer
    align="alignment option"
    autoplay="true|false"
    bgcolor="hexadecimal value"
    hideborder="true|false"
    hidetitle="true|false"
    controlbar="true|false"
    fullScreenControl="yes|no"
    name="name"
    onComplete="JavaScript function name"
    onLoad="JavaScript function name"
    onStart="JavaScript function name"
    quality="low|high|medium"
    source="source name"
    style="style specification"
    height="integer"
    width="integer"
    wmode="window|opaque|transparent">
</cfmediaplayer>
```

## History

ColdFusion 9: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
align	Optional	left	Specifies the horizontal alignment of the media player. You can select from <code>left</code> , <code>right</code> , and <code>center</code> .
autoplay	Optional	false	A Boolean value that specifies if the media player must automatically play the FLV file on loading the CFM page: <ul style="list-style-type: none"> <li>• <code>true</code></li> <li>• <code>false</code></li> </ul>
bgcolor	Optional	6b7c85	The background color of the media player specified as a Hexadecimal value or a recognized color name, for example <code>red</code> .
controlbar	Optional	true	A Boolean value that specifies if you want to display the control panel for the media player: <ul style="list-style-type: none"> <li>• <code>true</code></li> <li>• <code>false</code></li> </ul>
hideborder	Optional	true	A Boolean value that specifies if you want a border for the media player panel: <ul style="list-style-type: none"> <li>• <code>true</code></li> <li>• <code>false</code></li> </ul>
hidetitle	Optional	false	If <code>true</code> , displays the video file name.

Attribute	Req/Opt	Default	Description
fullScreenControl	Optional	yes	<p>Whether full screen is enabled:</p> <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul> <p>The following characteristics apply:</p> <ul style="list-style-type: none"> <li>• Single click plays/pauses the media player.</li> <li>• Borders, if defined, are not displayed in full-screen mode.</li> <li>• Double-click for full-screen mode.</li> <li>• (If you are in full-screen mode) Press "Esc" or double-click to restore the player to normal mode.</li> </ul>
height	Optional	360 pixels	Height of the media player, in pixels.
name	Required if source is not defined		<p>Name of the media player.</p> <p>The name attribute is required when you invoke JavaScript functions.</p>
onComplete	Optional		Custom JavaScript function to run when the FLV file has finished playing.
onLoad	Optional		Custom JavaScript function to run on loading of the player component.
onStart	Optional		Custom JavaScript function to run when the FLV file starts playing.
quality	Optional	high	<p>The quality of the media playback:</p> <ul style="list-style-type: none"> <li>• low</li> <li>• medium</li> <li>• high</li> </ul>
source	Required if name is not defined		<p>The URL to the FLV file. This can be a URL relative to the current page.</p> <p>You can store the FLV file on the ColdFusion server or any other streaming server.</p>

Attribute	Req/Opt	Default	Description
style	Optional		The following are the supported styles: <ul style="list-style-type: none"><li>• bgcolor: The background color of the media player.</li><li>• borderbottom: A numeric value. The default is 10.</li><li>• bordertop: A numeric value. The default is 10.</li><li>• borderleft: A numeric value. The default is 10.</li><li>• borderright: A numeric value. The default is 10.</li><li>• titletextcolor: Hexadecimal value of RGB color. For example, specify the color white as #FFFFFF or FFFFFFFF. The default is black.</li><li>• titlebgcolor: Hexadecimal value of RGB color. The default is black.</li><li>• progresscolor: The foreground color for the progress bar. Hexadecimal value of RGB color. The default is black.</li><li>• progressbgcolor: The background color for the progress bar. Hexadecimal value of RGB color. The default is black.</li><li>• controlscolor: The foreground color of the controls in the Control panel. Hexadecimal value of RGB color. The default is black.</li><li>• controlbarbgcolor: The background color of the controls. Hexadecimal value of RGB color. The default is black.</li></ul>
width	Optional	480 pixels	Width of the media player, in pixels.
wmode	Optional	window	Specifies the absolute positioning and layering capabilities in your browser: <ul style="list-style-type: none"><li>• window: Plays the media player in its own rectangular window on a web page</li><li>• opaque: Hides everything behind the media player on the web page</li><li>• transparent: Lets the background of the web page show through the transparent portions of the media player</li></ul>

### Example

In this example, the FLV file is stored in the web root used by the ColdFusion server. You need to store an FLV file - `mediafile.flv` in the location `web_root\xyz\`. You can now create the media player with the following content:

```
<h3>cfmediaplayer Example</h3>
<cfmediaplayer
    name="Myvideo"
    source="/xyz/mediafile.flv"
    width=500
    height=400
    align="center"
    quality="high"
    fullscreencontrol="true"/>
```

The following code illustrates styling of the media player:

```
<cfset bgColorTheme = "EDC393">
<cfset titleColorTheme = "800517">
<cfset controlsColorTheme = titleColorTheme>
<cfset progressColorTheme = "E67451">
<cfset progressbgColorTheme = "FFF8C6">
<cfmediaplayer name="player2" style="bgcolor:#bgColorTheme#;
titletextcolor:#titleColorTheme#;titlebgcolor:#bgColorTheme#;controlbarbgcolor:#bgColorTheme
#;controlsColor:#controlsColorTheme#;progressbgColor:#progressbgColorTheme#;progresscolor:#p
rogressColorTheme#;borderleft:20;borderright:20;bordertop:10;borderbottom:13"
hideborder="false" hideTitle=false controlbar="true" source="#defaultFlvfile#">
```

## cfmenu

### Description

Creates a horizontal or vertical menu. Any menu item can be the top level of a submenu.

### Category

[Display management tags](#)

### Syntax

```
<cfmenu
    bgcolor="HTML color value"
    childStyle="CSS style specification"
    font="HTML font family"
    fontColor="HTML color value"
    fontSize="Number of pixels"
    menuStyle="CSS style specification"
    name="string"
    selectedFontColor="HTML color value"
    selectedItemColor="HTML color value"
    type="horizontal|vertical"
    width="Number of pixels">

    cfmenuitem tags

</cfmenu>
```

The `cfmenu` tag must have a body that contains at least one `cfmenuitem` tag to define the menu items and an end `</cfmenu>` tag.

**Note:** You can specify this tag's attribute in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute name as structure key.

### History

ColdFusion 8: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
bgColor	Optional	Background color style of the menu	<p>The color of the menu background. You can use any valid HTML color specification.</p> <p>This specification has the following behaviors:</p> <ul style="list-style-type: none"> <li>You can override it locally by specifying the <code>menuStyle</code> attribute of this tag and any <code>cfmenuitem</code> tag.</li> <li>It controls the background of color surrounding a submenu whose background is specified by a <code>childStyle</code> attribute.</li> </ul>
childStyle	Optional		<p>A CSS style specification that applies to the following menu items:</p> <ul style="list-style-type: none"> <li>The items of the top-level menu</li> <li>All child menu items, including the children of submenus</li> </ul> <p>This attribute lets you use a single style specification for all menu items.</p>
font	Optional	Browser default font	The font to use for all child menu items. Use any valid HTML font-family style attribute. Some common values are <code>serif</code> , <code>sans-serif</code> , <code>Times</code> , <code>Courier</code> , and <code>Arial</code> .
fontColor	Optional	black	The color of the menu text. Use any valid HTML color specification.
fontSize	Optional	Font size of the menu item	<p>The size of the font. Use a numeric value, such as 8, to specify a pixel character size. Use a percentage value, such as 80%, to specify a size relative to the default font size.</p> <p>Font sizes larger than 20 pixels can result in submenu text exceeding the menu boundary.</p>
menuStyle	Optional		<p>A CSS style specification that applies to the menu, including any parts of the menu that do not have items.</p> <p>If you do not specify style information in the <code>cfmenuitem</code> tags, this attribute controls the style of the top-level items.</p>
name	Optional		The name of the menu.
selectedFontColor	Optional	black	The color of the text for the menu item that has the focus. Use any valid HTML color specification.
selectedItemColor	Optional	light blue	The color that highlights the menu item that has the focus. You can use any valid HTML color specification.
type	Optional	horizontal	<p>The orientation of the menu. The following values are valid:</p> <ul style="list-style-type: none"> <li><code>horizontal</code>: Menu items are arranged horizontally.</li> <li><code>vertical</code>: Menu items are arranged vertically.</li> </ul> <p>Submenus of both menu types are always arranged vertically.</p>
width	Optional	Width of the container	<p>The width of a vertical menu; not valid for horizontal menus.</p> <p>Use a numeric value, such as 50, to specify a pixel size. Use a percentage value, such as 30%, to specify a size relative to the parent element's size.</p>

## Usage

The `cfmenu` tag defines a horizontal or vertical ColdFusion menu. You use a single `cfmenu` tag to define the general menu characteristics, and you use `cfmenuitem` child tags to define the individual menu entries and any submenus. You create submenus by putting `cfmenuitem` tags in the body of a `cfmenuitem` tag.

You cannot nest a `cfmenu` tag inside a form or inside a `cfmenu` tag or `cfmenuitem` tag.

### Example

The following example creates a simple menu bar. When you click an entry in the bar, the browser displays the Adobe website page for the selected product. You can expand the ColdFusion item by clicking the icon, and then select an item to display a specific ColdFusion web page.

```
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
</head>
<body>
<cfmenu name="menu" type="horizontal" fontsize="14" bgcolor="##CCFFFF">
  <cfmenuitem name="acrobat" href="http://www.adobe.com/acrobat" display="Acrobat"/>
  <cfmenuitem name="aftereffects" href="http://www.adobe.com/aftereffects"
    display="After Effects"/>
  <!-- The ColdFusion menu item has a pop-up menu. -->
  <cfmenuitem name="coldfusion"
    href="http://www.adobe.com/products/coldfusion" display="ColdFusion">
    <cfmenuitem name="buy"
      href="http://www.adobe.com/products/coldfusion/buy/" display="Buy"/>
    <cfmenuitem name="devcenter"
      href="http://www.adobe.com/devnet/coldfusion/" display="Developer Center"/>
    <cfmenuitem name="documentation"
      href="http://www.adobe.com/support/documentation/en/coldfusion/"
      display="Documentation"/>
    <cfmenuitem name="support" href="http://www.adobe.com/support/coldfusion/"
      display="Support"/>
  </cfmenuitem>
  <cfmenuitem name="flex" href="http://www.adobe.com/flex" display="Flex"/>
</cfmenu>
</body>
</html>
```

## cfmenuitem

### Description

Defines an entry in a menu, including an item that is the head of a submenu.

### Category

[Display management tags](#)

## Syntax

```
<cfmenuitem
    display="string"
    childStyle="CSS style specification"
    href="URL or JavaScript function"
    image="path"
    menuStyle="CSS style specification"
    name="string"
    style="CSS style specification"
    target="location identifier">
    Optional child menuitem tags
</cfmenuitem>
```

OR

```
<cfmenuitem
    divider["true"]/>
```

If the `cfmenuitem` tag does not have a body with an end `</cfmenuitem>` tag, close the tag with a forward slash character before the closing greater than character (`/>`), for example, `<cfmenuitem divider="true"/>`.

**Note:** You can specify this tag's attribute in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute name as structure key.

## History

ColdFusion 8: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
display	Required if <code>divider</code> attribute is not specified		The text to show as the menu item label.
childStyle	Optional	Style determined by parent	A CSS style specification that applies to all child menu items, including the children of submenus.
divider	Optional		This attribute specifies that the item is a divider. If you specify this attribute, you cannot specify any other attributes. You can use this attribute without a value, as in the following example:  <code>&lt;cfmenuitem divider /&gt;</code> .  You cannot use this attribute in a top-level horizontal menu.
href	Optional		A URL link to activate or JavaScript function to call when the user clicks the menu item.
image	Optional		URL of an image to display at the left side of the menu item. The file type can be any format that the browser can display.  For most displays, you must use 15x15 pixel images, because larger images conflict with the menu item text.

Attribute	Req/Opt	Default	Description
menuStyle	Optional	Style determined by parent	A CSS style specification that controls the overall style of any submenu of this menu item. This attribute controls the submenu of the current menu item, but not any child submenus of the submenu.
style	Optional	Style determined by parent	A CSS style specification that applies to the current menu item only. It is not overridden by the <code>childStyle</code> attribute.
name	Optional		The name of the menu item.
target	Optional	The current window and frame (if any)	The target in which to display the contents returned by the <code>href</code> attribute. The attribute can be a browser window or frame name, or an HTML target value, such as <code>_self</code> .

### Usage

Every `cfmenuitem` tag must be a child of a `cfmenu` tag or a `cfmenuitem` tag. To create a submenu, put the `cfmenuitem` tags for submenu items in the body of the `cfmenuitem` tag for the submenu root in the parent menu. For an example of a simple submenu, see [cfmenu](#).

### Example

The following menu shows the effects of the various style attributes on the menu and menu item appearance.

```
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
</head>
<body>
<cfmenu name="menu" type="horizontal" fontsize="14" bgcolor="##FF9999"
  childStyle="font-weight:bold; font-size:12px; border:medium; background-color:##99FF99"
  menuStyle="font-weight:bold; font-style:italic; font-size:14px;
  background-color:##9999FF">
  <cfmenuitem name="acrobatInfo"
    href="http://www.adobe.com/acrobat" display="Acrobat"/>
  <cfmenuitem name="aftereffectsInfo"
    href="http://www.adobe.com/aftereffects" display="After Effects"/>
  <!-- The ColdFusion menu item has a pop-up menu. -->
  <cfmenuitem name="cfInfo"
    childStyle="font-weight:bold; font-size:12px; border:medium;
    background-color:##FF0000" style="font-weight:bold;
    font-style:italic; font-size:16px; border:medium; background color:##00FF00"
    menuStyle="font-weight:bold; font-style:italic; font-size:16px;

    </cfmenuitem>
    </cfmenuitem>
</cfmenu>
</body>
</html>
```

## cfmessagebox

### Description

Defines a control for displaying pop-up messages. The control has more features than the standard alert box, including the ability to include a prompt and entry field in the box.

### Category

[Display management tags](#)

### Syntax

```
<cfmessagebox
    bodyStyle = "CSS style specification"
    buttonType = "yesno|yesnocancel"
    callbackHandler = "function name"
    icon = "error|info|question|warning"
    labelCancel = "Cancel button label text"
    labelNo = "No button label text"
    labelOk = "OK button label text"
    labelYes = "Yes button label text"
    message = "message text"
    modal = "yes|no"
    multiline = "false|true"
    name = "control name"
    title = "title"
    type = "alert|confirm|prompt"
    width = "number of pixels"
    x = "numeric pixel coordinate"
    y = "numeric pixel coordinate"/>
```

### History

ColdFusion 9: Added this tag

## Attributes

Attribute	Req/Opt	Default	Description
bodyStyle	Optional		A CSS style specification for the body of the message box. As a general rule, use this attribute to set color and font styles.
buttonType	Optional	yesno	Applies to the control type - <code>confirm</code> . The buttons to display on the message box: <ul style="list-style-type: none"> <li>• <code>yesno</code>: displays the buttons Yes and No</li> <li>• <code>yesnocancel</code>: displays the buttons Yes, No, and Cancel</li> </ul>
callbackhandler	Optional		The function that the control calls when a user clicks one of the buttons. For more information see Usage.
icon	Optional		Specifies the following CSS classes: <ul style="list-style-type: none"> <li>• <code>error</code>: Provides the error icon. You can use this icon when displaying error messages.</li> <li>• <code>info</code>: Provides the info icon. You can use this icon when displaying any information.</li> <li>• <code>question</code>: Provides the question icon. You can use this icon in a confirmation message box that prompts a user response.</li> <li>• <code>warning</code>: Provides the warning icon. You can use this icon when displaying a warning message.</li> </ul>
labelCancel	Optional	Cancel	The text to put on the cancel button of a prompt message box.
labelOk	Optional	OK	The text to put on an alert button and prompt message box OK button.
labelNo	Optional	No	The text to put on the button used for a negative response in a confirm message box.
labelYes	Optional	Yes	The text to put on the button used for a positive response in a confirm message box.
message	Optional		The text to display inside the message box.
modal	Optional	yes	A Boolean value that specifies if the message box must be a modal window: <ul style="list-style-type: none"> <li>• <code>yes</code></li> <li>• <code>no</code></li> </ul>
multiline	Optional	false	Valid only for prompt type message boxes. A boolean value specifying whether the prompt input text box has a single or multiple lines for text input.
name	Required		The control name. Used to refer to the control in JavaScript.
title	Optional		The title for the message box.  If you do not specify a title, ColdFusion assigns the control type value as the default title.

Attribute	Req/Opt	Default	Description
type	Required		The control type. Must be one of the following: <ul style="list-style-type: none"><li>• <code>alert</code> - A message with a single OK button.</li><li>• <code>confirm</code> - A message box with two buttons YES and NO or three buttons YES, NO, and CANCEL.</li><li>• <code>prompt</code> - a message box with a single-line or multiline text input area and OK and CANCEL buttons.</li></ul>
width	Optional		Width of the message box in pixels.
x	Optional		The X (horizontal) coordinate of the upper-left corner of the message box. ColdFusion ignores this attribute if you do not set the <code>y</code> attribute.
y	Optional		The Y (vertical) coordinate of the upper-left corner of the message box. ColdFusion ignores this attribute if you do not set the <code>x</code> attribute.

### Usage

The `cfmessagebox` creates a message box, but does not show it. You show a message box, say named `mymessagebox`, in JavaScript code as follows:

```
ColdFusion.MessageBox.show("mymessagebox");
```

If you specify a callbackhandler, clicking a button in the message box invokes the callbackhandler by passing the button label as a parameter. For prompt boxes, an additional parameter containing the prompt text is also passed.

For alert and confirm boxes:

```
var function_name = function(button);
```

For prompt boxes:

```
var function_name = function(button, promptmessage);
```

The `EventObject` parameter is the JavaScript ID (not the name) of the button that was pressed.

The `textmessage` parameter is a string with the contents of the prompt text box.

### Example

The following example has three buttons, one to display each type of message box. The message box labels are customized, and the `messagebox` callback function displays the type of the clicked button.

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<meta http-equiv="Content-Type" content="text/html; charset=utf-8" />
<title>Untitled Document</title>

<script type="text/javascript">
    //Function to to show result of a message box.
    var showResult1 = function(btn,message){
        alert("You entered: "+message);
    }
    //Function to show results of other message boxes.
    var showResult2 = function(btn){
        alert("You clicked button: "+btn);
    }

    //The button onClick handler displays the message boxes.
    function showMB(mbox) {
        ColdFusion.MessageBox.show(mbox);
    }
</script>
</head>

<body>
<cfform>
    <p>Click a button display the corresponding message box.</p>
    <cfinput name="Prompt" type="button" value="Prompt"
        onclick="showMB('mymessagebox01')">
    <cfinput name="Prompt" type="button" value="Prompt"
        onclick="showMB('mymessagebox02')">
    <cfinput name="Prompt" type="button" value="Prompt"
        onclick="showMB('mymessagebox03')">
</cfform>

<!-- Code to define the message boxes. -->
<cfmessagebox name="mymessagebox01" type="prompt"
    message="Write a short description about yourself"
    labelOK="This is OK" labelCANCEL="Cancel this"
    callbackhandler="showResult1" multiline="true"/>

<cfmessagebox name="mymessagebox02" type="confirm"
    message="Is it OK to save the planet?"
    labelNO="Dont Save" labelYES="Sure"
    callbackhandler="showResult2"/>

<cfmessagebox name="mymessagebox03" type="alert"
    message="You have been ALERTED!"
    callbackhandler="showResult2" />

</body>
</html>
```

## cfmodule

### Description

Invokes a custom tag for use in ColdFusion application pages. This tag processes custom tag name conflicts.

### Category

[Application framework tags](#)

### Syntax

```
<cfmodule
    attributeCollection = "collection structure"
    attribute_name1 = "valuea"
    attribute_name2 = "valueb"
    name = "tag name"
    template = "path"
...>
```

### See also

[cfapplication](#), [cfassociate](#), [cflock](#); *Creating and Using Custom CFML Tags in the Developing ColdFusion Applications*

### History

ColdFusion MX: Changed behavior when using this tag within a custom tag: if the `attribute_name` parameter is the same as a key element within the `attributeCollection` parameter, ColdFusion now uses the name value that is within the `attributeCollection` parameter. (Earlier releases did not process this consistently.)

### Attributes

Attribute	Req/Opt	Default	Description
<code>attributeCollection</code>	Optional		Structure. A collection of key-value pairs that represent attribute names and values. You can specify multiple key-value pairs. You can specify this attribute only once.  <b>Note:</b> This attribute functions differently from the <code>attributeCollection</code> attribute that is supported by most other tags. You must specify the <code>name</code> and <code>template</code> attributes as direct <code>cfmodule</code> tag attributes, not in the <code>attributeCollection</code> structure.

Attribute	Req/Opt	Default	Description
attribute_name	Optional		Attribute for a custom tag. You can include multiple instances of this attribute to specify the parameters of a custom tag.
name	Required unless <code>templateattribute</code> is used		Mutually exclusive with the <code>template</code> attribute. A custom tag name, in the form "Name.Name.Name..." Identifies subdirectory, under the ColdFusion tag root directory, that contains custom tag page, for example (Windows format):  <pre>&lt;cfmodule name = ".Forums40.GetUserOptions"&gt;</pre> This identifies the page <code>GetUserOptions.cfm</code> in the directory <code>CustomTags\Forums40</code> under the ColdFusion root directory.
template	Required unless <code>name</code> attribute is used		Mutually exclusive with the <code>name</code> attribute. A path to the page that implements the tag. <ul style="list-style-type: none"><li>Relative path: expanded from the current page.</li><li>Absolute path: expanded by using ColdFusion mapping.</li></ul> A physical path is not valid.

### Usage

To name a ColdFusion page that contains the custom tag definition, including its path, use the `template` attribute. To refer to the custom tag in the ColdFusion installation directory, using dot notation to indicate its location, use the `name` attribute.

On UNIX systems, ColdFusion searches first for a file with a name that matches the `name` attribute, but is all lower case. If it does not find the file, it looks for a file name that matches the attribute with identical character casing.

You can use the `attributeCollection` attribute and explicit custom tag attributes in the same call.

Within the custom tag code, the attributes passed with `attributeCollection` are saved as independent attribute values, with no indication that they are grouped into a structure by the custom tag's caller.

Similarly, if the custom tag uses a `cfassociate` tag to save its attributes, the attributes passed with `attributeCollection` are saved as independent attribute values, with no indication that they are grouped into a structure by the custom tag's caller.

If you specify an end tag to `cfmodule`, ColdFusion calls your custom tag as if it had both a start and an end tag. For more information, see *Handling end tags* in the *Developing ColdFusion Applications*.

### Example

```
<h3>cfmodule Example</h3>
<p>This view-only example shows use of cfmodule to call a custom tag inline.</p>
<p>This example uses a sample custom tag that is saved in myTag.cfm in the snippets directory.
You can also save ColdFusion custom tags in the CFusionMX7\CustomTags directory.</p>
<cfset attrCollection1 = StructNew()>
    <cfparam name="attrCollection1.value1" default="22">
    <cfparam name="attrCollection1.value2" default="45">

        attributeCollection = ##attrcollection1##
        y = 4>")#
    </cfoutput>
    <p>The result: <cfoutput>#result#</cfoutput></p>
```

## cfNTauthenticate

### Description

Authenticates a user name and password against the Windows NT domain on which the ColdFusion server is running, and optionally retrieves the user's groups.

### Category

[Security tags](#)

### Syntax

```
<cfNTauthenticate
    domain="NT domain"
    password="password"
    username="user name"
    listGroups = "yes|no"
    result="result variable"
    throwOnError = "yes|no">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cflogin](#), [cfloginuser](#), [IsUserInAnyRole](#), [GetAuthUser](#)

### History

ColdFusion MX 7: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
domain	Required		Domain against which to authenticate the user. The ColdFusion J2EE server must be running on this domain.
password	Required		User's password.
username	Required		User's login name.
listGroups	Optional	No	Boolean value that specifies whether to include a comma-delimited list of the user's groups in the result structure.
result	Optional	cfntauthenticate	Name of the variable in which to return the results.
throwOnError	Optional	no	Boolean value that specifies whether to throw an exception if the validation fails. If this attribute is <code>yes</code> , ColdFusion throws an error if the username or password is invalid; the application must handle such errors in a try/catch block or ColdFusion error handler page.

## Usage

Use this function to authenticate a user against a Windows NT domain and optionally get the user's groups. This function does not work with the Microsoft Active Directory directory service, and does nothing on UNIX and Linux systems. You typically use this tag inside a `cflogin` tag to authenticate the user for a `cfloginuser` tag, as the example shows.

**Note:** ColdFusion must run as a user that has the privilege to authenticate other users in the specified domain.

The structure specified in the `result` attribute contains the following information:

Field	Value
auth	Whether the user is authenticated: <ul style="list-style-type: none"> <li>• <code>yes</code></li> <li>• <code>no</code></li> </ul>
groups	A comma-delimited list of the user's groups in the specified domain. The structure includes this field only if the <code>listGroups</code> attribute is <code>yes</code> .
name	The user name; equals the tag's <code>username</code> attribute.
status	The authentication status. One of the following: <ul style="list-style-type: none"> <li>• <code>success</code></li> <li>• <code>UserNotInDirFailure</code>: the user is not listed in the directory.</li> <li>• <code>AuthenticationFailure</code>: the user is in the directory, but the password is not valid.</li> </ul>

This tag provides two models for handling authentication: status checking and exception handling. If the `throwOnError` attribute is `no`, use the result variable's `auth` and `status` fields to determine whether the user was authenticated and, if not, the reason for the failure. If the `throwOnError` attribute is `yes`, ColdFusion throws an exception error if the user is not valid. In this case, use try/catch error handling. The catch block must handle any authentication failure.

### Example

The following example uses the `auth` and `status` fields to determine whether the user is authenticated and the failure cause. It consists of three files that you put in the same directory:

- A main `cfntauthexample.cfm` page that displays the name if the user is authenticated and contains a logout link.
- A login form page that is displayed if the user is not logged in.
- The `Application.cfm` page, which contains all the login, authentication, and logout processing code.

For a full description of login processing, see the *Developing ColdFusion Applications*. For information on how this example works, see the comments in the code.

Save the following page as `cfntauthenticateexample.cfm`. To run the example, request this page in your browser or IDE.

```
<!--- The Application.cfm page, which is processed each time a user
      requests this page, ensures that you log in first. --->
<cfoutput>
    <h3>Welcome #GetAuthUser()#</h3>
    <!--- A link to log out the user. --->
    <a href="#CGI.script_name#?logout=Yes">Log Out</a>
</cfoutput>
```

Save the following page as `loginform.cfm`:

```
<!--- A simple login form that posts back to the page whose request initiated the login. --->
<h2>Please Log In</h2>
<cfform action="#CGI.script_name#">
    <!--- j_username and j_password are special names that populate cflogin tag
          variables. --->
    User Name: <cfinput type="text" name="j_username" value="cfqa_user1" required="Yes"><br>
    Password: <cfinput type="password" name="j_password" value="cfqa_user1"
               required="Yes"><br>
    Domain: <cfinput type="text" name="domain" value="rnd" required="Yes"><br>
    <input type="submit" value="Log In">
</cfform>
```

Save the following page as `Application.cfm`:

```
<!--- If this page is executing in response to the user clicking a logout link,
      log out the user. The cflogin tag code will then run. --->
<cfif IsDefined("URL.logout") AND URL.logout>
    <cflogout>
</cfif>

<!--- The cflogin body code runs only if a user is not logged in. --->
<cflogin>
    <!--- cflogin variable exists only if login credentials are available. --->
    <cfif NOT IsDefined("cflogin")>
        <!--- Show a login form that posts back to the page whose request
              initiated the login, and do not process the rest of this page. --->
        <cfinclude template="loginform.cfm">
        <cfabort>
    <cfelse>
        <!--- Trim any leading or trailing spaces from the username and password
              submitted by the form. --->
        <cfset theusername=trim(form.j_username)>
        <cfset thepassword=trim(form.j_password)>
        <cfset thedomain=trim(form.domain)>
        <cfntauthenticate username="#thexusername#" password="#thepassword#">
```

```
        domain="#thedomain#" result="authresult" listgroups="yes">
<!--- authresult.auth is True if the user is authenticated. --->
<cfif authresult.auth>
    <!--- Log user in to ColdFusion and set roles to the user's Groups. --->
    <cfloginuser name="#theusername#" password="#thepassword#"
        roles="#authresult.groups#">
<cfelse>
    <!--- The user was not authenticated.
        Display an error message and the login form. --->
    <cfoutput>
        <cfif authresult.status IS "AuthenticationFailure">
            <!--- The user is valid, but not the password. --->
            <h2>The password for #theusername# is not correct<br>
                Please Try again</h2>
        <cfelse>
            <!--- There is one other status value, invalid user name. --->
            <H2>The user name #theusername# is not valid<br>
                Please Try again</h2>
        </cfif>
    </cfoutput>
    <cfinclude template="loginform.cfm">
    <cfabort>
</cfif>
</cfif>
</cflogin>
```

## cfobject

### Description

Creates a ColdFusion object of a specified type.

**Note:** You can enable and disable this tag in the ColdFusion Administrator page, under ColdFusion Security > Sandbox Security.

### Category

[Extensibility tags](#)

### Syntax

The tag syntax depends on the object type. Some types use the `type` attribute; others do not. See the following sections:

- “[cfobject: .NET object](#)” on page 436
- “[cfobject: COM object](#)” on page 439
- “[cfobject: component object](#)” on page 441
- “[cfobject: CORBA object](#)” on page 442
- “[cfobject: Java or EJB object](#)” on page 444
- “[cfobject: web service object](#)” on page 445

**Note:** On UNIX, this tag does not support COM objects.

### See also

[cfargument](#), [cfcomponent](#), [cffunction](#), [cfinvoke](#), [cfinvokeargument](#), [cfproperty](#), [cfreturn](#); Using Java objects in the *Developing ColdFusion Applications*

### History

ColdFusion 8:

- Added `password`, `proxyPassword`, `proxyPort`, `proxyServer`, `proxyUser`, `refreshWSDL`, `userName`, `wsdl2JavaArgs`, and `wsportname` attributes to for use with web service objects.
- Added `.NET/dotnet` type and the associated `assembly`, `port`, `protocol`, and `secure` attributes.

ColdFusion MX:

- Changed instantiation behavior: this tag, and the `CreateObject` function, can now instantiate ColdFusion components (CFCs); you can use them within the `cfscript` tag.
- For CORBA object: changed the Naming Service separator format for addresses from a dot to a forward slash. For example, if `context=NameService`, for a class, use either of the following formats for the `class` parameter:
  - `"/Eng/CF"`
  - `".current/Eng.current/CF"`(In earlier releases, the format was `".Eng.CF"`.)
- For CORBA object: changed the `locale` attribute; it specifies the Java configuration that contains the properties file.

## cfobject: .NET object

### Description

Creates a .NET object, that is, a ColdFusion proxy for accessing a class in a local or remote .NET assembly.

### Syntax

```
<cfobject
  class="class name"
  name="instance name"
  type=".NET|dotnet"
  action="create"
  assembly="absolute path"
  port="6086"
  protocol="tcp|http"
  secure="no|yes"
  server = "localhost">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[CreateObject](#): [.NET object](#), [DotNetToCFTType](#), Using Microsoft .NET Assemblies in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added `.NET` and `dotnet` type values, and the `assembly`, `port`, `protocol`, and `secure` attributes.

## Attributes

Attribute	Req/Opt	Default	Description
class	Required		Name of the .NET class to instantiate as an object.
name	Required		String; reference name of the component to use in your application.
type	Required for .NET		Object type. Must be <code>.NET</code> or <code>dotnet</code> for .NET objects.
action	Optional	create	Action to take. Must be <code>create</code> .
assembly	Optional.	mscorlib.dll which contains the .NET core classes.	<p><b>For local .NET assemblies</b>, the absolute path or paths to the assembly or assemblies (EXE or DLL files) from which to access the .NET class and its supporting classes. If a class in an assembly requires supporting classes that are in other assemblies, you must also specify those assemblies. You can, however, omit the supporting assemblies for the following types of supporting classes:</p> <ul style="list-style-type: none"><li>• .NET core classes (classes in mscorlib.dll)</li><li>• Classes in assemblies that are in the global assembly cache (GAC)</li></ul> <p>To specify multiple assemblies, use a comma-delimited list.</p> <p><b>For remote .NET assemblies</b>, you must specify the absolute path or paths of the local proxy JAR file or files that represent the assemblies.</p> <p>If you omit this attribute, and there is no local .NET installation, the tag fails without generating an error. If you omit this attribute, there is a local .NET installation, and the specified class is not in the .NET core classes, ColdFusion generates an error.</p>
port	Optional	6086	Port number at which the .NET-side agent is listening.
protocol	Optional	tcp	<p>Protocol to use for communication between ColdFusion and .NET. Must be one of the following values:</p> <ul style="list-style-type: none"><li>• <code>http</code>: Use HTTP/SOAP communication protocol. This option is slower than <code>tcp</code>, but might be required for access through a firewall.</li><li>• <code>tcp</code>: Use binary TCP/IP protocol. This method is more efficient than HTTP.</li></ul>
secure	Optional	false	Whether to secure communications with the .NET-side agent. If <code>true</code> , ColdFusion uses SSL to communicate with .NET.
server	Optional	localhost	<p>Host name or IP address of the server where the .NET-side agent is running. Can be in any of these forms:</p> <ul style="list-style-type: none"><li>• server name (for example, myserver)</li><li>• IP address (for example, 127.0.0.1)</li></ul> <p>You must specify this attribute to access .NET components on a remote server.</p>

## Usage

The `cfobject` tag with a `.NET` or `dotnet` value for the `type` attribute creates a reference to a .NET object of a given class. Using the reference, you can access the .NET object's fields and methods. The .NET classes do not have to be local, and you can use the `cfobject` tag on a system that does not have .NET installed, including UNIX-based or OS-X systems.

To access .NET assemblies, do the following:

- Install the ColdFusion 9 .NET Extension and run the .NET extension service on the system on which the assemblies are installed. You do not have to install the extension or run the extension service on a ColdFusion system that accesses *only* remote assemblies. For installation instructions, see *Installing and Using ColdFusion*.

- If the assemblies are located on a remote system, create Java proxies for the .NET classes that you use, copy the proxies to the ColdFusion system, and configure the remote system for access by the proxies. For information on these steps, see *Using Microsoft .NET Assemblies* in the *Developing ColdFusion Applications*. If the .NET assemblies are on your ColdFusion system, you do not have to perform these steps.

#### Accessing methods and fields

You call .NET methods as you use any other ColdFusion object methods. In the simplest case, your application code uses the following format to call a .NET class method:

```
<cfobject type=".NET" name="mathInstance" class="mathClass">
    assembly="C:/Net/Assemblies/math.dll">
<cfset myVar=mathInstance.multiply(1,2)>
```

If a .NET class has multiple constructors, and you do not want ColdFusion to use the default constructor to create the object, invoke a specific constructor by calling the special `init` method of the ColdFusion object with the constructor's arguments. For example, you can use the following tags to instantiate `com.foo.MyClass(int, int)`:

```
<cfobject type=".NET" class="com.foo.MyClass"
    assembly="c:\temp\myLib.dll" name="myObj" >
<cfset myObj.init(10, 5)>
```

You access and change .NET class public fields by calling the following methods:

```
Get_fieldName()
Set_fieldName()
```

For example, if the .NET class has a public field named `account`, you can access and modify its value by using `Get_account()` and `Set_account()` methods, respectively.

You can access, but not modify final fields, so you can only call `Get_fieldName()` for these fields.

#### Example

The following example uses the `GetProcess` method of the .NET `System.Diagnostics.Process` class to get and display information about the processes running on the local system. Because it uses a core .NET class, for which ColdFusion automatically generates proxies, you do not have to specify an assembly name in the `cfobject` tag.

For more complex examples, including examples that use custom .NET classes, see *Using Microsoft .NET Assemblies* in the *Developing ColdFusion Applications*.

```
<cfobject type=".NET" name="proc" class="System.Diagnostics.Process">
<cfset processes = proc.GetProcesses()>
<cfset arrLen = arrayLen(processes)>

<table border=0 cellspacing="3" cellpadding="3">
  <tr bgcolor="#33CCCC">
    <td style="font-size:12px; font-weight:bold" nowrap>Process ID</td>
    <td style="font-size:12px; font-weight:bold" nowrap>Name</td>
    <td style="font-size:12px; font-weight:bold" nowrap>Memory (KB)</td>
    <td style="font-size:12px; font-weight:bold" nowrap>Peak Memory (KB)</td>
    <td style="font-size:12px; font-weight:bold" nowrap>Virtual Memory Size (KB)</td>
    <td style="font-size:12px; font-weight:bold" nowrap>Start Time</td>
    <td style="font-size:12px; font-weight:bold" nowrap>Total Processor Time</td>
  </tr>
  <cfloop from = 1 to="#arrLen#" index=i>
    <cfset process = processes[i]>
    <cfset id = process.Get_Id()>
    <cfif id neq 0>
      <cfoutput>
        <tr>
          <td align="right">#process.Get_Id()#</td>
          <td>#process.Get_ProcessName()#</td>
          <td align="right">#process.Get_PagedMemorySize()/1000#</td>
          <td align="right">#process.Get_PeakPagedMemorySize()/1000#</td>
          <td align="right">#process.Get_VirtualMemorySize()/1000#</td>
          <td>#process.Get_StartTime()#</td>
          <td>#process.Get_TotalProcessorTime()#</td>
        </tr>
      </cfoutput>
    </cfif>
  </cfloop>
</table>
```

## cfobject: COM object

### Description

Creates and manipulates a Component Object Model (COM) object. Invokes a registered automation server object type.

For information on OLEView, and about COM and DCOM, see the Microsoft OLE Development website:  
[www.microsoft.com](http://www.microsoft.com).

To use this tag, provide the object's program ID or filename, the methods and properties available through the IDispatch interface, and the arguments and return types of the object's methods. For most COM objects, you can get this information with the OLEView utility.

**Note:** On UNIX, the *cfobject* tag does not support COM objects.

## Syntax

```
<cfobject
    class = "program ID"
    name = "instance name"
    action = "create|connect"
    context = "inproc|local|remote"
    server = "server name">
    type = "com"
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[ReleaseComObject](#), [cfcollection](#), [cfexecute](#); COM in the *Developing ColdFusion Applications*

## Attributes

Attribute	Req/Opt	Default	Description
class	Required		Component ProgID for the object to invoke. When using Java stubs to connect to the COM object, the class must be the ProgID of the COM object.
name	Required		String; name for the instantiated component.
action	Optional	create	<ul style="list-style-type: none"> <li>• <code>create</code>: instantiates a COM object (typically, a DLL) before invoking methods or properties.</li> <li>• <code>connect</code>: connects to a COM object (typically, an EXE) running on server.</li> </ul>
context	Optional		<ul style="list-style-type: none"> <li>• <code>inproc</code></li> <li>• <code>local</code></li> <li>• <code>remote</code></li> </ul> <p>In Windows, if not specified, uses Registry setting.</p>
server	Required if context = "Remote"		<p>Server name, using Universal Naming Convention (UNC) or Domain Name Serve (DNS) convention, in one of these forms:</p> <ul style="list-style-type: none"> <li>• <code>\\lanserver</code></li> <li>• <code>lanserver</code></li> <li>• <code>http://www.servername.com</code></li> <li>• <code>www.servername.com</code></li> <li>• <code>127.0.0.1</code></li> </ul>
type	Optional		Object type. The value <code>com</code> specifies COM objects:

### Example

```
<h3>cfobject (COM) Example</h3>
<!--- Create a COM object as an inproc server (DLL). (class = prog-id)--->
<cfobject action = "Create"
    type = "COM"
    class = Allaire.DocEx1.1
    name = "obj">

<!--- Call a method. Methods that expect no arguments should be called by using
    empty parentheses. --->
<cfset obj.Init()>

<!--- This is a collection object. It should support, at a minimum:
    Property : Count
    Method : Item(inarg, outarg)
    and a special property called _NewEnum
--->
<cfoutput>
    This object has #obj.Count# items.
    <br> <HR>
</cfoutput>

<!--- Get the 3rd object in the collection. --->
<cfset emp = obj.Item(3)>
<cfoutput>
    The last name in the third item is #emp.lastname#.
    <br> <HR>
</cfoutput>

<!---Loop over all the objects in the collection.--->
<p>Looping through all items in the collection:
<br>
<cfloop
    collection = #obj#
    item = file2>
    <cfoutput>Last name: #file2.lastname# <br></cfoutput>
</cfloop>
```

## cfobject: component object

### Description

Creates an instance of a ColdFusion component (CFC) object.

### Syntax

```
<cfobject
    component = "component name"
    name = "instance name"
    type = "component">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

**See also**

[cfcollection](#), [cfcomponent](#), [cfexecute](#), [cfindex](#), [IsInstanceOf](#), [cfreport](#), [cfsearch](#), [cfwddx](#); Using ColdFusion components in the *Developing ColdFusion Applications*

**Attributes**

Attribute	Req/Opt	Default	Description
component	Required		Name of component to instantiate.
name	Required		String; name for the instantiated component. The name must not have a period as the first or last character.
type	Optional	component	The object type. You can omit this attribute or specify <code>component</code> . ColdFusion automatically sets the type to <code>component</code> .

**Usage**

When the `cfobject` tag creates an instance of the CFC, ColdFusion executes any constructor code in the CFC; that is, it runs code that is not in the method definitions.

On UNIX systems, ColdFusion searches first for a file with a name that matches the specified component name, but is all lowercase. If it does not find the file, it looks for a filename that matches the component name exactly, with the identical character casing.

**Example**

```
<!--- Separate instantiation and method invocation; --->
<!--- permits multiple invocations. --->
<cfobject
    name="quoteService"
    component="nasdaq.quote">
<cfinvoke
    component="#quoteService#"
    method="getLastTradePrice"
    symbol="macr"
    returnVariable="res">
<cfoutput>#res#</cfoutput><br>

<cfinvoke
    component="#quoteService#"
    method="getLastTradePrice"
    symbol="mot"
    returnVariable="res">
<cfoutput>#res#</cfoutput>
```

**cfobject: CORBA object****Description**

Calls methods on a registered CORBA object.

## Syntax

```
<cfobject  
    class = "filepath or naming service"  
    context = "ior|nameservice"  
    name = "instance name"  
    type = "corba"  
    locale = "type-value arguments">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfcollection](#), [cfexecute](#), [cfindex](#), [cfreport](#), [cfsearch](#), [cfwddx](#); CORBA in the *Developing ColdFusion Applications*

## History

See the History section of the main [cfobject](#) tag page.

## Attributes

Attribute	Req/Opt	Default	Description
class	Required		<ul style="list-style-type: none"><li>If <code>context="ior"</code>, absolute path of file that contains string version of the Interoperable Object Reference (IOR). ColdFusion must be able to read file; it must be local to ColdFusion server or accessible on network.</li><li>If <code>context="nameservice"</code>, forward slash-delimited naming context for naming service, for example: <code>Allaire//Doc/empobject</code>.</li></ul>
context	Required		<ul style="list-style-type: none"><li><code>ior</code>: ColdFusion uses Interoperable Object Reference (IOR) to access CORBA server.</li><li><code>nameservice</code>: ColdFusion uses naming service to access server. This option is valid only with the <code>InitialContext</code> of a <code>VisiBroker Orb</code>.</li></ul>
locale	Optional		Sets arguments for a call to <code>init_orb</code> . Use this attribute only for <code>VisiBroker ORBs</code> . It is available on C++, Version 3.2. The value must be in the form:  <code>locale = " -ORBagentAddr 199.99.129.33 -ORBagentPort 19000"</code>  Each type-value pair must start with a hyphen.
name	Required		String; name for the instantiated component. An application uses it to reference the CORBA object's methods and attributes.
type	Required for CORBA		Object type. Must be <code>corba</code> for CORBA objects.

## Usage

ColdFusion Enterprise version 4.0 and later supports CORBA through the Dynamic Invocation Interface (DII). To use `cfobject` with CORBA objects, provide the name of the file that contains a string-formatted version of the IOR, or the object's naming context in the naming service; and the object's attributes, method names, and method signatures.

User-defined types (for example, structures) are not supported.

### Example

```
<cfobject type = "corba"
  context = "ior"
  class = "c:\\myobject.ior"
  name = "GetName">
```

## cfobject: Java or EJB object

### Description

Creates and manipulates a Java and Enterprise Java Bean (EJB) object.

### Syntax

```
<cfobject
  class = "Java class"
  type = "Java"
  name = "instance name"
  action = "create">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfcollection](#), [cfexecute](#), [cfindex](#), [IsInstanceOf](#), [cfreport](#), [cfsearch](#), [cfwddx](#); Using Java objects in the *Developing ColdFusion Applications*

### Attributes

Attribute	Req/Opt	Default	Description
action	Optional	create	Only the default <code>create</code> action, which creates the object, is supported.
class	Required		The Java class.
name	Required		String; name for the instantiated component.
type	Required for Java		Object type. Must be <code>java</code> for Java and EJB objects.

### Usage

To call Java CFXs or Java objects, ColdFusion uses a Java Virtual Machine (JVM) that is embedded in the process. You can configure JVM loading, location, and settings in the ColdFusion Administrator.

Any Java class available in the class path that is specified in the ColdFusion Administrator can be loaded and used from ColdFusion, by using the `cfobject` tag.

### Access Java methods and fields

- 1 Call the `cfobject` tag, to load the class. See the example code.
- 2 Use the `init` method with appropriate arguments, to call a constructor. For example:

```
<cfset ret = myObj.init(arg1, arg2)>
```

Calling a public method on the object without first calling the `init` method results in an implicit call to the default constructor. Arguments and return values can be any Java type (simple, array, object). ColdFusion makes the conversions if strings are passed as arguments, but not if they are received as return values.

Overloaded methods are supported if the number of arguments is different.

### Calling EJBs

To create and call EJB objects, use the `cfoject` tag. In the second example in the following section, the `WebLogic JNDI` is used to register and find `EJBHome` instances.

### Example

```
<!--- Example of a Java Object, this cfoject call loads the class MyClass
but does not create an instance object. Static methods and fields
are accessible after a call to cfoject. --->
<cfoject
  action = "create"
  type = "java"
  class = "myclass"
  name = "myobj">

<!--- Example of an EJB - The cfoject tag creates the Weblogic Environment
object, which is used to get InitialContext. The context object is
used to look up the EJBHome interface. The call to Create() results
in getting an instance of stateless session EJB. --->

<cfoject
  action = "create"
  type = "java"
  class = "weblogic/jndi/Environment"
  name = "wlEnv">

<cfset ctx = wlEnv.getInitialContext()>
<cfset ejbHome = ctx.lookup("statelessSession.TraderHome")>
<cfset trader = ejbHome.Create()>
<cfset value = trader.shareValue(20, 55.45)>
<cfoutput>
  Share value = #value#
</cfoutput>
<cfset value = trader.remove()>
```

## **cfoject: web service object**

### Description

Creates a web service proxy object.

## Syntax

```
<cfobject
    name = "local name">
    webservice= "service identifier"
    password = "string"
    proxyPassword = "string"
    proxyPort = "port number"
    proxyServer = "URL or IP address"
    proxyUser = "string"
    refreshWSDL = "no|yes"
    type = "webservice"
    username = "string"
    wsdl2javaArgs = "argument string"
    wsportname = "port name">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfcollection](#), [cfexecute](#), [cfindex](#), [cfreport](#), [cfsearch](#), [cfwddx](#); Consuming web services in Using Web Services in the *Developing ColdFusion Applications*

## History

See the History section of the main [cfobject](#) tag page.

## Attributes

Attribute	Req/Opt	Default	Description
name	Required		Local name for the web service. String.
webservice	Required		One of the following: <ul style="list-style-type: none"> <li>The absolute URL of the web service.</li> <li>The name (string) assigned in the ColdFusion Administrator to the web service.</li> </ul>
password	Optional	Password set in the Administrator, if any	The password to use to access the web service. If the <code>webservice</code> attribute specifies a web service name configured in the ColdFusion Administrator, overrides any password specified in the Administrator entry.
proxyPassword	Optional	http.proxyPassword system property, if any	The user's password on the proxy server.
proxyPort	Optional	http.proxyPort system property, if any.	The port to use on the proxy server.
proxyServer	Optional	http.proxyHost system property, if any.	The proxy server required to access the web service URL.
proxyUser	Optional	http.proxyUser system property, if any	The user ID to send to the proxy server.
refreshWSDL	Optional	no	<ul style="list-style-type: none"> <li><code>yes</code>: reloads the WSDL file and regenerates the artifacts used to consume the web service</li> <li><code>no</code></li> </ul>

Attribute	Req/Opt	Default	Description
type	Optional		The object type. You can omit this attribute or specify <code>webservice</code> .
username	Optional	User name set in the Administrator, if any	The user name to use to access the web service. If the <code>webservice</code> attribute specifies a web service configured name in the ColdFusion Administrator, overrides any user name specified in the Administrator entry.
wsdl2javaArgs	Optional		<p>A string that contains a space-delimited list of arguments to pass to the WSDL2Java tool that generates Java stubs for the web services. Useful arguments include the following:</p> <ul style="list-style-type: none"> <li>• <code>-w</code> or <code>--noWrapped</code>: turns off the special treatment of wrapped document/literal style operations.</li> <li>• <code>-a</code> or <code>--all</code>: generates code for all elements in the WSDL, even unreferenced ones.</li> <li>• <code>-w</code> or <code>--wrapArrays</code>: prefers building beans to straight arrays for wrapped XML array types. This switch is not included in the Axis documentation.</li> </ul> <p>For detailed information on valid arguments, see the <a href="#">Apache Axis WSDL2Java Reference</a>.</p>
wsportname	Optional	First port in the WSDL	<p>The port name for the web service. This value is case sensitive and corresponds to the <code>port</code> element's <code>name</code> attribute under the <code>service</code> element.</p> <p>Specify this parameter if the web service contains multiple ports.</p>

### Usage

Instantiates a proxy object for a web service. You can enter the absolute URL in this tag, or refer to a web service that is entered in the ColdFusion Administrator. To minimize potential code maintenance, enter the web service in the Administrator, and then refer to that name in this tag.

## cfobjectcache

### Description

Flushes the query cache.

### Category

[Database manipulation tags](#)

### Syntax

```
<cfobjectcache
    action = "clear">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfobject](#)

### History

ColdFusion 5: Added this tag.

### Attributes

Attribute	Req/Opt	Default	Description
action	Required		clear: clears queries from the cache in the Application scope.

## cfoutput

### Description

Displays output that can contain the results of processing ColdFusion variables and functions. Can loop over the results of a database query.

### Category

[Data output tags](#)

### Syntax

```
<cfoutput  
    group = "query column"  
    groupCaseSensitive = "yes|no"  
    maxRows = "maximum rows to display"  
    query = "query name"  
    startRow = "start row">  
</cfoutput>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfcol](#), [cfcontent](#), [cfdirectory](#), [cftable](#)

### History

ColdFusion 4.5.0: Added the `groupCaseSensitive` attribute.

### Attributes

Attribute	Req/Opt	Default	Description
group	Optional		Query column to use to group sets of records. Eliminates adjacent duplicate rows when data is sorted. Use if you retrieved a record set ordered on one or more a query columns. For example, if a record set is ordered on "Customer_ID" in the <code>cfquery</code> tag, you can group the output on "Customer_ID."
groupCaseSensitive	Optional	yes	Boolean. Whether to consider the case in grouping rows.
maxRows	Optional	Displays all rows	Maximum number of rows to display.
query	Optional		Name of <code>cfquery</code> from which to draw data for output section.
startRow	Optional	1	Row from which to start output.

### Usage

In the `cfoutput` tag body, ColdFusion treats text that is surrounded by number signs (#) as a ColdFusion variable or function call. For example, the following code displays the text "Hello World!":

```
<cfset myVar="Hello World!">
<cfoutput>#myVar#</cfoutput>
```

When you specify a `query` attribute, this tag loops over the query rows and produces output for each row within the range specified by the `startRow` and `maxRows` values, and groups or eliminates duplicate entries as specified by the grouping attribute values, if any. It also sets the `query.currentRow` variable to the current row being processed.

If you nest `cfoutput` blocks that process a query, you specify the `query` and `group` attributes at the top-most level; you can specify a `group` attribute for each inner block except the innermost `cfoutput` block.

This tag requires an end tag.

### Example

```
<!--- EXAMPLE: This example shows how cfoutput operates. --->
<!--- Run a sample query. --->
<cfquery name = "GetCourses" dataSource = "cfdocexamples">
    SELECT Dept_ID, CorName, CorLevel
    FROM courseList
    ORDER by Dept_ID, CorLevel, CorName
</cfquery>
<h3>cfoutput Example</h3>
<p>cfoutput tells ColdFusion Server to begin processing, and then to hand back control of page rendering to the web server.
<p>For example, to show today's date, you could write #DateFormat("#Now()#"). If you enclosed that expression in cfoutput, the result would be<cfoutput>#DateFormat(Now())#</cfoutput>.

<p>In addition, cfoutput may be used to show the results of a query operation, or only a partial result, as shown:

<p>There are <cfoutput>#getCourses.recordCount#</cfoutput> total records in our query. Using the maxRows parameter, we are limiting our display to 4 rows.
<p><cfoutput query = "GetCourses" maxRows = 4>
    #Dept_ID# #CorName# #CorLevel#<br>
</cfoutput>

<p>EXAMPLE: The next example uses the group attribute to eliminate duplicate lines from a list of course levels taught in each department.</p>
<p><cfquery name = "GetCourses" dataSource = "cfdocexamples"></p>
    SELECT Dept_ID, CorLevel
    FROM courseList
    ORDER by Dept_ID, CorLevel
</cfquery>
<p><cfoutput query = "GetCourses" group="CorLevel" GroupCaseSensitive="True">
    #Dept_ID# #CorLevel#<br></p>
</cfoutput>

<p>cfoutput can also show the results of a more complex expression, such as getting the day of the week from today's date. We first extract the integer representing the Day of the Week from the server function Now() and then apply the result to the DayOfWeekAsString function:</p>

<br>Today is #DayOfWeekAsString(DayOfWeek(Now()))#
<br>Today is <cfoutput>#DayOfWeekAsString(DayOfWeek(Now()))#</cfoutput>

<p>EXAMPLE: This last example shows nested cfoutput tags:</p>
<cfquery datasource="cfdocexamples" name="empSalary">
```

```
        SELECT Emp_ID, firstname, lastname, e.dept_id, salary, d.dept_name
        FROM employee e, departmt d
        WHERE e.dept_id = d.dept_id
        ORDER BY d.dept_name
    </cfquery>

    <!--- Outer cfoutput. --->
    <cfoutput query="empSalary" group="dept_id">
        <h2>#dept_name#</h2>
        <table width="95%" border="2" cellspacing="2" cellpadding="2" >
        <tr>
            <th>Employee</th>
            <th>Salary</th>
        </tr>
        <cfset deptTotal = 0 >
        <!--- Inner cfoutput. --->
        <cfoutput>
            <tr>

## Tags p-q

### cfparam

#### Description

Tests for the existence of a parameter (that is, a variable), validates its data, and, if a default value is not assigned, optionally provides one.

#### History

ColdFusion MX 7:

- Added min, max, and pattern attributes.
- Added creditcard, email, eurodate, float, integer, range, regex, regular\_expression, ssn, social\_security\_number, time, URL, USdate, XML, and zipcode values of the type attribute.

#### Category

[Variable manipulation tags](#)

### Syntax

```
<cfparam  
    name = "parameter name"  
    default = "value"  
    max = "value"  
    min = "value"  
    pattern = "regular expression"  
    type = "data_type">
```

### See also

[cfcookie](#), [cfregistry](#), [cfsavecontent](#), [cfschedule](#), [cfset](#); Validating data with the IsValid function and the cfparam tag in the *Developing ColdFusion Applications*

### Attributes

Attribute	Req/Opt	Default	Description
name	Required		Name of the parameter (variable) to test (such as "Client.Email " or "Cookie.BackgroundColor "). If omitted, and if the parameter does not exist, an error is thrown.
default	Optional		Value to set parameter to if it does not exist. Any expression used for the default attribute is evaluated, even if the parameter exists. The result is not assigned if the parameter exists, but if the expression has side effects, they still occur.
max	Optional		The maximum valid value; used only for range validation.

Attribute	Req/Opt	Default	Description
min	Optional		The minimum valid value; used only for range validation.
pattern	Optional		A JavaScript regular expression that the parameter must match; used only for <code>regex</code> or <code>regular_expression</code> validation.
type	Optional	any	<p>The valid format for the data; one of the following. For detailed information on validation algorithms, see <i>Validating form data using hidden fields</i> in <i>Validating Data</i> in the <i>Developing ColdFusion Applications</i>.</p> <ul style="list-style-type: none"> <li>• <code>any</code>: any type of value.</li> <li>• <code>array</code>: an array of values.</li> <li>• <code>binary</code>: a binary value.</li> <li>• <code>boolean</code>: a Boolean value: yes, no, true, false, or a number.</li> <li>• <code>creditcard</code>: a 13-16 digit number conforming to the mod10 algorithm.</li> <li>• <code>date</code> or <code>time</code>: a date-time value.</li> <li>• <code>email</code>: a valid e-mail address.</li> <li>• <code>eurodate</code>: a date-time value. Any date part must be in the format dd/mm/yy. The format can use /, -, or . characters as delimiters.</li> <li>• <code>float</code> or <code>numeric</code>: a numeric value.</li> <li>• <code>guid</code>: a Universally Unique Identifier of the form "XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX" where 'x' is a hexadecimal number.</li> <li>• <code>integer</code>: an integer.</li> <li>• <code>query</code>: a query object.</li> <li>• <code>range</code>: a numeric range, specified by the <code>min</code> and <code>max</code> attributes.</li> <li>• <code>regex</code> or <code>regular_expression</code>: matches input against <code>pattern</code> attribute.</li> <li>• <code>ssn</code> or <code>social_security_number</code>: a U.S. social security number.</li> <li>• <code>string</code>: a string value or single character.</li> <li>• <code>struct</code>: a structure.</li> <li>• <code>telephone</code>: a standard U.S. telephone number.</li> <li>• <code>URL</code>: an http, https, ftp, file, mailto, or news URL.</li> <li>• <code>UUID</code>: a ColdFusion Universally Unique Identifier, formatted 'XXXXXXXX-XXXX-XXXX-XXXXXXXXXXXX', where 'x' is a hexadecimal number. See "<a href="#">CreateUUID</a>" on page 788.</li> <li>• <code>USdate</code>: a U.S. date of the format mm/dd/yy, with 1-2 digit days and months, 1-4 digit years.</li> <li>• <code>variableName</code>: a string formatted according to ColdFusion variable naming conventions.</li> <li>• <code>xml</code>: XML objects and XML strings.</li> <li>• <code>zipcode</code>: U.S., 5- or 9-digit format ZIP codes.</li> </ul>

## Usage

You can use this tag to make the following tests:

- To test whether a required variable exists, use this tag with only the `name` attribute. If it does not exist, ColdFusion stops processing the page and returns an error.
- To test whether a required variable exists, and that it is of the specified type, use this tag with the `name` and `type` attributes. If the variable does not exist or its value is not of the specified type, ColdFusion returns an error.
- To set a default value for the variable, use this tag with the `name` and `default` attributes. If the variable does not exist, it is created and set to the `default` attribute value. If the variable exists, processing continues; the value is not changed.

If you specify `variableName` for the `type` attribute, the parameter's value must be a string that is in ColdFusion variable name format; that is, starts with a letter, underscore (`_`), or Unicode currency symbol, and contains letters, numbers, underscores, periods, and Unicode currency symbols, only. ColdFusion does not check whether the parameter value corresponds to an existing ColdFusion variable.

*To improve performance, avoid using the `cfparam` tag in ColdFusion functions, including in CFC methods. Instead, place the `cfparam` tags in the body of the CFML pages.*

## Example

```
<!--- This example shows how to use CFPARAM to define default values for page variables. --->
<cfparam name = "storeTempVar" default = "my default value">
<cfparam name = "tempVar" default = "my default value">

<!--- Check if form.tempVar was passed. --->
<cfif IsDefined("form.tempVar") is "True">
    <!--- Check if form.tempVar is not blank. --->
    <cfif form.tempVar is not "">
        <!--- If not, set tempVar to value of form.tempVar --->
        <cfset tempVar = form.tempVar>
    </cfif>
</cfif>

<body>
<h3>cfparam Example</h3>
<p>cfparam is used to set default values so that a developer does not have to
check for the existence of a variable using a function like IsDefined.</p>

<p>The default value of our tempVar is "<cfoutput>#StoreTempVar# </cfoutput>"</p>

<!--- Check if tempVar is still the same as StoreTempVar and that tempVar is not blank. --->
<cfif tempVar is not #StoreTempVar#
    and tempVar is not "">
    <h3>The value of tempVar has changed: the new value is
    <cfoutput>#tempVar#</cfoutput></h3>
</cfif>

<p>
<form action = "cfparam.cfm" method = "post">
    Type in a new value for tempVar, and hit submit:<br>
    <input type = "Text" name = "tempVar">
    <input type = "Submit" name = "" value = "submit">
</form>
```

## cfpdf

### Description

Manipulates existing PDF documents. The following list describes some of the tasks you can perform with the `cfpdf` tag:

- Merge several PDF documents into one PDF document.
- Delete pages from a PDF document.
- Merge pages from one or more PDF documents and generate a new PDF document.
- Linearize PDF documents for faster web display.
- Remove interactivity from forms created in Acrobat® to generate flat PDF documents.
- Encrypt and add password protection to PDF documents.
- Generate thumbnail images from PDF documents or pages.
- Add or remove watermarks from PDF documents or pages.
- Retrieve information associated with a PDF document, such as the software used to generate the file or the author, and set information for a PDF document, such as the title, author and keywords.
- Create PDF portfolios
- Add and remove header/footer from PDF documents
- Optimize PDF documents

### History

ColdFusion 8: Added this tag.

ColdFusion 9: Added new attributes: `jpgdpi`, `maxBreadth`, `noAttachments`, `leftMargin`, `algo`, `noMetadata`, `noBookMarks`, `noJavaScripts`, `useStructure`, `noFonts`, `text`, `noComments`, `encodeAll`, `numberFormat`, `compressTIFFs`, `addQuads`, `rightMargin`, `topMargin`, `bottomMargin`, `noThumbnails`, `align`, `noLinks`, `maxLength`, `hires`, `hScale`, `overridepage`, `honourspace`, `maxScale`, `package`, `vScale`

### Category

## Syntax

### Add a watermark to a PDF document

```
<cfpdf
    required
    action = "addwatermark"
    source = "absolute or relative pathname to a PDF file|PDF document variable|
              cfdocument variable"
    one of the following:
    copyfrom = "absolute or relative pathname to a PDF file from which the first page is
                used as a watermark"
    image = "absolute or relative pathname to image file|image variable used as a
             watermark"
    optional
    foreground = "yes|no"
    isBase64 = "yes|no"
    opacity = "watermark opacity"
    overwrite = "yes|no"
    pages = "page or pages to add the watermark"
    password = "user or owner password for the PDF source file"
    position = "position on the page where the watermark is placed"
    rotation = "degree of rotation of the watermark"
    showonprint = "yes|no">
    \\one of the following:
    destination = "PDF output file pathname"
    name = "PDF document variable name"
    image = "image file name to be used as the footer"
    text = "text to be used in the footer"
```

### Add headers

```
<cfpdf
    required
    action = "addheader"
    source = "absolute or relative pathname to a PDF file|PDF document variable|
              cfdocument variable"
    pages = "page or pages to add the footer"
    optional
    isBase64 = "yes|no"
    overwrite = "yes|no"
    password = "user or owner password for the PDF source file"
    showonprint = "yes|no">
    align = "left|right|center"
    leftmargin = "value of the header left margin"
    rightmargin = "value of the header right margin"
    numberformat = "LOWERCASEROMAN|NUMERIC|UPPERCASEROMAN" <!---used with either
                    _PAGENUMBER or _LASTPAGENUMBER--->
    opacity = "header opacity"
    topmargin = "value of the top margin of the header"
    \\one of the following:
    destination = "PDF output file pathname"
    name = "PDF document variable name"
    text = _PAGELABEL: add current page label|_LASTPAGELABEL: add last page label|
           _PAGENUMBER: add current page number|_LASTPAGENUMBER: add last page
           number \\text for the header. You can also add a normal text string.
    image = "image file name to be used as the header"
```

### Add footer

```
<cfpdf
```

```
required
action = "addfooter"
source = "absolute or relative pathname to a PDF file|PDF document variable|
        cfdocument variable"
pages = "page or pages to add the footer"
optional
isBase64 = "yes|no"
overwrite = "yes|no"

password = "user or owner password for the PDF source file"
showonprint = "yes|no">
destination = "PDF output file pathname"
name = "PDF document variable name"
align = "left|right|center"
one of the following:
image = "image file name to be used as the footer"
text = _PAGELABEL: add current page label|_LASTPAGELABEL: add last page label|
       _PAGENUMBER: add current page number|_LASTPAGENUMBER: add last page
       number \|text for the header
leftmargin = "value of the footer left margin"
rightmargin = "value of the footer right margin"
numberformat
opacity = "footer opacity"
bottommargin = "value of the bottom margin"
```

**Delete pages from a PDF document**

```
<cfpdf
required
action = "deletepages"
pages = "page or pages to delete"
source = "absolute or relative pathname to a PDF file|PDF document variable|
        cfdocument variable"
optional
overwrite = "yes|no"
password = "PDF source file password"
one of the following:
destination = "PDF output file pathname"
name = "PDF document variable name">
```

**Delete headers and footers**

```
<cfpdf
required
action = "removeheaderfooter"
source = "absolute or relative pathname to a PDF file|PDF document variable|
        cfdocument variable"
optional
overwrite = "yes|no"
pages = "page or pages to add the watermark"
password = "user or owner password for the PDF source file"
one of the following:
destination = "PDF output file pathname"
name = "PDF document variable name">
```

**Retrieve information about a PDF document**

```
<cfpdf
required
action = "getinfo"
name = "structure variable name"
source = "absolute or relative pathname to a PDF file|PDF document variable|
        cfdocument variable">
```

**optional**  
password = "PDF source file password">

#### Merge PDF documents into an output PDF file

```
<cfpdf
  required
  action = "merge"
  one of the following:
  directory = "directory of PDF files to merge"
  source = "comma-separated list of PDF source files|absolute or relative pathname
           to a PDF file|PDF document variable|cfdocument variable"
  <cfpdfparam>
  \\required only when package is specified as true
  order = "name|time"
  one of the following if <cfpdfparam> is specified:
  name = "PDF document variable name"
  destination = "PDF output file pathname"
  optional
  package = "true|false" <!---create PDF packages if set to true. You can provide
           description in cfpdfparam tag, such as <cfpdfparam file="filename desc=">--->

## Attributes

Attribute	Action	Req/Opt	Default	Description
action	N/A	Optional	<i>processddx</i>	Action to take: <ul style="list-style-type: none"> <li>• addWatermark</li> <li>• deletePages</li> <li>• getInfo</li> <li>• merge</li> <li>• processddx</li> <li>• protect</li> <li>• read</li> <li>• removeWatermark</li> <li>• setInfo</li> <li>• thumbnail</li> <li>• write</li> <li>• optimize</li> <li>• extracttext</li> <li>• extractimage</li> <li>• archive</li> <li>• addheader</li> <li>• addfooter</li> <li>• removeheaderfooter</li> <li>• transform</li> </ul>
addquads	extracttext	optional	false	Add the position or quadrants of the thumbnail
align	addheader addfooter	Optional	center	Aligns the header and footer in PDF.
algo	optimize	required		Specifies the algorithm for image downsampling. The values are <i>bilinear</i> , <i>bicubic</i> , and <i>nearest_neighbour</i>
ascending	merge	Optional	no	Order in which the PDF files are sorted: <ul style="list-style-type: none"> <li>• yes: Files are sorted in ascending order</li> <li>• no: Files are sorted in descending order</li> </ul> Applicable only when you specify the <i>directory</i> attribute.
bottomMargin	addfooter	optional		Specifies the value of the bottomMargin
copyFrom	addWatermark	Optional		Pathname of the PDF document from which to use the first page as a watermark

Attribute	Action	Req/Opt	Default	Description
compressstiffs	thumbnail	optional	no	Compress thumbnail which are in TIFF format.
ddxfile	processddx	Required		Pathname of the DDX file, or a string with DDX instructions
destination	addWatermark deletePages merge protect removeWatermark setInfo thumbnail write optimize extracttext extractimage addheader addfooter removeheaderfooter transform	Required for the write action  Optional for all other actions		<p>Pathname of the modified PDF document. If the destination file exists, set the overwrite attribute to yes. If the destination file does not exist, ColdFusion creates the file, if the parent directory exists.</p> <p>You can specify the <code>destination</code> attribute or the <code>name</code> attribute, but not both.</p> <p>For the <code>thumbnail</code> action, the destination is the directory path where the images are written. If you specify a relative pathname to the destination directory, the destination directory is relative to the template directory. If you do not specify a destination directory, ColdFusion creates a directory called thumbnails in the directory in the template directory.</p> <p>For the <code>optimize</code> action, destination is the path where the PDF document which needs to be optimized is located.</p> <p>For <code>extracttext</code> and <code>extractimage</code>, destination is the path of the PDF document from which the text or image needs to be extracted.</p> <p>For <code>addheader</code>, <code>addfooter</code>, <code>removeheader</code> footer, destination is the path of the PDF document where you need to add a header or footer, or remove the header and footer.</p> <p>For <code>transform</code>, destination specifies the directory path of the PDF document where you need to perform page level transformations.</p>
directory	merge	Optional		Directory of the PDF documents to merge. Specify either the <code>directory</code> attribute or the <code>source</code> attribute. If you specify the <code>directory</code> attribute, ColdFusion orders the documents by filename in descending order, by default. To change the order of the files, use the <code>order</code> attribute.
encodeall	write	Optional	no	Encode streams that are not encoded to optimize page content

Attribute	Action	Req/Opt	Default	Description
encrypt	protect	Optional	RC4_128 (Acrobat 5.0 or higher)	Encryption type for the PDF output file: <ul style="list-style-type: none"> <li>• RC4_40</li> <li>• RC4_128</li> <li>• RC4_128M</li> <li>• AES_128</li> <li>• None</li> </ul> For more information, see the section <i>Encryption for PDF documents</i> .
flatten	write	Optional	no	Applies to forms created in Acrobat only (not forms created in LiveCycle); specifies whether interactivity is turned off: <ul style="list-style-type: none"> <li>• yes: the form fields are no longer interactive.</li> <li>• no: the form fields remain interactive.</li> </ul>
<b>foreground</b>	addWatermark	Optional	no	Placement of the watermark on the page: <ul style="list-style-type: none"> <li>• yes: the watermark appears in the foreground (over the page content).</li> <li>• no: the watermark appears in the background (behind the page content).</li> </ul>
format	thumbnail	Optional	jpg	File type of thumbnail image output: <ul style="list-style-type: none"> <li>• jpg</li> <li>• tiff</li> <li>• png</li> </ul>
hires	thumbnail	optional	no	Sets a high resolution for the thumbnail if set to yes.
honourspace	extracttext	optional	false	Set this option to "true", for improved readability and spacing.
hscale	optimize	optional		Horizontal scale of the image to be modified. Valid values are hscale<1.
image	addWatermark	Optional		Image used as a watermark. You can specify a pathname, a variable that contains an image file, or a ColdFusion image variable.
imagePrefix	thumbnail	Optional	If the source is a pathname, the filename is used as the prefix; otherwise thumbnail is the prefix	Prefix used for each image thumbnail file generated. The image filenames use the format: <i>imagePrefix_page_n.format</i> .  For example, the thumbnail for page 1 of a document with the imagePrefix attribute set to myThumbnail is myThumbnail_page_1.jpg.

Attribute	Action	Req/Opt	Default	Description
info	setInfo	Required		Structure variable for relevant information, for example, "#infoStruct#". You can specify the Author, Subject, Title, and Keywords for the PDF output file.
inputFiles	processddx	Required		Structure that maps the PDF source files to the input variables in the DDX file, or a string of elements and their pathname.
isBase64	addWatermark	Optional	no	Valid only when the image attribute is specified. Specifies whether the image used as a watermark is in Base64 format: <ul style="list-style-type: none"> <li>yes: the image is in Base64 format.</li> <li>no: the image is not in Base64 format.</li> </ul>
keepBookmark	merge	Optional	no	Specifies whether bookmarks from the source PDF documents are retained in the merged document: <ul style="list-style-type: none"> <li>yes: the bookmarks are retained.</li> <li>no: the bookmarks are removed.</li> </ul>
leftmargin	addheader	Optional		Specifies the value of the header left margin
maxbreadth	thumbnail	Optional		Specifies maximum width of the thumbnail
maxlength	thumbnail	Optional		Specifies the maximum length of the thumbnail
maxscale	thumbnail	Optional		Specifies the maximum scale of the thumbnail
name	addWatermark deletePages getInfo merge processddx protect read removeWatermark write transform addheader addfooter removeheaderfooter	Required: getInfo processddx read  Optional: addWatermark deletePages merge protect removeWatermark transform addheader addfooter removeheaderfoot er		PDF document variable name, for example, <i>myBook</i> .  If the source is a PDF document variable, you cannot specify the name attribute again; you can write the modified PDF document to the destination.  You can specify the destination attribute or the name attribute, but not both.  For the processddx action, the name represents the structure that is populated with the success or failure of the output variables.

Attribute	Action	Req/Opt	Default	Description
newOwnerPassword	protect	Optional (see Description)		Password used to set permissions on a PDF document.  To change the default permissions, specify the <code>newOwnerPassword</code> attribute. For more information, see the section PDF document passwords.
newUserPassword	protect	Optional (see Description)		Password used to open PDF document.  Specify either the <code>newUserPassword</code> attribute or a <code>newOwnerPassword</code> attribute; if you specify both, the passwords must differ. For more information, see the section PDF document passwords.
noattachments	thumbnail	optional	no	Removes all attachments from PDF documents.
noattachments	optimize	Optional	no	Remove all file attachments
nobookmarks	optimize	Optional	no	Remove bookmarks from PDF document
nocomments	optimize	Optional	no	Remove comments from PDF document
nofonts	optimize	Optional	no	Remove font styling
nojavascripts	optimize	Optional	no	Remove all document level JavaScript actions
nolinks	optimize	Optional	no	Remove external cross-references
nometadata	optimize	Optional	no	Remove document information and metadata
nothumbnails	optimize	Optional	no	Remove embedded page thumbnails
numberformat	addfooter	optional		Specify the numbering format for PDF pages in the footer.
opacity	addWatermark addheader addfooter	Optional	3	Opacity of the watermark. Valid values are integers in the range 0 (transparent) through 10 (opaque).
order	merge	Optional	time	Order in which the PDF documents in the directory are merged: <ul style="list-style-type: none"><li>• <code>name</code>: orders the documents alphabetically by filename.</li><li>• <code>time</code>: orders the documents by timestamp.</li></ul> By default, ColdFusion merges the files in descending order (for example, from Z to A). To change this, set the ascending attribute to <code>yes</code> .
outputFiles	processddx	Required		Structure that contains the output files in the DDX file or string as keys and the pathname to the result file as the value.

Attribute	Action	Req/Opt	Default	Description
overwrite	addWatermark deletePages merge protect removeWatermark setInfo thumbnail write transform addheader addfooter removeheaderfooter	Optional	no	Specifies whether PDF output overwrites the destination file: <ul style="list-style-type: none"><li>• yes: overwrites the destination file.</li><li>• no: does not overwrite the destination file.</li></ul> For the thumbnail action, specifies whether to overwrite the destination directory. If the directory exists, the thumbnails are not generated unless overwrite is set to yes.
package	merge	optional	true	Create PDF packages
pages	addWatermark deletePages merge removeWatermark optimize extracttext extractimage addheader addfooter removeheaderfooter transform	Required: deletePages  Optional: addWatermark merge removeWatermark thumbnail optimize extracttext extractimage transform addheader addfooter removeheaderfoote r	all	Page or pages in the source PDF document on which to perform the action. You can specify multiple pages and page ranges as follows: "1,6–9,56–89,100, 110–120".  For the removeWatermark action, the pages attribute applies only to the watermark type.  ColdFusion ignores duplicate pages and numbers greater than the total page count.

Attribute	Action	Req/Opt	Default	Description
password	addWatermark deletePages getInfo merge protect read removeWatermark setInfo thumbnail write optimize extracttext extractimage addheader addfooter removeheaderfooter transform	Optional		Owner or user password of the source PDF document, if the document is password-protected.
permissions	protect	Optional	All	Type of permissions on the PDF document: <ul style="list-style-type: none"> <li>• All</li> <li>• AllowAssembly</li> <li>• AllowCopy</li> <li>• AllowDegradedPrinting</li> <li>• AllowFillIn</li> <li>• AllowModifyAnnotations</li> <li>• AllowModifyContents</li> <li>• AllowPrinting</li> <li>• AllowScreenReaders</li> <li>• AllowSecure</li> <li>• None</li> </ul> <p>Except for All or None, you can specify a comma-separated list of permissions. To set permissions, you must also set the newOwnerPassword attribute.</p>
position	addWatermark	Optional		Position on the page where the watermark is placed. The position represents the top-left corner of the watermark. Specify the x and y coordinates; for example "50,30".

Attribute	Action	Req/Opt	Default	Description
resolution	thumbnail	Optional	high	Image quality used to generate thumbnail images: <ul style="list-style-type: none"> <li>• high: use high resolution (uses more memory).</li> <li>• low: use low resolution.</li> </ul>
rotation	addWatermark transform	Optional		Degree of rotation of the watermark image on the page, for example, "30".
saveOption	write	Optional	full	Save options for the PDF output: <ul style="list-style-type: none"> <li>• full: normal save (default)</li> <li>• incremental: required to save modifications to a signed PDF document.</li> <li>• linear: for faster display.</li> </ul>
scale	thumbnail	Optional	25	Size of the thumbnail relative to the source page. The value represents a percentage from 1 through 100.
showOnPrint	addWatermark	Optional	no	Specify whether to print the watermark with the PDF document: <ul style="list-style-type: none"> <li>• yes: the watermark is printed with the PDF document.</li> <li>• no: the watermark is display-only.</li> </ul>
source	addWatermark deletePages getInfo merge protect read removeWatermark setInfo thumbnail write optimize extracttext extractimage addheader addfooter removeheaderfooter transform	Required (see Usage section for merge)		PDF document used as the source. The source can be one of the following: <ul style="list-style-type: none"> <li>• An absolute or relative pathname to a PDF document, for example, c:\work\myPDF.pdf or myPDF.pdf.</li> <li>• A PDF document variable in memory that is generated by the <code>cfdocument</code> tag or the <code>cfpdf</code> tag, for example, "myPDFdoc".</li> </ul>

Attribute	Action	Req/Opt	Default	Description
stopOnError	merge	Optional	no	Valid only if the <code>directory</code> attribute is specified. If the specified directory contains files other than ColdFusion-readable PDF files, ColdFusion either stops merge process or continues. <ul style="list-style-type: none"><li>• <code>yes</code>: stops the merge process if invalid PDF files exist in the specified directory.</li><li>• <code>no</code>: continues the merge process even if invalid files exist in the specified directory.</li></ul>
transparent	thumbnail	Optional	no	( <code>format="png"</code> only) Specifies whether the image background is transparent or opaque: <ul style="list-style-type: none"><li>• <code>yes</code>: the background is transparent.</li><li>• <code>no</code>: the background is opaque.</li></ul>
useStructure	extracttext	optional	true	Lets you extract content based on the PDF structure. For better readability of the extracted text, use this attribute together with the attribute <code>honourspaces</code> .
version	write	Optional		Version of the PDF used to write the document: <ul style="list-style-type: none"><li>• 1.1</li><li>• 1.2</li><li>• 1.3</li><li>• 1.4</li><li>• 1.5</li><li>• 1.6</li></ul> For more information, see the section PDF versions.

**Note:** To modify the PDF source document, specify the same file pathname for the `source` and `destination` attributes, and set the `overwrite` attribute to `yes`.

### Usage

You use the `cfpdf` tag to manipulate and assemble existing PDF documents. Although the `cfpdf` tag provides much of the functionality available in Acrobat, you cannot use this tag to generate a PDF document from another file format. To create PDF output from HTML and CFML content, use the [cfdocument](#) tag.

You cannot embed a `cfpdf` tag within a `cfdocument` tag or embed a `cfdocument` tag within a `cfdpdf` tag; however, you can write the output of a `cfdocument` tag to a variable and pass the variable to the `cfpdf` tag. The following example shows how to use the `cfdocument` tag to create a cover page and add it to a merged PDF document:

```
<!--- Use the cfdocument tag to create a cover page and write the output to a variable called
      cfdoc. --->
<cfdocument format="PDF" name="cfdoc">
<html>
<body>
<h1>Here is a cover page</h1>
</body>
</html>
</cfdocument>

<!--- Use the cfpdf tag and cfpdfparam tags to merge individual PDF documents into a new PDF
document called new.pdf. Notice that the cfdoc variable created by using the cfdocument tag is
the source value of the first cfpdfparam tag. --->
<cfpdf action="merge" destination="/samtemp/pdfs/new.pdf" overwrite="yes">
    <cfpdfparam source="cfdoc">
    <cfpdfparam source="/samtemp/pdfs/pdf2.pdf">
    <cfpdfparam source="/samtemp/pdfs/pdf1.pdf">
</cfpdf>
```

You can use the `cfpdf` tag to assemble interactive PDF form files into a single PDF document and flatten forms created in Acrobat (by using the `flatten` attribute with the `write` action); however, to process PDF form data, use the [cfpdfform](#) and related tags. You cannot use the `cfpdf` tag to flatten forms created in Adobe LiveCycle Designer ES.

### Reading and writing PDF files

The `cfpdf` tag provides several options for reading and writing PDF files. You can specify a PDF variable or a PDF file as the source, and you can write the output to a variable or to a file (but not both). The following table explains the read and write operations:

Task	Attributes	Example
Overwrite a source PDF file	Specify the PDF file pathname as the source and do not specify a destination.	<code>&lt;cfpdf action="addWatermark" source="myPDF.pdf" image="myImage.jpg"&gt;</code>
Write a PDF document in memory to a file	Specify the PDF variable as the source and a PDF file pathname for the destination.	<code>&lt;cfpdf action="addWatermark" source="myPDF" image="myImage.jpg" destination="outputFile.pdf"&gt;</code>
Write a PDF document to a new file	Specify a PDF file pathname as the source and a different PDF file pathname as the destination.	<code>&lt;cfpdf action="addWatermark" source="sourceFile.pdf" image="myImage.jpg" destination="outputFile.pdf"&gt;</code>
Write a PDF file to a PDF variable	Specify the PDF file pathname as the source and a PDF variable name.	<code>&lt;cfpdf action="addWatermark" source="sourceFile.pdf" image="myImage.jpg" name="myPDF"&gt;</code>
Overwrite a PDF document in memory	Specify the PDF variable name as the source and do not specify a destination.	<code>&lt;cfpdf action="addWatermark" source="myPDF" image="myImage.jpg"&gt;</code>

### Working with PDF files in memory

ColdFusion gives you the option to write a PDF file to a variable by using the `name` attribute, which is useful if you want to perform multiple operations on a document before writing it to a file. However, this is practical for small files only because of memory requirements. If you are working with large PDF documents, write the PDF documents to files.

ColdFusion recommends that you do not specify the `name` attribute when you specify a variable as the source because it creates a copy, which increases processing. In most cases, this is unnecessary because you can reuse variables even after you write them to files.

**Note:** When you use PDF variables within a try/catch block and ColdFusion generates an error, the variables are unusable after the error is generated.

### Printing PDF documents

Use the `cfprint` tag to print PDF documents. Markups, such as sticky notes, comments, and editorial revisions, are not printed with the document.

**addWatermark action** Use the `addwatermark` action to add a watermark to specified pages in a PDF document. You can add a watermark in one of the following ways:

- Use the first page of another PDF document as a watermark. ColdFusion overlays the `copyfrom` page on the source document, without enlarging the image.
- Specify an image file to use as a watermark.
- Specify an image in memory by using an image variable.

The following code shows how to use the first page of a PDF document as a watermark:

```
<cfpdf action="addWatermark" source="c:\myBook.pdf" copyFrom="e:\yourBook.pdf"
  destination="ourBook.pdf" overwrite="yes">
```

By default, ColdFusion applies the watermark to all of the pages in the output file, with the watermark image centered on the page. The following code applies a JPEG image as a watermark to the first page of the output file:

```
<cfpdf action="addWatermark" source="Book.pdf"
  image="../cfdocs/images/artgallery/paul01.jpg" destination="newBook.pdf" pages="1"
  overwrite="yes">
```

To specify a ColdFusion image as a watermark, use the `cfimage` tag or `Image` functions. With ColdFusion 9, the `addwatermark` action also supports RGB and ARGB images, especially the images added using the `cfimage` tag and related functions. The following example converts an image to grayscale and applies it as a watermark to a PDF file:

```
<!--- Use the ImageNew function to create a ColdFusion image from a JPEG file. --->
<cfset myImage=ImageNew("../cfdocs/images/artgallery/jeff05.jpg")>

<!--- Use the ImageGrayscale function to convert the image to grayscale in memory. --->
<cfset ImageGrayscale(myImage)>

<!--- Specify the image variable to apply the grayscale image as a watermark in the Book.pdf
file. Because the source and destination are the same and the overwrite attribute is set to
yes, ColdFusion overwrites the source file. --->
<cfpdf action="addWatermark" source="Book.pdf" destination="Book.pdf" overwrite="yes"
  image="#myImage#">
```

For more information on ColdFusion images, see *Creating and Manipulating ColdFusion Images* in the *Developing ColdFusion Applications*.

**addfooter** Use this action to add a footer in a PDF document. Specify the source where the PDF document is located and the destination where the new PDF document with the footer is saved, as shown in the following code snippet:

```
<cfpdf action = "addfooter"
  source = "../myBook.pdf"
  destination = "../myBookwithfooter.pdf"
  image = "adobelogo.JPG" // Use this attribute to add an image in the
                           footer
  align = "right"> // By default, the alignemnt is center
```

You can also specify an image or text that you have to insert in the footer along with various other attributes such as `align`, `bottommargin`, `leftmargin`, `numberformat`, and `opacity`.

**addheader** Use this action to add header in a PDF document. Specify the source and destination for the PDF document and specify the text or image that you want to insert in the header, as shown in the following code:

```
<cfpdf action = "addheader"
      source = "../myBook.pdf"
      destination = "../myBookwithheader.pdf"
      text = "Adobe"
      align = "left">
```

**deletePages action** Use the deletePages action to remove pages from a specified PDF document. You can specify a single page, a page range, or a comma-separated list of pages, as the following code shows:

```
<cfpdf action="deletePages" source="c:\myBook.pdf" pages="1,16-32,89,100-147"
      destination="myLittleBook.pdf">
```

**extracttext** Use the extracttext action to extract all words from the specified page numbers in the PDF document, as shown in the following code snippet:

```
<cfpdf action = "extracttext" source = "../myBook.pdf" pages = "5-20, 29, 80" destination =
"../adobe/textdoc.txt"
```

**extractimage** Use the extractimage action to extract all images from the specified page number in a PDF document, as shown in the following code snippet:

```
<cfpdf action = "extractimage" source = "../myBook.pdf" pages = "1-200" destination =
"../mybookimages" imageprefix = "mybook">
```

The images are extracted and saved in the directory that you specify in the destination attribute. You can specify a prefix for the images (imageprefix) being extracted, otherwise the system prefixes the image name similar to “cf+page number”. To save the images in a specific format, use the format attribute.

**getInfo action** Use the getInfo action to extract information associated with the PDF document, such as the author, title, and creation date. You specify the name of the structure variable that contains the relevant data associated with the file, as the following code shows:

```
<cfpdf action="getInfo" source="myBook.pdf" name="PDFInfo">
<p><cfoutput>#PDFInfo.title#</cfoutput></p>
<p><cfoutput>#PDFInfo.author#</cfoutput></p>
<p><cfoutput>#PDFInfo.keywords#</cfoutput></p>
<p><cfoutput>#PDFInfo.created#</cfoutput></p>
```

For a complete list of information elements, use the cfdump tag, as the following code shows:

```
<cfdump var="#PDFInfo#">
```

**Note:** To view the permissions for a PDF document that is password-protected, specify the user password, not the owner password. If you specify the owner password, all permissions are set to Allowed.

### Reducing quality of PDF document

The optimize action is used to downsample images and discard unused objects in a PDF document.

**optimize** To downsample images in a PDF document, the algos attribute is used with values bilinear, bicubic, and nearest\_neighbour. The following code snippet generates a PDF after image downsampling:

```
<cfpdf action = "optimize" algo = "bicubic" source "../myBook.pdf" name = #mybook#>
```

You can also discard unused objects such as comments, JavaScripts, attachments, bookmarks, and metadata from your PDF document using the following attributes with optimize action:

```
<cfpdf action = "optimize"
    noJavaScripts
    noThumbnails
    noBookmarks
    noComments
    noMetadata
    noFileAttachments
    noLinks
    noFonts>
```

### Transforming pages in a PDF document

You can scale a page, specify the position, and rotation values for pages in a PDF document.

**transform** The `transform` action has four attributes that define the size (`hscale`, `vscale`), position (`position`), and rotation (`rotation`) of a page. The following code snippet shows the usage:

```
<cfpdf action = "transform"
    required
    source = "..\myBook.pdf"
    optional
    destination = "..\new\myBook.pdf">
    hscale = ".5"
    vscale = ".15"
    position = "8, 10"
    rotation = "180">
```

The value for rotation must be in steps (0, 90, 180, 270). If you specify any other value, the system generates an error.

### PDF file information elements

The following table describes the information elements you can retrieve with the `getinfo` action:

Element	Example	Description
Application	Acrobat PDFMaker 7.0.7 for Word	Application used to create the PDF document. This value is read-only.
Author	Harper Lee	Author of the PDF document. You can specify a text string with the <code>setInfo</code> action.
CenterWindowOnScreen	[empty string]	Display setting for initial view of the PDF document. To change this setting, use the <code>processddx</code> action with the <code>InitialViewProfile</code> DDX element.
ChangingDocument	Not Allowed	Permissions assigned for editing the PDF content. To change this setting, use the <code>permissions</code> attribute with the <code>protect</code> action.
Commenting	Allowed	Permissions assigned for adding comments to the PDF document. To change this setting, use the <code>permissions</code> attribute with the <code>protect</code> action.
ContentExtraction	Allowed	Permissions assigned for extracting content from the PDF document. To change this setting, use the <code>permissions</code> attribute with the <code>protect</code> action.
CopyContent	Allowed	Permissions assigned for copying content from the PDF document. To change this setting, use the <code>permissions</code> attribute with the <code>protect</code> action.
Created	D:20061121155226-05'00'	System-generated creation date of the PDF document. You can specify a text string with the <code>setInfo</code> action.
DocumentAssembly	Not Allowed	Permissions assigned for merging the PDF document with other PDF documents. To change this setting, use the <code>permissions</code> attribute with the <code>protect</code> action.
Encryption	Password Security	Specifies whether the PDF file is password-protected. To change the encryption algorithm, or add a password, use the <code>protect</code> action.
FilePath	C:\ColdFusion\wwwroot\lion\myDoc.pdf	Absolute pathname for the PDF file. This value is read-only.
FillingForm	Allowed	Permissions assigned for entering data in form fields. To change this setting, use the <code>permissions</code> attribute with the <code>protect</code> action.
FitToWindow	[empty string]	Display setting for initial view of the PDF document. To change this setting use the <code>processddx</code> action with the <code>InitialViewProfile</code> DDX element.
HideMenubar	[empty string]	Display setting for initial view of the PDF document. To change this setting, use the <code>processddx</code> action with the <code>InitialViewProfile</code> DDX element.
HideToolbar	[empty string]	Display setting for initial view of the PDF document. To change this setting, use the <code>processddx</code> action with the <code>InitialViewProfile</code> DDX element.
HideWindowUI	[empty string]	Display setting for initial view of the PDF document. To change this setting, use the <code>processddx</code> action with the <code>InitialViewProfile</code> DDX element.
Keywords	marketing, sales, production	Keywords specified for searches in the PDF document. You can specify a comma-separated list of keywords with the <code>setInfo</code> action.
Language	EN-US	Language version used to create the source file for the PDF document. This value is read-only.

Element	Example	Description
Modified	D:20061121155226-06'00'	System-generated timestamp for when the PDF file was last modified. You can specify a text string with the <code>setInfo</code> action.
PageLayout	OneColumn	Display setting for the initial view of the PDF document. To change this setting, use the <code>processddx</code> action with the <code>InitialViewProfile</code> DDX element.
Printing	Allowed	Permissions assigned for printing the document. To change this setting, use the <code>permissions</code> attribute with the <code>protect</code> action.
Producer	Acrobat Distiller 7.0.5 (Windows)	Version of Acrobat Distiller used to generate the PDF document. This value is read-only.
Properties	[empty string]	This value is read-only.
Secure	Not Allowed	Display setting that shows whether the PDF document is password protected.
ShowDocumentsOption	[empty string]	Display setting for initial view of the PDF document. To change this setting, use the <code>processddx</code> action with the <code>InitialViewProfile</code> DDX element.
ShowWindowsOption	[empty string]	Display setting for initial view of the PDF document. To change this setting, use the <code>processddx</code> action with the <code>InitialViewProfile</code> DDX element.
Signing	Allowed	Permissions for allowing electronic signatures to the PDF document. To change this setting, use the <code>permissions</code> attribute with the <code>protect</code> action.
Subject	Product Marketing	The subject assigned to the PDF document. You can specify a text string with the <code>setInfo</code> action.
Title	Chapter 1: Getting Started	The title assigned to the PDF document. You can specify a text string with the <code>setInfo</code> action.
TotalPages	25	Total pages in the PDF document. This value is read-only.
Trapped	[empty string]	Indicates whether trapping is applied to the PDF document. Trapping is used in printing to eliminate gaps between two adjoining ink colors. You can specify a text string with the <code>setInfo</code> action.
Version	1.6	Version of the Adobe PDF generator used to create the PDF document. To change this setting use the <code>version</code> attribute with the <code>write</code> action. For more information, see the section PDF versions.

**merge action** Use the `merge` action to assemble PDF documents or pages from PDF source files into one output file. The following code shows how to merge all the PDF files in a directory:

```
<cfpdf action="merge" directory="c:\myPDFfiles" destination="oneBigFile.pdf"
  overwrite="yes">
```

By default, ColdFusion adds the files in descending order by timestamp. The following code merges the source files in ascending order by filename:

```
<cfpdf action="merge" directory="c:\book" order="name" ascending="yes"
  destination="c:\book\output1.pdf" overwrite="yes">
```

This is useful if the source files have logical names, such as `Chap0.pdf`, `Chap1.pdf`, `Chap2.pdf`, and so on.

By default, ColdFusion continues the merge process even if it encounters a file in the specified directory that is not a valid PDF document. To stop the merge process if the directory contains files other than valid PDF documents, set the `stopOnError` attribute to `yes`:

```
<cfpdf action="merge" directory="c:\bookfiles" destination="book.pdf" overwrite="yes"
      order="name" ascending="yes" keepBookmark="yes" stopOnError="yes">
```

To create a PDF file from specific pages in a document, use the `source` attribute with the `pages` attribute. The following code creates a file from pages 1–5 of the source document:

```
<cfpdf action="merge" source="myBigBook.pdf" pages="1-5" destination="myShortBook.pdf"
      overwrite="yes">
```

To merge several files into one document, specify the absolute pathnames of the files in a comma-separated list, as the following code shows:

```
<cfpdf action="merge" source="c:\PDFdocs\myBook\Chap1.pdf,
      c:\PDFdocs\myBook\Chap2.pdf,c:\PDFdocs\myBook\Chap3.pdf" destination="myBook.pdf"
      package = "true" overwrite="yes">
```

You can now create PDF packages using the `package = "true"` attribute with the `merge` action.

For more control over the order of files, to assemble files in different locations, and to extract pages from multiple PDF files, use the `cfpdfparam` tag with the `merge` action. For more information on merging PDF files, see *Assembling PDF Documents* in the *Developing ColdFusion Applications*.

If `cfpdf action="merge"` and `package="yes"`, all file formats can be used as source. The following sample code has ZIP and JPEG file formats as source:

```
<cfpdf action="merge" package="yes" destination="./myBook/adobetest.pdf" overwrite="yes">
  <cfpdfparam source="./inputFiles/c.zip" >
  <cfpdfparam source="./inputFiles/d.jpg" >
</cfpdf>
```

**processddx action** Use the `processddx` action to assemble PDF files by processing Document Description XML (DDX) instructions. DDX is a declarative markup language used by Adobe® LiveCycle® Assembler. You can use DDX instructions to perform advanced tasks, such as adding table of contents pages, headers and footers, automatic page numbers, and text-string watermarks to PDF documents.

ColdFusion provides a subset of LiveCycle Assembler functionality. To determine whether you can perform your tasks in ColdFusion or whether you have to purchase LiveCycle Assembler, see the tables in the following sections.

For complete DDX syntax, see the *Adobe LiveCycle Assembler Document Description XML Reference*.

### Supported DDX elements

The following table lists the DDX elements that ColdFusion supports:

About	Author	Background
Center	DatePattern	DDX
DocumentInformation	DocumentText	Footer
Header	InitialViewProfile	Keyword
Keywords	Left	MasterPassword
Metadata	NoBookmarks	OpenPassword
PageLabel	Password	PasswordAccessProfile

PasswordEncryptionProfile	PDF (see Note)	PDFGroup
Permissions	Right	StyledText
StyleProfile	Subject	TableOfContents
TableOfContentsEntryPattern	TableOfContentsPagePattern	Title
Watermark		

**Note:** ColdFusion does not support the *certification* and *mergeLayers* attributes of the PDF element.

### Restricted DDX elements

The following table lists the DDX elements that ColdFusion excludes:

ArtBox	AttachmentAppearance	Bookmarks
BlankPage	BleedBox	Comments
Description	FileAttachments	FilenameEncoding
LinkAlias	Links	NoBackgrounds
NoComments	NoFileAttachments	NoFooters
NoForms	NoHeaders	NoLinks
NoPageLabels	NoThumbnails	NoWatermarks
NoXFA	PageMargins	PageSize
PageRotation	PageOverlay	PageUnderlay
PDFsFromBookmarks	Transform	TrimBox

### Simple DDX instructions

You can create DDX instructions in any text editor and save the file with a DDX extension. The following example shows the DDX instructions for merging several documents and generating a table of contents with bookmarks from the source PDF documents:

```
<?xml version="1.0" encoding="UTF-8"?>
<DDX xmlns="http://ns.adobe.com/DDX/1.0/"
      xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xsi:schemaLocation="http://ns.adobe.com/DDX/1.0/ coldfusion_ddx.xsd">
  <PDF result="Out1">
    <PDF source="Title"/>
    <TableOfContents/>
    <PDF source="Doc1"/>
    <PDF source="Doc2"/>
    <PDF source="Doc3"/>
  </PDF>
</DDX>
```

### Processing DDX instructions in ColdFusion

The following code processes the DDX instructions in ColdFusion:

```
<!--- The following code verifies that the DDX file exists and the DDX instructions are valid.
--->
<cfif IsDDX("Book.ddx")>

    <!--- The following code maps the PDF source files to the PDF source variables in the
    DDX file. --->
    <cfset inputStruct=StructNew()>
    <cfset inputStruct.Title="Title.pdf">
    <cfset inputStruct.Doc1="Chap1.pdf">
    <cfset inputStruct.Doc2="Chap2.pdf">
    <cfset inputStruct.Doc3="Chap3.pdf">

    <!--- The following code maps the PDF output file to the PDF result variable in the DDX
    file. --->
    <cfset outputStruct=StructNew()>
    <cfset outputStruct.Out1="output.pdf">

    <!--- The following code process the DDX instructions in the Book.ddx file to generate
    a merged document. --->
    <cfpdf action="processddx" ddxfile="Book.ddx" inputfiles="#inputStruct#"
        outputfiles="#outputStruct#" name="ddxVar">
<cfelse>
    <p>The DDX instructions are not valid.</p>
</cfif>

<!--- The following code displays a success or failure message. --->
<cfoutput>#ddxVar.Out1#</cfoutput>
```

The name attribute defines a variable that you use to determine the success or failure of the process. Use the `cfoutput` tag to display the success or failure message, as the previous example shows, or use the `cfdump` tag to display a structure:

```
<cfdump var="#ddxVar#">
```

This code returns the following information for each output file in the structure:

- “Successful”, if the file is assembled successfully.
- “Reason for failure”, if the file is not assembled successfully and the reason for failure is known.
- “Failure”, if the file is not assembled successfully and the reason for failure is not known.

Use the `IsDDX` function to determine whether a DDX file or set of instructions is valid.

For detailed examples, see *Assembling PDF Documents* in the *Developing ColdFusion Applications*.

**protect action** Use the `protect` action to password-protect PDF output files, set permissions, and encrypt PDF output files.

When you use the `protect` action, set a `newUserPassword` or a `newOwnerPassword`. (You can set both, as long as the passwords differ.) When you assign a user password to a document, all users must use this password to open the PDF document. The following code adds a user password to a PDF document:

```
<cfpdf action="protect" source="Finances.pdf" destination="myFinances.pdf"
    newUserPassword="keepOut">
```

To set the permissions on the output file, set the `newOwnerPassword`. A user who enters the owner password when accessing the PDF file is considered the owner of file. The following example shows how to set a new owner password:

```
<cfpdf action="protect" encrypt="AES_128" source="Book.pdf" destination="MysteryBook.pdf"
    overwrite="yes" newOwnerPassword="psst" permissions="AllowDegradedPrinting">
```

Because the permissions are set to `AllowDegradedPrinting` in this example, ColdFusion lets users print the document at 150 DPI, but prohibits all other actions. If a user tries to delete the file, for example, ColdFusion generates an error message indicates that the password was entered incorrectly or the permissions do not allow the action to be performed.

ColdFusion does not retain permissions: if you add a `newUserPassword` attribute, you also must set the permission explicitly.

To work with `myVar`, you specify `newownerpw` as the password.

### PDF document passwords

A PDF document can have two kinds of passwords: a *user* password and an *owner* password. The following table describes the two types of ColdFusion passwords and their equivalents in Acrobat:

ColdFusion password	Acrobat equivalent	Description
User password	Document Open password, user password	Anyone who tries to open the PDF document must enter the password that you specify. A user password does not allow a user to change restricted features in the PDF document.
Owner password	Permissions password, master password	Lets the person who enters the password restrict access to features in a PDF document.

When you protect a PDF, your password changes to the one you provide. ColdFusion updates the variable's saved password to the one you provide. However, if you provide both passwords, ColdFusion uses the owner password.

The following protects a PDF:

```
<cfpdf action="protect" source="myVar" password="oldpassword"
permissions="none" newuserpassword="newuserpw"
newownerpassword="newownerpw">
```

To get all the properties of the PDF, you do the following:

```
<cfpdf action="info" source="myVar" name="info">
```

To get only the properties allowed for the user, you do the following:

```
<cfpdf action="info" source="myVar" password=" newuserpw" name="info">
```

### Permissions for PDF documents

The following table lists the permissions an owner can set for PDF documents:

Permissions	Description
All	There are no restrictions on the PDF document.
AllowAssembly	Users can add the PDF document to a merged document.
AllowCopy	Users can copy text, images, and other file content. This setting is required to generate thumbnail images with the <code>thumbnail</code> action.
AllowDegradedPrinting	Users can print the document at low-resolution (150 DPI).
AllowFillIn	Users can enter data into PDF form fields. Users can sign PDF forms electronically.
AllowModifyAnnotations	Users can add or change comments in the PDF document.
AllowModifyContents	Users can change the file content. Users can add the PDF document to a merged document.

Permissions	Description
AllowPrinting	Users can print the document at high-resolution (print-production quality). This setting is required for use with the <code>cfprint</code> tag.
AllowScreenReaders	Users can extract content from the PDF document.
AllowSecure	Users can sign the PDF document (with an electronic signature).
None	Users can view the document only.

### Encryption for PDF documents

The `encrypt` attribute sets the type of encryption used for opening a password-protected document. By default, ColdFusion uses the RC4 128-bit encryption algorithm to encrypt PDF files. To change the encryption algorithm, use the `encrypt` attribute with the `protect` action. The following code encrypts the PDF output file with the AES algorithm:

```
<cfpdf action="protect" encrypt="AES_128" source="Book.pdf" destination="MysteryBook.pdf"
      overwrite="yes" newOwnerPassword="pssst" permissions="AllowDegradedPrinting">
```

ColdFusion supports the following encryption algorithms:

Encryption algorithm	Compatibility	Description
AES_128	Adobe Acrobat 7.0 and later	Advanced Encryption Standard (AES) specifies the Rijndael algorithm, a symmetric block cipher that can process data blocks of 128 bits. This is the highest encryption level.  This encryption algorithm lets users do the following: <ul style="list-style-type: none"><li>• Encrypt all document contents.</li><li>• Encrypt all document contents except for the metadata.</li><li>• Encrypt only the file attachments.</li></ul>
RC4_128M	Adobe Acrobat 6.0 and later	RC4 specifies the RSA Security software stream cipher for algorithms such as Secure Sockets Layer (SSL), to protect Internet traffic, and WEP, to secure wireless networks.  This encryption algorithm lets users do the following: <ul style="list-style-type: none"><li>• Encrypt all document contents.</li><li>• Encrypt all document contents except for the metadata.</li></ul>
RC4_128	Adobe Acrobat 5.0 and later	RC4 128-bit encryption. This encryption algorithm lets users encrypt the document contents, but not the document metadata.
RC4_40	Adobe Acrobat 3.0 and later	RC4 40-bit encryption. This is the lowest encryption level.
None		The document is not encrypted.

**Note:** Document metadata is used in Internet searches. If the metadata is encrypted, search engines cannot search the PDF document. Users running an earlier version of Acrobat cannot open a PDF document with a higher encryption setting. For example, if you specify AES 128 encryption, a user cannot open the document in Acrobat 6.0 or earlier.

**read action** Use the `read` action to read the source PDF document into the `name` variable, as the following code shows:

```
<cfif IsPDFFile("Book.pdf")>
    <cfpdf action="read" source="Book.pdf" name="myBook">
    ...
</cfif>
```

**removeWatermark action** Use the `removewatermark` action to remove a watermark from a PDF document or specified pages in a document. The following example removes a watermark from the first page of a PDF document and writes the output to a new file:

```
<cfpdf action="removeWatermark" source="Book.pdf" pages="1" destination="newBook.pdf"
overwrite="yes">
```

**removeheaderfooter action** Use this action to remove the header and footer from a PDF document or from specified pages in a document. The following example removes the header and footer from the entire document:

```
<cfpdf action = "removeheaderfooter" source="..\mybook.pdf" destination = "new.pdf">
```

**setInfo action** Use the `setinfo` action to specify information associated with a PDF document to be saved with it. Create a structure that contains the relevant information. Use the `info` attribute of the `cfpdf` tag to refer to the structure. The following code shows the elements that you can modify by using the `setInfo` action:

```
<cfset PDFinfo=StructNew() >
<cfset PDFinfo.Title="Make Way for Ducklings">
<cfset PDFinfo.Author="Donald Duck">
<cfset PDFinfo.Keywords="Huey, Dewy, Louie">
<cfset PDFinfo.Subject="Ducks">

<cfpdf action="setInfo" source="chap1.pdf" info="#PDFinfo#" destination="meta1.pdf"
overwrite="yes">
```

**thumbnail action** Use the `thumbnail` action to generate thumbnail images from the source PDF document.

If you do not specify a destination directory for the thumbnail files, ColdFusion creates a directory for the thumbnails in the directory where the CFM page is located. If you specify a filename as the source, the thumbnail directory name is a concatenation of the name of the source file and `_thumbnails`. For example, the following code generates a thumbnail image for each page in `myBook.pdf` and stores them in a directory called `myBook_thumbnails`:

```
<cfpdf action="thumbnail" source="myBook.pdf">
```

If the CFM page is located in the directory `c:\myProject\genThumbnails.cfm`, the pathname for the thumbnails directory is `c:\myProject\myBook_thumbnails`.

By default, ColdFusion generates thumbnail files in JPEG format and the images are scaled to 25% of the original.

You can specify individual pages within the source document to generate thumbnails. Also, you can change the size of the thumbnail; the resolution, the output format (JPEG, PNG, or TIFF); and the prefix used for the thumbnail filenames. The following code generates a low-resolution thumbnail from the first page of the source document that is scaled at 50% of the original size:

```
<cfpdf action="thumbnail" source="myBook.pdf" pages="1" destination="c:\myBook\images"
imagePrefix="Cover" format="png" scale="50" resolution="low">
```

The full output file pathname is as follows:

```
c:\myBook\images\Cover_page_1.png
```

**Note:** To generate thumbnail images, the permissions of the source document must include `AllowCopy`. For more information, see *Permissions for PDF documents in `cfpdf`*.

ColdFusion 9 release has introduced some new attributes for the thumbnail action:

- **hires:** You can set this attribute to `true` to extract high-resolution images from the page. If a document contains high-resolution images and you want to retain the resolution of the images, then this attribute is useful.

For example:

```
<cfpdf action="thumbnail" source="./WORK/myBook.pdf" destination="./WORK/Testing_CFPDF"
overwrite="true" hires="yes">
```

- **overridepage**: If you set this attribute to true, the thumbnail generated does not adhere to the PDF page size, but to the image size that is present in that page. If the image is not present, the size is set to the maximum size of the page.
- **compressstiffs**: Use this attribute to compress the size of the thumbnail images. As the name of the attribute suggests, it is only valid for the TIFF format. Following is an example:

```
<cfpdf action="thumbnail" source="C:\WORK\myBook.pdf" destination="C:\WORK\Testing_CFPDF"
overwrite="true" hires="yes" format="tiff" compressstiffs="yes">
```

- **maxscale**: Use this attribute to specify an integer value for the maximum scale of the thumbnail images.
- **maxlength**: Use this attribute to specify an integer value of the maximum length of the thumbnail images.
- **maxbreadth**: Use this attribute to specify an integer value of the maximum width of the thumbnail.

The following example illustrates the use of **maxscale**, **maxlength**, and **maxbreadth**:

```
<cfpdf action="thumbnail" source="./WORK/myBook.pdf" destination="./WORK/Testing_CFPDF"
overwrite="true" format="jpg" maxscale="3" maxlength="300" maxbreadth="200" hires="yes"
scale="100">
```

**Note:** Typically, the value of the *scale* attribute is set to '100' when using the *maxscale* attribute.

**write action** Use the **write** action to write the source PDF document, or the PDF document stored in memory as a variable, to a file. The following code converts a PDF file stored in memory to a different PDF version and writes the output to a new file:

```
<cfpdf action="read" source="Book.pdf" name="myBook">
<cfpdf action="write" source="myBook" destination="myBook1.pdf"
version="1.4">
```

You can now use either **name** or **destination** attributes with the **write** action. The **name** attribute takes the value as the PDF document variable. For example, you can write the preceding code snippet as:

```
<cfpdf action="read" source="Book.pdf" name="myBook">
<cfpdf action="write" source="myBook" name=#myBook#
version="1.4">
```

The new **encodeall** attribute encodes all the unencoded streams in the source. However, it does not discriminate between dumb encodings like **LZW** and encodings like **flate**, so only unencoded streams get **flate** encoded.

**Note:** You can now register thumbnail fonts using the font management screen.

### PDF versions

Change the PDF version so that users running an older version of Acrobat or Adobe Reader can open the file. The following table shows the compatibility between the PDF version and the corresponding Acrobat and Adobe Reader versions:

PDF version	Compatibility
1.1	Acrobat and Adobe Reader 2
1.2	Acrobat and Adobe Reader 3
1.3	Acrobat and Adobe Reader 4

PDF version	Compatibility
1.4	Acrobat and Adobe Reader 5
1.5	Acrobat and Adobe Reader 6
1.6	Acrobat and Adobe Reader 7

To linearize PDF documents for faster web display, set the `saveOption` attribute to `linear`, as the following code shows:

```
<cfpdf action="write" source="myBook" destination="myBook1.pdf" saveOption="linear"
      overwrite="yes">
```

Do not use the linear save option if you have to maintain interactivity in PDF forms or if the PDF document is enabled for electronic signatures. To allow for electronic signatures, set the `saveOption` attribute to `incremental`, as the following code shows:

```
<cfpdf action="write" source="myDraft" destination="mySignedDoc.pdf"
      saveOption="incremental" overwrite="yes">
```

Use the `flatten` attribute to flatten forms created in Acrobat:

```
<cfpdf action="write" source="myAcrobatForm.pdf"
      destination="myFlatForm.pdf" flatten="yes" overwrite="yes">
```

**Note:** ColdFusion does not support flattening forms created in Adobe® LiveCycle®. For more information about forms created in LiveCycle and Acrobat, see *Manipulating PDF Forms in ColdFusion in the Developing ColdFusion Applications*.

### Example

The following example generates thumbnail images from pages in a PDF document and links the thumbnail images to the pages in the PDF document:

```
<h3>PDF Thumbnail Demo</h3>

<!-- Create a variable for the name of the PDF document. -->
<cfset mypdf="myBook">
<cfset thisPath=ExpandPath(".")>
<!-- Use the getInfo action to retrieve the total page count for the
    PDF document. -->
<cfpdf action="getInfo" source="#mypdf#.pdf" name="PDFInfo">
<cfset pageCount="#PDFInfo.TotalPages#">

<!-- Generate a thumbnail image for each page in the PDF source document,
    create a directory (if it doesn't already exist) in the web root that is
    a concatenation of the PDF source name and the word "thumbnails", and
    save the thumbnail images in that directory. -->
<cfpdf action="thumbnail" source="#mypdf#.pdf" overwrite="yes"
    destination="#mypdf#_thumbnails" scale=60>

<!-- Loop through the images in the thumbnail directory and generate a link
    from each image to the corresponding page in the PDF document. -->
<cfloop index="LoopCount" from ="1" to="#pageCount#" step="1">
    <cfoutput>
        <!-- Click the thumbnail image to navigate to the page in the PDF
            document. -->
        <a href="#mypdf#.pdf##page=#LoopCount#" target="_blank">
            </a>
        </cfoutput>
    </cfloop>
```

## cfpdfform

### Description

Manipulates existing forms created in Adobe® Acrobat® and Adobe® LiveCycle® Designer. The following list describes some of the tasks you can perform with the `cfpdfform` tag:

- Embed an interactive form created in Acrobat LiveCycle in a PDF document. You use the `cfpdfform` tag to embed the PDF form in a `cfdocument` tag.
- Render an existing form created in Acrobat or LiveCycle. This includes prefilling fields from a database or an XML data file and processing form data from an HTTP post or PDF submission.
- Extract or prefill values in stored PDF forms and save the output to a file or use it to update a data source.

### History

ColdFusion 8: Added this tag.

### Category

[Forms tags](#)

## Syntax

### populate

```
<cfpdfform
    required
    action = "populate"
    source = "PDF file pathname|byte array"
    optional
    XMLdata = "XML object|XML string|XML data filename|
        URL that returns XML data"
    destination = "output file pathname"
    overwrite = "yes|no"/
    fdf = "true|false" <!---New attribute that populates data in FDF format instead of
XML with subforms and params--->
    fdfdata = "file name to be imported" <!--- New attribute populates data in FDF format
from the AcroForm--->
```

### read

```
<cfpdfform
    required
    action = "read"
    source = "pathname|byte array"
        at least one of the following:
    XMLdata = "variable name for XML data"
    result = "structure containing form field values"
    optional
    overwrite = "yes|no"/>
    fdfdata = "filename to be exported to"
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## Attributes

Attribute	Action	Req/Opt	Default	Description
action	NA	Required		Action to perform on the source: <ul style="list-style-type: none"> <li>• populate</li> <li>• read</li> </ul>
destination	populate	Optional	Write to browser	Pathname for the output file. You can specify an absolute pathname or a pathname relative to the context root.  The file extension must be PDF or XDP. The file extension determines the format of the file. (The XDP format applies only to LiveCycle forms.)  If you do not specify the destination, ColdFusion displays the form in the browser.  Do not specify the destination when you embed a form in a PDF document.
overwrite	populate read	Optional	no	Specifies whether to overwrite the destination file (if action="populate") or the data file (if action="read"): <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul>
overwriteData	populate	Optional	no	Specifies whether to overwrite existing data in PDF form fields with data from the data source: <ul style="list-style-type: none"> <li>• yes: Overwrite existing data in the form fields with that from the data source.</li> <li>• no: Retain existing data in form fields and populate only those fields without data.</li> </ul> This attribute applies to data supplied from an XML data source and from the cfpdfparam and cfpdfsubform tags.
result	read	Optional (see Description)		ColdFusion structure that contains the form field values.  Specify the XMLdata attribute or the result attribute; you can specify both.
source	populate read	Required		Pathname of the source PDF (absolute on-disk or in-memory path, or path relative to the context root) or byte array representing a PDF.
XMLdata	populate read	Optional (see Description)		Pathname for the XML data file. <ul style="list-style-type: none"> <li>• If action="populate", the data from this file, XML object, or XML string populates the form fields. You can specify a pathname relative to the context root or a relative pathname.</li> <li>• If action="read", ColdFusion writes the data to the variable.</li> </ul> Specify either the XMLdata attribute or the result attribute for the read action; you can specify both.
fdf	populate	Optional	false	If set to true, the system creates FDF with subforms and params instead of an XML
fdfdata	populate read	Optional		For populate, you specify the file name from where the FDF data is imported.  For read, you specify the file name where the FDF data is exported.

## Usage

ColdFusion supports two types of interactive forms: forms created in Adobe Acrobat 6.0 or earlier, and forms created in Adobe LiveCycle. In Adobe Acrobat Professional and Standard 7.0, Adobe introduced Adobe® LiveCycle® Designer for creating PDF forms. ColdFusion supports forms created in LiveCycle Designer 7.0 and later.

Forms created in Acrobat have a flat structure: a list of fields at the same level. Forms created in LiveCycle Designer are hierarchical, often composed of nested subforms. To map the data to the form field, you use `cfpdfsubform` tags to recreate the structure of the form in ColdFusion. For examples, see the Usage section of the `cfpdfsubform` tag, and “Manipulating PDF Forms in ColdFusion in the *Developing ColdFusion Applications*.

**populate action** Use the `populate` action to populate PDF form fields from the specified data file. You can specify a destination to write the output to a file or write the populated form directly to the browser. To display the interactive PDF form in the browser, do not specify a destination.

The following example shows how to populate a PDF form with an XML data file and display the completed form in a browser:

```
<cfpdfform source="c:\payslipTemplate.pdf" action="populate" XMLdata="c:\formdata.xml"/>
```

This example shows how to populate a PDF form with an XML data file and write the completed form to a new PDF file:

```
<!-- Specify an XML file to populate a PDF form. -->
<cfpdfform source="c:\payslipTemplate.pdf"
  destination="c:\employeeid123.pdf" action="populate"
  XMLdata="c:\formdata.xml"/>
```

Also, you can specify a URL that returns XML data. In the following example, "http://test1.com/xyz" returns XML content:

```
<cfpdfform source="#sourcefile#" action="populate" XMLdata=
  "http://test1.com/xyz" destination="#resultfile#" overwrite="true"/>
```

For forms created in Acrobat, you can write the output to a PDF file only. For forms created in LiveCycle, you have the option to write the output to an XML Data Package (XDP) file. An XDP file is an XML representation of a PDF file.

**Note:** Supplied values in form fields created in Acrobat or LiveCycle Designer are case sensitive. For example, if a check box in a form requires a “Yes” value, the value “yes” does not populate that field.

The file extension determines the file format: to save the output in XDP format, use an XDP extension in the destination filename:

```
<!-- Specify a an XML file to populate a PDF form. -->
<cfpdfform source="c:\payslipTemplate.pdf"
  destination="c:\employeeid123.xdp" action="populate"
  XMLdata="c:\formdata.xml"/>
```

You can use one or more `cfpdfformparam` tags within a `cfpdfform` tag to populate individual fields in a PDF form.

The following example shows how to populate an existing form created in Acrobat (payslipTemplate.pdf) and create a PDF form (employeeid123.pdf) with the employeeID and salary fields filled in:

```
<!-- This example shows how to populate two fields in a form created in Acrobat. -->
<cfpdfform source="c:\payslipTemplate.pdf"
  destination="c:\employeeid123.pdf" action="populate">
  <cfpdfformparam name="employeeId" value="123">
  <cfpdfformparam name="salary" value="$85,000">
</cfpdfform>
```

ColdFusion requires that you reproduce the exact structure of the source PDF form to populate fields. To verify the structure of a PDF form in ColdFusion, use the `read` action of `cfpdfform` tag, and then use the `cfdump` tag to display

the result structure. Use a `cfpdfsubform` tag for each level within the structure. For more information, see *Manipulating PDF Forms in ColdFusion* in the *Developing ColdFusion Applications*.

The following example shows how to populate a form created in LiveCycle. Many forms created from templates in LiveCycle contain a subform called `form1`. Use the `cfpdfsubform` tag to create a subform in ColdFusion.

```
<!--- This example shows how to populate two fields in a LiveCycle form.
--->
<cfpdfform source="c:\payslipTemplate.pdf"
  destination="c:\employeeid123.pdf" action="populate">
  <cfpdfsubform name="form1">
    <cfpdfformparam name="employeeId" value="123">
    <cfpdfformparam name="salary" value="$85,000">
  </cfpdfsubform>
</cfpdfform>
```

You can now import files in FDF format using the `populate` action. The following example shows how:

```
<cfpdfform source="write_acroform.pdf" action="populate" fdfdata="abc.fdf"
destination="hello.pdf">
</cfpdfform>
```

If the `fdf` attribute for the `populate` action is set to `true`, it allows you to populate data in FDF format with subforms and params instead of XML, as shown in the following example:

```
<cfpdfform source="acroform2.pdf" destination="source_result17.pdf" action="populate"
overwrite="true" fdf="true">
<cfpdfsubform name="Text1">
  <cfpdfsubform name="0">
    <cfpdfformparam name="0" value="Test1.0.0">
    <cfpdfformparam name="1" value="Test1.0.1">
    <cfpdfformparam name="2" value="Test1.0.2">
  </cfpdfsubform>
<cfpdfsubform name="1">
  <cfpdfformparam name="0" value="Test1.1.0">
  <cfpdfformparam name="1" value="Test1.1.1">
  <cfpdfformparam name="2" value="Test1.1.2">
</cfpdfsubform>
</cfpdfsubform>

<cfpdfsubform name="Text2">
  <cfpdfformparam name="0" value="Test2.0">
  <cfpdfformparam name="1" value="Test2.1">
    <cfpdfformparam name="2" value="Test2.2">
    <cfpdfformparam name="3" value="Test2.3">
  </cfpdfsubform>
<cfpdfformparam name="Text3" value="Test3">
<cfpdfformparam name="Text4" value="Test4">
<cfpdfformparam name="checkbox1" value="Yes">
<cfpdfformparam name="listbox1" value="item4">
<cfpdfformparam name="radiobutton1" value="2">
</cfpdfform>
```

**read action** Use the `read` action to read the data from the source PDF form and generate a result structure that contains the form fields and their values. Also, you can use the `read` action to generate an XML data file from a PDF source file.

The following example shows how to read a PDF file and generate a result structure from the data:

```
<!--- Use the read action to retrieve the values from the saved PDF. --->
<cfpdfform source="c:\employeeid123.pdf" result="resultStruct" action="read"/>
```

You can use the `cfdump` tag to display the result structure:

```
<cfdump var="#resultStruct#">
```

You can use the result fields in ColdFusion, for example, `#resultStruct.employeeId#` and `#resultStruct.salary#`.

The following example shows how to read a PDF file and write the data to an XML file:

```
<cfpdfform source="c:\employeeid123.pdf" result="c:\employeeid123.xml" overwrite="yes"
  action="read"/>
```

The following example shows how to read a PDF file into a variable that contains XML data:

```
<cfpdfform source="c:\employeeid123.pdf" XMLdata="myXMLdata" action="read"/>
```

The following example shows how to read a PDF file into an XML data variable and generate a result structure. The `cfwrite` tag writes the data to an XML file:

```
<cfset sourcefile = "Grant Application Updated.pdf">
<cfset resultfile = "Expandpath('datafile_result1.xml')">
<!--- Use the cfpdfform tag to read data extracted from a form into an XML data variable and
  generate a result structure. --->
<cfpdfform source="#sourcefile#" action="read" xmldata="xmldata" result="resultstruct"/>
<!--- Use the cffile tag to write the XML data to a file. --->
<cffile action="write" file="#resultfile#" output="#xmldata#">
<!--- Use the cfdump tag to display the result structure. --->
<cfdump var="#resultstruct#">
```

### Extracting data from a PDF submission

Use the following code to extract data from a PDF submission and write it to a structure called `fields`:

```
<!--- The following code reads the submitted PDF file and generates a result structure called
  fields. --->
<cfpdfform source="#PDF.content#" action="read" result="fields"/>
```

Use the `cfdump` tag to display the data structure, as follows:

```
<cfdump var="#fields#">
```

**Note:** When you extract data from a PDF submission, always specify `"#PDF.content#" as the source.`

You can set the form fields to a variable, as the following code shows:

```
<cfset empForm="#fields.form1#">
```

Use the `populate` action of the `cfpdfform` tag to write the output to a file. Specify `"#PDF.content#" as the source.` In the following example, the unique filename is generated from a field on the PDF form:

```
<cfpdfform action="populate" source="#PDF.content#"
  destination="timesheets\#empForm.txtsheet#.pdf" overwrite="yes"/>
```

### Extracting data from an HTTP post submission

An HTTP post submission transmits the data from the PDF form, but not the form itself. You can extract data from the PDF form fields, but you cannot write the output directly to a file. To extract the data and update a database, for example, you must map the fields in the database to the structure and HTTP post data exactly.

**Note:** The structure of the HTTP post data (after submission) is not the same as the structure of the PDF form (before data submission). For examples of both, see *Manipulating PDF Forms in ColdFusion in the Developing ColdFusion Applications*.

To determine the structure of the HTTP post data, use the `cfdump` tag with the form name as the variable to display the data structure, as follows:

```
<cfdump var="#FORM.form1#">
```

**Note:** When you extract data from an HTTP post submission, always specify the form name as the source. For example, specify `"#FORM.form1#"` for a form generated from a template in LiveCycle Designer. When data extraction that uses the `cfpdfform` tag results in more than one page, instead of returning one structure, ColdFusion returns one structure per page.

### Embedding PDF forms within a PDF document

You can use the `cfpdfform` tag inside the `cfdocument` tag to embed an existing interactive PDF form within a PDF document. Use at least one `cfdocumentsection` tag with the `cfpdfform` tag, but do not place the `cfpdfform` tag within the `cfdocumentsection` tag. For more information about embedding PDF forms, see *Manipulating PDF Forms in ColdFusion in the Developing ColdFusion Applications*.

### Flattening forms created in Acrobat

You use the `cfpdf` tag to flatten forms created in Acrobat. ColdFusion does not support flattening forms created in LiveCycle. For more information, see *Assembling PDF Documents in the Developing ColdFusion Applications*.

### Printing forms

Use the `cfprint` tag to print forms created in Acrobat. Markups, such as sticky notes, comments, and editorial revisions, are not printed with the form. You cannot use the `cfprint` tag to print forms created in LiveCycle Designer.

### Exporting PDF Forms in FDF

In ColdFusion 9, you can now export PDF forms in FDF format using the `read` action. The following example shows how you can export a PDF form in FDF format:

```
<cfpdfform source= "acroform_export.pdf" action="read" fdfdata="abc.fdf" >  
</cfpdfform>
```

### Example

The following example shows how to embed an interactive PDF form in a PDF document created with the `cfdocument` tag:

```

<!-- The following code extracts data from the cfdocexamples database based
on a username entered in a login form. --->
<cfquery name="getEmpInfo" datasource="cfdocexamples">
    SELECT * FROM EMPLOYEES
    WHERE EMAIL = <cfqueryparam value="#form.username#">
</cfquery>

<!-- The following code creates a PDF document with headers
and footers. --->
<cfdocument format="pdf">
    <cfdocumentitem type="header">
        <font size="-1" align="center"><i>Nondisclosure Agreement</i></font>
    </cfdocumentitem>
    <cfdocumentitem type="footer">
        <font size="-1"><i>Page <cfoutput>#cfdocument.currentpagenumber# of
            #cfdocument.totalpagecount#</cfoutput></i></font>
    </cfdocumentitem>

<!-- The following code creates the first section in the PDF document. --->
    <cfdocumentsection>
        <h3>Employee Nondisclosure Agreement</h3>
        <p>Please verify the information in the enclosed form. Make any of the
        necessary changes in the online form and click the <b>Print</b> button.
        Sign and date the last page. Staple the pages together and return the
        completed form to your manager.</p>
    </cfdocumentsection>

<!-- The following code embeds an interactive PDF form within the PDF
document with fields populated by the database query. The cfpdpfform tag
automatically creates a section in the PDF document. Do not embed the
cfpdpfform within cfdocumentsection tags. --->

    <cfpdpfform action="populate" source="c:\forms\embed.pdf">
        <cfpdpfformsubform name="form1">
            <cfpdpfformparam name="txtEmpName" value="#getEmpInfo.FIRSTNAME#
                #getEmpInfo.LASTNAME#">
            <cfpdpfformparam name="txtDeptName" value="#getEmpInfo.DEPARTMENT#">
            <cfpdpfformparam name="txtEmail" value="#getEmpInfo.IM_ID#">
            <cfpdpfformparam name="txtPhoneNum" value="#getEmpInfo.PHONE#">
            <cfpdpfformparam name="txtManagerName" value="Randy Nielsen">
        </cfpdpfformsubform>
    </cfpdpfform>

<!-- The following code creates the last document section. Page numbering
resumes in this section. --->
    <cfdocumentsection>
        <p>I, <cfoutput>#getEmpInfo.FIRSTNAME# #getEmpInfo.LASTNAME#</cfoutput>,
        hereby attest that the information in this document is accurate and complete.</p>
        <br/><br/>
        <table border="0" cellpadding="20">
            <tr><td width="300">
                <hr />
                <p><i>Signature</i></p></td>
                <td width="150"><hr />
                <p><i>Today's Date</i></p></td></tr>
        </table>
    </cfdocumentsection>
</cfdocument>

```

## cfpdfformparam

### Description

Provides additional information to the [cfpdfform](#) tag.

The `cfpdfformparam` tag is always a child tag of the `cfpdfform` or [cfpdfsubform](#) tag. Use the `cfpdfformparam` tag to populate fields in a PDF form.

### History

ColdFusion 8: Added this tag.

### Category

[Forms tags](#)

### Syntax

```
<cfpdfform ...>
  <cfpdfformparam
    name = "field name"
    value = "ColdFusion variable"
    index = "integer">
</cfpdfform>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfdocument](#), [cfdocumentsection](#), [cform](#), [cfinput](#), [cfpdf](#), [cfpdfform](#), [cfpdfparam](#), [cfpdfsubformcfprint](#), [IsPDFFile](#), [IsPDFObject](#)

### Attributes

Attribute	Req/Opt	Default	Description
index	Optional	1	Index associated with the field name. If multiple fields have the same name, use the index value to locate one of them. Applies to forms created in LiveCycle only.
name	Required		Field name on the PDF form.
value	Required		Value associated with the field name. For interactive fields, specify a ColdFusion variable.

### Usage

Use the `cfpdfformparam` tag inside the `cfpdfform` tag or the `cfpdfsubform` tag to populate fields in a PDF form.

Use the `index` attribute of the `cfpdfformparam` tag to specify fields with the same name and different values, as the following code shows:

```
<!--- This example shows how to use multiple cfpdfformparam tags with the same name and
      different index values for a PDF form that contains fields with same name. --->
<cfpdfform source="c:\payslipTemplate.pdf"
  destination="c:\employeeid123.pdf" action="populate">
  <cfpdfformparam name="phone" value="781-869-1234" index="1"/>
  <cfpdfformparam name="phone" value="617-273-9021" index="2"/>
</cfpdfform>
```

**Note:** Use the `index` attribute with forms created in LiveCycle only. Forms created in Acrobat cannot contain more than one field with the same name; therefore the `index` attribute is not valid.

### Example

See the [cfpdfform](#) tag examples.

## cfpdfparam

### Description

Provides additional information for the [cfpdf](#) tag. The `cfpdfparam` tag applies only to the `merge` action of the `cfpdf` tag and is always a child tag of the `cfpdf` tag.

### History

ColdFusion 8: Added this tag.

### Category

[Forms tags](#)

### Syntax

```
<cfpdf action = "merge" ...>
  <cfpdfparam
    pages = "page number|page range|comma-separated page numbers"
    password = "user or owner password"
    source = "absolute or relative pathname to a PDF file|PDF document variable|
              cfdocument variable">
</cfpdf>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfdocument](#), [cfdocumentsection](#), [cfpdf](#), [cfpdfform](#), [cfpdfformparam](#), [cfpdfsubform](#), [cfprint](#), [IsPDFFile](#), [IsPDFObject](#)

### Attributes

Attribute	Req/Opt	Default	Description
pages	Optional		Page or pages of the PDF source file to merge. You can specify a range of pages, for example, "1-5 ", or a comma-separated list of pages, for example, "1-5,9-10,18".
password	Optional		User or owner password, if the source PDF file is password-protected.
source	Required		Source PDF file to merge. You can specify a PDF variable, a <code>cfdocument</code> variable, or the pathname to a file.

### Usage

Use the `cfpdfparam` tag to merge several PDF documents into one file. The `cfpdfparam` tag lets you specify the order of source files explicitly. You can use this tag to merge pages from multiple PDF document source files in different locations.

The following code creates a single PDF document called combined.pdf that contains pages 1–3 and page 5 of the file abc.pdf, followed by all of the pages in xyz.pdf, a file in memory with the variable name myPDFvariable, and lastly pages 10–90 from the file abc.pdf. The password attribute applies only if the source file is password-protected:

```
<cfpdf action="merge" destination="combined.pdf" overwrite="yes">
  <cfpdfparam source="c:\abc.pdf" pages="1-3,5" password="adobe">
    \x
  <cfpdfparam source="myPDFvariable">
  <cfpdfparam source="abc.pdf" pages="10-90" password="adobe">
</cfpdf>
```

**Note:** When you use the `cfpdfparam` tag with the `cfpdfmerge` action, you must specify either the destination attribute or the name attribute for the `cfpdf` tag.

### Example

The following ColdFusion page creates a form for downloading tax forms and tax information booklets:

```
<h3>Downloading Federal Tax Documents</h3>
<p>Please choose the your type of business.</p>
<!-- Create the ColdFusion form to determine which PDF documents to merge. -->
<table>
<cfform action="cfpdfMergeAction.cfm" method="post">
  <tr><td><cfinput type="radio" name="businessType" Value="SoleP">
    Sole Proprietor</td></tr>
  <tr><td><cfinput type="radio" name="businessType"
    Value="Partner">Partnership</td></tr>
  <tr><td><cfinput type="radio" name="businessType" Value="SCorp">S Corporation</td></tr>
  <cfinput type = "hidden" name = "selection required" value = "must make a selection">
  <tr><td><cfinput type="Submit" name="OK" label="OK"></td></tr>
</tr>
</cfform>
</table>
```

The ColdFusion action page merges PDF files in different locations based on the selection in the form:

```
<!--- Create a merged PDF document based on the selection in the form. --->
<cfpdf action="merge" name="taxDoc">
    <cfif #form.businessType# is "SoleP">
        <cfpdfparam source="taxForms\f2106ez.pdf">
        <cfpdfparam source="taxForms\f1040.pdf">
        <cfpdfparam source="taxForms\f1040sc.pdf">
        <cfpdfparam source="taxInfo\i1040sc.pdf">
        <cfpdfparam source="taxInfo\i2106.pdf">
        <cfpdfparam source="taxInfo\i1040sc.pdf">
        <cfpdfparam source="taxInfo\p535.pdf">
        <cfpdfparam source="taxInfo\p560.pdf">
        <cfpdfparam source="taxInfo\p334.pdf">
    <cfelseif #form.businessType# is "Partner">
        <cfpdfparam source="taxForms\f1065.pdf">
        <cfpdfparam source="taxForms\f1065b.pdf">
        <cfpdfparam source="taxForms\f1065bsk.pdf">
        <cfpdfparam source="taxForms\f8804.pdf">
        <cfpdfparam source="taxForms\f8825.pdf">
        <cfpdfparam source="taxInfo\p535.pdf">
        <cfpdfparam source="taxInfo\p560.pdf">
        <cfpdfparam source="taxInfo\i1065bsk.pdf">
    <cfelseif #form.businessType# is "SCorp">
        <cfpdfparam source="taxForms\f1120s.pdf">
        <cfpdfparam source="taxForms\f2553.pdf">
        <cfpdfparam source="taxForms\f8453s.pdf">
        <cfpdfparam source="taxForms\f8825.pdf">
        <cfpdfparam source="taxInfo\i1120s.pdf">
        <cfpdfparam source="taxInfo\p542.pdf">
        <cfpdfparam source="taxInfo\p535.pdf">
        <cfpdfparam source="taxInfo\p560.pdf">
    </cfif>
</cfpdf>

<cfpdf action="write" source="taxDoc" destination="c:\taxDoc.PDF"
    overwrite="yes"/>
```

**Note:** ColdFusion automatically flattens form fields when you use the `merge` action of the `cfpdf` tag.

## cfpdfsubform

### Description

Populates a subform within the `cfpdfform` tag.

The `cfpdfsubform` tag can be a child tag of the `cfpdfform` tag or nested in another `cfpdfsubform` tag.

### History

ColdFusion 8: Added this tag.

### Category

[Forms tags](#)

### Syntax

```
<cfpdfform ..>
  <cfpdfsubform
    name = "field name"
    index = "integer">
  </cfpdfsubform>
</cfpdfform>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfdocument](#), [cfdocumentsection](#), [cform](#), [cfinput](#), [cfpdf](#), [cfpdfform](#), [cfpdfformparam](#), [cfpdfparam](#), [cfprint](#), [IsPDFFile](#), [IsPDFObject](#)

### Attributes

Attribute	Req/Opt	Default	Description
index	Optional	1	Index associated with the field name. If multiple fields have the same name, ColdFusion uses the index value to locate one of them.
name	Required		Name of the subform corresponding to subform name in the PDF form.

### Usage

Use the `cfpdfsubform` tag with the `cfpdfform` tag to populate one or more subforms within a PDF form. The `cfpdfsubform` tag can contain multiple `cfpdfformparam` tags. Also, you can nest subforms, as the following example shows:

```
<!--- This example shows how to nest cfpdfsubform tags. --->
<cfpdfform source="c:\payslipTemplate.pdf"
  destination="c:\employeeid123.pdf" action="populate">
  <cfpdfsubform name="employeeDetail">
    <cfpdfsubform name="address">
      <cfpdfformparam name="txtAddLine1" value="572 Evergreen Terrace">
      <cfpdfformparam name="txtCity" value="Springfield">
      <cfpdfformparam name="txtState" value="Oregon">
      <cfpdfformparam name="txtZip" value="65412">
      <cfpdfformparam name="txtCountry" value="United States">
    </cfpdfsubform>
    <cfpdfformparam name="txtEmployeeId" value="879104">
    <cfpdfformparam name="numSalary" value="$85,000">
  </cfpdfsubform>
</cfpdfform>
```

Use subforms to match the exact structure of the source PDF form. If you do not, ColdFusion cannot prefill the form with data and generates an error. Many of the forms generated from templates in LiveCycle contain a subform called `form1`. You must specify this as a subform in your code, as the following example shows:

```
<cfpdfform source="c:\forms\timesheetForm.pdf" action="populate">
  <cfpdfsubform name="form1">
    <cfpdfformparam name="txtCompanyName" value="Adobe">
    <cfpdfformparam name="txtManager" value="Randy Nielsen">
  </cfpdfsubform>
</cfpdfform>
```

To verify the structure of a PDF form in ColdFusion, use the `read` action of the `cfpdfform` tag, as the following example shows:

```
<cfpdfform source="c:\forms\timesheetForm.pdf" result="resultStruct" action="read"/>
```

Then use the `cfdump` tag to display the structure:

```
<cdump var="#resultStruct#">
```

### Example

See the `cfpdfform` tag examples.

## cfpod

### Description

Creates a pod, an area of the browser window or layout area with an optional title bar and a body that contains display elements.

### Category

[Display management tags](#)

### Syntax

```
<cfpod
    source = "path"
    bodyStyle = "CSS style specification"
    headerStyle = "CSS style specification"
    height = "number of pixels"
    name = "string"
    onBindError = "JavaScript function name"
    title = "string"
    width = "number of pixels"/>
```

OR

```
<cfpod
    bodyStyle = "CSS style specification"
    headerStyle = "CSS style specification"
    height = "number of pixels"
    name = "string"
    onBindError = "JavaScript function name"
    title = "string"
    width = "number of pixels">
    pod contents
</pod>
```

If the tag does not have a body and end tag, close it with `/>` character combination.

**Note:** You can specify this tag's attribute in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute name as structure key.

### See also

[cfajaximport](#), [cfdiv](#), [cflayout](#), [cfwindow](#)

## History

ColdFusion 8: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
bodyStyle	Optional		A CSS style specification for the pod body.  As a general rule, use this attribute to set color and font styles. Using this attribute to set the height and width, for example, can result in distorted output.
headerStyle	Optional		A CSS style specification for the pod header.  As a general rule, use this attribute to set color and font styles. Using this attribute to set the height and width, for example, can result in distorted output.
height	Optional	100	Height if the control, including the title bar and borders, in pixels
name	Optional		Name of the pod control.
onBindError	Optional	See Description	The name of a JavaScript function to execute if evaluating a bind expression results in an error. The function must take two attributes: an HTTP status code and a message.  If you omit this attribute, and have specified a global error handler (by using the <a href="#">ColdFusion.setGlobalErrorHandler</a> function), it displays the error message; otherwise a default error pop-up displays.
overflow	Optional	auto	Specifies how to display child content whose size would cause the control to overflow the pod boundaries. The following values are valid: <ul style="list-style-type: none"><li>• <code>auto</code>: shows scrollbars when necessary.</li><li>• <code>hidden</code>: does not allow access to overflowing content.</li><li>• <code>scroll</code>: always shows horizontal and vertical scroll bars, even if they are not needed.</li><li>• <code>visible</code>: content can display outside the bounds of the pod.</li></ul> <b>Note:</b> In Internet Explorer, pods with the <code>visible</code> setting expand to fit the size of the contents, rather than having the contents extend beyond the layout area.
source	Required if the tag does not have a body		A URL that returns the pod contents. ColdFusion uses standard page path resolution rules.  If you specify this attribute and the <code>cfpod</code> tag has a body, ColdFusion ignores the body contents.  You can use a bind expression with dependencies in this attribute; for more information see Usage.  <b>Note:</b> If a CFML page specified in this attribute contains tags that use AJAX features, such as <code>cfform</code> , <code>cfgrid</code> , and <code>cfwindow</code> , you must use a <code>cfajaximport</code> tag on the page with the <code>cfpod</code> tag. For more information, see <a href="#">cfajaximport</a> .
title	Optional		Text to display in the pod's title bar. You can use HTML mark-up to control the title appearance, of example to show the text in red italic font. If you omit this attribute, the pod does not have a title bar.
width	Optional	500	Width if the control, including borders, in pixels.

## Usage

You use a `source` attribute or a tag body to specify the pod contents; if you specify both, ColdFusion uses the contents specified by the `source` attribute and ignores the tag body. If you use a `source` attribute, an animated icon and the text "Loading..." appears while the contents is being fetched.

If the `source` attribute specifies a page that defines JavaScript functions, the function definitions on that page must have the following format:

```
functionName = function(arguments) {function body}
```

Function definitions that use the following format may not work:

```
function functionName (arguments) {function body}
```

However, Adobe recommends that you include all custom JavaScript in external JavaScript files and import them on the application's main page, and not write them inline in code that you get using the `source` attribute. Imported pages do not have this function definition format restriction.

If you use the `source` attribute, you can use a *bind expression* to include form field values or other form control attributes as part of the source specification. You can bind to HTML format form controls only.

To use a bind expression, specify a URL and pass one or more URL parameters the page, including *bind parameters*. In its most basic form, a bind parameter consists of the `name` or `id` attribute of the control to which you are binding in braces (`{ }`). To include the value of the `city` control as a bind parameter, for example, use the following format:

```
source="/myapplication/cityPod.cfm?cityname={city}"
```

For detailed information about using bind expressions, see Binding data to form fields in the *Developing ColdFusion Applications*.

### Example

The following CFML page displays two pods in a vertical layout. Each pod gets its contents from a `displayforpod.cfm` page that uses the `cffeed` tag to get an Atom feed.

```
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<meta http-equiv="Content-Type" content="text/html; charset=utf-8"/>
<title>Untitled Document</title>
</head>

<body>
<cflayout type="hbox" style="background-color:##CCffFF; color:red;">
  <cflayoutarea>
    <cfpod name="pod01" source="displayforpod.cfm?start=1" height="500" width="300"
      title="Comment 1"/>
  </cflayoutarea>
  <cflayoutarea>
    <cfpod name="pod02" source="displayforpod.cfm?start=2" height="500" width="450"
      title="Comment 2"/>
  </cflayoutarea>
</cflayout>
</body>
</html>
```

The following code shows the contents of the `displayforpod.cfm` page:

```
<cffeed action="read" source="http://googleblog.blogspot.com/atom.xml"
        query="feedQuery" properties="feedMetadata" >

<cfloop query = "feedQuery"
        startRow = "#url.start#" endRow = "#url.start#">
    <cfoutput>#feedQuery.content#<br />
    =====<br/>
    </cfoutput>
</cfloop>
```

## cfpop

### Description

Retrieves or deletes e-mail messages from a POP mail server.

### Category

[Communications tags](#), [Internet protocol tags](#)

### Syntax

```
<cfpop
    server = "server name"
    action = "getHeaderOnly|getAll|delete"
    attachmentPath = "path"
    debug = "yes|no">
    generateUniqueFileNames = "yes|no"
    maxRows = "number"
    messageNumber = "number"
    name = "query name"
    password = "password"
    port = "port number"
    startRow = "number"
    timeout = "seconds"
    uid = "number"
    username = "user name">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfftftp](#), [cfhttp](#), [cflldap](#), [cfmail](#), [cfmailparam](#), [SetLocale](#); Sending and Receiving E-Mail in the *Developing ColdFusion Applications*

### History

ColdFusion MX 7.01: Added `cids` query variable.

ColdFusion MX 6.1:

- Added support for multipart mail messages with Text and HTML parts.
- Changed the attachment name separator: the TAB character is now the separator between attachment names in the `attachments` and `attachmentfiles` query fields if a message has multiple attachments. This behavior is identical to ColdFusion 5 and earlier versions.

ColdFusion MX: Changed the attachment name separator: the comma separates names in the `attachments` and `attachmentfiles` query fields if a message has multiple attachments.

### Attributes

Attribute	Req/Opt	Default	Description
<code>server</code>	Required		POP server identifier: <ul style="list-style-type: none"> <li>A host name, for example, "biff.upperlip.com".</li> <li>An IP address, for example, "192.1.2.225".</li> </ul>
<code>action</code>	Optional	<code>getHeaderOnly</code>	<ul style="list-style-type: none"> <li><code>getHeaderOnly</code>: returns message header information only</li> <li><code>getAll</code>: returns message header information, message text, and attachments if <code>attachmentPath</code> is specified</li> <li><code>delete</code>: deletes messages on POP server</li> </ul>
<code>attachmentPath</code>	Optional		<p>If <code>action="getAll"</code>, specifies a directory in which to save any attachments. If the directory does not exist, ColdFusion creates it.</p> <p>If you omit this attribute, ColdFusion does not save any attachments. If you specify a relative path, the path root is the ColdFusion temporary directory, which is returned by the <code>GetTempDirectory</code> function.</p>
<code>debug</code>	Optional	<code>no</code>	<ul style="list-style-type: none"> <li><code>yes</code>: sends debugging output to standard output. By default, if the console window is unavailable on server configurations, ColdFusion sends output to <code>cf_root/runtime/logs/coldfusion-out.log</code>. On J2EE configurations, with JRun, the default location is <code>jrun_home/logs/servername-out.log</code>. <i>Caution:</i> If you set this option to Yes, ColdFusion writes detailed debugging information to the log, including all retrieved message contents, and can generate large logs quickly.</li> <li><code>no</code>: does not generate debugging output.</li> </ul>
<code>generateUniqueFileNames</code>	Optional	<code>no</code>	<ul style="list-style-type: none"> <li><code>yes</code>: generate unique filenames for files attached to an e-mail message, to avoid naming conflicts when files are saved.</li> <li><code>no</code></li> </ul>
<code>maxRows</code>	Optional	Retrieves all available rows	Number of messages to return or delete, starting with the number in <code>startRow</code> . Ignored if <code>messageNumber</code> or <code>uid</code> is specified.
<code>messageNumber</code>			<p>Message number or comma-separated list of message numbers to get or delete. Invalid message numbers are ignored.</p> <p>Ignored if <code>uid</code> is specified.</p>
<code>name</code>	Required if <code>action="getAll"</code> or <code>"getHeaderOnly"</code>		Name for query object that contains the retrieved message information.
<code>password</code>	Optional		Password that corresponds to <code>username</code> .

Attribute	Req/Opt	Default	Description
port	Optional	110	POP port.
startRow	Optional	1	First row number to get or delete. Ignored if <code>messageNumber</code> or <code>uid</code> is specified.
timeout	Optional	60	Maximum time, in seconds, to wait for mail processing.
uid			UID or a comma-separated list of UIDs to get or delete. Invalid UIDs are ignored.
username	Optional		A user name.

### Usage

The `cfpop` tag retrieves one or more mail messages from a POP server and populates a ColdFusion query object with the resulting messages, one message per row. Alternatively, it deletes one or more messages from the POP server.

**Note:** When the `cfpop` tag encounters malformed mail messages, it does not generate errors; instead, it returns empty fields.

To optimize performance, two retrieve options are available. Message header information is typically short, and therefore quick to transfer. Message text and attachments can be long, and therefore take longer to process.

### Attachmentpath attribute

Use the following syntax to specify an in-memory directory in the `attachmentpath` attribute. In-memory files speed processing of transient data.

```
ram:///path
```

The path can include multiple directories, for example `ram:///petStore/mail/attachments`. You must create the directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files in the Developing ColdFusion Applications*.

### The cfpop query variables

The following table describes the variables that provide information about the query that is returned by `cfpop`:

Variable names	Description
<code>queryname.recordCount</code>	Number of records returned by query.
<code>queryname.currentRow</code>	Current row that <code>cfoutput</code> is processing.
<code>queryname.columnList</code>	List of column names in query.

### Query message header and body columns

The following table lists the message header and body columns that are returned if `action = "getHeaderOnly"` or `"getAll"`:

Column name	<code>getHeaderOnly</code> returns	<code>getAll</code> returns
<code>queryname.date</code>	yes	yes
<code>queryname.from</code>	yes	yes
<code>queryname.messageNumber</code>	yes	yes
<code>queryname.messageid</code>	yes	yes

Column name	getHeaderOnly returns	getAll returns
queryname.replyto	yes	yes
queryname.subject	yes	yes
queryname.cc	yes	yes
queryname.to	yes	yes
queryname.body	no	yes
queryname.textBody	no	yes
queryname.HTMLBody	no	yes
queryname.header	yes	yes
queryname.attachments	no	yes
queryname.attachmentfiles	no	yes
queryname.UID	yes	yes
queryname.cids	no	yes

If the mail message includes a part with a Content-Type of text/plain, the queryname.textBody column contains the part's message content. If the mail message includes a part with a Content-Type of text/HTML, the queryname.HTMLBody column contains the part's message content. If no Content-Type matches these types, the columns are empty. The queryname.Body column always contains the first message body found.

The queryname.attachments column contains a tab-separated list of all the attachment names. The queryname.attachmentfiles column contains a tab-separated list of the locations of the attachment files. Use the `cffile` tag to delete these temporary files when you have processed them.

To create a ColdFusion date/time object from the date-time string that is extracted from a mail message in the queryname.date column, use the following table:

Locale	How to create a ColdFusion date/time object from queryname.date
English (US)	Use the <a href="#">ParseDateTime</a> function. If you specify the <code>pop-conversion</code> attribute, the function adjusts the date/time object to UTC.
Other	Extract the date part of string; pass it to the <a href="#">LSParseDateTime</a> function.

**Note:** To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

For more information on `cfpop`, see Sending and Receiving E-Mail in the *Developing ColdFusion Applications*.

### Example

```
<!--- This view-only example shows the use of cfpop. --->
<h3>cfpop Example</h3>
<p>cfpop lets you retrieve and manipulate mail in a POP3 mailbox.
    This view-only example shows how to create one feature of
    a mail client, to display the mail headers in a POP3 mailbox.
<p>To execute this, un-comment this code and run with a mail-enabled CF Server.
<!---
<cfif IsDefined("form.server")>
    <!--- Make sure server, username are not empty. --->
    <cfif form.server is not "" and form.username is not "">
        <cfpop server = "#form.popserver# " username = #form.username# password = #form.pwd#
            action = "getHeaderOnly" name = "GetHeaders ">
        <h3>Message Headers in Your Inbox</h3>
        <p>Number of Records:
        <cfoutput>#GetHeaders.recordCount#</cfoutput></p>

        <ul>
            <cfoutput query = "GetHeaders">
                <li>Row: #currentRow#: From: #From# -- Subject: #Subject#
            </cfoutput>
        </ul>
    </cfif>
</cfif>

<form action = "cfpop.cfm " method = "post">
    <p>Enter your mail server:</p>
    <p><input type = "Text" name = "popserver"></p>
    <p>Enter your username:</p>
    <p><input type = "Text" name = "username"></p>
    <p>Enter your password:</p>
    <p><input type = "password" name = "pwd"></p>
    <p><input type = "Submit" name = "get message headers"></p>
</form>
--->
```

## cfpresentation

### Description

Defines the look of a dynamic slide presentation and determines whether to write the presentation files to disk. The `cfpresentation` tag is the parent tag for one or more `cfpresentationslide` tags, where you define the content for the presentation, and the `cfpresenter` tags, which provide information about the people presenting the slides.

### History

ColdFusion 9: Added `format` and `destination` attributes.

ColdFusion 8: Added this tag.

### Category

[Data output tags](#)

## Syntax

```
<cfpresentation
    title = "text string"
    authPassword = "authentication password"
    authUser = "authentication user name"
    autoPlay = "yes|no"
    backgroundColor = "hexadecimal color|HTML named color"
    control = "normal|brief"
    controlLocation = "right|left"
    destination = "filepath"
    directory = "pathname"
    format = "ppt|html"
    glowColor = "hexadecimal color|HTML named color"
    initialTab = "outline|search|notes"
    lightColor = "hexadecimal color|HTML named color"
    loop = "yes|no"
    overwrite = "yes|no"
    primaryColor = "hexadecimal color|HTML named color"
    proxyHost = "IP address or server name for proxy host"
    proxyPassword = "password for the proxy host"
    proxyPort = "port of the proxy host"
    proxyUser = "user name for the proxy host"
    shadowColor = "hexadecimal color|HTML named color"
    showNotes = "yes|no"
    showOutline = "yes|no"
    showSearch = "yes|no"
    textColor = "hexadecimal color|HTML named color"
    userAgent = "HTTP user agent identifier">
    presentation content...
</cfpresentation>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## Attributes

Attribute	Req/Opt	Default	Description
authPassword	Optional		Sends a password to the target URL for Basic Authentication. Combined with <code>username</code> to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerberos authentication.
authUser	Optional		Sends a user name to the target URL for Basic Authentication. Combined with <code>password</code> to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerebos authentication.
autoPlay	Optional	yes	Specifies whether to play the presentation automatically: <ul style="list-style-type: none"> <li>• <code>yes</code>: the presentation automatically runs through the entire presentation at startup.</li> <li>• <code>no</code>: the user must click the Play button to start the presentation and click the Next button to advance to the next slide in the presentation.</li> </ul>
backgroundColor	Optional	727971	Background color of the presentation. The value is hexadecimal: use the form " <code>##xxxxxx</code> " or " <code>##xxxxxxxx</code> ", where <code>x</code> = 0–9 or A–F; use two number signs or none. Also, you can use a subset of HTML named colors listed in the section Named colors.
control	Optional	normal	Presentation control: <ul style="list-style-type: none"> <li>• <code>normal</code></li> <li>• <code>brief</code></li> </ul>
controlLocation	Optional	right	Specifies the location of the presentation control: <ul style="list-style-type: none"> <li>• <code>right</code></li> <li>• <code>left</code></li> </ul>
destination	Optional		Absolute file name or a file path relative to the CFM page. You can use this for both connect presentation and ppt presentations. Required if <code>format="html"</code> .
directory	Optional		Directory where the presentation is saved. This can be an absolute path or a path relative to the CFM page. Also, ColdFusion creates a subdirectory called <code>data</code> that contains: <ul style="list-style-type: none"> <li>• A SWF file for each slide</li> <li>• <code>srchdata.xml</code> (which creates the search interface)</li> <li>• <code>vconfig.xml</code></li> <li>• <code>viewer.xml</code></li> <li>• images, video clips, and SWF files referenced by the <code>cfpresentationsslide</code> tags</li> </ul> <p>If you do not specify a directory, ColdFusion writes the files to a temp directory and runs the presentation in the client browser.</p>
format	Optional		Specifies the file format for conversion: <ul style="list-style-type: none"> <li>• <code>ppt</code> converts html input provided in <code>cfpresentationsslide</code> to a PowerPoint file.</li> <li>• <code>html</code> converts ppt to an HTML presentation.</li> </ul>

Attribute	Req/Opt	Default	Description
glowColor	Optional	35D334	Color used for glow effects on the buttons. The value is hexadecimal: use the form "##xxxxxx" or "##xxxxxxxx", where x = 0–9 or A–F; use two number signs or none. Also, you can use a subset of HTML named colors listed in the section Named colors.
initialTab	Optional	outline	Specifies which tab displays on top when the presentation is run. This applies only when the <code>control</code> value is <code>normal</code> : <ul style="list-style-type: none"> <li>outline</li> <li>search</li> <li>notes</li> </ul>
lightColor	Optional	4E5D60	Light color used for light-and-shadow effects. The value is hexadecimal: use the form "##xxxxxx" or "##xxxxxxxx", where x = 0–9 or A–F; use two number signs or none. Also, you can use a subset of HTML named colors listed in the section Named colors.
loop	Optional	no	Specifies whether the presentation runs in a loop: <ul style="list-style-type: none"> <li>yes: the presentation restarts automatically after it ends.</li> <li>no: the user must click the Play button to restart the presentation.</li> </ul>
overwrite	Optional	yes	Specifies whether files in the directory are overwritten. Valid only when the <code>directory</code> attribute is specified. <ul style="list-style-type: none"> <li>yes: overwrites files if they are already present</li> <li>no: creates new files</li> </ul>
primaryColor	Optional	6F8488	Primary color of the presentation. The value is hexadecimal: use the form "##xxxxxx" or "##xxxxxxxx", where x = 0–9 or A–F; use two number signs or none. Also, you can use a subset of HTML named colors listed in the section Named colors.
proxyHost	Optional		Host name or IP address of a proxy server to which to send the request.
proxyPassword	Optional		Password required by the proxy server.
proxyPort	Optional	80	The port to connect to on the proxy server.
proxyUser	Optional		User name to provide to the proxy server.
shadowColor	Optional	000000	Shadow color used for light-and-shadow effects. The value is hexadecimal: use the form "##xxxxxx" or "##xxxxxxxx", where x = 0–9 or A–F; use two number signs or none. Also, you can use a subset of HTML named colors listed in the section Named colors.
showNotes	Optional	no	Specifies whether the Notes tab is present in the presentation control panel: <ul style="list-style-type: none"> <li>yes</li> <li>no</li> </ul>
showOutline	Optional	yes	Specifies whether the Outline is present in the presentation control panel: <ul style="list-style-type: none"> <li>yes</li> <li>no</li> </ul>

Attribute	Req/Opt	Default	Description
showSearch	Optional	yes	Specifies whether the Search tab is present in the presentation control panel: <ul style="list-style-type: none"><li>• yes</li><li>• no</li></ul>
textColor	Optional	FFFFFF	Color for all the text in the presentation user interface. The value is hexadecimal: use the form "##xxxxxx" or "##xxxxxxxx", where x = 0–9 or A–F; use two number signs or none. Also, you can use a subset of HTML named colors listed in the section Named colors.
title	Required		Title of the presentation
userAgent	Optional	ColdFusion	Text to put in the HTTP User-Agent request header field. Used to identify the request client software.

### Usage

Use the `cfpresentation` tag to create the container for a slide presentation. You can define the position and appearance of the presentation controls, the background color, and the text for the presentation. Also, use this tag to determine whether to write the presentation to files or to run it directly in the client browser.

The settings in the `cfpresentation` tag do not affect the appearance of the content defined in the `cfpresentationslide` tags.

### destination attribute

Use the following syntax to specify an in-memory file, which is not written to disk in the `destination` attribute. In-memory files speed processing of transient data.

```
ram:///filepath
```

The filepath can include directories, for example `ram:///petStore/presentations/quarterlyresults.html`. Create the directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files in the Developing ColdFusion Applications*.

### Named colors

The `cfpresentation` tag supports the following named colors for use with the `backgroundColor`, `glowColor`, `lightColor`, `primaryColor`, `shadowColor`, and `textColor` attributes:

Named color	Hexadecimal value
red	FF0000
green	008000
blue	0000FF
black	000000
white	FFFFFF
yellow	FFFF00
gray	808080
darkgray	A9A9A9
lightgray	D3D3D3
cyan	00FFFF

Named color	Hexadecimal value
magenta	FF00FF
orange	FFA500
pink	FFC0CB

### Example

```
<!-- This example shows how to create a slide presentation from --->
<!-- an HTML file and from HTML code on the CFM page and write --->
<!-- the presentation files to a directory called myPresentation, --->
<!-- which is relative to the CFM page. --->
<cfpresentation title="Sales Presentation" directory="myPresentation">
    <cfpresenter name="Shyam" title="Vice President" email="shyam@somecompany.com"
image="shyam.jpg">
    <cfpresenter name="Ram" title="Sr. Vice President" email="ram@somecompany.com">

<!-- The following code creates a slide from an HTML file --->
<!-- located on the ColdFusion server. --->
    <cfpresentationslide src="introduction.htm" title="Introduction" presenter="Shyam"
        audio="myAudio.mp3" duration="36"/>

<!-- The following code creates a slide from HTML code in the CFM file. --->
    <cfpresentationslide>
        <h3>Sales</h3>
        <ul>
            <li>Overview</li>
            <li>Q1 Sales Figures</li>
            <li>Projected Sales</li>
            <li>Competition</li>
            <li>Advantages</li>
            <li>Long Term Growth</li>
        </ul>
    </cfpresentationslide>

<!-- The following code creates a slide from HTML and CFML code. --->
    <cfpresentationslide Title="Q1 Sales Figures" duration="14" presenter="Ram"
        audio="myAudio2.mp3">
        <h3>Q1 Sales Figures</h3>
        <cfchart format="png" showborder="yes" chartheight="250" chartwidth="300"
            pieslicestyle="sliced">
        <cfchartseries type="pie">
            <cfchartdata item="Europe" value="9">
            <cfchartdata item="Asia" value="20">
            <cfchartdata item="North America" value="50">
            <cfchartdata item="South America" value="21">
        </cfchartseries>
        </cfchart>
    </cfpresentationslide>
</cfpresentation>
```

## cfpresentationslide

### Description

Creates a slide dynamically from a source file or HTML and CFML code on the ColdFusion page. The `cfpresentationslide` is a child tag of the `cfpresentation` tag.

### History

ColdFusion 9: Added the `slides` attribute. Added PowerPoint file support to the `src` attribute.

ColdFusion 8: Added this tag.

### Category

[Data output tags](#)

### Syntax

```
<cfpresentation ...>
  <cfpresentationslide
    advance = "auto|never|click"
    audio = "pathname relative to the CFM page or the web root for audio file"
    authPassword = "authentication password"
    authUser = "authentication user name"
    duration = "duration of slide in seconds"
    marginBottom = "margin in pixels"
    marginLeft = "margin in pixels"
    marginRight = "margin in pixels"
    marginTop = "margin in pixels"
    notes = "text string"
    presenter = "presenter name"
    scale = "decimal"
    src = "absolute path|URL|path relative to CFM page"
    title = "text string"
    userAgent = "HTTP user agent identifier"
    video = "pathname relative to the CFM page
             or the web root for video file"
    useExternalProgram = "true|false" />
</cfpresentation>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfchart](#), [cfpresentation](#), [cfpresenter](#), [cfreport](#), Creating Slide Presentations in the *Developing ColdFusion Applications*

## Attributes

Attribute	Req/Opt	Default	Description
advance	Optional	See Description	Overrides the <code>cfpresentation</code> tag <code>autoPlay</code> attribute for the slide: <ul style="list-style-type: none"> <li><code>auto</code>: after the slide plays, the presentation advances to the next slide automatically. This is the default value if <code>cfpresentation autoPlay="yes"</code>.</li> <li><code>never</code>: after the slide plays, the presentation does not advance to the next slide until the user clicks the Next button. This is the default value if <code>cfpresentation autoPlay="no"</code>.</li> <li><code>click</code>: after the slide plays, the presentation advances to the next slide if the user clicks anywhere in the main presentation area.</li> </ul>
audio	Optional		Pathname of the audio file relative to the CFM page or the web root. The audio file must be an MP3 file.  You cannot specify both audio and video for a slide.
authPassword	Optional		Use to pass a password to the target URL for Basic Authentication. Combined with <code>username</code> to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerberos authentication.
authUser	Optional		Use to pass a user name to the target URL for Basic Authentication. Combined with <code>password</code> to form a base64 encoded string that is passed in the Authenticate header. Does not provide support for Integrated Windows, NTLM, or Kerberos authentication.
duration	Optional		Duration in seconds that the slide is played. If you do not specify a duration, the slide plays for the duration of the audio clip associated with the slide.
marginBottom	Optional	0	Bottom margin of the slide.
marginLeft	Optional	0	Left margin of the slide.
marginRight	Optional	0	Right margin of the slide
marginTop	Optional	0	Top margin of the slide
notes	Optional		Notes used for the slide. Notes are displayed only if the <code>showNotes</code> attribute of the <code>cfpresentationslide</code> tag is set to <code>yes</code> .
presenter	Optional		Presenter of the slide. A slide can have only one presenter. This name must match one of the presenter names in the <code>cfpresenter</code> tag.
scale	Optional	1.0	Scale used for the HTML content in the slide presentation. If you do not specify the scale, ColdFusion automatically scales the content to fit in the slide.
slides	Optional	All slides	Specifies the slide numbers required to export when the <code>src</code> attribute points to a PowerPoint file. Use a hyphen to specify a range; use a comma to specify non-contiguous slides. For example:  <code>slides="1-10"</code> or <code>slides="1,10"</code>

Attribute	Req/Opt	Default	Description
src	Optional		HTML, SWF, or PPT source files used as a slide. You can specify the following as the slide source: <ul style="list-style-type: none"><li>• An absolute path</li><li>• A path relative to the CFM page</li><li>• A URL: Specify if the source returns HTML content</li></ul> SWF files must be present on the system running ColdFusion and the path must be either an absolute path or a path relative to the CFM page.  If you do not specify a source file, include HTML/CFML code as the body. If you specify a source file and HTML /CFML, ColdFusion ignores the source file and displays the HTML/CFML content in the slide.
title	Optional		Title of the slide
userAgent	Optional	ColdFusion	Text to put in the HTTP User-Agent request header field. Identifies the request client software.
useExternalProgram	Optional	true	Boolean value to switch between OpenOffice and POI libraries: <ul style="list-style-type: none"><li>• true: OpenOffice libraries.</li><li>• false: POI libraries</li></ul>
video	Optional		Video file used for the presenter of the slide. If you specify video for the slide and an image for the presenter, the video is used instead of the image for the slide. You cannot specify both audio and video for a slide. The video must be an FLV or SWF file.  The video file pathname must be relative to the CFM page or the web root.

## Usage

Use the `cfpresentation slide` tag within the `cfpresentation` tag to create a slide presentation from individual SWF or HTML source files. If you do not specify a source file, include the HTML or CFML code for the body of the slide within the `cfpresentation slide` tag. You can assign one presenter to each slide. Use the [cfpresenter](#) tag to define presenters referenced by the `cfpresentation slide` tags.

The following code shows how to create a slide presentation from existing SWF files:

```
<!-- The following example shows how to create a slide presentation -->
<!-- from individual SWF files located on the ColdFusion server. -->
<!-- Because no directory is specified, the presentation runs in -->
<!-- the browser. -->
<cfpresentation title="myPresentation">
    <cfpresentation slide title="1st slide" src="slide1.swf" duration="10"/>
    <cfpresentation slide title="2nd slide" src="slide2.swf"
        audio="audio1.mp3" duration="20"/>
    <cfpresentation slide title="3rd slide" src="slide3.swf"
        audio="audio2.mp3" duration="218"/>
</cfpresentation>
```

**Note:** The `cfpresentation slide` tag requires an end tag. If you specify a source file as the content for the slide instead of CFML and HTML code within start and end tags, use the end slash as a shortcut for the end tag.

You can reference source files from a URL as long as they return HTML content. The following code shows how to create a slide presentation from HTML files located on an external website:

```
<!--- The following example shows how to create a slide presentation --->
<!--- from HTML files located on an external site. --->
<cfpresentation title="USGS Naming Conventions" directory="myPresenation">
  <cfpresenter name="Robert L. Payne" title="Executive Secretary">
    <cfpresentation slide src="http://geonames.usgs.gov/index.html"
      duration="10" presenter="Robert L. Payne"/>
    <cfpresentation slide src="http://geonames.usgs.gov/domestic/index.html"
      duration="15" presenter="Robert L. Payne"/>
    <cfpresentation slide src="http://geonames.usgs.gov/foreign/index.html"
      duration="15" presenter="Trent Palmer"/>
  </cfpresenter>
</cfpresentation>
```

**Note:** *The links within slides created from HTML files are not active.*

Also, you can enter HTML and CFML code as the body for a slide. Within the code, you can include charts, graphs, and images, as the following code shows:

```
<!--- This example shows how to create a slide presentation dynamically --->
<!--- from HTML code and CFML code. Because no directory is specified, --->
<!--- the presentation runs in the client browser. --->
<cfpresentation title="Sales Presentation">
    <cfpresenter name="Shyam" title="Vice President" email="shyam@somecompany.com">
    <cfpresenter name="Ram" title="Sr. Vice President" email="ram@somecompany.com">
    <cfpresentationslide title="Introduction" presenter="Shyam" audio="myAudio3.mp3"
        duration="10">
        <h3>Introduction</h3>
        <table>
            <tr>
                <td>
                    <ul>
                        <li>Overview</li>
                        <li>Q1 Sales Figures</li>
                        <li>Projected Sales</li>
                        <li>Competition</li>
                        <li>Advantages</li>
                        <li>Long Term Growth</li>
                    </ul>
                </td>
                <td></td>
            </tr>
        </table>
    </cfpresentationslide>
    <cfpresentationslide Title="Q1 Sales Figures" duration="14" presenter="Ram"
        audio="myAudio1.mp3">
        <h3>Q1 Sales Figures</h3>
        <cfchart format="png" showborder="yes" chartheight="250" chartwidth="300"
            pieslicestyle="sliced">
            <cfchartseries type="pie">
                <cfchartdata item="Europe" value="9">
                <cfchartdata item="Asia" value="20">
                <cfchartdata item="North America" value="50">
                <cfchartdata item="South America" value="21">
            </cfchartseries>
        </cfchart>
    </cfpresentationslide>
</cfpresentation>
```

## Example

```
<!--- The following example shows how to create a slide presentation --->
<!--- dynamically from HTML in ColdFusion and from HTML files located --->
<!--- on an external site. ColdFusion writes the presentation files --->
<!--- to a directory relative to the CFM page. --->
<cfpresentation title="USGS Naming Conventions" directory="namingConventions">
    <cfpresenter name="Robert L. Payne" title="Executive Secretary">
        <cfpresenter name="Trent Palmer" title="Executive Secretary Foreign Names">
            <cfpresentationsslide presenter="Robert L. Payne">
                <h3>USGS Naming Conventions</h3>
                <ul>
                    <li>Overview</li>
                    <li>General Naming Conventions</li>
                    <li>Domestic Naming Conventions</li>
                    <li>Foreign Naming Conventions</li>
                </ul>
                <p></p>
            </cfpresentationsslide>
            duration="10" presenter="Robert L. Payne"/>
            <cfpresentationsslide src="http://geonames.usgs.gov/domestic/index.html"
                duration="15" presenter="Robert L. Payne"/>
            <cfpresentationsslide src="http://geonames.usgs.gov/foreign/index.html"
                duration="15" presenter="Trent Palmer"/>
        </cfpresentation>
```

## cfpresenter

### Description

Describes a presenter in a slide presentation. A slide presentation can have multiple presenters. The presenters must be referenced from the slides defined by the [cfpresentationsslide](#) tag.

### History

ColdFusion 8: Added this tag.

### Category

[Data output tags](#)

### Syntax

```
<cfpresenter
    biography = "text string"
    email = "e-mail address of the presenter"
    image = "relative pathname for JPG"
    name = "text string"
    logo = "relative pathname for JPG"
    title = "text string">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfchart](#), [cfpresentation](#), [cfpresentationsslide](#)

## Attributes

Attribute	Req/Opt	Default	Description
biography	Optional		A text string that provides information about the presenter; for example, "Sally Maverick has been a top seller of Adobe products for the last five years."
email	Optional		E-mail address of the presenter. This attribute activates the Contact link in the presentation control panel, which opens an e-mail message when you click it.
image	Optional		Pathname for the presenter's image in JPEG format. The JPEG file must be relative to the CFM page. If you specify a video for the <code>cfpresentationsslide</code> tag, the video clip overrides this value for that slide.
name	Required		Name of the presenter. Use this value in the <code>presenter</code> attribute of the <code>cfpresentationsslide</code> tag to associate the presenter with the slide.
logo	Optional		Pathname of the image file that represents the presenter's logo or the logo of the presenter's organization. The logo must be in JPEG format. The file must be relative to the CFM file website.
title	Optional		Title of the presenter, for example, "VP of Sales".

## Usage

Use the `cfpresenter` tag to define the presenters that you specify for each slide. The presenter information appears in the control panel for the slide to which it is assigned. To specify a presenter for a slide, use the `presenter` attribute of the `cfpresentationsslide` tag.

You can specify an image of the presenter and the presenter's company logo by using the `image` and `logo` attributes of the `presenter` tag, respectively. To display a video clip in place of the presenter's image, you can specify an FLV or SWF file for `video` attribute of the `cfpresentationsslide` tag.

## Example

```
<!--- This example shows how to specify presenters for a slide --->
<!--- presentation and assign a presenter to each slide in the presentation. --->
<cfpresentation title="myPresentation" directory="presentation" overwrite="yes">

<!--- The following code defines three presenters. --->
<cfpresenter name="Shyam" title="President" email="shyam@somecompany.com"
  image="images\shyam01.jpg">
<cfpresenter name="Ram" title="V.P. Sales" email="ram@somecompany.com"
  image="images\ram01.jpg">
<cfpresenter name="Michelle" title="V.P. Engineering"
  email="mhatther@adobe.com" image="images\michelle01.jpg">

<!--- The following code assigns a presenter to each of three slides in the presentation. --->
<cfpresentationsslide title="myFirstSlide" src="slide1.swf" duration="10"
  presenter="Shyam"/>
<cfpresentationsslide title="mySecondSlide" src="slide2.swf" duration="15"
  presenter="Michelle"/>
<cfpresentationsslide title="myThirdSlide" src="slide3.swf" duration="2"
  presenter="Ram"/>

<!--- In the following slide, ColdFusion uses a video clip --->
<!--- instead of the JPEG image for the presenter. --->
<cfpresentationsslide title="myFourthSlide" src="slide4.swf" duration="5"
  presenter="Shyam" video="video\video1.flv"/>
</cfpresentation>
```

## cfprint

### Description

Prints specified pages from a PDF file. Use this tag to perform automated batch print jobs. Use the `cfprint` tag to print any PDF document, including the ones generated by the `cfdocument`, `cfpdf`, and `cfpdfform` tag. Also, you use this tag to print Report Builder reports exported in PDF format.

### History

ColdFusion 8: Added this tag.

### Category

[Data output tags](#)

### Syntax

```
<cfprint
    source = "absolute or relative pathname to a PDF file|PDF document variable"
    attributeStruct = "ColdFusion structure that contains standard print request
        key-value pairs"
    color = "yes|no"
    copies = "number of copies"
    fidelity = "yes|no"
    pages = "page or pages to print"
    password = "PDF source file owner or user password"
    paper = "letter|legal|A4|A5|B4|B5|B4-JIS|B5-JIS|any media supported by the printer"
    printer = "string that specifies the printer name"
    type = "PDF">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

### Attributes

Attribute	Req/Opt	Default	Description
<code>attributeStruct</code>	Optional		ColdFusion structure used to specify additional print instructions. Individually named attributes take precedence over the key-value pairs in the attribute structure. For information about key-value pairs, see the table in the section <code>attributeStruct</code> .
<code>color</code>	Optional		Color or monochrome printing: <ul style="list-style-type: none"><li><code>yes</code>: print in color</li><li><code>no</code>: print in black and white, with colors in shades of gray</li></ul>
<code>copies</code>	Optional		Number of copies to print. The value must be greater than or equal to 1.

Attribute	Req/Opt	Default	Description
<code>fidelity</code>	Optional	<code>no</code>	Whether to print a job based on the print requirements specified. Valid values are: <ul style="list-style-type: none"> <li><code>yes</code>: if the job cannot be printed exactly as specified in the print requirements, the job is rejected.</li> <li><code>no</code>: a reasonable attempt to print the job is acceptable</li> </ul>
<code>pages</code>	Optional	<code>all</code>	Pages in the source file to print. Duplicate pages and pages beyond the total count of pages in the document are ignored as long as there is at least one page between 1 and the total number of pages in the document. You can combine individual page numbers and page ranges, for example, 1–3,6,10–20. If you do not specify a value for the <code>pages</code> attribute, ColdFusion prints the entire document.
<code>paper</code>	Optional		Paper used for the print job. The value can be any returned by the <a href="#">GetPrinterInfo</a> function. The following values are valid: <ul style="list-style-type: none"> <li><code>na-letter</code></li> <li><code>na-legal</code></li> <li><code>iso-a4</code></li> <li><code>iso-a5</code></li> <li><code>iso-b4</code></li> <li><code>iso-b5</code></li> <li><code>jis-b4</code></li> <li><code>jis-b5</code></li> </ul> For more information, see the section Supported paper types.
<code>password</code>	Optional		The owner or user password for the PDF source file. If the PDF file is password-protected, specify this attribute for the file to print.
<code>printer</code>	Optional		The name of a printer. An example in Windows is <code>\\s1001prn02\NTN-2W-HP_BW02</code> . The default name is the default printer for the account where the ColdFusion server is running. Printer names are case sensitive and must be entered exactly as they appear in the System Information page of the ColdFusion Administrator. For more information, see Usage.
<code>source</code>	Required		Source document to print. Specify one of the following: <ul style="list-style-type: none"> <li>An absolute or relative pathname to an on-disk or in-memory PDF document file, for example, <code>c:\work\myPDF.pdf</code> or <code>myPDF.pdf</code>. The default directory is the template directory.</li> <li>A PDF document variable in memory that is generated by the <code>cfdocument</code> tag or the <code>cfpdf</code> tag, for example, <code>"myPDFdoc"</code>.</li> </ul>
<code>type</code>	Optional	<code>PDF</code>	The file type of the document being printed. The only valid value is <code>PDF</code> .

### Usage

Use the `cfprint` tag for automated batch printing of PDF documents. For example, you can run a batch job each evening that generates a report in PDF format and then prints either the entire report or selected pages for review the next morning without user intervention.

Most of the `cfprint` tag attributes are printer-dependent. If a printer does not support a specified attribute, it ignores the instruction. The default settings for the attributes also are printer-dependent. If you set a default printer, only specify the PDF file source and the password, if the file is password-protected.

**Note:** *The particular printer attributes supported are dependent on the operating system, the network printer server, if there is one, and the printer. The `cfprint` tag is dependent on the Java Print Service (JPS). Many printers support attributes that are not accessible from JPS. For example, the JPS for a Macintosh OSX running JDK 1.5 supports the fewest printer attributes. Upgrading to JDK 1.6 adds some functionality, but finishing attributes are still not supported.*

If the `fidelity` attribute is set to `yes`, the job does not print if any of the specified attributes are not supported by the printer. If the `fidelity` attribute is set to `no`, the printer accepts the print job and either ignores any attribute it does not support or substitutes a reasonable alternative for the attribute.

To determine which attributes are supported on a specified printer, use the [GetPrinterInfo](#) function.

### Supported paper types

You can use the equivalent page types supported by the `cfdocument` tag, but they are not returned by the `GetPrinterInfo` function:

cfdocument	cfprint
<ul style="list-style-type: none"><li>• letter</li><li>• legal</li><li>• A4</li><li>• A5</li><li>• B4</li><li>• B5</li><li>• B4-JIS</li><li>• B5-JIS</li></ul>	<ul style="list-style-type: none"><li>• na-letter</li><li>• na-legal</li><li>• iso-a4</li><li>• iso-a5</li><li>• iso-b4</li><li>• iso-b5</li><li>• jis-b4</li><li>• jis-b5</li></ul>

### View a list of configured printers

- 1 Log on to the ColdFusion Administrator.
- 2 Click the System Information icon located at the top right of the Administrator Console window. (The icon has an “i” on it.)
- 3 Scroll to the bottom of the System Information page. Under Printer Details is the Default Printer. Below the default printer is Printers, which lists the configured printers available to ColdFusion, including the default printer.

Printer configuration is operating system-dependent. Configure printers outside of ColdFusion.

### View the print log

- 1 Log on to the ColdFusion Administrator.
- 2 Expand the Debugging and Logging topic.
- 3 Click the Log Files link. The `print.log` file appears in the list of log files.

### Permissions for printing

If the PDF file is encrypted, the permissions for the file must be set to `AllowPrinting`, or specify the owner password to print the file. Use the `protect` action of the `cfpdf` tag to set permissions and passwords on PDF files. For more information, see Permissions for PDF documents in “[cfpdf](#)” on page 454.

If a Security Manager is installed, the following permission is required in the `coldfusion.policy` file to initiate a print job request:

```
grant { permission java.lang.RuntimePermission "queuePrintJob"; };
```

In Windows systems, the account running the ColdFusion server must have `PRINTER_ACCESS_USE` access rights for each printer it uses. Even if the printer is configured locally on the system, the printer is not available if the account in which ColdFusion is running does not have the proper permissions.

**Note:** By default, ColdFusion installs and runs as the Local System account, which may not have printer queue access rights. For information on running ColdFusion as a specific user, see the following Tech Note:

[http://www.adobe.com/cfusion/knowledgebase/index.cfm?id=tn\\_17279](http://www.adobe.com/cfusion/knowledgebase/index.cfm?id=tn_17279)

### attributeStruct

The following table lists the optional `attributeStruct` key-value pairs that you use to specify print requests:

Element	Description
<code>autoRotateAndCenter</code>	Adjusts the document's orientation to match the orientation specified in the printer attributes and centers the page in the imaging area: <ul style="list-style-type: none"><li>• <code>yes</code>: the orientation, if specified, is ignored (default)</li><li>• <code>no</code>: the orientation, if specified, is applied to the document</li></ul>
<code>collate</code> or <code>sheetCollate</code>	Specifies whether the sheets of each copy of each printed document in a job are in sequence when multiple copies of the document are specified by the <code>copies</code> attribute: <ul style="list-style-type: none"><li>• <code>yes</code></li><li>• <code>no</code></li></ul>
<code>color</code> or <code>chromaticity</code>	Specifies color or monochrome printing. Monochrome printing displays colors in shades of gray: <ul style="list-style-type: none"><li>• <code>yes</code>: print in color.</li><li>• <code>no</code>: print in monochrome.</li></ul>
<code>copies</code>	Number of copies of the source document to print. Valid values are integers greater than or equal to 1.
<code>coverPage</code> or <code>jobSheets</code>	Specifies which job start and end sheets, if any, are printed with a job: <ul style="list-style-type: none"><li>• <code>none</code></li><li>• <code>standard</code></li></ul>
<code>fidelity</code>	Specifies whether to print a job based on the print requirements specified. The following values are valid values: <ul style="list-style-type: none"><li>• <code>yes</code>: If the job cannot be printed exactly as specified in the print requirements, the job is rejected.</li><li>• <code>no</code>: A reasonable attempt to print the job is acceptable (default).</li></ul>

Element	Description
<code>finishings</code>	<p>Finishing operation to perform after each copy of a document is printed:</p> <ul style="list-style-type: none"> <li>• <code>staple-top-left</code></li> <li>• <code>staple-bottom-left</code></li> <li>• <code>staple-top-right</code></li> <li>• <code>staple-bottom-right</code></li> <li>• <code>edge-stitch-left</code></li> <li>• <code>edge-stitch-right</code></li> <li>• <code>edge-stitch-top</code></li> <li>• <code>edge-stitch-bottom</code></li> <li>• <code>dual-right</code></li> <li>• <code>dual-top</code></li> <li>• <code>dual-bottom</code></li> <li>• <code>dual-left</code></li> </ul>
<code>jobHoldUntil</code>	Date-time attribute for the exact date and time at which the job is available for printing. Valid values are ColdFusion date and time variables.
<code>jobName</code>	The name of a print job.
<code>jobPriority</code>	Integer value that represents a print job's priority. Among those jobs that are ready to print, a printer must print all jobs with a priority value of <i>n</i> before printing those with a priority value of <i>n-1</i> for all <i>n</i> . Valid values are integers from 1 (lowest priority) through 100 (highest priority).
<code>numberUp</code>	Number of pages to print on a single side of paper. The value must be a number greater than or equal to 1.
<code>orientation</code> or <code>orientationRequested</code>	Orientation of the page to be printed. The only valid value for PDF documents is <code>portrait</code> . To change the orientation to <code>landscape</code> , set the <code>autoRotateAndCenter</code> to <code>yes</code> (which is the default value). The <code>autoRotateAndCenter</code> instruction overrides the <code>orientation</code> instruction.
<code>pages</code>	Pages in the source file to print. Duplicate pages and pages beyond the total count of pages in the document are ignored as long as there is at least one page between 1 and the total number of pages in the document. You can combine individual page numbers and page ranges, for example, <code>1-3,6,10-20</code> . If you do not specify a value for the <code>pages</code> attribute, ColdFusion prints the entire document.
<code>pageScaling</code>	<p>Specifies how pages are scaled on the paper:</p> <ul style="list-style-type: none"> <li>• <code>fit-to-printer-margins</code>: Reduces or enlarges each page to fit the printable area of the currently selected paper size.</li> <li>• <code>reduce-to-printer-margins</code>: Shrinks large pages to fit the currently selected paper size but does not enlarge small pages. If an area is selected and is larger than the printable area of the currently selected paper, the page is scaled to fit the printable area (Default).</li> <li>• <code>none</code>: Prints the upper left or center of a page (if autorotated and centered) without scaling. Pages that don't fit on the paper are cropped.</li> </ul>
<code>pageSubset</code>	<p>Prints a subset of pages in specified by the <code>pages</code> attribute:</p> <ul style="list-style-type: none"> <li>• <code>all</code>: Prints all the pages in the specified page range (Default).</li> <li>• <code>odd</code>: Prints only the odd pages in the specified page range.</li> <li>• <code>even</code>: Prints only the even pages in the specified page range.</li> </ul>

Element	Description
paper	Paper used for the print job. The value can be any returned by the <a href="#">GetPrinterInfo</a> function. The following values are the most common: <ul style="list-style-type: none"> <li>na-letter</li> <li>iso-a4</li> </ul>
presentationDirection	Used in conjunction with the <code>numberUp</code> attribute to indicate the layout of multiple document pages on one side of the paper.
printer	The name of a printer. An example in Windows is \\s1001prn02\NTN-2W-HP_BW02. The default name is the default printer for the account where the ColdFusion server is running. Printer names are case sensitive and you must enter the names exactly as they appear in the System Information page of the ColdFusion Administrator. For more information on viewing print logs, see Usage.
quality	Print quality for the print job: <ul style="list-style-type: none"> <li>draft</li> <li>high</li> <li>normal</li> </ul>
requestingUserName	A string that specifies the name of the end user that submitted the print job.
reversePages	Prints pages in reverse order. If page ranges are entered, the pages print opposite of the order in which they were entered. For example, if the Pages box shows 3-5, 7-10, selecting Reverse Pages prints pages 10-7, and then 5-3. <ul style="list-style-type: none"> <li>yes</li> <li>no (default)</li> </ul>
sides	Sides of the paper on which the pages are printed: <ul style="list-style-type: none"> <li>one-sided (default)</li> <li>duplexor two-sided-long-edge</li> <li>tumbleor two-sided-short-edge</li> </ul>
usePdfPageSize	Uses the PDF page size to determine the area of the paper printed rather than the paper size. This is useful for printing PDF documents that contain multiple page sizes: <ul style="list-style-type: none"> <li>yes</li> <li>no (default)</li> </ul>

### Example

The following example shows how to use the `attributeStruct` attribute and the `cfprint` tag to print five, double-sided copies of a letter-sized PDF document, which are stapled on the top-left corner and collated:

```
<cfset aset=StructNew()>
<cfset aset["sides"] = "duplex">
<cfprint type="pdf" source="myfile.pdf"
    printer="\\s1001prn02\NTN-2W-HP_BW02" copies="5" paper="letter"
    attributeStruct="#aset#">
```

The following example shows how to specify all of the print attributes with the `attributeStruct` attribute:

```
<cfset aset=StructNew()>
<cfset aset["paper"] = "letter">
<cfset aset["sides"] = "duplex">
<cfset aset["copies"] = "5">
<cfset aset["printer"] = "\\s1001prn02\NTN-2W-HP_BW02">

<cfprint type="pdf" source="myfile.pdf" attributeStruct="#aset#">
```

Printers have a setting called `autoRotateAndCenter`, which is set to `yes` by default. The following example shows how to override the default `autoRotateAndCenter` setting and use the `orientation` setting instead:

```
<cfset aset=StructNew()>
  <cfset aset["autoRotateAndCenter"] = "no">
  <cfset aset["orientation"] = "portrait">

  <cfprint printer="myprinter" source="_mydoc.pdf" attributeStruct="#aset#">
```

To run a print job asynchronously, start a print job in a thread. Do not wait for the print job to be sent to the printer before proceeding. To start a print job in a thread, enclose the `cfprint` tag within `cfthread` start and end tags, as the following example shows:

```
<cfthread name="mythread" action="run">
  <cfprint type="pdf" source="myfile.pdf" printer="//s1001prn02\NTN-2W-HP_BW02">
</cfthread>
....
```

For more information, see “[cfthread](#)” on page 632.

## cfprocessingdirective

### Description

Provides the following information to ColdFusion about how to process the current page:

- Specifies whether to remove excess whitespace character from ColdFusion generated content in the tag body.
- Identifies the character encoding (character set) of the page contents.

### Category

[Data output tags](#), [Page processing tags](#)

### Syntax

```
<cfprocessingdirective
  pageencoding = "page-encoding literal string"/>
```

OR

```
<cfprocessingdirective
  pageEncoding = "page-encoding literal string"
  suppressWhiteSpace = "yes|no">
  CFML tags
</cfprocessingdirective>
```

### See also

[cfcol](#), [cfcontent](#), [cfoutput](#), [cfsetting](#), [cfsilent](#), [cftable](#); Developing Globalized Applications in the *Developing ColdFusion Applications*

## History

ColdFusion MX:

- Changed `suppresswhitespace` attribute value behavior: you can specify the `suppresswhitespace` attribute value as a string variable. (ColdFusion 5 supported setting it only as a constant.)
- Added the `pageEncoding` attribute.

## Attributes

Attribute	Req/Opt	Default	Description
<code>pageEncoding</code>	Optional	Character encoding identified by the page byte order mark, if any; otherwise, system default encoding	<p>A string literal; cannot be a variable. Identifies the character encoding of the current CFML page. This attribute affects the entire page, not just the <code>cfprocessing</code> tag body. The value may be enclosed in single- or double-quotation marks, or none.</p> <p>The following list includes commonly used values:</p> <ul style="list-style-type: none"><li>• <code>utf-8</code></li><li>• <code>iso-8859-1</code></li><li>• <code>windows-1252</code></li><li>• <code>us-ascii</code></li><li>• <code>shift_jis</code></li><li>• <code>iso-2022-jp</code></li><li>• <code>euc-jp</code></li><li>• <code>euc-kr</code></li><li>• <code>big5</code></li><li>• <code>euc-cn</code></li><li>• <code>utf-16</code></li></ul> <p>For more information on character encodings, see <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>.</p>
<code>suppressWhiteSpace</code>	Optional		Boolean; whether to suppress white space characters within the <code>cfprocessingdirective</code> block that are generated by CFML tags and often do not affect HTML appearance. Does not affect any white space in HTML code.

## Usage

The `cfprocssingdirective` tag has limitations that depend on the attribute you use. For this reason, Adobe recommends that you include either the `pageencoding` or `suppresswhitespace` attribute in a `cfprocessingdirective` tag, not both. To specify both values, use separate tags.

In a ColdFusion component (.cfc file), the `cfprocessingdirective` tag must follow the `cfcomponent` tag.

If you use the `pageEncoding` attribute, the following rules apply:

- You must put the tag within the first 4096 bytes of a page. It can be positioned after a `cfsetting` or `cfsilent` tag.
- If you use the tag on a page that includes other pages by using the `cfinclude` or `cfmodule` tags, custom tag invocation, and so on, the tag has no effect on the included pages.

- You cannot embed the tag within conditional logic, because the `pageEncoding` attribute is evaluated when ColdFusion compiles a page (not when it executes the page). For example, the following code has no effect at execution time, because the `cfprocessingdirective` tag has already been evaluated:

```
<cfif dynEncoding is not "dynamic encoding is not possible">
  <cfprocessingdirective pageencoding=#dynEncoding#>
</cfif>
```

- If you have multiple `cfprocessingdirective` tags in one page that specify the `pageEncoding` attribute, they must all specify the same value; if not, ColdFusion throws an error.
- If you specify only the `pageencoding` attribute, do not use a separate end tag.
- ColdFusion accepts character encoding names that are supported by the Java platform. If an invalid name is specified, ColdFusion throws an `InvalidEncodingSpecification` exception.
- If a page has a byte order mark (BOM), and a `pageencoding` attribute specifies an encoding that differs from the BOM, ColdFusion generates an error.

The following rules apply to the `suppressWhiteSpace` attribute:

- You can specify the `suppresswhitespace` attribute value as a constant or a variable. To use a variable: define the variable (for example, `whitespaceSetting`), assign it the value yes or no, and code a statement such as the following:

```
<!-- ColdFusion allows suppression option to be set at runtime -->
<cfprocessingdirective suppresswhitespace=#whitespaceSetting#>
code to whose output the setting is applied
</cfprocessingdirective>
```

- The `suppresswhitespace` attribute only affects code that you put between the `<cfprocessingdirective>` begin tag and the `</cfprocessingdirective>` end tag.

The following example shows the use of a nested `cfprocessingdirective` tag. The outer tag suppresses unnecessary whitespace during computation of a large table; the inner tag retains whitespace, to output a preformatted table.

### Example

```
<cfprocessingdirective suppressWhiteSpace = "Yes">
  <!-- CFML code -->
  <cfprocessingdirective suppressWhiteSpace = "No">
    <cfoutput>#table_data#
  </cfoutput>
</cfprocessingdirective>
</cfprocessingdirective>
```

The following example shows the use of the `pageencoding` attribute:

```
<cfprocessingdirective pageencoding = "shift_jis">
```

## cfprocparam

### Description

Defines stored procedure parameters. This tag is nested within a `cfstoredproc` tag.

### Category

[Database manipulation tags](#)

### Syntax

```
<cfprocparam  
    CFSQLType = "parameter data type"  
    maxLength = "length"  
    null = "yes|no"  
    scale = "decimal places"  
    type = "in|out|inout"  
    value = "parameter value"  
    variable = "variable name">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfinsert](#), [cfprocresult](#), [cfquery](#), [cfqueryparam](#), [cfstoredproc](#), [cftransaction](#), [cfupdate](#); [Optimizing ColdFusion applications in Designing and Optimizing a ColdFusion Application in the Developing ColdFusion Applications](#)

### History

ColdFusion MX:

- The `maxrows` attribute is obsolete.
- Changed the `dbvarname` attribute behavior: it is now ignored for all drivers. ColdFusion uses JDBC 2.2 and does not support named parameters. This is deprecated.
- Changed the `maxLength` attribute behavior: it now applies to IN and INOUT parameter values.

## Attributes

Attribute	Req/Opt	Default	Description
CFSQLType	Required		<p>SQL type to which the parameter (any type) is bound. ColdFusion supports the following values, where the last element of the name corresponds to the SQL data type. Different database systems might support different subsets of this list. For information on supported parameter types, see your DBMS documentation.</p> <ul style="list-style-type: none"> <li>• CF_SQL_BIGINT</li> <li>• CF_SQL_BIT</li> <li>• CF_SQL_BLOB</li> <li>• CF_SQL_CHAR</li> <li>• CF_SQL_CLOB</li> <li>• CF_SQL_DATE</li> <li>• CF_SQL_DECIMAL</li> <li>• CF_SQL_DOUBLE</li> <li>• CF_SQL_FLOAT</li> <li>• CF_SQL_IDSTAMP</li> <li>• CF_SQL_INTEGER</li> <li>• CF_SQL_LONGVARCHAR</li> <li>• CF_SQL_MONEY</li> <li>• CF_SQL_MONEY4</li> <li>• CF_SQL_NUMERIC</li> <li>• CF_SQL_REAL</li> <li>• CF_SQL_REFCURSOR</li> <li>• CF_SQL_SMALLINT</li> <li>• CF_SQL_TIME</li> <li>• CF_SQL_TIMESTAMP</li> <li>• CF_SQL_TINYINT</li> <li>• CF_SQL_VARCHAR</li> </ul> <p>For a mapping of ColdFusion SQL data types to JDBC data types, see <a href="#">cfqueryparam</a>.</p>
maxLength	Optional	0	<p>Maximum length of a string or character IN or INOUT value attribute. A <code>maxLength</code> of 0 allows any length. The <code>maxLength</code> attribute is not required when specifying <code>type=out</code>.</p>
null	Optional	no	<p>Whether the parameter is passed in as a null value. Not used with OUT type parameters.</p> <ul style="list-style-type: none"> <li>• <code>yes</code>: tag ignores the <code>value</code> attribute.</li> <li>• <code>no</code></li> </ul>

Attribute	Req/Opt	Default	Description
scale	Optional	0	Number of decimal places in numeric parameter. A <code>scale</code> of 0 limits the value to an integer.
type	Optional	in	<ul style="list-style-type: none"> <li><code>in</code>: the parameter is used to send data to the database system only. Passes the parameter by value.</li> <li><code>out</code>: the parameter is used to receive data from the database system only. Passes the parameter as a bound variable.</li> <li><code>inout</code>: the parameter is used to send and receive data. Passes the parameter as a bound variable.</li> </ul>
value	Required if <code>type="IN"</code>		Value that ColdFusion passes to the stored procedure. This is optional for <code>inout</code> parameters.
variable	Required if <code>type="OUT"</code> or <code>"INOUT"</code>		ColdFusion variable name; references the value that the output parameter has after the stored procedure is called. This is ignored for <code>in</code> parameters.

### Usage

Use this tag to identify stored procedure parameters and their data types. Code one `cfprocparam` tag for each parameter. The parameters that you code vary based on parameter type and DBMS. ColdFusion supports positional parameters. If you use positional parameters, you must code `cfprocparam` tags in the same order as the associated parameters in the stored procedure definition.

Output variables are stored in the ColdFusion variable specified by the `variable` attribute.

You cannot use the `cfprocparam` tag for Oracle 8 and 9 reference cursors. Instead, use the `cfprocresult` tag.

### Example

The following examples list the equivalent Oracle and Microsoft SQL Server stored procedures that insert data into the database. The CFML to invoke either stored procedure is the same.

The following example shows the Oracle stored procedure:

```
CREATE OR REPLACE PROCEDURE Insert_Book (
    arg_Title Books.Title%type,
    arg_Price Books.Price%type,
    arg_PublishDate Books.PublishDate%type,
    arg_BookID OUT Books.BookID%type)
AS
    num_BookID NUMBER;
BEGIN
    SELECT seq_Books.NEXTVAL
    INTO num_BookID
    FROM DUAL;

    INSERT INTO
        Books (
            BookID,
            Title,
            Price,
            PublishDate )
    VALUES (
        num_BookID,
        arg_Title,
        arg_Price,
        arg_PublishDate );

    arg_BookID := num_BookID;
END;
/
```

The following example shows the SQL Server stored procedure:

```
CREATE PROCEDURE Insert_Book (
    @arg_Title VARCHAR(255),
    @arg_Price SMALLMONEY,
    @arg_PublishDate DATETIME,
    @arg_BookID INT OUT)
AS
BEGIN
    INSERT INTO
        Books (
            Title,
            Price,
            PublishDate )
    VALUES (
        @arg_Title,
        @arg_Price,
        @arg_PublishDate );

    SELECT @arg_BookID = @@IDENTITY;
END;
```

You use the following CFML code to call either stored procedure:

```
<cfset ds = "sqltst">
<!--- <cfset ds = "oratst"> --->

<!--- If submitting a new book, insert the record and display confirmation --->
<cfif isDefined("form.title")>
    <cfstoredproc procedure="Insert_Book" datasource="#ds#">
        <cfprocparam cfsqltype="cf_sql_varchar" value="#form.title#">
        <cfprocparam cfsqltype="cf_sql_numeric" value="#form.price#">
        <cfprocparam cfsqltype="cf_sql_date" value="#form.price#">
        <cfprocparam cfsqltype="cf_sql_numeric" type="out" variable="bookId">
    </cfstoredproc>

    <cfoutput>
        <h3>'#form.title#' inserted into database.The ID is #bookId#.</h3>
    </cfoutput>

</cfif>
<cfform action="#CGI.SCRIPT_NAME#" method="post">
    <h3>Insert a new book</h3>

    Title:
    <cfinput type="text" size="20" required="yes" name="title"/>
    <br/>

    Price:
    <cfinput type="text" size="20" required="yes" name="price" validate="float"/>
    <br/>

    Publish Date:
    <cfinput type="text" size="5" required="yes" name="publishDate" validate="date"/>
    <br/>

    <input type="submit" value="Insert Book"/>

</cfform>
```

## cfprocrresult

### Description

Associates a query object with a result set returned by a stored procedure. Other ColdFusion tags, such as `cfoutput` and `cftable`, use this query object to access the result set. This tag is nested within a `cfstoredproc` tag.

### Category

[Database manipulation tags](#)

### Syntax

```
<cfprocrresult
    name = "query name"
    maxRows = "number"
    resultSet = "1-n">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfinsert](#), [cfprocparam](#), [cfquery](#), [cfqueryparam](#), [cfstoredproc](#), [cftransaction](#), [cfupdate](#); Optimizing database use in Designing and Optimizing a ColdFusion Application in the *Developing ColdFusion Applications*

### Attributes

Attribute	Req/Opt	Default	Description
name	Required		Name for the query result set.
maxRows	Optional	-1 (All)	Maximum number of rows returned in result set.
resultSet	Optional	1	Names one result set, if stored procedure returns more than one.

### Usage

To enable access to data returned by the stored procedure, specify one or more `cfprocresult` tags. If the stored procedure returns more than one result set, use the `resultSet` attribute to specify which of the stored procedure's result sets to return.

The `resultSet` attribute must be unique within the scope of the `cfstoredproc` tag. If you specify a result set twice, the second occurrence overwrites the first.

CFML supports Oracle 8 and 9 Reference Cursor type, which passes a parameter by reference. Parameters that are passed this way can be allocated and deallocated from memory within the execution of one application. To use reference cursors in packages or stored procedures, use the `cfprocresult` tag. This causes the ColdFusion JDBC database driver to put Oracle reference cursors into a result set. (You cannot use this method with Oracle's ThinClient JDBC drivers.)

### Example

```
<!--- This example executes a Sybase stored procedure that returns three result sets, two
      of which we want. The stored procedure returns status code and one output parameter, which
      we display. We use named notation for parameters. --->
<!--- cfstoredproc tag --->
<cfstoredproc procedure = "foo_proc"
  dataSource = "MY_SYBASE_TEST" username = "sa"
  password = "" dbServer = "scup" dbName = "pubs2"
  returnCode = "Yes" debug = "Yes">
  <!--- cfprocresult tags --->
  <cfprocresult name = RS1>
  <cfprocresult name = RS3 resultSet = 3>
  <!--- cfprocparam tags --->
  <cfprocparam type = "IN" CFSQLType = CF_SQL_INTEGER value = "1">
  <cfprocparam type = "OUT" CFSQLType = CF_SQL_DATE variable = FOO>
  <!--- Close the cfstoredproc tag. --->
</cfstoredproc>
<cfoutput>
  The output param value: '#foo#'  
</cfoutput>
<h3>The Results Information</h3>
<cfoutput query = RS1>#name#,#DATE_COL#<br>
</cfoutput>
<p></p>
<cfoutput>
  <hr>
  <p>Record Count: #RS1.recordCount# <p>Columns: #RS1.columnList#</p>
  <hr>
</cfoutput>
<cfoutput query = RS3>#col1#,#col2#,#col3#<br>
</cfoutput>
<p></p>
<cfoutput>
  <hr>
  <p>Record Count: #RS3.recordCount# <p>Columns: #RS3.columnList#</p>
  <hr>
  The return code for the stored procedure is:
  '#cfstoredproc.statusCode#'  
</cfoutput>
...
```

## cfprogressbar

### Description

Defines a progress bar to indicate the progress of an activity such as a file download.

### Category

[Display management tags](#)

## Syntax

```
<cfprogressbar
    autoDisplay="true|false"
    name="control identifier"
    bind ="bind expression"
    duration="time value"
    height="height in pixels"
    interval="time in milliseconds"
    onComplete="function name"
    onError="JavaScript function name"
    style="style specification"
    width="pixel value">
```

## History

ColdFusion 9: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
autoDisplay	Optional	true	Set to true to display the progress bar.
name	Required		The control name. Used to refer to the control in JavaScript, for example in the script that starts the progress.
bind	Required if duration is not specified		A bind expression specifying a client JavaScript function or server CFC that the control calls to get progress information each time the period defined by the interval attribute elapses. You cannot use this attribute with a duration attribute.  If an error occurs, no further bind expression calls are triggered and onError is called (if defined).
duration	Required if bind is not specified		The time, in milliseconds, between when the bar starts showing progress and when it shows completed progress. Use only on automatic progress bars that do not use a bind expression to get actual progress information. You cannot use this attribute with a bind attribute.
height	Optional		Height of the bar in pixels.
interval	Optional	1000	Used if duration is specified. The time interval, in milliseconds, at which the progress bar updates. Although this attribute is optional, specify it to prevent the bar from updating frequently.
onComplete	Optional		The name of a function to call when progress completes.
onError			Applies only if you use bind. The JavaScript function to run on an error condition. The error can be a network error or server-side error.
style	Optional		The following are the supported colors: <ul style="list-style-type: none"> <li>bgcolor: The background color for the progress bar. A hexadecimal value without "#" prefixed.</li> <li>textcolor: Text color on progress bar.</li> <li>progresscolor: Color used to indicate the progress.</li> </ul>
width	Optional	400	The width (length) of the bar in pixels.

## Usage

A progress bar has one of two behaviors:

- Manual, where the progress indicator length increases steadily over a time specified by the `duration` attribute.
- Dynamic, where the `bind` attribute specifies a function that determines the indicator length.

If you use a `bind` expression, the called function takes no parameters, and must return a structure with two values:

- `status` - A decimal completion value, in the range 0 -1.0
- `message` - A message to display in the progress bar, such as "Loading..." or "Completed".

You use two Ajax functions to start and stop the progress bar:

```
ColdFusion.ProgressBar.start(barName)  
ColdFusion.ProgressBar.stop(barName)
```

You must call the `start` method to start the progress bar.

You call the `stop` method to explicitly stop the progress bar. The bar stops automatically when the `bind` method returns a `status` value of 1 or the period specified by the `duration` attribute elapses. Therefore, you need to use this method only if a process does not complete, if the process completes before the `duration` period, or in other nonstandard situations, such as error conditions.

## Example

The following uses a simple comment form, and uses a timer to simulate the time it would take to process the form.

The `Application.cfc` page must enable session management.

The main application page contains the following code:

```
<!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"  
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">  
<html xmlns="http://www.w3.org/1999/xhtml">  
<head>  
<meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1" />  
<title>Untitled Document</title>  
</head>  
  
<script type="text/javascript">  
// The function that starts the progress bar,  
// called when the user clicks the Send comment button.  
function startProgress() {  
    ColdFusion.ProgressBar.start("mydataProgressbar");  
};  
  
// The function called when the progress bar finishes,  
// specified by the cfprogressbar tag onComplete attribute.  
function onfinish() {  
    alert("Done");  
};  
</script>  
  
<body>  
<!-- Ensure there is no Session.STATUS value, which is used by  
the progress bar bind CFC, when the page displays. -->  
<cfif IsDefined("Session.STATUS")>  
    <cfscript>  
        StructDelete(Session, "STATUS");
```

The `mycfc.cfc` file has a single `getStatus` function:

```
<cfcomponent>
<!--- This function simulates the time taken
      by and operation by using sleep functions.
      It increments the progressbar status by 1/10 each time the
      progressbar bind expression calls it (that is, each time the
      time specified by the cfprogressbar interval attribute passes.
--->
  <cffunction name="getstatus" access="remote">
    <cfset str = StructNew()>
    <cfset str.message = "Saving Data">
    <cfif NOT IsDefined("session.STATUS")>
      <cfset session.STATUS = 0.1>
      <cfscript>
        Sleep(200);
      </cfscript>
    <cfelseif session.STATUS LT 0.9>
      <cfset session.STATUS=session.STATUS + .1>
      <cfscript>
        Sleep(200);
      </cfscript>
    <cfelse>
      <cfset str.message = "Done...">
      <cfset session.STATUS="1.0">
    </cfif>
    <cfset str.status = session.STATUS>
    <cfreturn str>
  </cffunction>
</cfcomponent>
```

## cfproperty

### Description

Defines properties and their annotations for a ColdFusion component (CFC). The properties are used to create complex data types for web services, while the annotations are used to define Object Relational Model (ORM) for a CFC. The attributes of this tag are exposed as component metadata and are subject to inheritance rules.

### Category

[Extensibility tags](#)

### Syntax

```
<cfproperty
  name="name"
  default="default value"
  displayname="descriptive name"
  hint="extended description"
  required="false|true"
  serializable="true|false"
  type="type">
```

**Note:** For ORM-related attributes and their usage, see *ColdFusion ORM in the Developing ColdFusion Applications*.

### History

ColdFusion 9: Added attributes for defining Object Relational Model for the CFC.

Added implicit getters and setters. Added validate and validateparams attributes.

ColdFusion MX: Added this tag.

### Attributes

Attribute	Req/Opt	Default	Description
batchsize			For information about these attributes, see ColdFusion ORM.
cascade			
catalog			
cfc			
collectiontype			
column			
constrained			
datatype			
default	Optional		<p>If no property value is set when the component is used for a web service, specifies a default value.</p> <p>If this attribute is present, the <code>required</code> attribute must be set to <code>no</code> or not specified.</p> <p>For ORM-specific usage of the <code>default</code> attribute, see ColdFusion ORM.</p>
displayname	Optional		A value to be displayed when using introspection to show information about the CFC. The value appears in parentheses following the property name.
dynamicInsert			For information about these attributes, see ColdFusion ORM.
dynamicupdate			
elementColumn			
elementtype			
entityname			
fetchbatchsize			
fieldType			
fkcolumn			
formula			
generator			

Attribute	Req/Opt	Default	Description
getter	Optional		Specifies whether to generate getter methods or not. Value are: <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul>
hint	Optional		Text to be displayed when using introspection to show information about the CFC. This attribute can be useful for describing the purpose of the parameter.
index			For information about these attributes, see ColdFusion ORM.
insert			
inverse			
inversejoincolumn			
joincolumn			
lazy			
length			
linkcatalog			
linkschema			
linktable			
mappedby			
missingrowIgnored			
name	Required		A string; a property name. Must be a static value.
notnull			For information about these attributes, see ColdFusion ORM.
optimisticLock			
optimisticLockgenerated			
orderby			
orderByreadonly			
params			For information about these attributes, see ColdFusion ORM.
persistent			
precession			
readonly			
readonly			
required	Optional	no	Whether the parameter is required: <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul>
rowid			For information about these attributes, see ColdFusion ORM.
scale			

Attribute	Req/Opt	Default	Description
setter			Specifies whether to generate setter methods or not. Possible values are: <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul>
schema			For information about these attributes, see ColdFusion ORM.
selectbeforeupdate			
selectkey			
sequence			
serializable	Optional	true	Specifies whether this property can be serialized. If you set this value to <code>false</code> , the property cannot be serialized, so any changes made are not retained on session replication, and the property has its default value (if any) on the second server. Use this attribute to prevent serializaton of properties in CFCs that are serializable.
source			For information about these attributes, see ColdFusion ORM.
structkeycolumn			
structkeycolumn			
structkeydatatype			
structkeyType			
table			
table			

Attribute	Req/Opt	Default	Description
type	Optional	any	<p>A string; identifies the property data type:</p> <ul style="list-style-type: none"><li>• any</li><li>• array</li><li>• binary</li><li>• boolean</li><li>• date</li><li>• guid: the argument must be a UUID or GUID of the form xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx where each x is a character representing a hexadecimal number (0-9A-F).</li><li>• numeric</li><li>• query</li><li>• string</li><li>• struct</li><li>• uuid: The argument must be a ColdFusion UUID of the form xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxxxxxx where each x is a character representing a hexadecimal number (0-9A-F).</li><li>• variableName: a string formatted according to ColdFusion variable naming conventions.</li><li>• a component name: if the type attribute value is not one of the preceding items, ColdFusion treats it as the name of a ColdFusion component. When the function executes, it generates an error if the argument that is passed in is not a CFC with the specified name.</li></ul>
unique			For information about these attributes, see ColdFusion ORM.
uniquekey			
update			
where			
validate	Optional		For more information, see Validate and validateparams attributes.
validateparam	Optional		

### Usage

You must position `cfproperty` tags at the beginning of a component, above executable code and function definitions.

If a component is not used as a web service, `<cfproperty>` only provides metadata information of the property. It does not define variables or set values that you can use in your component. However, it creates implicit setters and getters for the property in the CFC depending on whether getter/setter attributes are enabled. For details, see Implicit Get and Set Functions in *Developing ColdFusion Applications*.

For Object Relational Model (ORM), `cfproperty` is used to define relational mapping for the property of the CFC. For details, see ColdFusion ORM in *Developing ColdFusion Applications*.

For web services that you create in ColdFusion, the `cfproperty` tag defines complex variables used by the web service.

### Example

The following code defines a component in the file `address.cfc` that contains properties that represent a street address:

```
<cfcomponent>
    <cfproperty name="Number" type="numeric">
    <cfproperty name="Street" type="string">
    <cfproperty name="City" type="string">
    <cfproperty name="State" type="string">
    <cfproperty name="Country" type="string">
</cfcomponent>
```

This component represents a complex data type that can be used in a component that is exported as a web service, such as the following:

```
<cfcomponent>
    <cffunction name="echoAddress" returnType="address" access="remote">
        <cfargument name="input" type="address">
        <cfreturn arguments.input>
    </cffunction>
</cfcomponent>
```

## cfquery

### Description

Passes queries or SQL statements to a data source.

Adobe recommends that you use the `cfqueryparam` tag within every `cfquery` tag, to help secure your databases from unauthorized users. For more information, see Security Bulletin ASB99-04, "Multiple SQL Statements in Dynamic Queries," in the Security Zone, [www.adobe.com/go/sn\\_asb99-04](http://www.adobe.com/go/sn_asb99-04), and Accessing and Retrieving Data in the *Developing ColdFusion Applications*.

### Category

Database manipulation tags

### Syntax

```
<cfquery
    name = "query name"
    blockFactor = "block size"
    cachedAfter = "date"
    cachedWithin = "timespan"
    dataSource = "data source name"
    dbtype = "query"
    debug = "yes|no"
    maxRows = "number"
    ormoptions = #orm options structure#
    password = "password"
    result = "result name"
    timeout = "seconds"
    username = "user name">
</cfquery>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

**See also**

[cfdbinfo](#), [cfinsert](#), [cfprocparam](#), [cfprocresult](#), [cfqueryparam](#), [cfstoredproc](#), [cftransaction](#), [cfupdate](#);  
Optimizing database use in the *Developing ColdFusion Applications*

**History**

ColdFusion 9.0.1: Introduced support for HQL queries; added the attribute `ormoptions`.

ColdFusion 9: Datasource attribute is optional now.

ColdFusion 8: Added the result variable that specifies the ID of a row.

ColdFusion MX 7:

- Added the `result` attribute for specifying an alternate name for the structure that holds the result variables.
- Added result variables for the SQL statement executed (`sql`), the number of records returned (`recordcount`), whether the query was cached (`cached`), an array of `cfqueryparam` values (`sqlparameters`), and the list of columns in the returned query (`columnlist`).

ColdFusion MX:

- Changed Query of Queries behavior: it now supports a larger subset of standard SQL.
- Changed dot notation support: ColdFusion now supports dot notation within a record set name. ColdFusion interprets such a name as a structure.
- Deprecated the `connectString`, `dbName`, `dbServer`, `provider`, `providerDSN`, and `sql` attributes, and all values of the `dbtype` attribute except `query`. They do not work, and might cause an error, in releases later than ColdFusion 5.
- New query object variable: `cfquery.ExecutionTime`.
- No longer supports native drivers. It now uses JDBC (and ODBC-JDBC bridge) for database connectivity.

**Attributes**

Attribute	Req/Opt	Default	Description
<code>name</code>	Required		Name of query. Used in page to reference query record set. Must begin with a letter. Can include letters, numbers, and underscores.
<code>blockFactor</code>	Optional	1	Maximum rows to get at a time from server. Range: 1 - 100. Might not be supported by some database systems.
<code>cachedAfter</code>	Optional		Date value (for example, April 16, 1999, 4-16-99). If date of original query is after this date, ColdFusion uses cached query data. To use cached data, current query must use same SQL statement, data source, query name, user name, password.  A date/time object is in the range 100 AD–9999 AD.  When specifying a date value as a string, enclose it in quotation marks.
<code>cachedWithin</code>	Optional		Timespan, using the <a href="#">CreateTimeSpan</a> function. If original query date falls within the time span, cached query data is used. <code>CreateTimeSpan</code> defines a period from the present, back. Takes effect only if query caching is enabled in the Administrator.  To use cached data, the current query must use the same SQL statement, data source, query name, user name, and password.
<code>dataSource</code>	Optional		The Datasource attribute is now optional. If omitted, the query uses the datasource specified in the application. If it is not specified in either places, then the error will be thrown.

Attribute	Req/Opt	Default	Description
dbtype	Optional		Results of a query as input. Specify either <code>dbtype</code> or <code>dataSource</code> .  ColdFusion 9.0.1 supports HQL in <code>cfquery</code> . Therefore, you can specify <code>dbtype="hql"</code> as shown in the following example:  <pre>&lt;cfquery dbtype="hql" name="artists" ormoptions=#{cachename="" }#&gt;from Artists where firstname=&lt;cfqueryparam value="Aiden"&gt;&lt;/cfquery&gt;</pre>
debug	Optional; value and equals sign may be omitted		<ul style="list-style-type: none"><li>• <code>yes</code>, or if omitted: if debugging is enabled, but the Administrator Database Activity option is not enabled, displays SQL submitted to the data source and number of records returned by query.</li><li>• <code>no</code>: if the Administrator Database Activity option is enabled, suppresses display.</li></ul>
maxRows	Optional	-1 (All)	Maximum number of rows to return in record set.
ormoptions Added in ColdFusion 9.0.1	Optional		A struct that takes orm options for executing HQL. Applies only if <code>dbtype</code> is set to <code>hql</code> .
password	Optional		Overrides the password in the data source setup.
result	Optional		Name for the structure in which <code>cfquery</code> returns the result variables. For more information, see <a href="#">Usage</a> .
timeout			Maximum number of seconds that each action of a query is permitted to execute before returning an error. The cumulative time may exceed this value.  For JDBC statements, ColdFusion sets this attribute. For other drivers, see the driver documentation.
username	Optional		Overrides user name in the data source setup.

### Usage

Use this tag to execute a SQL statement against a ColdFusion data source. Although you can use the `cfquery` tag to execute any SQL Data Definition Language (DDL) or Data Manipulation Language (DML) statement, you typically use it to execute a SQL SELECT statement.

**Note:** To call a stored procedure, use the [cfstoredproc](#) tag.

This tag creates a query object, providing this information in query variables:

Variable name	Description
<code>query_name.CurrentRow</code>	Current row of query that <code>cfoutput</code> is processing.
<code>query_name.columnList</code>	Comma-separated list of the query columns.
<code>query_name.RecordCount</code>	Number of records (rows) returned from the query.

The `cfquery` tag also returns the following result variables in a structure. You can access these variables with a prefix of the name you specified in the `result` attribute. For example, if you assign the name `myResult` to the `result` attribute, you would retrieve the name of the SQL statement that was executed by accessing `#myResult.sql#`. The `result` attribute provides a way for functions or CFCs that are called from multiple pages, possibly at the same time, to avoid overwriting results of one call with another. The result variable of INSERT queries contains a key-value pair that is the automatically generated ID of the inserted row; this is available only for databases that support this feature. If more than one record was inserted, the value can be a list of IDs. The key name is database-specific.

Variable name	Description
result_name.sql	The SQL statement that was executed.
result_name.recordcount	Number of records (rows) returned from the query.
result_name.cached	True if the query was cached; False otherwise.
result_name.sqlparameters	An ordered Array of cfqueryparam values.
result_name.columnList	Comma-separated list of the query columns.
result_name.ExecutionTime	Cumulative time required to process the query.
result_name.IDENTITYCOL	SQL Server only. The ID of an inserted row.
result_name.ROWID	Oracle only. The ID of an inserted row. This is not the primary key of the row, although you can retrieve rows based on this ID.
result_name.SYB_IDENTITY	Sybase only. The ID of an inserted row.
result_name.SERIAL_COL	Informix only. The ID of an inserted row.
result_name.GENERATED_KEY	MySQL only. The ID of an inserted row. MySQL 3 does not support this feature.

You can cache query results and execute stored procedures. For information about this and about displaying `cfquery` output, see the *Developing ColdFusion Applications*.

Because the `timeout` attribute only affects the maximum time for each suboperation of a query, the cumulative time may exceed its value. To set a timeout for a page that might get a very large result set, set the Administrator > Server Settings > Timeout Requests option to an appropriate value or use the `RequestTimeout` attribute of the `cfsetting` tag (for example, `<cfsettingrequestTimeout="300">`).

The Caching page of the ColdFusion Administrator specifies the maximum number of cached queries. Setting this value to 0 disables query caching.

You cannot use ColdFusion reserved words as query names.

You cannot use SQL reserved words as variable or column names in a Query of Queries, unless they are escaped. The escape character is the bracket `[]`; for example:

```
SELECT [count] FROM MYTABLE.
```

For a list of reserved keywords in ColdFusion, see Escaping reserved keywords in the *Developing ColdFusion Applications*.

### Example

```
<!--- This example shows the use of CreateTimeSpan with CFQUERY ----->
<!--- to cache a record set. Define startrow and maxrows to ----->
<!--- facilitate 'next N' style browsing. ----->
<cfparam name="MaxRows" default="10">
<cfparam name="StartRow" default="1">
<!------->
Query database for information if cached database information has
not been updated in the last six hours; otherwise, use cached data.
<!------->
<cfquery
    name="GetParks" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT PARKNAME, REGION, STATE
    FROM Parks
    ORDER BY ParkName, State
</cfquery>
<!--- Build HTML table to display query. ----->
<table cellpadding="1" cellspacing="1">
    <tr>
        <td bgcolor="f0f0f0">
            &nbsp;
        </td>
        <td bgcolor="f0f0f0">
            <b><i>Park Name</i></b>
        </td>
        <td bgcolor="f0f0f0">
            <b><i>Region</i></b>
        </td>
        <td bgcolor="f0f0f0">
            <b><i>State</i></b>
        </td>
    </tr>
<!--- Output the query and define the startrow and maxrows parameters.
Use the query variable CurrentCount to keep track of the row you are displaying. ----->
<cfoutput query="GetParks" startrow="#StartRow#" maxrows="#MaxRows#">
    <tr>
        <td valign="top" bgcolor="ffffed">
            <b>#GetParks.CurrentRow#</b>
        </td>
        <td valign="top">
            <font size="-1">#ParkName#</font>
        </td>
```

```
<td valign="top">
    <font size="-1">#Region#</font>
</td>
<td valign="top">
    <font size="-1">#State#</font>
</td>
</tr>
</cfoutput>
<!-- If the total number of records is less than or equal to the total number of rows,
then offer a link to the same page, with the startrow value incremented by maxrows
(in the case of this example, incremented by 10). ----->
<tr>
    <td colspan="4">
        <cfif (StartRow + MaxRows) LTE GetParks.RecordCount>
            <cfoutput><a href="#CGI.SCRIPT_NAME#?startrow=#Evaluate(StartRow + MaxRows)#">
                See next #MaxRows# rows</a></cfoutput>
        </cfif>
    </td>
</tr>
</table>
```

## cfqueryparam

### Description

Verifies the data type of a query parameter and, for DBMSs that support bind variables, enables ColdFusion to use bind variables in the SQL statement. Bind variable usage enhances performance when executing a `cfquery` statement multiple times.

This tag is nested within a `cfquery` tag, embedded in a query SQL statement. If you specify optional parameters, this tag performs data validation.

Adobe recommends that you use the `cfqueryparam` tag within every `cfquery` tag, to help secure your databases from unauthorized users. For more information, see Security Bulletin ASB99-04, “*Multiple SQL Statements in Dynamic Queries*,” at [www.adobe.com/go/sn\\_asb99-04](http://www.adobe.com/go/sn_asb99-04), and Accessing and Retrieving Data in the *Developing ColdFusion Applications*.

### Category

[Database manipulation tags](#)

## Syntax

```
<cfquery
    name = "query name"
    dataSource = "data source name"
    ...other attributes...
    SQL STATEMENT column_name =
    <cfqueryparam value = "parameter value"
        CFSQLType = "parameter type"
        list = "yes|no"
        maxLength = "maximum parameter length"
        null = "yes|no"
        scale = "number of decimal places"
        separator = "separator character">
    AND/OR ...additional criteria of the WHERE clause...>
</cfquery>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## Attributes

Attribute	Req/Opt	Default	Description
value	Required		Value that ColdFusion passes to the right of the comparison operator in a where clause.  If CFSQLType is a date or time option, ensure that the date value uses your DBMS-specific date format. Use the <code>CreateODBCDateTime</code> or <code>DateFormat</code> and <code>TimeFormat</code> functions to format the date value.
CFSQLType	Optional	CF_SQL_CHAR	SQL type that parameter (any type) is bound to: <ul style="list-style-type: none"> <li>• CF_SQL_BIGINT</li> <li>• CF_SQL_BIT</li> <li>• CF_SQL_CHAR</li> <li>• CF_SQL_BLOB</li> <li>• CF_SQL_CLOB</li> <li>• CF_SQL_DATE</li> <li>• CF_SQL_DECIMAL</li> <li>• CF_SQL_DOUBLE</li> <li>• CF_SQL_FLOAT</li> <li>• CF_SQL_IDSTAMP</li> <li>• CF_SQL_INTEGER</li> <li>• CF_SQL_LONGVARCHAR</li> <li>• CF_SQL_MONEY</li> <li>• CF_SQL_MONEY4</li> <li>• CF_SQL_NUMERIC</li> <li>• CF_SQL_REAL</li> <li>• CF_SQL_REFCURSOR</li> <li>• CF_SQL_SMALLINT</li> <li>• CF_SQL_TIME</li> <li>• CF_SQL_TIMESTAMP</li> <li>• CF_SQL_TINYINT</li> <li>• CF_SQL_VARCHAR</li> </ul>
list	Optional	no	<ul style="list-style-type: none"> <li>• yes: the value attribute value is a delimited list.</li> <li>• no</li> </ul>
maxLength	Optional	Length of string in value attribute	Maximum length of parameter. Ensures that the length check is done by ColdFusion before the string is sent to the DBMS, thereby helping to prevent the submission of malicious strings.

Attribute	Req/Opt	Default	Description
null	Optional	no	Whether parameter is passed as a null value: <ul style="list-style-type: none"> <li>yes: tag ignores the value attribute.</li> <li>no</li> </ul>
scale	Optional	0	Number of decimal places in parameter. Applies to CF_SQL_NUMERIC and CF_SQL_DECIMAL.
separator	Required, if you specify a list in value attribute	, (comma)	Character that separates values in list, in value attribute.

### Usage

Use the `cfqueryparam` tag in any SQL statement (for example, SELECT, INSERT, UPDATE, and DELETE) that uses ColdFusion variables.

For maximum validation of string data, specify the `maxLength` attribute.

This tag does the following:

- Allows the use of SQL bind parameters, which improves performance.
- Ensures that variable data matches the specified SQL type.
- Allows long text fields to be updated from a SQL statement.
- Escapes string variables in single-quotation marks.

To benefit from the enhanced performance of bind variables, use `cfqueryparam` for all ColdFusion variables, and your DBMS must support bind variables. If a DBMS does not support bind parameters, ColdFusion validates and substitutes the validated parameter value back into the string. If validation fails, it returns an error message.

The validation rules are as follows:

- For these types, a data value can be converted to a numeric value: CF\_SQL\_SMALLINT, CF\_SQL\_INTEGER, CF\_SQL\_REAL, CF\_SQL\_FLOAT, CF\_SQL\_DOUBLE, CF\_SQL\_TINYINT, CF\_SQL\_MONEY, CF\_SQL\_MONEY4, CF\_SQL\_DECIMAL, CF\_SQL\_NUMERIC, and CF\_SQL\_BIGINT
- For these types, a data value can be converted to a date supported by the target data source: CF\_SQL\_DATE, CF\_SQL\_TIME, CF\_SQL\_TIMESTAMP
- For all other types, if the `maxLength` attribute is used, a data value cannot exceed the maximum length specified.

ColdFusion debug output shows the bind variables as question marks and lists the values beneath the query, in order of usage.

**Note:** To insert an empty string into a Microsoft Access table using the *SequelLink ODBC Socket* or *SequelLink Access driver*, the `CFSQLType` attribute must specify `CF_SQL_LONGVARCHAR`.

The following table shows the mapping of ColdFusion SQL data types with JDBC SQL types and those of the listed database management systems:

ColdFusion	JDBC	DB2	Informix	Oracle	MSSQL
CF_SQL_ARRAY	ARRAY				
CF_SQL_BIGINT	BIGINT	Bigint	int8, serial8		bigint
CF_SQL_BINARY	BINARY	Char for Bit Data			binary timestamp
CF_SQL_BIT	BIT		boolean		bit
CF_SQL_BLOB	BLOB	Blob	blob	blob, bfile	longvarbinary
CF_SQL_CHAR	CHAR	Char	char, nchar	char, nchar	char
CF_SQL_CLOB	CLOB	Clob	clob	clob, nclob	
CF_SQL_DATE	DATE	Date	date, datetime, year to day		date
CF_SQL_DECIMAL	DECIMAL	Decimal	decimal, money	number	decimal
CF_SQL_DISTINCT	DISTINCT				
CF_SQL_DOUBLE	DOUBLE	Double			double
CF_SQL_FLOAT	FLOAT	Float	float	number	real
CF_SQL_IDSTAMP	CHAR	Char	char, nchar	char, nchar	char
CF_SQL_INTEGER	INTEGER	Integer	integer, serial		integer
CF_SQL_LONGVARBINARY	LONGVARBINARY	Long Varchar for Bit Data	byte	long raw	longvarbinary
CF_SQL_LONGVARCHAR	LONGVARCHAR	Long Varchar	text	long	longvarchar
CF_SQL_MONEY	DOUBLE	Double			double
CF_SQL_MONEY4	DOUBLE	Double			double
CF_SQL_NULL	NULL				
CF_SQL_NUMERIC	NUMERIC	Numeric			numeric
CF_SQL_OTHER	OTHER				
CF_SQL_REAL	REAL	Real	smallfloat		real
CF_SQL_REFCURSOR	REF				
CF_SQL_SMALLINT	SMALLINT	Smallint	smallint		smallint
CF_SQL_STRUCT	STRUCT				
CF_SQL_TIME	TIME	Time	datetime hour to second		time
CF_SQL_TIMESTAMP	TIMESTAMP	Timestamp	datetime year to fraction(5), datetime year to second	date	timestamp

ColdFusion	JDBC	DB2	Informix	Oracle	MSSQL
CF_SQL_TINYINT	TINYINT				tinyint
CF_SQL_VARBINARY	VARBINARY	Rowid		raw	varbinary
CF_SQL_VARCHAR	VARCHAR	Varchar	varchar, nvarchar, lvarchar	varchar2, nvarchar2	varchar

### Example

```
<!--- This example shows cfqueryparam with VALID input in Course_ID. --->
<h3>cfqueryparam Example</h3>
<cfset Course_ID = 12>
<cfquery name = "getFirst" dataSource = "cfdocexamples">
    SELECT *
    FROM courses
    WHERE Course_ID = <cfqueryparam value = "#Course_ID#"
        CFSQLType = 'CF_SQL_INTEGER'>
</cfquery>
<cfoutput query = "getFirst">
    <p>Course Number: #Course_ID#<br> Description: #descript#</p>
</cfoutput>

<!--- This example shows the use of CFQUERYPARAM when INVALID string data is
in Course_ID. ---->
<p>This example throws an error because the value passed in the CFQUERYPARAM tag exceeds the
MAXLENGTH attribute</p>

<cfset LastName="Peterson; DELETE employees WHERE LastName='Peterson'">
<!------- Note that for string input you must specify the MAXLENGTH attribute
for validation. ----->
<cfquery
    name="getFirst" datasource="cfdocexamples">
    SELECT *
    FROM employees
    WHERE LastName=<cfqueryparam
        value="#LastName#"
        cfsqltype="CF_SQL_VARCHAR"
        maxlength="17">
</cfquery>
<cfoutput
    query="getFirst"> <p>
        Course Number: #FirstName# #LastName#
        Description: #Department# </p>
</cfoutput>
```

## Tags r-s

### cfregistry

#### Description

This tag is deprecated for the UNIX platform.

Reads, writes, and deletes keys and values in the system registry. Provides persistent storage of client variables.

**Note:** For this tag to execute, it must be enabled in the ColdFusion Administrator. For more information, see *Configuring and Administering ColdFusion*.

### Category

Other tags, Variable manipulation tags

### Syntax

The tag syntax depends on the `action` attribute value. See the following sections:

- `cfregistry action = "get"`
- `cfregistry action = "set"`
- `cfregistry action = "getAll"`
- `cfregistry action = "delete"`

### See also

`cfcookie`, `cfparam`, `cfsavecontent`, `cfschedule`, `cfset`; About resource and sandbox security and Using Persistent Data and Locking in the *Developing ColdFusion Applications*

### History

ColdFusion MX:

- Deprecated this tag on the UNIX platform. It might not work, and might cause an error, in later releases.
- Changed how persistent data is stored: ColdFusion now stores most persistent data outside the system registry, in XML files.

## **cfregistry action = "getAll"**

### Description

Returns all registry keys and values defined in a branch. You can access the values as you would any record set.

### Syntax

```
<cfregistry  
    action = "getAll"  
    branch = "branch"  
    name = "query name"  
    sort = "asc|desc"  
    type = "string|dword|key|any">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

Using Persistent Data and Locking in the *Developing ColdFusion Applications*

### Attributes

Attribute	Req/Opt	Default	Description
action	Required		Always <code>getAll</code> .
branch	Required		Name of a registry branch.
name	Required		Name of record set to contain returned keys and values.
sort	Optional	asc	Sorts query column data (case-insensitive). Sorts on Entry, Type, and Value columns as text. Specify a combination of columns from query output, in a comma-delimited list. For example:  <code>sort = "value desc, entry asc"</code> <ul style="list-style-type: none"><li>• <code>asc</code>: ascending (a to z) sort order.</li><li>• <code>desc</code>: descending (z to a) sort order.</li></ul>
type	Optional	string	<ul style="list-style-type: none"><li>• <code>string</code>: returns string values.</li><li>• <code>dWord</code>: returns DWord values.</li><li>• <code>key</code>: returns keys.</li><li>• <code>any</code>: returns keys and values.</li></ul>

### Usage

This tag returns `#entry#`, `#type#`, and `#value#` in a record set that you can access through tags such as `cfoutput`. To fully qualify these variables, use the record set name, as specified in the `name` attribute.

If `#type#` is a key, `#value#` is an empty string.

If you specify `type= "any"`, `getAll` also returns binary registry values. For binary values, the `#type#` variable contains `UNSUPPORTED` and `#value#` is blank.

### Example

```
<!--- This example uses cfregistry with the getAll action. --->
<cfregistry action = "getAll"
    branch = "HKEY_LOCAL_MACHINE\Software\Microsoft\Java VM"
    type = "Any" name = "RegQuery">
<h1>cfregistry action = "getAll"</h1>
<cftable query = "RegQuery" colHeaders HTMLTable border = "yes">
    <cfcol header = "<b>Entry</b>" width = "35" text = "#RegQuery.Entry#">
    <cfcol header = "<b>Type</b>" width = "10" text = "#RegQuery.type#">
    <cfcol header = "<b>Value</b>" width = "35" text = "#RegQuery.Value#">
</cftable>
```

### cfregistry action = "get"

#### Description

Accesses a registry value and stores it in a ColdFusion variable.

## Syntax

```
<cfregistry  
    action = "get"  
    branch = "branch"  
    entry = "key or value"  
    variable = "variable"  
    type = "string|dWord|key">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

Using Persistent Data and Locking in the *Developing ColdFusion Applications*

## Attributes

Attribute	Req/Opt	Default	Description
action	Required		Always get.
branch	Required		Name of a registry branch.
entry	Required		Registry value to access.
variable	Required		Variable into which to put value.
type	Optional	<i>string</i>	<ul style="list-style-type: none"><li>string: returns string value.</li><li>dWord: returns DWord value.</li><li>key: returns key's default value.</li></ul>

## Usage

If the value does not exist, the `cfregistry` tag does not create an entry.

## Example

```
<!--- This example uses cfregistry with the get action. --->  
<cfregistry action = "get"  
    branch = "HKEY_LOCAL_MACHINE\Software\Microsoft\Java VM"  
    entry = "ClassPath" type = "String" variable = "RegValue">  
<h1>cfregistry action = "get"</h1>  
<cfoutput>  
    Java ClassPath value is #RegValue#  
</cfoutput>
```

## cfregistry action = "set"

### Description

Adds a registry key, adds a value, or updates a value.

### Syntax

```
<cfregistry  
    action = "set"  
    branch = "branch"  
    entry = "key or value"  
    type = "string|dWord|key"  
    value = "data">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

Using Persistent Data and Locking in the *Developing ColdFusion Applications*

### Attributes

Attribute	Req/Opt	Default	Description
action	Required		Always set .
branch	Required		Name of a registry branch.
entry	Required		Key or value to set.
type	Optional		<ul style="list-style-type: none"><li>string: sets a string value (default).</li><li>dWord: sets a DWord value.</li><li>key: creates a key.</li></ul>
value	Optional		Value data to set. If you omit this attribute, the <code>cfregistry</code> tag creates default value, as follows: <ul style="list-style-type: none"><li>string: creates an empty string: "".</li><li>dWord: creates a value of 0 (zero).</li></ul>

### Usage

If it does not exist, the `cfregistry` tag creates the key or value.

### Example

```
<!--- This example uses the cfregistry set action to modify registry value data. --->  
<!--- Normally you pass in a filename instead of setting one here. --->  
<cfset FileName = "dummy.cfm">  
<cfregistry action = "set"  
    branch = "HKEY_LOCAL_MACHINE\Software\cflangref"  
    entry = "LastCFM01" type = "String" value = "#FileName#">  
<h1>cfregistry action = "set"</h1>
```

### cfregistry action = "delete"

#### Description

Deletes a registry key or value.

### Syntax

```
<cfregistry  
    action = "delete"  
    branch = "branch"  
    entry = "key or value">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

Using Persistent Data and Locking in the *Developing ColdFusion Applications*

### Attributes

Attribute	Req/Opt	Default	Description
action	Required		Always delete.
branch	Required		<ul style="list-style-type: none"><li>For key deletion: name of registry key to delete. Do not specify the <code>entry</code> attribute.</li><li>For value deletion: name of registry branch that contains value to delete. Specify the <code>entry</code> attribute.</li></ul>
entry	Required for value deletion		Value to delete.

### Usage

If you delete a key, the `cfregistry` tag also deletes values and subkeys defined beneath it.

### Example

```
<cfregistry action = "delete"  
    branch = "HKEY_LOCAL_MACHINE\Software\cflangref\tempkey"  
    entry = "LastCFM01">  
<h1>cfregistry action = "delete"</h1>
```

## cfreport

### Description

Used to do either of the following:

- Execute a report created with the ColdFusion Report Builder, displaying it in PDF, Adobe® FlashPaper®, RTF, HTML, XML or Excel format. Optionally, you can save this report to a file.
- Run a predefined Crystal Reports report. Applies only to Windows systems.

### Category

[Data output tags](#)

## Syntax

ColdFusion Report Builder syntax:

```
<cfreport
    format = "PDF|FlashPaper|Excel|RTF|HTML|XML"
    template = "absolute pathname or pathname relative to the report file"
    encryption = "128-bit|40-bit|none"
    filename = "output filename"
    name = "ColdFusion variable"
    ownerpassword = "password"
    overwrite = "no|yes"
    permissions = "permission list"
    query = "query variable"
    resourceTimespan = #CreateTimeSpan (days, hours, minutes, seconds)#
    style = "CSS style definition or css file pathname"
    userpassword = "password">
    <cfreportparam ...>
</cfreport>
```

Crystal Reports syntax:

```
<cfreport
    report = "report path"
    dataSource = "data source name"
    formula = "formula"
    orderBy = "result order"
    password = "password"
    timeout = "number of seconds"
    type = "standard|netscape|microsoft"
    username = "username">
</cfreport>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## History

ColdFusion 8: Added the `style` and `resourceTimespan` attributes. Added the `HTML` and `XML` values to the `format` attribute.

ColdFusion MX 7.0.1: Added the `RTF` value to the `format` attribute, to let you generate reports in RTF format.

ColdFusion MX 7: Added support for the ColdFusion Report Builder.

ColdFusion MX: Changed data source connection behavior: Crystal Reports now establishes an independent connection to the data source. The connection is not subject to any ColdFusion data source-specific restrictions. For example, the Crystal Reports server can access a data source, regardless of whether it is disabled in the ColdFusion Administrator.

## Attributes

Attribute	Applies to	Req/Opt	Default	Description
datasource	Crystal Reports	Optional		Name of registered or native data source.
encryption	Report Builder	Optional	none	(format="PDF" only) Type of encryption for the report output. Valid values are: <ul style="list-style-type: none"> <li>128-bit</li> <li>40-bit</li> <li>none</li> </ul>
filename	Report Builder	Optional		Filename to contain the report. You cannot specify both the name and filename attributes. The filename extension must match the value of the format attribute.  If you write report output to an HTML file, ColdFusion automatically creates a directory relative to the output file in the format <i>filename_files</i> . Also, it generates PNG files for any charts in the report and copies of any image files imported into the report and stores them in this directory.
format	Report Builder	Required		Format of the report output: <ul style="list-style-type: none"> <li>PDF</li> <li>FlashPaper</li> <li>Excel</li> <li>RTF</li> <li>XML</li> <li>HTML</li> </ul> When you write report output directly to the browser in HTML format, ColdFusion generates a temporary directory and files for the images in the report. The location of the temporary directory that contains the image files is: C:\ColdFusion9\tmpCache\CFFileServlet\_cfreport\_report[unique_identifier] To determine when the images are removed from the browser, use the resourceTimespan attribute.
formula	Crystal Reports	Optional		One or more named formulas. Terminate each formula with a semicolon. Use the format:  <pre>formula = "formulaname1 = 'formula1';formulaname2 = 'formula2';"</pre> If you use a semicolon in a formula, escape it by typing it twice (;). For example:  <pre>formula = "Name1 = 'Val_1a;;Val_1b';Name2 = 'Val2';"</pre>
name	Report Builder	Optional		Name of the ColdFusion variable that contains the report output. You cannot specify both name and filename. This attribute is not valid when format="HTML".
orderBy	Crystal Reports	Optional		Orders results according to your specifications.

Attribute	Applies to	Req/Opt	Default	Description
overwrite	Report Builder	Optional	no	Specifies whether to overwrite files that have the same name as that specified in the <code>filename</code> attribute: <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul>
ownerPassword	Report Builder	Optional		(format="PDF" only) Owner password for the report,
password	Crystal Reports	Optional		Password that corresponds to username required for database access. Overrides default settings for data source in the ColdFusion Administrator.
permissions	Report Builder	Optional		(format="PDF" only) Specifies one or more of the following permissions: <ul style="list-style-type: none"> <li>• AllowPrinting</li> <li>• AllowModifyContents</li> <li>• AllowCopy</li> <li>• AllowModifyAnnotations</li> <li>• AllowFillIn</li> <li>• AllowScreenReaders</li> <li>• AllowAssembly</li> <li>• AllowDegradedPrinting</li> </ul> Separate multiple permissions with commas.
query	Report Builder	Optional		Name of the query that contains input data for the report. This query overrides the query in the Report Builder report. The ColdFusion query must contain at least all of the columns included in the Report Builder query; however, the WHERE clause can differ. If you omit this parameter, Report Builder uses the data from the internal SQL statement or from <code>cfreportparam</code> items.
report	Crystal Reports	Required		Report pathname. Store Crystal Reports files in the same directories as ColdFusion page files.
resourceTimespan	Report Builder	Optional	5 minutes	(format="HTML" only) Life span of the resource directory. When you export a Report Builder report in HTML format, ColdFusion writes any images or other resource files in the report to a temporary resource directory. Use this attribute to determine when the resource directory is deleted. For the value, use the <code>CreateTimeSpan</code> function and specify the time span in days, hours, minutes, and seconds, separated by commas; for example, to delete the resource directory after one hour, specify: <code>#CreateTimeSpan(0,1,0,0)#</code>  If the value is set to 0, the resource directory persists until the next server restart.  ColdFusion deletes the resource directory only when <code>format="HTML"</code> and neither the name nor filename attribute is specified. The default setting is 5 minutes: <code>#CreateTimeSpan(0,0,5,0)#</code>
style	Report Builder	Optional		Style in CSS format that overrides a style defined in the Report Builder report at run time. You can specify an absolute file path, a file path relative to the report, or a string in valid CSS format. For the styles to take effect, the style names must match Style Name attributes assigned to elements in the Report Builder report. You can generate a CSS file in Report Builder and export it or you can create a CSS file with a text editor. For a list of supported CSS styles, see the section <i>Style properties</i> .
template	Report Builder	Required		Specifies the pathname to the Report Builder (CFR) file, relative to the web root.

Attribute	Applies to	Req/Opt	Default	Description
timeout	Crystal Reports	Optional		Specifies the maximum time, in seconds, in which a connection must be made to a Crystal Reports file.
type	Crystal Reports	Optional	standard	Type of report: <ul style="list-style-type: none"><li>• standard (not valid for Crystal Reports 8.0)</li><li>• netscape</li><li>• microsoft</li></ul>
userName	Crystal Reports	Optional		Username required for entry into a database from which the report is created. Overrides default settings for data source in ColdFusion Administrator.
userPassword	Report Builder	Optional		(format="PDF" only) User password.

### Usage

Use this tag to generate a report using a report definition created in either ColdFusion Report Builder or in Crystal Reports. (For more information on using the ColdFusion Report Builder, display the online help by opening the Report Builder and pressing F1.)

**Note:** The Excel report output format type provides limited support for the formatting options available in ColdFusion Reporting. Images and charts are not supported and numeric data containing formatting (commas, percents, currency, and so on) appear as plain text in Excel. The Excel output format supports simple reports only and Adobe recommends that you give careful design and layout consideration to reports designed for Excel output.

This tag requires an end tag.

### Using Cascading Style Sheets

You can override Cascading Style Sheets (CSS) in Report Builder reports at run time by using the `style` attribute of the `cfreport` tag in ColdFusion.

You can create CSS files in one of two ways: by exporting styles with the Export Report Styles icon in Report Builder or by creating a CSS file in any text editor. For the CSS styles to take effect, however, you must use Report Builder to assign the style names to the elements in the report. (The exception is the default style: you can use the `style` attribute to define the default style in ColdFusion and apply it to the report even if the default style is not defined in Report Builder.)

After you assign the style names in Report Builder, you can update the style definitions in the CSS file at any time and apply them at run time by using the `cfreport` and `cfreportparam` tags. If your report contains subreports, the default style applies to the master report and to all of the subreports. If the master report uses CSS styles other than the default style, the CSS styles do not apply to the subreports unless you specify them explicitly.

The following code shows how to apply three different style sheets to the main report and two subreports at run time:

```
<cfreport template="myreport.cfr" style="mystyle.css" format="PDF">
  <cfreportParam subreport="subreport1" style="subreport1-style.css">
  <cfreportParam subreport="subreport2" style="subreport2-style.css">
</cfreport>
```

The following code shows how to apply a CSS style as a value of the `style` attribute:

```
<cfreport template="myreport.cfr" style='mystyle { defaultStyle: true; font-family:"Comic Sans MS"; color: ##00FF00; }' format="FlashPaper">
</cfreport>
```

The following code shows how to create a variable called *myStyle* and use it as a value of the `style` attribute:

```
<cfset mystyle='mystyle { defaultStyle: false; font-family: "Comic Sans MS"; }'>
<cfreport template="myreport.cfr" style="#mystyle#" format="HTML">
</cfreport>
```

### Style attribute syntax

The style file or string must be valid CSS syntax. For more information, see <http://www.w3.org/Style/CSS/>. The style must contain one or more rule sets. Each rule set consists of a simple selector, which is the Report Builder style name, followed by a declaration block, which consists of a series of declarations separated by semicolons. A declaration is a property:value pair.

If a selector contains invalid syntax, ColdFusion ignores the selector and its declaration block. Selectors and properties not supported by this feature are ignored. Styles are case-insensitive, except parts not under the control of CSS (such as font names).

The following example shows the CSS definition for the default style:

```
DefaultStyle
{
    default-style: true;
    color: black;
    font-family: Arial, "Comic Sans MS";
    font-size: 16;
    text-decoration: underline;
}
```

The following example shows the CSS definition for a custom style called *PurpleBoldItalicText*:

```
PurpleBoldItalicText
{
    color: purple;
    font: italic bold 20px 30px Arial;
}
```

Identifiers for styles must be CSS2-compliant. For example, CSS1 allows '\_' in identifiers, but CSS2 does not.

In CSS2, identifiers, including element names, classes, and IDs in selectors, can contain only the characters A-Z, a-z, and 0-9. Also, they can include ISO 10646 characters 161 and higher and the hyphen character (-); however, identifiers cannot start with a hyphen or a digit. They can contain escaped characters and any ISO 10646 character as a numeric code. For example, you can write the identifier "B&W?" as "B&W\?" or "B\26 W\3F".

### Style properties

The following table shows the style properties exported by Report Builder:

Property name	Report Builder only	Valid values	Description
background-color	No	See the section <i>Valid color values</i>	Background color of the specified report element, if the element is not transparent. The default background color is white.
border	No	[border-width] [border-style] [border-color]	A shorthand property that specifies the border-width, border-style, and border-color properties for all of the borders in an element.
border-color	No	See the section <i>Valid color values</i>	Border color for text, images, and charts. You can customize each side of the border. The default color is white.
border-style	No	solid dashed none	A shorthand property that specifies the border-top-style, border-right-style, border-bottom-style, and border-left-style (the comma-separated values must be in this order). If one or more values are not specified, the value for the opposite side is used. If only one value is listed, that value applies to all sides.  The none value overrides the border-width value. Any other values, including hidden, dotted, groove, ridge, inset, outset, and double, are displayed as solid.
border-top-color border-left-color border-bottom-color border-right-color	No	See the section <i>Valid color values</i>	Color of the element's top, left, bottom, and right border. For more details see that section <i>Border and margin styles</i> .  If no border-color property is specified, the value of the color property is used instead.
border-top-style border-left-style border-bottom-style border-right-style	No	solid dashed	Line style of the element's top, left, bottom, and right border. For more details see the section <i>Border and margin styles</i> .  Any value other than dashed displays as solid.
border-top-width border-left-width border-bottom-width border-right-width	No	thin medium thick 1px 2px 4px	Thickness of the top, left, bottom, and right border of an element. Negative values are not valid. For more details see the section <i>Border and margin styles</i> :  <ul style="list-style-type: none"> <li>• thin = 1/2 pt</li> <li>• medium = 2px</li> <li>• thick = 4px</li> </ul>
border-width	No	thin medium thick 1px 2px 4px	A shorthand property that specifies the border-top-width, border-right-width, and border-bottom-width properties with a single property and value notation (the comma-separated values must be in this order). If one or more values are not specified, the value for the opposite side is used. If only one value is listed, it applies to all sides:  <ul style="list-style-type: none"> <li>• thin = 1/2 pt</li> <li>• medium = 2px</li> <li>• thick = 4px</li> </ul>

Property name	Report Builder only	Valid values	Description
clip	No	auto stretch ratio	Specifies how images are resized: <ul style="list-style-type: none"> <li>• <b>auto</b>: If the dimensions of the source image differ from the element in the report, this attribute crops the image to fit within the element boundaries. The image is not resized. Only the part of the image that fits in the boundaries is displayed.</li> <li>• <b>stretch</b>: If the dimensions of the source image differ from the element in the report, this attribute resizes the image so that it fits within the element boundaries. If the dimensions differ, the image is distorted.</li> <li>• <b>ratio</b>: If the dimensions of the source image differ from the element in the report, this attribute resizes the image to fit within the element boundaries but maintains the aspect ratio of the source so that the image is not distorted.</li> </ul>
color	No	See the section <i>Valid color values</i>	Color of the text (in text elements) and the border (in graphic elements). The default color is black.
corner-radius	Yes	integer	Radius for arcs used to draw the corner of rectangles. The default is 0 (square corners). Values less than 0 are interpreted as 0.
default-style	Yes	true false	Default style for elements that do not or cannot have a style applied. A subreport inherits its parent's default-style if it does not have one of its own.
embed-pdf-font	Yes	true false	Specifies whether fonts are embedded in the PDF document. Embedded fonts insure that the fonts display properly even if the font is not installed on the system where the report is viewed.
empty-cells	No	show hide	Shows or hides a null value for text expressions: <ul style="list-style-type: none"> <li>• <b>show</b>: If the text expression returns a null value, the string "null" is displayed.</li> <li>• <b>hide</b>: If the text expression returns a null value, the null value is replaced with an empty string. This is the default.</li> </ul>
font	No	[font-style] [font-weight] [font-size] [line-height] [font-family]	Font characteristic specifications. Use this as a shorthand to specifying multiple property values; for example:  font: italic 20px Arial;  Default values for this property match those used for the individual properties. Default values for the individual properties are applied to the values omitted from the font property.
font-family	No	Comma-separated list of font names.	Group of fonts to apply to the element. The first font found in the list is applied to the element. The default is:  font-family: Arial, Helvetica, sansserif;  If a font name contains spaces, enclose the name in quotation marks, for example:  font-family: Courier, "Courier New", Arial;

Property name	Report Builder only	Valid values	Description
font-size	No	[length]	Font size measured in points or pixels. Negative values are not valid. The default value is 10 points. You can specify points or pixels. 1 pixel = 0.75 points. This property also is a component of the font property.  Standard CSS supports other types of values not supported by Report Builder.
font-style	No	normal italic oblique	Font style. The italic and oblique values are similar. The default value is normal. Also, this property is a component of the font property.
font-weight	No	normal bold bolder lighter 100 200 300 400 500 600 700 800 900	Font weight. Report Builder does not support varying degrees of boldness or lightness; therefore, normal and lighter appear as normal; all other values appear as bold. The default is normal. Also, this property is a component of the font property.
line-height	No	normal [number] [length] [percentage]	Amount of space between consecutive lines of text: <ul style="list-style-type: none"> <li>normal: Sets the line-height to single-spacing (default).</li> <li>number: A multiplier that determines the line height as a factor of the element's font size. To determine the line height from this number, multiply the current element font-size by the number. Negative values are not valid.</li> <li>length: Sets the line height to an explicit length. You can specify points (for example, "20") or pixels (for example, "20px"). 1 pixel = 0.75 points. Negative values are not valid. Standard CSS allows other units of length not supported by Report Builder.</li> <li>percentage: Defines the line-height as a percentage. The percent symbol is required (for example, 150%). Negative values are invalid.</li> </ul>
line-size	Yes	none thin 1px 2px 4px dashed	Type of the border around a graphic element or the type and the thickness of line elements. By default, lines and rectangles have a 1-pixel border; thin is 0.05 pixels.

Property name	Report Builder only	Valid values	Description
margin	No	[top-integer] [right-integer] [bottom-integer] [left-integer]	Amount of blank space within the bounding box of an element. This is a shorthand property that specifies the <code>margin-top</code> , <code>margin-right</code> , <code>margin-bottom</code> , and <code>margin-left</code> properties with a single property and value notation (the values must be in this order separated by commas.) If one or more values are not specified, the value for the opposite side is used. If only one value is listed, it applies to all sides. For more details see the section <i>Border and margin styles</i> .  CSS margins are transparent, which reveals the background of the parent element. Negative values are valid; this allows for text overlays.  Examples:  <code>margin: 10,20,30,40;</code>  <code>margin: 10;</code>  <code>margin: 10,20,30;</code>
margin-top margin-left margin-bottom margin-right	No	integer	See margin.
parent-style	Yes	styleName	Name of the parent report style from which this style inherits some or all of its properties. The style name must be defined in either the report or before this style definition in the CSS file or text.
text-align	No	left center right justify	Alignment of text and images on the horizontal axis. The default value is <code>left</code> .
text-decoration	No	underline line-through underline line-through	Text characteristics not defined with the <code>font-style</code> and <code>font-weight</code> properties. The color of the text-decoration is determined by the color property for the element. Unknown values are ignored.
text-rotation	Yes	none left right	Rotation of text elements. Use it to change the text direction by rotating it 90 degrees to the right or left.

Property name	Report Builder only	Valid values	Description
transparency-mode	Yes	opaque transparent	Transparency of elements. Graphic elements, such as rectangles and lines, are opaque by default, but images are transparent. Subreport elements, static text, and text fields are transparent by default.
vertical-align	No	top middle bottom	Alignment of text and images on the vertical axis. The default value is <code>top</code> .
xhtml-formatted-text	Yes	true false	Specifies whether the text element contains XHTML-compatible instructions: <ul style="list-style-type: none"><li>• <code>true</code>: The text element contains xhtml-compatible instructions, for example, <code>&lt;b&gt;My Text Label&lt;/b&gt;</code>. In this example, the text within the tags displays in bold (<b>My Text Label</b>), and the tags (<code>&lt;b&gt;</code> <code>&lt;/b&gt;</code>) are not displayed.</li><li>• <code>false</code>: The text element does not contain xhtml-compatible instructions; therefore, all the text within the text element is displayed. This is the default.</li></ul>

Styles or values that are not supported by Report Builder are ignored in the report, in which case, if a default-style is defined, Report Builder applies the default style to the element.

### Valid color values

You can specify a color as `#RRGGBB`. This represents a color that uses a triplet of hexadecimal values concatenated together. The values represent the red, green, and blue components for a given color. The range of each component value is 00-FF in hexadecimal. Also, you can use one of the 140 X11 color names (see <http://www.bloobery.com/indexdot/color/x11makerFrameNS.htm>). The color name is case-insensitive. This set of names assigns names to specific RGB values. Also, a color name can also be specified as `##RGB`, `rgb(r,g,b)`, or `rgb(r%,g%,b%)`. See CSS Color Units for syntax details (see <http://www.bloobery.com/indexdot/css/syntax/units/color.htm>). UI Name is not supported.

The following example shows the different ways you can represent the color lime:

```
color:lime
color:#00FF00
color:#0F0
color:rgb(0,255,0)
color:rgb(0%,50%,0%)
```

If you specify a color in hexadecimal format as part of the `style` attribute for the `cfreport` tag, use the format `##00FF00`. For example:

```
<cfreport template="myreport.cfr" style='mystyle { defaultStyle: true;
    font-family:"Comic Sans MS"; color: ##00FF00; }' format="HTML"/>
```

### Border and margin styles

Use the `border-width`, `border-style`, `border-color`, and `margin` properties when all four sides of the element have the same value. You can specify from one to four parameters for these properties:

Number of parameters	Example	Result
1	<code>border-width: thick</code>	Parameter applied to all four sides of the element's border.
2	<code>border-width: thick, thin</code>	First parameter ( <code>thick</code> ) applied to the top and bottom sides; second parameter ( <code>thin</code> ) applied to the left and right sides.
3	<code>border-width: thick, thin, medium</code>	First parameter ( <code>thick</code> ) applied to the top; second parameter ( <code>thin</code> ) applied to the left and right sides; third parameter ( <code>medium</code> ) applied to the bottom.
4	<code>border-width: thick, thin, medium, thick</code>	First parameter ( <code>thick</code> ) applied to the top; second parameter ( <code>thin</code> ) applied to the right side; third parameter ( <code>medium</code> ) applied to the bottom; fourth parameter ( <code>thick</code> ) applied to the left side.

You can use the properties for each side of a border to override the style specified by the `border-width`, `border-style`, `border-color`, and `margin` properties.

### Example

Example 1: This example shows the use of `cfreport` for the ColdFusion Report Builder.

```
<cfquery name="northwindemployees" datasource="localnorthwind">
    SELECT EmployeeID, LastName, FirstName, Title, City, Region, Country
    FROM Employees
    ORDER BY Country, City
</cfquery>

<CFREPORT format="PDF" template="FifthReport.cfr"
    query="#northwindemployees#" />
```

Example 2: This view-only example shows the use of `cfreport` for Crystal Reports.

```
<h3>cfreport Tag</h3>
<p>cfreport lets reports from the Crystal Reports Professional report writer display through a ColdFusion interface. To run, the tag requires the name of the report. cfreport can also pass information to the report file displayed, to change the output conditions.</p>
<p>This example would run a report called "monthlysales.rpt " and pass it an optional filter condition to show only the information for a subset of the report.</p>

<cfreport report = '/reports/monthlysales.rpt'>
    {Departments.Department} = 'International'
</cfreport>

<p>Substitute your report files and filters for this code. cfreport can put Crystal Reports into web pages.</p>
```

## cfreportparam

### Description

The `cfreportparam` tag lets you perform the following tasks:

- Pass input parameters to a ColdFusion Report Builder report definition.
- Override query data in subreports and charts defined in Report Builder reports.
- Override styles defined in Report Builder subreports.

The `cfreportparam` tag is always a child tag of the "`cfreport`" on page 556 tag.

## Category

### Data output tags

## Syntax

```
<cfreport template = ...>
  <cfreportparam
    chart = "name of the chart contained in the report or subreport"
    name = "data name"
    query = "query value passed to the chart or subreport"
    series = "ordinal number of a chart series"
    style = "CSS style definition or CSS file pathname"
    subreport = "name of the subreport"
    value = "data value">
</cfreport>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfreport](#); Creating Reports with Report Builder in the *Developing ColdFusion Applications*; Report Builder online Help

## History

ColdFusion 8: Added the `chart`, `query`, `series`, `subreport`, and `style` attributes.

ColdFusion MX 7: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
chart	Optional		Name of the chart contained in a report or subreport. The value of this attribute must match Name property of a chart defined in the Report Builder report. If you specify the <code>chart</code> attribute, you cannot specify the <code>subreport</code> or <code>name</code> attribute.
name	Optional		Variable name for data that is passed. The value of this attribute must match the name of an input parameter defined in the Report Builder report. If you specify the <code>name</code> attribute, you cannot specify the <code>chart</code> or <code>subreport</code> attribute.
query	Optional		Query value to pass to a subreport or chart. The ColdFusion query must contain at least all of the columns included in the Report Builder query. Charts and subreports require this attribute.
series	Optional	1	Ordinal number of a chart series to use for the query. This attribute is valid only when the <code>chart</code> attribute is specified.

Attribute	Req/Opt	Default	Description
subreport	Optional		Name of the subreport. The value of this attribute must match the Name property of the subreport in Report Builder. Subreport names within a report must be unique. If you specify the subreport attribute, you cannot specify the chart or name attribute.
style	Optional		Style in CSS format for a subreport. The value can be an absolute file path, a file path relative to the report, or a string in valid CSS format. For the styles to take effect, the style names must match Style Name attributes assigned to elements in the Report Builder report. You can generate the CSS file in Report Builder and exported or created with a text editor. For a list of supported CSS styles, see the section <i>Style properties</i> .
value	Optional (see Description)		Value of the data that is sent. Specify the value attribute with the name attribute. You cannot specify this attribute when a chart or subreport attribute is specified. The value can be a string or a variable.

### Usage

You can specify only one of the following attributes in a `cfreportparam` tag:

- name
- subreport
- chart

You can use the `query`, `subreport`, and `chart` attributes to override Report Builder queries and chart information at run time. This way you can customize subreport and chart data from the CFM page without having to change the queries built into your report.

For example, in Report Builder, you can create a master report that contains several subreports and populate each subreport with a different query. Instead of modifying the queries in Report Builder, you can customize your reports by creating modified queries on the ColdFusion calling page. The ColdFusion query must contain at least all of the columns included in the Report Builder query.

**Note:** You cannot specify a subreport query that depends on arguments from the master report. Instead, you can define a CFML function or CFC method that returns the subreport query given the arguments from the master report. ColdFusion calls this code when it executes the subreport.

On the calling CFM page, you can specify a `cfreportparam` tag for any subreport and chart in the Report Builder report. The value of the `subreport` or `chart` attribute must match the Name property of the subreport or chart defined in the Report Builder report. (Charts are treated like subreports.)

The following code shows a master report that contains two subreports and a chart with two chart series:

```
<cfreport template="myreport.cfr" query="master" format="RTF">
  <cfreportParam subreport="subreport1" query="subquery1">
  <cfreportParam subreport="subreport2" query="subquery2">
  <cfreportParam chart="chart1" series="1" query="chartquery1">
  <cfreportParam chart="chart1" series="2" query="chartquery2">
  <cfreportParam name="ReportDate" value="#DateFormat(Now())#, #TimeFormat(Now())#">
</cfreport>
```

The `cfreportparam` tag also lets you override CSS styles assigned to subreports in Report Builder. Use the `style` attribute with the `subreport` attribute; the value of the `subreport` attribute must match the name of the subreport in Report Builder. The following code applies a style sheet to the master report and two different style sheets to the subreports:

```
<cfreport template="myreport.cfr" style="myStyle.css" format="PDF">
    <cfreportParam subreport="subreport1" style="subreport-style.css">
    <cfreportParam subreport="subreport2" style="subreport-style.css">
</cfreport>
```

For more information, see the section *Using Cascading Style Sheets*.

### Example

<!-- The following example shows how to override a query in a Report Builder report from the CFM page. The cfreportparam tag adds the current date and time to the report.-->

```
<cfquery name="coursedept" datasource="cfdocexamples">
    SELECT Departments.Dept_ID as dDept_ID, Departments.Dept_Name,
    CourseList.Course_ID, CourseList.Dept_ID as cDept_ID,
    CourseList.CorNumber, CourseList.CorName,
    CourseList.CorLevel
FROM Departments, CourseList
WHERE Departments.Dept_ID = CourseList.Dept_ID
ORDER BY CourseList.Dept_ID
</cfquery>

<cfreport format="PDF" template="FourthReport.cfr" query="#coursedept#" overwrite="yes">
<cfreportparam name="ReportTime" value="#DateFormat(Now())#, #TimeFormat(Now())#">
</cfreport>
```

## cfrethrow

### Description

Rethrows the currently active exception. Preserves the exception's `cfcatch.type` and `cfcatch.tagContext` variable values.

### Category

[Exception handling tags](#), [Extensibility tags](#)

### Syntax

```
<cfrethrow>
```

### See also

[cferror](#), [cfthrow](#), [cftry](#); Handling runtime exceptions with ColdFusion tags in the *Developing ColdFusion Applications*

### Usage

Use this tag within a `cfcatch` block. This tag is useful in error handling code, if the error handler cannot handle an error that it catches. For example, if `cfcatch type = "any"` gets a DATABASE exception, and the code is designed to handle only CFX exceptions, the handler raises the exceptions again, with details intact, so that a higher-level handler can process the error information. If you used the `cfthrow` tag, the type and details of the original exception would be lost.

### Example

```
<h3>cfrethrow Example</h3>
<!--- Rethrow a DATABASE exception. --->
<cftry>
    <cftry>
        <cfquery name = "GetMessages" dataSource = "cfdocexamples">
            SELECT*
            FROM Messages
        </cfquery>
        <cfcatch type = "DATABASE">
            <!--- If database signalled a 50555 error, ignore; otherwise, rethrow
            exception. --->
            <cfif cfcatch.sqlstate neq 50555>
                <cfrethrow>
            </cfif>
        </cfcatch>
    </cftry>
</cfcatch>
<h3>Sorry, this request can't be completed</h3>
<h4>Catch variables</h4>
<cfoutput>
    <cfloop collection = #cfcatch# item = "c">
        <br>
        <cfif IsSimpleValue(cfcatch[c])>#c# = #cfcatch[c]#
        </cfif>
    </cfloop>
</cfoutput>
</cfcatch>
</cftry>
```

## cfreturn

### Description

Returns result values from a component method. Contains an expression returned as result of the function.

### Return value

An expression; the result of the function from which this tag is called.

### Category

[Extensibility tags](#)

### Syntax

```
<cfreturn
    expr>
```

### See also

[cfargument](#), [cfcomponent](#), [cffunction](#), [cfinvoke](#), [cfinvokeargument](#), [cfobject](#), [cfproperty](#); Building and Using ColdFusion Components in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Added this tag.

### Attributes

Attribute	Req/Opt	Default	Description
expr	Required		Function result; value of any type.

### Usage

This tag is equivalent to a `return` statement within a `cfscript` tag. It accepts one return variable argument. To return more than one value, populate a structure with name-value-pairs, and return the structure with this tag.

To access the result value from this tag, you use the variable scope that is the value of the `cfinvoke` tag `returnVariable` attribute.

You can code a maximum of one `cfreturn` tag within a function.

For example code, see [Building and Using ColdFusion Components](#) in the *Developing ColdFusion Applications*.

### Example

```
<cfcomponent>
    <cffunction name="getEmp">
        <cfquery name="empQuery" datasource="ExampleApps" >
            SELECT FIRSTNAME, LASTNAME, EMAIL
            FROM tblEmployees
        </cfquery>
        <cfreturn empQuery>
    </cffunction>
    <cffunction name="getDept">
        <cfquery name="deptQuery" datasource="ExampleApps" >
            SELECT *
            FROM tblDepartments
        </cfquery>
        <cfreturn deptQuery>
    </cffunction>
</cfcomponent>
```

## cfsavecontent

### Description

Saves the generated content of the `cfsavecontent` tag, including the results of evaluating expressions and executing custom tags, in the specified variable.

### Category

[Variable manipulation tags](#)

### Syntax

```
<cfsavecontent
    variable = "variable name">
    the content
</cfsavecontent>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

Caching parts of ColdFusion pages in the *Developing ColdFusion Applications*

### Attributes

Attribute	Req/Opt	Default	Description
variable	Required		Name of the variable in which to save the generated content of the tag.

### Usage

This tag requires an end tag.

You cannot use this tag to suppress output from a tag library.

### Example

The following example uses a custom tag to generate a report and saves the report in the variable CONTENT. It replaces all instances of the word "report" with the phrase "MyCompany Quarterly Report" and outputs the result.

```
<cfsavecontent variable="content">
    <CF_OutputBigReport>
</cfsavecontent>
<cfoutput>
    #replace(content, "report", "MyCompany Quarterly Report", "all")#
</cfoutput>
```

## cfschedule

### Description

Provides a programmatic interface to the ColdFusion scheduling engine. Can run a CFML page at scheduled intervals, with the option to write the page output to a static HTML page. This feature enables you to schedule pages that publish data, such as reports, without waiting while a database transaction is performed to populate the page.

### Category

[Variable manipulation tags](#)

## Syntax

```
<cfschedule
    action = "run|update|pause|resume|delete"
    task = "task name"
    endDate = "date"
    endTime = "time"
    file = "filename"
    interval = "seconds"
    operation = "HTTPRequest"
    password = "password"
    path = "path to file"
    port = "port number"
    proxyPassword = "password"
    proxyPort = "port number"
    proxyServer = "host name"
    proxyUser = "user name"
    publish = "yes|no"
    requestTimeout = "seconds"
    resolveURL = "yes|no"
    startDate = "date"
    startTime = "time"
    url = "URL"
    username = "user name">
```

OR

```
<cfschedule
    action = "delete"
    task = "task name">
```

OR

```
<cfschedule
    action = "run"
    task = "task name">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## History

ColdFusion MX 6.1: Changed the way intervals are calculated. The day length now reflects changes between standard and daylight saving times. The month length is now the calendar month length, not four weeks. The scheduler handles leap years correctly.

## Attributes

Attribute	Req/Opt	Default	Description
action	Required		<ul style="list-style-type: none"> <li>delete: deletes the specified task.</li> <li>update: updates an existing task or creates a task, if one with the name specified by the <code>task</code> attribute does not exist.</li> <li>run: executes the specified task.</li> <li>pause: pauses the specified task.</li> <li>resume: continues executing the specified task.</li> </ul>
task	Required		Name of the task.
endDate	Optional		Date when scheduled task ends. The default date format is mm/dd/yy.
endTime	Optional		Time when scheduled task ends (seconds).
file	Required if <code>publish="Yes"</code>		Name of the file in which to store the published output of the scheduled task.
interval	Required if <code>action="update"</code>		Interval at which task is scheduled: <ul style="list-style-type: none"> <li>number of seconds</li> <li>once</li> <li>daily</li> <li>weekly</li> <li>monthly</li> </ul>
operation	Required if <code>action="update"</code>		Operation that the scheduler performs. Must be <code>HTTPRequest</code> .
password	Optional		Password, if URL is protected.
path	Required if <code>publish = "Yes"</code>		Path to the directory in which to put the published file.
port	Optional	80	Port to use on the server that is specified by the <code>url</code> parameter. If <code>resolveURL="yes"</code> , retrieved document URLs that specify a port number are automatically resolved, to preserve links in the retrieved document. A port value in the <code>url</code> attribute overrides this value.
proxyPassword	Opt		Password to provide to the proxy server.
proxyPort	Optional	80	Port number to use on the proxy server.
proxyServer	Optional		Host name or IP address of a proxy server.
proxyUser	Opt		User name to provide to the proxy server.
publish	Optional	no	<ul style="list-style-type: none"> <li>yes: saves the result to a file.</li> <li>no</li> </ul>
requestTimeout	Optional		Can be used to extend the default time-out period.
resolveURL	Optional	no	<ul style="list-style-type: none"> <li>yes: resolves links in the output page to absolute references.</li> <li>no</li> </ul>

Attribute	Req/Opt	Default	Description
startDate	Required if action="update"		Date on which to first run the scheduled task. The default date format is mm/dd/yy.
startTime	Required if action="update"		Time at which to run the scheduled of task starts.
url	Required if action="update"		URL of the page to execute.
username	Optional		User name, if URL is protected.

### Usage

This tag and the ColdFusion Administrator Scheduled task page schedule ColdFusion tasks. Tasks that you add or change using this tag are visible in the Administrator. You can disable this tag in the Administrator Sandbox/Resource security page. This tag's success or failure status is written to the schedule.log file in the *cf\_root/logs* directory (*cf\_webapp\_root/WEB-INF/cfusion/logs* in the multiserver and J2EE configurations).

When you create a task, you specify the URL of the ColdFusion page to execute, the date, time and frequency of execution, and whether to publish the task output to an HTML file. If the output is published, you specify the output file path and file.

If you schedule a job to run monthly on any date in the range 28-31, the scheduler does the following:

- If you schedule a monthly job to run on the last day of a month, the scheduled job will run on the last day of each month. For example, if you schedule a monthly job to start on January 31, it will run on January 31, February 28 or 29, March 31, April 30, and so on.
- If you schedule a monthly job to run on the 29th or 30th of the month, the job will run on the specified day of each month for 30 or 31-day months, and the last day of February. For example, if you schedule a monthly job to start on January 30, the job will run on January 30, February 28 or 29, March 30, April 30, and so on.

If you schedule a job to run once, the starting time is in the past, and the task has not yet run, it runs immediately. If you schedule a recurring job with a start time in the past, ColdFusion schedules the job to run on the next closest interval in the future.

The Scheduler configuration file, *cf\_root\lib\neo-cron.xml* contains all scheduled events, as individual entries.

### Example

```
<h3>cfschedule Example</h3>
<!--- This read-only example schedules a task.
      To run the example, remove the comments around the code
      and change the startDate, startTime, url, file, and path attributes
      to appropriate values. --->
<!---
<cfschedule action = "update"
    task = "TaskName"
    operation = "HTTPRequest"
    url = "http://127.0.0.1/playpen/history.cfm"
    startDate = "8/17/09"
    startTime = "12:25 PM"
    interval = "3600"
    resolveURL = "Yes"
    publish = "Yes"
    file = "sample.html"
    path = "c:\inetpub\wwwroot\playpen"
    requestTimeout = "600">
--->
```

## cfscript

### Description

Encloses a code block that contains `cfscript` statements.

### Category

[Application framework tags](#), [Other tags](#)

### Syntax

```
<cfscript>
    cfscript code here
</cfscript>
```

### See also

[cfinvoke](#), [cfmessagebox](#), [CreateObject](#); *Extending ColdFusion Pages with CFML Scripting in the Developing ColdFusion Applications*

### History

ColdFusion MX:

- Changed how to invoke component methods: this tag can now invoke component methods, using the `CreateObject` function
- Changed use of reserved words: you cannot use ColdFusion reserved words within this tag
- Added the `try` and `catch` statements.

### Usage

Performs processing in CFScript. This tag uses ColdFusion functions, expressions, and operators. You can read and write ColdFusion variables within this tag.

For a detailed description of the CFScript scripting language, including documentation of CFScript statements and the CFScript equivalents of CFML tags, see Extending ColdFusion Pages with CFML Scripting in the *Developing ColdFusion Applications*.

You can use this tag to enclose a series of assignment statements that would otherwise require `cfset` statements.

**Important:** If you code a `cftry/cfcatch` block within this tag using an exception's Java class name, provide the fullyqualified class name.

You cannot use some ColdFusion reserved words in this tag. You cannot put a user-defined function whose name begins with any of these strings within this tag:

- `cf`
- `cf_`
- `_cf`
- `coldfusion`
- `coldfusion_`
- `_coldfusion`

You cannot use the `elseif` construct within a `cfscript` tag. You can use code such as the following:

```
else if ( condition )
{
...
}
```

### Keywords

The following words are now treated as keywords:

- `import`
- `finally`
- `component`
- `interface`
- `pageencoding`

### Exception handling with the `cfscript` tag

To handle exceptions with this tag, use `try` and `catch` statements, which are equivalent to the `cftry` and `cfcatch` tags. For each `try` statement, you must have a `catch` statement. In the `catch` block, the variable `exceptionVariable` contains the exception type. This variable is the equivalent of the `cfcatch` tag built-in variable `cfcatch.Type`. For more information, see Extending ColdFusion Pages with CFML Scripting in the *Developing ColdFusion Applications*.

### Invoking ColdFusion components with the `cfscript` tag

CFScript invokes component methods using the `CreateObject` function.

The following example shows how to invoke a component object with the `cfscript` tag, using ordered arguments:

```
<cfscript>
quote = CreateObject( "component", "nasdaq.quote" ) ;
<!--- Invocation using ordered arguments. --->
res = quote.getLastTradePrice( "macr" ) ;
</cfscript>
```

The following example shows how to use an attribute collection within the `cfscript` tag to pass parameters when invoking a component object. An attribute collection is a structure in which each key corresponds to a parameter name and each value is the parameter value passed for the corresponding key.

```
<cfscript>
    stArgs = structNew();
    stArgs.zipcode = "55987";
</cfscript>
...
<cfinvoke
    webservice = "http://www.xmethods.net/sd/2001/TemperatureService.wsdl"
    method = "getTemp"
    argumentCollection = "#stArgs#"
    returnVariable = "aTemp">
<cfoutput>The temperature at zip code 55987 is #aTemp#</cfoutput>
```

In this example, the structure is created in a `cfscript` block, but you can use any ColdFusion method to create the structure.

### Consuming web services with the `cfscript` tag

The following example shows how to consume a web service with the `cfscript` tag. You use the [CreateObject](#) function to connect to the web service.

```
<cfscript>
    ws = CreateObject("webservice",
        "http://www.xmethods.net/sd/2001/TemperatureService.wsdl");
    xlatstring = ws.getTemp("55987");
    writeoutput(xlatstring);
</cfscript>
```

For more information, see Using Web Services in the *Developing ColdFusion Applications*.

### Example

```
<p>This simple example shows variable declaration and manipulation.
<cfif IsDefined("form.myValue")>
    <cfif IsNumeric(form.myValue)>
        <cfset x = form.myValue>
        <cfscript>
            y = x;
            z = 2 * y;
            StringVar = form.myString;
        </cfscript>
        <cfoutput><p>twice #x# is #z#.
            <p>Your string value was: <b><i>#StringVar#</i></b></cfoutput>
    <cfelse>
```

## cfsearch

### Description

Searches one or more Solr or Verity collections.

A collection must be created and indexed before this tag can return search results.

A collection can be *created* in these ways:

- With the `<cfcollection>` on page 82 tag
- In the ColdFusion Administrator
- Using a native Verity indexing tool, such as Vspider or MKVDK. For more information on Vspider and MKVDK, see *Introducing Verity and Verity Tools in Configuring and Administering ColdFusion*.

Register any collection that you create with a native Verity tool. A collection can be *registered with* ColdFusion in the following ways:

- With the `<cfcollection>` on page 82 tag
- In the ColdFusion Administrator

A collection can be *indexed* in the following ways:

- In ColdFusion, with the `<cfindex>` on page 326 tag
- In the ColdFusion Administrator, which calls the `cfindex` tag
- Using a native Verity indexing tool, such as Vspider or MKVDK

For more information, see *Building a Search Interface in the Developing ColdFusion Applications*.

## Category

[Extensibility tags](#)

## Syntax

```
<cfsearch
  collection = "collection name"
  name = "search name"
  category = "category[,category2,...]"
  categoryTree = "tree location"
  contextBytes = "number of bytes"
  contextHighlightBegin = "HTML string"
  contextHighlightEnd = "HTML string"
  contextPassages = "number of passages"
  criteria = "search expression"
  language = "language"
  maxRows = "number"
  previousCriteria = "criteria"
  startRow = "row number"
  status = ""
  suggestions = "suggestion option"
  type = "criteria">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## History

ColdFusion 9: Added support for Solr search engine.

#### ColdFusion MX 7:

- Added `category`, `categoryTree`, `status`, `suggestions`, `contextPassages`, `contextBytes`, `contextHighlightBegin`, `contextHighlightEnd`, and `previousCriteria` attributes.
- Added `author`, `category`, `categoryTree`, `context`, `rank`, `size`, `recordsSearched`, and `type` result columns.
- Added information on the status structure and its associated keys.
- Removed references to a separate K2 server and `k2server.ini` file.
- Removed references to unregistered collections.
- Removed references to external collections. ColdFusion MX now manages all collections through the Verity Search service.
- Changed `cflock` recommendation. It is no longer a best practice to surround the `cfsearch` tag with a `cflock` tag.

#### ColdFusion MX:

- Deprecated the `external` attribute. It might not work, and might cause an error, in later releases. (ColdFusion stores this information about each collection; it automatically detects whether a collection is internal or external.) This tag supports absolute (also known as fully qualified) collection pathnames and mapped collection names.
- Changed query result behavior: the `cfindex` tag can index the query results from a `cfsearch` operation.
- Changed Verity operations behavior: ColdFusion supports Verity operations on Acrobat PDF files.
- Changed multiple collection behavior: this tag can search multiple collections. In a multiple collection search, you cannot combine collections that are registered with K2Server and registered in another way.
- Changed acceptable collection naming: this tag accepts collection names that include spaces.
- Changed the following support: this tag supports Verity 2.6.1 and the LinguistX and ICU locales.
- Changed thrown exceptions: this tag can throw the `SEARCHENGINE` exception.

#### Attributes

**Note:** Some attributes can be used only with Verity collections. The Req/Opt column indicates these options.

Attribute	Req/Opt	Default	Description
<code>name</code>	Required		Name of the search query.
<code>collection</code>	Required		One or more collection names. You can specify more than one collection unless you are performing a category search (that is, specifying <code>category</code> or <code>categoryTree</code> ).
<code>category</code>	Optional		A list of categories, separated by commas, to which the search is limited. If specified, and the collection does not have categories enabled, ColdFusion throws an exception.
<code>categoryTree</code>	Optional		The location in a hierarchical category tree at which to start the search. ColdFusion searches at and below this level. If specified, and the collection does not have categories enabled, ColdFusion throws an exception. Can be used in addition to the <code>category</code> attribute.
<code>criteria</code>	Optional		Search criteria. Follows the syntax rules of the <code>type</code> attribute. If you pass a mixed-case entry in this attribute, the search is case sensitive. If you pass all uppercase or all lowercase, the search is case-insensitive. Follow Verity or Solr syntax and delimiter character rules; see Using Verity Search Expressions and Solr search support in the <i>Developing ColdFusion Applications</i> .
<code>contextBytes</code>	Optional Verity and Solr	300	The maximum number of bytes Verity returns in the context summary.

Attribute	Req/Opt	Default	Description
contextHighlightBegin	Optional Verity and Solr	<b>	The HTML to prepend to search terms in the context summary. Use this attribute in conjunction with contextHighlightEnd to highlight search terms in the context summary.
contextHighlightEnd	Optional Verity and Solr	</b>	The HTML to append to search terms in the context summary. Use this attribute in conjunction with contextHighlightBegin to highlight search terms in the context summary.
contextPassages	Optional Verity and Solr	0	The number of passages/sentences Verity returns in the context summary (that is, the context column of the results). The default is 0, which disables context summary.
language	Optional	english	Deprecated. This attribute is now ignored and the language of the collection is used to perform the search.
maxRows	Optional	all	Maximum number of rows to return in query results.
previousCriteria	Optional Verity only		The name of a result set from an existing set of search results. The search engine searches the result set for criteria without regard to the previous search score or rank. Use this attribute to implement searching within result sets.
startRow	Optional	1	Row number of the first row to get.
status	Optional		Specifies the name of the structure variable into which ColdFusion places search information, including alternative criteria suggestions (spelling corrections). For a list of keys in this structure, see the section Status structure keys.
suggestions	Optional	never	Specifies whether the search engine returns spelling suggestions for possibly misspelled words. Use one of the following options: <ul style="list-style-type: none"> <li>• Always: Always return spelling suggestions.</li> <li>• Never: Never return spelling suggestions.</li> <li>• positive integer: Return spelling suggestions if the number of documents retrieved by the search is less than or equal to the number specified.</li> </ul> There is a small performance penalty for retrieving suggestion data.
type	Optional	simple	Used to specify the parser that the engine uses to process the criteria. <ul style="list-style-type: none"> <li>• simple: STEM and MANY operators are implicitly used.</li> <li>• explicit: operators must be invoked explicitly. Also known as Bool_Plus.</li> <li>• internet: for documents that are mostly WYSIWIG (what-you-see-is-what-you-get) documents. Also known as Internet_advanced.</li> <li>• internet_basic: minimizes search time.</li> <li>• natural: specifies the Query By Example (QBE) parser. Also known as FreeText.</li> </ul> For more information, see Using Verity Search Expressions in the <i>Developing ColdFusion Applications</i> . Also see your Verity documentation.

## Usage

The `cfsearch` tag returns a query object whose columns you can reference in a `cfoutput` tag. For example, the following code specifies a search for the exact terms "filming" or "filmed":

```
<cfsearch
    name = "mySearch"
    collection = "myCollection"
    criteria = '<WILDCARD>`film{ing,ed}`'
    type="explicit"
    startrow=1
    maxrows = "100">
<cfdump var = "#mySearch#>
```

In this example, the single-quotation mark (') and backtick (`) characters are used as delimiters; for more information, see *Using Verity Search Expressions* in the *Developing ColdFusion Applications*.

To optimize search performance, always specify the `maxrows` attribute, setting it to a value that matches your application's needs. A value less than 300 helps to ensure optimal performance.

Adobe does not recommend using the `cflock` on page 379 tag with this tag; Verity/Solr provides the locking function. Using the `cflock` on page 379tag slows search performance.

### The cfsearch tag result columns

Variable	Description
context	A context summary containing the search terms, highlighted in bold (by default). This is enabled if you set the <code>contextpassages</code> attribute to a number greater than zero.
url	Value of <code>URLpath</code> attribute in the <code>cfindex</code> tag used to populate a collection.
key	Value of the <code>key</code> attribute in the <code>cfindex</code> tag used to populate a collection.
title	Value of <code>title</code> attribute in <code>cfindex</code> tag used to populate the collection, including PDF and Office document titles. If a title is not extracted from the document, the tag uses the <code>cfindextitle</code> attribute value for each row.
score	Relevancy score of document based on search criteria
custom1, custom2, custom3, custom4	Value of custom fields in <code>cfindex</code> tag used to populate a collection.
size	The number of bytes in the index document.
rank	The rank of this document in the search results.
author	Extracted from the HTML, Office, and PDF documents when available.
type	The MIME type of the document.
category	A list of the categories that were specified for this document when it was indexed.
categoryTree	A hierarchical category tree, or serial list of categories, that was specified for this document when it was indexed. Only a single tree is returned.
summary	Contents of automatic summary generated by <code>cfindex</code> .
recordCount	Number of records returned in record set
currentRow	Current row that <code>cfoutput</code> is processing.
columnList	List of column names within record set.
recordsSearched	Number of records searched. This is the same value for each row in the record set. Corresponds to the <code>searched</code> key in the status structure.

### Status structure keys

Variable	Description
found	The number of documents that contain the search criteria.
searched	The number of documents searched. Corresponds to the <code>recordsSearched</code> column in the search results.
time	The number of milliseconds the search took, as reported by the Verity K2 search service.
suggestedQuery	An alternative query, as suggested by Verity, that might produce better results. This often contains corrected spellings of search terms. Present only when the <code>suggestions</code> tag attribute criteria is met.
keywords	A structure containing each search term as a key to an array of up to five possible alternative terms, in order of preference. Present only when the <code>suggestions</code> attribute criteria is met.
keywordScore	A structure in the same format as for keywords, except it also includes Verity-reported weighted values from 0 to .99, in which higher scores indicate better-quality results.

To permit application users to search Verity collections for nonstandard strings, words, or characters (for example, "AB23.45.67" or "--->") that would otherwise cause an error, you can create a text file that lists these elements and defines their formats for Verity. Name the file `style.lex` and put copies of the file in these directories:

- Windows:
  - `cf_root\verity\k2\common\style`
  - `cf_root\verity\Data\stylesets\ColdFusionK2`
- UNIX:
  - `cf_root/verity/k2/common/style`
  - `cf_root/verity/Data/stylesets/ColdFusionK2`

In the multiserver and J2EE configurations, you install Verity in a separate directory.

**Note:** To search for a character such as an angle bracket (< or >), use a `criteria` attribute value such as `"&lt;"` or `"&gt;"`. The bracket characters are reserved in Verity, and using a backslash to escape the character (`criteria="\<"`) does not work in this context. For more information, see *Using Verity Search Expressions in the Developing ColdFusion Applications*.

### Example

```
<!-- #1 (TYPE=SIMPLE) ----->
<cfsearch
    name="name"
    collection="snippets,syntax,snippets"
    criteria="example"
    maxrows = "100">

<p>
<cfoutput>Search Result total =#name.RecordCount# </cfoutput><br>
<cfoutput>
    url=#name.url#<br>
    key=#name.key#<br>
    title=#name.title#<br>
    score=#name.score#<br>
    custom1=#name.custom1#<br>
    custom2=#name.custom2#<br>
    summary=#name.summary#<br>
    recordcount=#name.recordcount#<br>
    currentrow=#name.currentrow#<br>
    columnlist=#name.columnlist#<br>
    recordssearched=#name.recordssearched#<br>
```

```
</cfoutput>
<cfdump var = #name#>
<br>

<!-- #2 (TYPE=EXPLICIT) ----->
<cfsearch
    name = "snippets"
    collection = "snippets"
    criteria = '<wildcard>`film{ing,ed}`'
    type="explicit"
    startrow=1
    maxrows = "100">
<cfoutput
    query="snippets">
    url=#url#<br>
    key=#key#<br>
    title=#title#<br>
    score=#score#<br>
    custom1=#custom1#<br>
    custom2=#custom2#<br>
    summary=#summary#<br>
    recordcount=#recordcount#<br>
    currentrow=#currentrow#<br>
    columnlist=#columnlist#<br>
    recordssearched=#recordssearched#<br>
</cfoutput>
<cfdump var = #snippets#>
<br>

<!-- #3 (search by CF key) ----->
<cfsearch
    name = "book"
    collection = "custom_book"
    criteria = "cf_key=bookid2"
    maxrows = "100">
<cfoutput>
    url=#book.url#<br>
    key=#book.key#<br>
    title=#book.title#<br>
    score=#book.score#<br>
    custom1=#book.custom1#<br>
    custom2=#book.custom2#<br>
    summary=#book.summary#<br>
    recordcount=#book.recordcount#<br>
    currentrow=#book.currentrow#<br>
    columnlist=#book.columnlist#<br>
    recordssearched=#book.recordssearched#<br>
</cfoutput>
<cfdump var = #book#>
```

## cfselect

### Description

Constructs a drop-down list box form control. Used in a `cfform` tag. You can populate the list from a query, or by using the `HTML` option tag.

## Category

### Forms tags

## Syntax

```
<cfselect
    name="name" bind="bind expression"
    bindAttribute="attribute name"
    bindOnLoad="yes|no"
    display="text" editable="yes|no"
    enabled="yes|no"
    group="query column name" height="number of pixels"
    id="HTML id"
    label="label" message="text" multiple="yes|no"
    onBindError="JavaScript function name"
    onChange="JavaScript or ActionScript"
    onClick="JavaScript function name"
    onError="JavaScript"
    onKeyDown="JavaScript or ActionScript"
    onKeyUp="JavaScript or ActionScript"
    onMouseDown="JavaScript or ActionScript"
    onMouseUp="JavaScript or ActionScript"
    query="query name" queryPosition="above|below"
    required="yes|no"
    selected="value or list" size="integer" sourceForTooltip="URL"
    style="style specification" tooltip="text"
    value="text" visible="yes|no"
    width="number of pixels">
```

zero or more HTML option tags

```
</cfselect>
```

Some attributes apply to only specific display formats. For details see the Attributes table.

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

Introduction to Retrieving and Formatting Data and Using Ajax User Interface Components and Features in the *Developing ColdFusion Applications*

## History

ColdFusion 8:

- Added support for binding in HTML format forms, including the `bind`, `bindAttribute`, and `bindOnLoad`, and `onBindError` attributes.
- Added support for tool tips in HTML format forms, including the `sourceForTooltip` attribute.

ColdFusion MX 7:

- When populating a `cfselect` tag with a query when the database field has spaces instead of a value, the error processing of the `cform` tag required field is not triggered as it was in ColdFusion MX 6.1.
- Added support for specifying multiple values to the `selected` attribute.

- Deprecated the `passthrough` attribute. The tag now supports all HTML `select` tag attributes directly.
- Added `on-`prefixed attributes.
- Added `enabled`, `group`, `height`, `label`, `queryPosition`, `tooltip`, `visible`, and `width` attributes.

### Attributes

The following table lists attributes that ColdFusion uses directly. The tag also supports all HTML `select` tag attributes that are not on this list, and passes them directly to the browser.

**Note:** Attributes that are marked as *Flash only* are not handled by the skins provided with ColdFusion. They are, however, included in the generated XML.

Attribute	Req/Opt; Format	Default	Description
<code>name</code>	Required; All		Name of the select form element.
<code>bind</code>	Optional; HTML		A bind expression that dynamically sets an attribute of the control. For details, see Usage.
<code>bindAttribute</code>	Optional; HTML	Populate the options	Specifies the HTML tag attribute whose value is set by the <code>bind</code> attribute. You can only specify attributes in the browser's HTML DOM tree, not ColdFusion-specific attributes.  Ignored if there is no <code>bind</code> attribute.
<code>bindOnLoad</code>	Optional; HTML	no	A Boolean value that specifies whether to execute the <code>bind</code> attribute expression when first loading the form. Ignored if there is no <code>bind</code> attribute.
<code>display</code>	Optional; All	Value of <code>value</code> attribute	Query column to use for the display label of each list element. Used with the <code>query</code> attribute.
<code>editable</code>	Optional; Flash	no	Boolean value specifying whether you can edit the contents of the control.
<code>enabled</code>	Optional; Flash	yes	Boolean value specifying whether the control is enabled. A disabled control appears in light gray. The inverse of the <code>disabled</code> attribute.
<code>group</code>	Optional; HTML and XML		Query column to use to group the items in the drop-down list into a two-level hierarchical list.
<code>height</code>	Optional; Flash		The height of the control, in pixels.
<code>id</code>	Optional; HTML	Value of <code>name</code> attribute	The HTML ID of the control.
<code>label</code>	Optional; Flash and XML		Label to put next to the control on a Flash or XML-format form.
<code>message</code>	Optional; All		Message to display if <code>required="yes"</code> and no selection is made.

Attribute	Req/Opt;  Format	Default	Description
multiple	Optional;  All	no	<ul style="list-style-type: none"> <li>• yes: allows selecting multiple elements in drop-down list.</li> <li>• no</li> </ul>
onBindError	Optional;  HTML	See Description	<p>The name of a JavaScript function to execute if evaluating a bind expression results in an error. The function must take two attributes: an HTTP status code and a message. (The status code is -1 if the error is not an HTTP error.)</p> <p>If you omit this attribute, and specified a global error handler (by using the <code>"ColdFusion.setGlobalErrorHandler"</code> on page 1377 function), it displays the error message; otherwise a default error pop-up appears.</p>
onChange	Optional;  All		JavaScript (HTML/XML) or ActionScript (Flash) to run when the control changes due to user action.
onClick	Optional;  HTML and XML		JavaScript to run when the user clicks the control.
onError	Optional;  HTML and XML		Custom JavaScript function to execute if validation fails.
onKeyDown	Optional;  All		JavaScript (HTML/XML) or ActionScript (Flash) to run when the user presses a keyboard key in the control.
onKeyUp	Optional;  All		JavaScript (HTML/XML) or ActionScript (Flash) to run when the user releases a keyboard key in the control.
onMouseDown	Optional;  All		JavaScript (HTML/XML) or ActionScript (Flash) to run when the user releases a mouse button in the control.
onMouseUp	Optional;  All		JavaScript (HTML/XML) or ActionScript (Flash) to run when the user presses a mouse button in the control.
query	Optional;  All		Name of query to populate drop-down list.
queryPosition	Optional;  All	above	<p>If you populate the options list with a query and use HTML <code>option</code> child tags to specify additional entries, this attribute determines the location of the items from the query relative to the items from the <code>option</code> tags:</p> <ul style="list-style-type: none"> <li>• above: puts the query items above the <code>options</code> items.</li> <li>• below: puts the query items below the <code>options</code> items.</li> </ul>
required	Optional;  All	no	<p>Note: This attribute has no effect if you omit the <code>size</code> attribute or set it to 1, because the browser always submits the displayed item. You can work around this issue: format forms by having an initial <code>option</code> tag with <code>value=" "</code> (notice the space character between the quotation marks). This workaround applies only for Flash forms and not for HTML forms or XML forms.</p> <ul style="list-style-type: none"> <li>• yes: a list element must be selected when the form is submitted.</li> <li>• no</li> </ul>

Attribute	Req/Opt; Format	Default	Description
selected	Optional; All		One or more option values to preselect in the selection list. To specify multiple values, use a comma-delimited list. This attribute applies only if selection list items are generated from a query. The <code>cfform</code> tag <code>preserveData</code> attribute can override this value.
size	Optional; All	1	Number of entries to display at one time. The default value displays a drop-down list. Any other value displays a list box with <code>size</code> number of entries visible at one time.
sourceForTooltip	Optional; HTML		The URL of a page to display as a tool tip. The page can include CFML and HTML markup to control the tip contents and format, and the tip can include images.  If you specify this attribute, an animated icon appears with the text "Loading..." while the tip is being loaded.
style	Optional; All		In HTML or XML format forms, ColdFusion passes the <code>style</code> attribute to the browser or XML.  In Flash format, must be a style specification in CSS format, with the same syntax and contents as used in Flex for the corresponding Flash element.
tooltip	Optional; Flash, HTML		Text to display when the mouse pointer hovers over the control. The text can include HTML markup.  Ignored if you specify a <code>sourceForTooltip</code> attribute.
value	Optional; All		Query column to use for the value of each list element. Used with the <code>query</code> attribute.
visible	Optional; Flash	yes	Boolean value that specifies whether to show the control. The display reserves empty space for an invisible control.
width	Optional; Flash		The width of the control, in pixels.

## Usage

For this tag to work properly, the browser must have JavaScript enabled.

This tag requires an end tag and can include HTML `option` and `optgroup` child tags.

To ensure that a selected list box item persists across postbacks, use the `cfform` tag `preserveData` attribute with a list generated from a query. (This strategy works only with data that is populated from a query.)

If the `cfform` `preserveData` attribute is `yes` and the form posts back to the same page, and if the control is populated by a query, the posted selections for the `cfselect` control are used instead of the `Selected` attribute. For controls that are populated with regular HTML `option` tags, the developer must dynamically add the `Selected` attribute to the appropriate option tags.

The `group` option generates a query by using SQL GROUP BY syntax and places the `value` column entries from each group in an indented list under the `group` column's field value. This option generates an HTML `optgroup` tag for each entry in the `group` column.

Close each HTML `option` tag in the `cfselect` tag body with a `</option>` end tag. If you do not do so, and you specify `queryPosition="below"`, the first item from the query might not appear in the list.

The `bind` attribute lets you set `cfselect` attributes dynamically. Often, it is used to dynamically create the options list based on values that the user enters in the form. For example, you can use the `bind` attribute to create a Cities option list based on the user's selection from a States `cfselect` control.

When you use a `bind` attribute to populate the selection list, the function or URL that returns the selection values must return one of the following:

- A two-dimensional array, where the first element in each array row is the option value and the second element in the row is the text to display in the option list.
- If the `bind` specifies a CFC function, a query, or, if the `bind` specifies a URL, a JSON representation of a query. The query must include columns whose names are the values of the `cfselect` tag `value` and `display` attributes. Although you can return additional columns, you cannot use them in your client-side code. When you call a CFC function, you do not have to convert the query to JSON format yourself; ColdFusion automatically does the conversion.

To use this format, specify a `value` attribute. If you omit the `display` attribute, you must have only a single column in the query that contains the values; the values are also used as the displayed text.

For detailed information on binding, see Binding data to form fields in the *Developing ColdFusion Applications*.

For more information, see the "`cfform`" on page 225 tag entry.

### Example

Example 1: Without data binding

The following example lets you select one or more employee names from a list of all employees, grouped by departments, and displays the selected names and the employee's e-mail addresses. It includes an option to get data for all employees.

```
<!--- Get the employee names from the database. --->
<!--- Use SQL to create a Name field with first and last names. --->
<cfquery name = "GetAllEmployees" dataSource = "cfdocexamples"
    cachedwithin="#createTimeSpan(0,1,0,0)#">
    SELECT Emp_ID, EMail, Phone, Department, FirstName, LastName,
           FirstName || ' '
           ||lastName as Name
    FROM Employees
    GROUP BY Department, Emp_ID, EMail, Phone, FirstName, LastName, FirstName
</cfquery>

<h2>cfselect Example</h2>
<!-- The cfif statement is true if the form was submitted.
      Show the selected names. --->
<cfif IsDefined("form.employeeid")>
    <!--- The form was submitted. --->
    <h3>You Selected the following employees</h3>
    <cfif form.employeeid IS "">
        <!--- Select All option was selected. Show all employees. --->
        <cfoutput query="GetAllEmployees">
            #name#<br>
            Email: #email#<br><br>
        </cfoutput>
    <cfelse>
        <!---
            Use a query of queries to get the data for the selected users.
            Form.employeeid is a comma-delimited list of selected employee IDs.
        --->
        <cfquery name = "GetSelectedEmployees" dbtype="query">
            SELECT Emp_ID, EMail, Phone, Department, FirstName, LastName,
                   FirstName
```

```

        || ' ' ||lastName as Name
    FROM GetAllEmployees
    WHERE Emp_ID in (#form.employeeid#)
</cfquery>
<!--- Display the names and e-mail addresses from the query. --->
<cfoutput query="GetSelectedEmployees">
    #firstName# #lastName#<br>
    Email: #email#<br>
    <br>
</cfoutput>
</cfif>
</cfif>

<!--- The cfform tag posts back to the current page. --->
<h3>Select one or more employees</h3>
<cfform action = "#CGI.SCRIPT_NAME#">
    <!---
        Use cfselect to present the query's LastName column,
        grouped by department.
        Allow Multiple selections.
    --->
    <cfselect
        name = "employeeid"
        size = "15"
        multiple="yes"
        required = "Yes"
        message = "Select one or more employee names"
        query = "GetAllEmployees"
        group="Department"
        display = "name"
        value = "emp_id"
        queryPosition="Below">
        <!--- Add an option to select all employees. --->
        <option value = "">Select All</option>
    </cfselect><br><br>
    <input type="Submit">
</cfform>

```

#### Example 2: With data binding

The following example uses binding to fill in the options list of the Cities control only after the user selects a state. (In this example, only two states, California and New Jersey, have city entries.)

The CFML page is the simplest part of the example. It consists of the following lines:

```
<html>
<head>
</head>
<body>
<cfform name="mycfform">
  <!---
    The States selector.
    The bindonload attribute is required to fill the selector.
  --->
  <cfselect name="state" bind="cfc:bindFcns.getstates()" bindonload="true">
    <option name="0">--state--</option>
  </cfselect>
  <cfselect name="city" bind="cfc:bindFcns.getcities({state})">
    <option name="0">--city--</option>
  </cfselect>
</cfform>
</body>
</html>
```

The BinFcns CFC has three functions: `getstates`, to get the states; `getcities`, to get the cities; and an internal `getXmlData` function that parses an XML file to get the state and city information. The following examples shows the CFC:

```
<cfcomponent>
  <cffunction name="getXmlData" output="true">
    <cfset var xmlData = "">
    <cffile action="read" file="#expandpath('.')#\states.xml"
      variable="xmlData">
    <cfset xmlData = XmlParse(xmlData)>
    <cfreturn xmlData>
  </cffunction>

  <cffunction name="getstates" access="remote">
    <cfset state = arraynew(2)>
    <cfset xmlData = getXmlData()>
    <cfset numStates = 0>
    <cfset state[1][1] = "0">
    <cfset state[1][2] = "--state--">
    <cfset numStates = ArrayLen(xmlData.states.XmlChildren)>
    <cfloop from="1" to="#numStates#" index="j">
      <cfset state[j+1][1] =
        ltrim(xmlData.states.state[j].XmlAttributes.abr)>
      <cfset state[j+1][2] = ltrim(xmlData.states.state[j].name.xmlText)>
    </cfloop>
    <cfreturn state>
  </cffunction>

  <cffunction name="getcities" access="remote">
    <cfargument name="state" required="yes">
    <cfset var city = arraynew(2)>
    <cfset var xmlData = getXmlData()>
    <cfset var numStates = 0>
    <cfset var numCities = 0>
  <cflog text="In getcities">
    <cfset city[1][1] = "0">
    <cfset city[1][2] = "--city--">
    <cftry>
      <cfset numStates = ArrayLen(xmlData.states.XmlChildren)>
```

```
<cfloop from="1" to="#numStates#" index="j">
    <cfif xmlData.states.state[j].XmlAttributes.abr eq state>
        <cfset numCities =
            ArrayLen(xmlData.states.state[j].cities.XmlChildren)>
        <cfloop from="1" to="#numCities#" index="k">
            <cfset city[k+1][1] =
ltrim(xmlData.states.state[j].cities.city[k].XmlAttributes.name)>
            <cfset city[k+1][2] =
ltrim(xmlData.states.state[j].cities.city[k].XmlAttributes.name)>
            </cfloop>
            <cfbreak>
        </cfif>
    </cfloop>
    <cfcatch type="any">
        <!-- Do nothing. -->
    </cfcatch>
</cftry>
    <cfreturn city>
</cffunction>

</cfcomponent>
```

The states.xml file has the following code. To keep the code short, only two states have cities, and only four states are listed.

```
<states>
  <state abr="NJ">
    <name>New Jersey</name>
    <cities>
      <city name="Edison" />
      <city name="Rahway" />
      <city name="Atlantic City" />
      <city name="Hoboken" />
      <city name="Jersey City" />
      <city name="Newark" />
      <city name="Trenton" />
      <city name="Union City" />
    </cities>
  </state>
  <state abr="CA">
    <name>California</name>
    <cities>
      <city name="Anaheim" />
      <city name="Beverly Hills" />
      <city name="Elk Grove" />
      <city name="Fairfield" />
      <city name="Fremont" />
      <city name="Indian Wells" />
      <city name="Long Beach" />
    </cities>
  </state>
  <state abr="ME">
    <name>Maine</name>
  </state>
  <state abr="MA">
    <name>Massachusetts</name>
  </state>
</states>
```

## cfServlet

### Description

This tag is deprecated. Executes a Java servlet on a JRun engine.

To access servlets that run on the same server as ColdFusion, use code such as the following, in which *path* specifies a servlet, JSP, or anything else:

```
GetPageContext().include(path)
GetPageContext().forward(path)
```

For more information, see the JSP PageContext API or the Servlet RequestDispatcher API.

### History

ColdFusion MX: Deprecated this tag. It might not work, and it might cause an error, in later releases.

## cfServletparam

### Description

This tag is deprecated.

A child tag of the `cfServlet` tag. Passes data to a servlet. Each `cfServletparam` tag within the `cfServlet` block passes a separate item of data to the servlet.

To access servlets that run on the same server as ColdFusion, use code such as the following, in which *path* specifies a servlet, JSP, or anything else:

```
GetPageContext().include(path)
GetPageContext().forward(path)
```

For more information, see the JSP `PageContext` API or the Servlet `RequestDispatcher` API.

### History

ColdFusion MX: Deprecated this tag. It might not work, and it might cause an error, in later releases.

## cfset

### Description

Sets a value in ColdFusion. Used to create a variable, if it does not exist, and assign it a value. Also used to call functions.

### Category

[Variable manipulation tags](#)

### Syntax

```
<cfset
    var variable_name = expression>
```

### See also

[cfcookie](#), [cfparam](#), [cfregistry](#), [cfsavecontent](#), [cfschedule](#); Elements of CFML in the *Developing ColdFusion Applications*

### Attributes

Attribute	Req/Opt	Default	Description
variable_name	Required		A variable.
var	Optional		A keyword. Does not take a value. Identifies the variable as being local to a function. The variable only exists for the time of the current invocation of the function.

### Usage

You use the `cfset` tag in several ways in your applications.

### Calling functions

When you use the `cfset` tag to call a function, you do not have to assign the function return value to a variable if the function does not return a value or you do not have to use the value returned by the function. For example, the following line is a valid ColdFusion `cfset` tag for deleting the `MyVariable` variable from the Application scope:

```
<cfset StructDelete(Application, "MyVariable")>
```

### Arrays

The following example assigns a new array to the variable `months`:

```
<cfset months = ArrayNew(1)>
```

This example creates a variable `Array_Length` that resolves to the length of the `Scores` array:

```
<cfset Array_Length = ArrayLen(Scores)>
```

This example assigns, to index position two in the array `months`, the value `February`:

```
<cfset months[2] = "February">
```

### Dynamic variable names

In this example, the variable name is itself a variable:

```
<cfset myvariable = "current_value">  
<cfset "#myvariable#" = 5>
```

### Function local variables

The `var` keyword specifies that the variable being defined is only available inside the body of a function that you define by using the `cffunction` tag. The variable value that is set in one invocation of the function is not available in any other invocation of the function. The `var` keyword is the equivalent of the `var` statement in CFScript. The following rules apply to the `var` keyword:

- Any `cfset` tag that uses the `var` keyword must be inside the body of a `cffunction` tag. If you use the `var` keyword in a `cfset` tag outside a `cffunction` tag body, ColdFusion displays an error message.
- Place all `cfset` tags that use the `var` keyword at the beginning of the `cffunction` tag body, before any other ColdFusion tags.

The following example shows how to use the new keyword:

```
<cffunction name="myFunc">  
    <cfset var myVar = "This is a test">  
    <cfreturn myVar & " Message.">  
</cffunction>  
<cfoutput>#myFunc()#</cfoutput>
```

In this example, the variable `myVar` exists only when the function `myFunc` executes, and it is not available elsewhere on the ColdFusion page.

### COM objects

In this example, a COM object is created. A `cfset` tag defines a value for each method or property in the COM object interface. The last `cfset` creates a variable to store the return value from the COM object's `SendMail` method.

```
<cfobject action = "Create"
    name = "Mailer"
    class = "SMTPsvg.Mailer">

<cfset MAILER.FromName = form.fromname>
<cfset MAILER.RemoteHost = RemoteHost>
<cfset MAILER.FromAddress = form.fromemail>
<cfset MAILER.AddRecipient("form.fromname", "form.fromemail")>
<cfset MAILER.Subject = "Testing cfobject">
<cfset MAILER.BodyText = "form.msgbody">
<cfset Mailer.SMTPLog = "logfile">
<cfset success = MAILER.SendMail()>
<cfoutput> #success# </cfoutput>
```

### Example

```
<!--- This example shows how to use cfset. --->
<cfquery name = "GetMessages" dataSource = "cfdocexamples">
    SELECT *
    FROM Messages
</cfquery>

<h3>cfset Example</h3>
<p>cfset sets and reassigns values to local or global variables within a page.

<cfset NumRecords = GetMessages.recordCount>
<p>For example, the variable NumRecords has been declared on this
page to hold the number of records returned from query
(<cfoutput>#NumRecords#</cfoutput>).

<p>In addition, cfset can be used to pass variables from other pages,
such as this example, which takes the url parameter Test from this
link: <a href = "cfset.cfm?test = <cfoutput>
#URLEncodedFormat("hey, you, get off of my cloud")#</cfoutput>
">click here</A>) to display a message:

<p>
<cfif IsDefined ("url.test") is "True">
    <cfoutput><b><i>#url.test#</i></b></cfoutput>
<cfelse>
    <h3>The variable url.test has not been passed from another page.</h3>
</cfif>
```

<p>cfset can also be used to collect environmental variables, such as the time, the IP address of the user, or another function or expression.

```
<cfset the_date = #DateFormat(Now())# & " " & #TimeFormat(Now())#>
<cfset user_ip = CGI.REMOTE_ADDR>
<cfset complex_expr = (23 MOD 12) * 3>
<cfset str_example = Reverse(Left(GetMessages.body, 35))>

<cfoutput>
  <ul>
    <li>The date: #the_date#
    <li>User IP Address: #user_ip#
    <li>Complex Expression ((23 MOD 12) * 3): #complex_expr#
    <li>String Manipulation (the first 35 characters of
      the body of the first message in our query)
      <br><b>Reversed</b>: #str_example#
      <br><b>Normal</b>: #Reverse(str_example)#
    </li>
  </ul>
</cfoutput>
```

## cfsetting

### Description

Controls aspects of page processing, such as the output of HTML code in pages.

### Category

[Page processing tags](#), [Variable manipulation tags](#)

### Syntax

```
<cfsetting
  enableCFoutputOnly = "yes|no"
  requestTimeout = "value in seconds"
  showDebugOutput = "yes|no" >
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfcache](#), [cfflush](#), [cfheader](#), [cfhtmlhead](#), [cfinclude](#), [cfprocessingdirective](#), [cfsilent](#); Controlling debugging output with the `cfsetting` tag in the *Developing ColdFusion Applications*

### History

ColdFusion MX 6.1: Changed behavior: if the tag has a body, ColdFusion executes its contents.

ColdFusion MX:

- Added the `requestTimeout` attribute.
- The `catchExceptionsByPattern` attribute is obsolete. It does not work, and causes an error, in releases later than ColdFusion 5.
- Changed exception handling: the structured exception manager searches for the best-fit `cfcatch` handler. (In earlier releases, an exception was handled by the first `cfcatch` block that could handle an exception of its type.)

## Attributes

Attribute	Req/Opt	Default	Description
enableCFoutputOnly	Optional		<ul style="list-style-type: none"><li>• yes: blocks output of HTML that is outside cfoutput tags.</li><li>• no: displays HTML that is outside cfoutput tags.</li></ul>
requestTimeout	Optional		<ul style="list-style-type: none"><li>• integer; number of seconds. Time limit, after which ColdFusion processes the page as an unresponsive thread. Overrides the time-out set in the ColdFusion Administrator.</li></ul>
showDebugOutput	Optional	yes	<ul style="list-style-type: none"><li>• yes: if debugging is enabled in the Administrator, displays debugging information.</li><li>• no: suppresses debugging information that would otherwise display at the end of the generated page.</li></ul>

## Usage

The cfsetting requestTimeout attribute replaces the use of requestTimeOut within a URL. To enforce a page time-out, detect the URL variable and use code such as the following to change the page time-out:

```
<cfsetting RequestTimeout = "#URL.RequestTimeout#">
```

You can use this tag to manage whitespace in ColdFusion output pages.

If you nest cfsetting tags: to make HTML output visible, match each enableCFoutputOnly = "Yes" statement with an enableCFoutputOnly = "No" statement. For example, after five enableCFoutputOnly = "Yes" statements, to enable HTML output, you must have five corresponding enableCFoutputOnly = "No" statements.

If HTML output is enabled (no matter how many enableCFoutputOnly = "No" statements have been processed) the first enableCFoutputOnly = "Yes" statement blocks output.

If the debugging service is enabled and showDebugOutput = " Yes", the IsDebugMode function returns Yes; otherwise, No.

**Note:** Releases after ColdFusion MX allow a </cfsetting> end tag; however, this end tag does not affect processing. The cfsetting attributes affect code inside and outside the cfsetting tag body. ColdFusion MX ignored code between cfsetting start and end tags.

## Example

```
<p>CFSETTING is used to control the output of HTML code in ColdFusion pages.
```

```
    This tag can be used to minimize the amount of generated whitespace.
```

```
<cfsetting enableCFoutputOnly = "Yes">
    This text is not shown
<cfsetting enableCFoutputOnly = "No">
    <p>This text is shown
<cfsetting enableCFoutputOnly = "Yes">
    <cfoutput>

```

## cfsharepoint

### Description

Invokes a feature that SharePoint exposes as a web service action, such as the Document Workspace `getdwsdata` action.

### Category

[Extensibility tags](#), MS Office Integration tags.

### Syntax

```
<cfsharepoint
    action="webservice action"
    params="parameter structure"
    domain="domain name"
    name ="result variable name"
    password="connection password"
    userName="user ID"
    wsdl="WSDL file path">
or
```

```
<cfsharepoint
    action="webservice action"
    params="parameter structure"
    login = "credentials structure"
    name ="result variable name"
    wsdl="WSDL file path">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### History

ColdFusion 9: Added tag.

### Attributes

Attribute	Req/Opt	Default	Description
action	Required		The name of a web service action. See Usage for the list of service actions you can specify.
domain	Optional		The domain name required to connect to the SharePoint server. Required if you do not specify a <code>login</code> attribute.
login	Optional		A structure containing user, password, and domain login credentials to pass to the service. If you do not specify <code>domain</code> , <code>password</code> , and <code>userName</code> attributes, specify a <code>login</code> structure with <code>domain</code> , <code>password</code> , and <code>userName</code> entries.
name	Optional		Name of the result variable in which to put the data returned by the SharePoint service.
params	Optional		A structure containing names and values of the parameters to pass to the service.  This attribute is required for any service that requires parameters.

Attribute	Req/Opt	Default	Description
password	Optional		The password required to connect to the SharePoint server. Required if you do not specify a <code>login</code> attribute.
userName	Optional		The user name required to connect to the SharePoint server. Required if you do not specify a <code>login</code> attribute.
wsdl	Optional		Path to the service wsdl file. Required to invoke an action that is not in the list of supported actions. See Usage for details.

### Usage

The `cfsharepoint` tag invokes a Microsoft SharePoint web service. You call many SharePoint web service actions by specifying the action name in the `action` attribute and passing the web service parameters in the `params` attribute. You access the services and methods that the `cfsharepoint` tag does not support directly by specifying the service WSDL URLs in the `wsdl` attribute.

**Note:** You can use the `cfsharepoint` tag with servers that use basic authentication only.

You request a service and action by specifying the `action` attribute values listed in the following tables. In nearly all cases, these are identical to the SharePoint action names. Notes indicate where the attribute values differ from the action names because multiple services have the same action name.

**Note:** The web service action parameters are documented at [http://msdn.microsoft.com/en-us/library/dd878586\(v=office.12\).aspx](http://msdn.microsoft.com/en-us/library/dd878586(v=office.12).aspx). You can also determine the parameters from the web service WSDL, at [http://server\\_name/\\_vti\\_bin/WebServiceName?wsdl](http://server_name/_vti_bin/WebServiceName?wsdl).

When the `cfsharepoint` tag receives the results from the SharePoint server and completes, the structure specified by the `name` attribute contains the response. This structure also has a `ResultFlag` entry containing the value `Success` or `Failure`. The entry value is `Success` if there is no Axis Fault or an error is returned in the response, otherwise, the value is `Failure`.

### Document Workspace

cancreatedwsurl	deletedwsfolder	renamedws
createdws	finddwsdoc	updatedwsdata
createdwsfolder	getdwsdata	
deletedws	removedwsuser	

**Note:** The `createdwsfolder` and `deletedwsfolder` action attribute values correspond to the `createfolder` and `deletefolder` actions of the Document Workspace service.

### Imaging

delete	getitemsbyids	upload
download	listpicturelibrary	
getimaginglistitems	rename	

**Note:** The `getimaginglistitems` action attribute value correspond to the `getlistitems` action of the Imaging service.

### Lists

addattachment	getattachmentcollection	updatelist
addlist	getlist	updatelistitems
deleteattachment	getlistcollection	
deletelist	getlistitems	

### Search or spsearch

**Note:** *spsearch/search* is not present in Windows Sharepoint Services 2.0.

In Windows SharePoint Services 3.0, if the action attribute specifies any of the following actions, the spsearch.asmx web service is used to perform the search. In Microsoft Office SharePoint Portal Server 2003 or Microsoft Office SharePoint Server 2007, search.asmx is used to perform the search. In Windows Sharepoint Services 2.0, an exception is thrown.

query	registration
queryex	status

### UserGroup

addgrouptorole	getgroupcollection	removerole
addrole	getrolecollection	removeusercollectionfromgroup
addusercollectiontogroup	getusercollectionfromrole	removeuserfromgroup
addusercollectiontorole	getusercollectionfromrole	
addusertogroup	getuserinfo	

### Views

addview	getview	updateview
deleteview	getviewcollection	

### Data type conversion

Some web service actions require parameters in a Microsoft data type that does not correspond directly to a ColdFusion data type. The `cfsharepoint` tag automatically converts between the Microsoft data types and the most appropriate Java data types, which ColdFusion uses internally. The following table lists the conversions, and indicates the corresponding ColdFusion data type.

SharePoint data type	ColdFusion Java data type
XmlNode	XMLNodeList - corresponds to a ColdFusion XML object, for example created by passing an XML string to the <code>XmlParse</code> function.)
ArrayOfString	string array - corresponds to a ColdFusion array containing string data.
UnsignedInt	int - corresponds to a ColdFusion number that is an integer value
ArrayOfUnsignedInt	int array - corresponds to a ColdFusion array containing string data.

### Example

The following example shows how you can manipulate lists and views. It requires resources on the SharePoint server that are not specified here.

```
<!DOCTYPE HTML PUBLIC "-//W3C//DTD HTML 4.0 Transitional//EN">
<html>
<head>
    <title>cfsharepoint Views Example</title>
</head>

<body>
<cfoutput>

Getting the list collection<br />
<!-- All login information is defined using variables in the Application.cfc file. --->
<cfsharepoint action="getlistcollection" login="#login#" name="result"/>

result.ResultFlag: #result.ResultFlag#<br><br>

Deleting mycustomlist from the collection, if it exists.<br>
<cfloop array=#result.lists# index="list">
    <cfif list.Title EQ "mycustomlist">
        <cfsharepoint action="deletelist" login="#login#"
            name="result1" params="#{listname="mycustomlist"}#"/>
    </cfif>
</cfloop>

    Was anything deleted?
<cfif IsDefined("result1")>
    <b>YES.</b> The result is:</b><br>
    <cfdump var="#result1#"><br>
<cfelse>
    <b>NO</b>
</cfif>

Adding a mycustomlist list<br />
<cfsharepoint action="addlist" login="#login#" name="result1"
    params="#{listname="mycustomlist",
        description="Adding a list via cfsharepoint",
        templateid=100}#"/>

addlist result.ResultFlag: #result1.ResultFlag#<br><br>

<cfset viewFields = xmlparse("<ViewFields>
    <FieldRef Name='Title' />
    <FieldRef Name='ID' />
</ViewFields>")>

<cfset query = xmlparse("<Query>
    <Where>
    <Lt>
    <FieldRef Name='ID' />
    <Value Type='Counter'>10</Value>
    </Lt>
    </Where>
```

```
<OrderBy>
<FieldRef Name='ID' />
</OrderBy>
</Query>">

<cfset rowlimit = xmlparse("<RowLimit Paged='True'>50</RowLimit>")>

Adding a myview1 view for the mycustomlist list<br />
<cfsharepoint action="addview" login="#login#" name="result"
    params="#{listName="mycustomlist",viewname="myview1",

Deleting the list<br>
<cfsharepoint action="deletelist" login="#login#" name="result1"
params="#{listname="mycustomlist"}##"/>

deletelist result.ResultFlag: #result1.ResultFlag#
</cfoutput>

</body>
</html>
```

## cfslider

### Description

Places a slider control, for selecting a numeric value from a range, in a ColdFusion form. The slider moves over the slider groove. As the user moves the slider, the current value displays. Used within a “[cform](#)” on page 225 tag for forms in HTML and applet format. Not supported with Flash forms.

In HTML forms, you can create visually rich sliders that let you modify adjustable values in fixed increments. You can specify maximum, minimum, and increment values, to help you quickly filter complex results.

The sliders are categorized based on the slider control. The available slider controls are:

**Vertical** The slider has vertical controls that can be adjusted to the top or bottom.

**Horizontal** The slider has horizontal controls that can be adjusted to the left or right.

**Tip** The slider displays the values as data tips.

**Snapping** The slider moves in incremental values.

### Category

[Forms tags](#)

### Syntax

For HTML

```
<cfslider
  name = "name"
  clickToChange = "true|false"
  format = "html"
  height = "integer"
  increment = "Unit increment value"
  max = "maximum value for the slider"
  min = "minimum value for the slider"
  onChange = "JavaScript function name"
  onDrag = "JavaScript function name"
  tip = "true|false"
  value = "integer"
  vertical = "true|false"
  width = "integer">
```

### Syntax

For Applet

```
<cfslider
    name = "name"
    align = "top|left|bottom|baseline|texttop|absbottom|
middle|absmiddle|right"
    bgColor = "color"
    bold = "yes|no"
    font = "font name"
    fontSize = "integer"
    height = "integer"
    hSpace = "integer"
    italic = "yes|no"
    label = "text"
    lookAndFeel = "motif|windows|metal"
    message = "text"
    notSupported = "text"
    onError = "text"
    onValidate = "script name"
    range = "minimum value, maximum value"
    scale = "integer"
    textColor = "color"
    value = "integer"
    vertical = "yes|no"
    vSpace = "integer"
    width = "integer">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

Introduction to Retrieving and Formatting Data and Building Dynamic Forms with `cform` Tags in the *Developing ColdFusion Applications*

#### History

ColdFusion MX: Deprecated the `img`, `imgStyle`, `grooveColor`, `refreshLabel`, `tickmarklabels`, `tickmarkmajor`, `tickmarkminor`, and `tickmarkimages` attributes. They sometimes do not work, and can cause an error, in later releases.

## Attributes

Attribute	Req/Opt	Default	Description
name	Required		Name of <code>cfslider</code> control.
align	Optional		Alignment of slider: <ul style="list-style-type: none"> <li>• top</li> <li>• left</li> <li>• bottom</li> <li>• baseline</li> <li>• texttop</li> <li>• absbottom</li> <li>• middle</li> <li>• absmiddle</li> <li>• right</li> </ul>
bgColor	Optional		Background color of slider label. For a hexadecimal value, use the form: <code>bgColor="####xxxx"</code> , where x = 0-9 or A-F; use two number signs or none. <ul style="list-style-type: none"> <li>• any color, in hexadecimal format</li> <li>• black</li> <li>• red</li> <li>• blue</li> <li>• magenta</li> <li>• cyan</li> <li>• orange</li> <li>• darkgray</li> <li>• pink</li> <li>• gray</li> <li>• white</li> <li>• lightgray</li> <li>• yellow</li> </ul>
bold	Optional	no	<ul style="list-style-type: none"> <li>• yes: label text in bold.</li> <li>• no: medium text.</li> </ul>
clickToChange	Optional HTML		Whether clicking the slider changes the value of the pointer: <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul>
font	Optional		Font name for label text.

Attribute	Req/Opt	Default	Description
fontSize	Optional		Font size for label text, in points.
format	Optional	applet	Specifies if the format is: <ul style="list-style-type: none"> <li>html</li> <li>applet</li> </ul>
height	Optional	40, for applet 100, for HTML	Slider control height, in pixels.
hSpace	Optional		Horizontal spacing to left and right of slider, in pixels.
italic	Optional	no	<ul style="list-style-type: none"> <li>yes: label text in italics.</li> <li>no: normal text.</li> </ul>
increment	Optional HTML		The unit increment value for a snapping slider.
label	Optional		Label to display with control; for example, "Volume" This displays: "Volume %value%" To reference the value, use "%value%". If %% is omitted, slider value displays directly after label.
lookAndFeel	Optional	Windows	<ul style="list-style-type: none"> <li>motif: renders slider using Motif style.</li> <li>windows: renders slider using Windows style.</li> <li>metal: renders slider using Java Swing style.</li> </ul> If platform does not support choice, the tag defaults to the platform's default style.
max	Optional HTML		Maximum value for the slider.
min	Optional HTML		Minimum value for the slider.
message	Optional Applet		Message text to appear if validation fails.
notSupported	Optional		Text to display if a page that contains a Java applet-based <code>cfForm</code> control is opened by a browser that does not support Java or has Java support disabled. For example: " <b>&lt;b&gt; Browser must support Java to view ColdFusion Java Applets&lt;/b&gt;</b> " Default message: <b>&lt;b&gt;Browser must support Java to &lt;br&gt;view ColdFusion Java Applets!&lt;/b&gt;</b>
onChange	Optional HTML		Custom JavaScript function to run when slider value changes. Specify only the function name.
onDrag	Optional HTML		Custom JavaScript function to run when you drag the slider. Specify only the function name.
onError	Optional		Custom JavaScript function to run if validation fails. Specify only the function name.

Attribute	Req/Opt	Default	Description
onValidate	Optional		Custom JavaScript function to validate user input; in this case, a change to the default slider value.  Specify only the function name.
range	Optional	"0,100"	Numeric slider range values.  Separate values with a comma.
scale	Optional		Unsigned integer. Defines slider scale, within range. For example, if range="0,1000" and scale="100", the display values are:  0, 100, 200, 300, ...  Signed and unsigned integers in ColdFusion are in the range -2,147,483,648 to 2,147,483,647.
textColor	Optional		Options: same as for bgColor attribute.
tip	Optional HTML	true	Whether the data value has to display as data tips:  <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul>
value	Optional	Minimum in range	Starting slider setting. Must be within the range values.
vertical	Optional	no (for applet forms) false (for HTML forms)	For Applet forms: <ul style="list-style-type: none"> <li>• yes: renders slider in browser vertically. Set width and height attributes; ColdFusion does not automatically swap width and height values.</li> <li>• no: renders slider horizontally.</li> </ul> For HTML forms: <ul style="list-style-type: none"> <li>• true: renders slider in browser vertically. Set width and height attributes; ColdFusion does not automatically swap width and height values.</li> <li>• false: renders slider horizontally.</li> </ul>
vSpace	Optional		Vertical spacing above and below slider, in pixels.
width	Optional	200, for HTML	Slider control width, in pixels.

### Usage

This tag requires the client to download a Java applet. Using this tag is sometimes slightly slower than using an HTML form element to display the same information. Also, if the client does not have an up-to-date Java plug-in installed, the system sometimes has to download an updated Java plug-in to display the tag.

For this tag to work properly, the browser must be JavaScript-enabled.

If the following conditions are true, a user's selection from query data that populates this tag's options continues to display after the user submits the form:

- The `cfformpreserveData` attribute is set to "Yes".
- The `cfformaction` attribute posts to the same page as the form itself (this is the default), or the action page has a form that contains controls with the same names as corresponding controls on the user entry form.

For more information, see the "[cfform](#)" on page 225 tag entry.

### Example

```
<!--- This example shows how to use cfslider</h3>
  <br/ >
  <cfform name="form01">
    <cfslider name="slider1"
      format="HTML"
      vertical="false"
      width="350"
      value="100"
      min="0"
      max="200"
      increment="10"
      tip="true"/>
  </cfform>
```

## cfsilent

### Description

Suppresses output produced by CFML within a tag's scope.

### Category

[Data output tags](#), [Page processing tags](#)

### Syntax

```
<cfsilent>
  ...
</cfsilent>
```

### See also

[cfcache](#), [cfflush](#), [cfheader](#), [cfhtmlhead](#), [cfinclude](#), [cfsetting](#); Writing and Calling User-Defined Functions in the *Developing ColdFusion Applications*

### Usage

This tag requires an end tag.

### Example

```
<h3>cfsilent</h3>

<cfsilent>
<cfset a = 100>
<cfset b = 99>
<cfset c = b-a>
<cfoutput>Inside cfsilent block<br>
b-a = #c#</cfoutput><br>
</cfsilent>

<p>Even information within cfoutput tags does not display within a
cfsilent block.<br>
<cfoutput>
b-a = #c#
</cfoutput>
</p>
```

## cfspreadsheet

### Description

Manages Excel spreadsheet files:

- Reads a sheet from a spreadsheet file and stores it in a ColdFusion spreadsheet object, query, CSV string, or HTML string.
- Writes single sheet to a new XLS file from a query, ColdFusion spreadsheet object, or CSV string variable.
- Add a sheet an existing XLS file.

### Category

[Extensibility tags](#)

### Syntax

The tag syntax depends on the `action` attribute value:

#### Read

```
<cfspreadsheet  
  action="read"  
  src = "filepath"  
  columns = "range"  
  columnnames = "comma-delimited list"  
  excludeHeaderRow = "true | false"  
  format = "CSV|HTML"  
  headerrow = "row number"  
  name = "text"  
  query = "query name"  
  rows = "range"  
  sheet = "number"  
  sheetname = "text">
```

#### Update

```
<cfspreadsheet  
  action="update"  
  filename = "filepath"  
  format = "csv"  
  name = "text"  
  password = "password"  
  query = "query name"  
  sheetname = "text" >
```

#### Write

```
<cfspreadsheet  
  action="write"  
  filename = "filepath"  
  format = "csv"  
  name = "text"  
  overwrite = "true | false"  
  password = "password"  
  query = "queryname"  
  sheetname = "text" >
```

#### See also

Spreadsheet functions.

#### History

ColdFusion 9.0.1: Added the attribute `excludeHeaderRow`

ColdFusion 9: Added this tag.

## Attributes

Attribute	Action	Req/Opt	Default	Description
action	All	Required		One of the following: <ul style="list-style-type: none"> <li><code>read</code> Reads the contents of an XLS format file.</li> <li><code>update</code> Adds a new sheet to an existing XLS file. You cannot use the <code>update</code> action to change an existing sheet in a file. For more information, see Usage.</li> <li><code>write</code> Writes a new XLS format file or overwrites an existing file.</li> </ul>
filename	update, writer	Required		The pathname of the file that is written.
excludeHeaderRow	read	Optional	false	If set to <code>true</code> , excludes the header row from being included in the query results. The attribute helps when you read Excel as a query. When you specify the <code>headerrow</code> attribute, the column names are retrieved from the header row. But they are also included in the first row of the query. To not include the header row, set <code>true</code> as the attribute value.
name	All	name or query is required.		<ul style="list-style-type: none"> <li><code>read</code> action: The variable in which to store the spreadsheet file data. Specify <code>name</code> or <code>query</code>.</li> <li><code>write</code> and <code>update</code> actions: A variable containing CSV-format data or an ColdFusion spreadsheet object containing the data to write. Specify the <code>name</code> or <code>query</code>.</li> </ul>
query	All	name or query is required.		<ul style="list-style-type: none"> <li><code>read</code> action: The query in which to store the converted spreadsheet file. Specify <code>format</code>, <code>name</code>, or <code>query</code>.</li> <li><code>write</code> and <code>update</code> actions: A query variable containing the data to write. Specify <code>name</code> or <code>query</code>.</li> </ul>
src	read	Required		The pathname of the file to read.
columns	read	Optional		Column number or range of columns. Specify a single number, a hyphen-separated column range, a comma-separated list, or any combination of these; for example: 1,3-6,9.
columnnames	read	Optional		Comma-separated column names.
format	All	Optional	For <code>read</code> , save as a spreadsheet object.  For <code>update</code> and <code>write</code> : Save a spreadsheet object.	<p>Format of the data represented by the <code>name</code> variable.</p> <ul style="list-style-type: none"> <li>All: <code>csv</code> On read, converts an XLS file to a CSV variable.</li> <li>On update or write, Saves a CSV variable as an XLS file.</li> <li>Read only: <code>html</code> Converts an XLS file to an HTML variable.</li> </ul> <p>The <code>cfspreadsheet</code> tag always writes spreadsheet data as an XLS file. To write HTML variables or CSV variables as HTML or CSV files, use the <code>cffile</code> tag.</p>
headerrow	read	Optional		Row number that contains column names.
overwrite	write	Optional	false	A Boolean value specifying whether to overwrite an existing file.
password	update write	Optional		<p>Set a password for modifying the sheet.</p> <p><b>Note:</b> Setting a password of the empty string does no unset password protection entirely; you are still prompted for a password if you try to modify the sheet.</p>

Attribute	Action	Req/Opt	Default	Description
rows	read	Optional		The range of rows to read. Specify a single number, a hyphen-separated row range, a comma-separated list, or any combination of these; for example: 1,3-6,9.
sheet	read	Optional		Number of the sheet. For the read action, you can specify sheet or sheetname.
sheetname	All	Optional		Name of the sheet For the read action, you can specify sheet or sheetname.  For write and update actions, the specified sheet is renamed according to the value you specify for sheetname.

### Usage

Each ColdFusion spreadsheet object represents Excel sheet:

- To read an Excel file with multiple sheets, use multiple `cfspreadsheet` tags with the `read` option and specify different name and `sheet` or `sheetname` attributes for each sheet.
- To write multiple sheets to a single file, use the `write` action to create the file and save the first sheet and use the `update` action to add each additional sheet.
- To update an existing file, read all sheets in the file, modify one or more sheets, and use the contents, and use the `write` action and `Update` actions (for multiple sheet files) to rewrite the entire file.

The `cfspreadsheet` tag writes only XLS format files. To write a CSV file, put your data in a CSV formatted string variable and use the `cffile` tag to write the variable contents in a file.

Use the ColdFusion Spreadsheet\* functions, such as "[SpreadsheetNew](#)" on page 1219 and "[SpreadsheetAddColumn](#)" on page 1185 to create a new ColdFusion Spreadsheet object and modify the spreadsheet contents.

### Example

The following example uses the `cfspreadsheet` tag to read and write Excel spreadsheets using various formats. It also shows a simple use of ColdFusion Spreadsheet functions to modify a sheet.

```
<!--- Read data from two datasource tables. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER,DEPT_ID,COURSE_ID,CORNAME
    FROM COURSELIST
</cfquery>

<cfquery
    name="centers" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT *
    FROM CENTERS
</cfquery>

<cfscript>
    //Use an absolute path for the files. --->
    theDir=GetDirectoryFromPath(GetCurrentTemplatePath());
    theFile=theDir & "courses.xls";
    //Create two empty ColdFusion spreadsheet objects. --->
    theSheet = SpreadsheetNew("CourseData");
    theSecondSheet = SpreadsheetNew("CentersData");
    //Populate each object with a query. --->
```

```

        SpreadsheetAddRows(theSheet,courses);
        SpreadsheetAddRows(theSecondSheet,centers);
    </cfscript>

    <!--- Write the two sheets to a single file --->
    <cfspreadsheet action="write" filename="#theFile#" name="theSheet"
        sheetname="courses" overwrite=true>
    <cfspreadsheet action="update" filename="#theFile#" name="theSecondSheet"
        sheetname="centers">

    <!--- Read all or part of the file into a spreadsheet object, CSV string,
        HTML string, and query. --->
    <cfspreadsheet action="read" src="#theFile#" sheetname="courses" name="spreadsheetData">
    <cfspreadsheet action="read" src="#theFile#" sheet=1 rows="3,4" format="csv" name="csvData">
    <cfspreadsheet action="read" src="#theFile#" format="html" rows="5-10" name="htmlData">
    <cfspreadsheet action="read" src="#theFile#" sheetname="centers" query="queryData">

    <h3>First sheet row 3 read as a CSV variable</h3>
    <cfdump var="#csvData#">

    <h3>Second sheet rows 5-10 read as an HTML variable</h3>
    <cfdump var="#htmlData#">

    <h3>Second sheet read as a query variable</h3>
    <cfdump var="#queryData#">

    <!--- Modify the courses sheet. --->
    <cfscript>
        SpreadsheetAddRow(spreadsheetData,"03,ENGL,230,Poetry 1",8,1);
        SpreadsheetAddColumn(spreadsheetData,
            "Basic,Intermediate,Advanced,Basic,Intermediate,Advanced,Basic,Intermediate,Advanced",
            3,2,true);
    </cfscript>

    <!--- Write the updated Courses sheet to a new XLS file --->
    <cfspreadsheet action="write" filename="#theDir#updatedFile.xls" name="spreadsheetData"
        sheetname="courses" overwrite=true>
    <!--- Write an XLS file containing the data in the CSV variable. --->
    <cfspreadsheet action="write" filename="#theDir#dataFromCSV.xls" name="CSVData"
        format="csv" sheetname="courses" overwrite=true>

```

## cfspdydataset

### Description

Creates a Spry XML or JSON data set from the results of a bind expression.

### Category

[Internet protocol tags](#)

## Syntax

```
<cfsprydataset  
    bind = "bind expression"  
    name = "data set name"  
    onBindError = "JavaScript function name"  
    options = "Spry options object"  
    type = "xml|json"  
    xpath = "XPath expression">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfajaximport](#), Using Spry with ColdFusion in the *Developing ColdFusion Applications*

## History

ColdFusion 8: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
bind	Required		A bind expression that returns an XML- or JSON- formatted string to populate the Spry data set. The bind expression specifies a CFC function or URL and includes bind parameters that represent the values of ColdFusion controls.  For detailed information on bind expressions, see Binding data to form fields in the <i>Developing ColdFusion Applications</i> .
name	Required		The name of the Spry data set.
onBindError	Optional; HTML	See Descriptio n	The name of a JavaScript function to execute if the bind expression results in an error. The function must take two attributes: an HTTP status code and a message.  If you omit this attribute, and specified a global error handler (by using the <a href="#">ColdFusion.setGlobalErrorHandler</a> function), the handler displays the error message; otherwise a default error pop-up appears.
options	Optional		A JavaScript object containing constructor options for the data set. For example, to request the data using the HTTP POST method, specify the following attribute:  <code>options="{method: 'POST'}"</code> .  For detailed information on Spry options, see the Spry documentation at <a href="http://www.adobe.com/go/learn_spry_framework_en">www.adobe.com/go/learn_spry_framework_en</a> .
type	Optional	xml	Specifies data set type, corresponding to the format of the data that is returned by the bind expression. The following values are valid: <ul style="list-style-type: none"><li>• json</li><li>• xml</li></ul>
xpath	Required for xml type Not used for JSON		An XPath expression that extracts data from the XML returned by the bind expression. The data set contains only the data that matches the XPath expression.

## Usage

Use this tag to use a bind expression to dynamically create the contents of a Spry XML or JSON data set based on the value of a ColdFusion control or another Spry data set. To create a Spry data set without using a bind expression, use the `Spry.Data.JSONDataSet()` and `Spry.Data.XMLDataSet()` JavaScript functions.

This tag cannot create a Spry HTML data set.

To use a filter to select the contents of a JSON data set from a JSON expression, specify a `path` or `subpath` option in the `options` attribute. For example, to create a Spry JSON data set by using only the `items.item` element from the JSON data, use a tag such as the following:

```
<cfsprydataset name="theItems" type="json"
  bind="CFC:dataMgr.getDetails(prodname={myform:mygrid.TITLE})"
  options="{path: 'items.item.'}">
```

### Example

The following `cfsprydataset` tag updates the `dsProduct` Spry XML data set by calling the `GridDataManager.getProductDetails` CFC function each time the selected row in the bookgrid control changes. It passes the `TITLE` field of the selected row to the CFC function as a `prodname` parameter. For a complete example that uses this tag, see *Using Spry with ColdFusion in the Developing ColdFusion Applications*.

```
<cfsprydataset
  name="dsProduct"
  type="xml"
  bind="CFC:GridDataManager.getProductDetails(prodname=
    {bookform:bookgrid.TITLE})"
  xpath="products/product"
  options="{method: 'POST'}"
  onBindError="errorHandler">
```

## cfstoredproc

### Description

Executes a stored procedure in a server database. It specifies database connection information and identifies the stored procedure.

### Category

[Database manipulation tags](#)

### Syntax

```
<cfstoredproc
  dataSource = "data source name"
  procedure = "procedure name"
  cachedAfter = "date"
  cachedWithin = "time span"
  debug = "yes|no"
  blockFactor = "block size"
  password = "password"
  result = "result name"
  returnCode = "yes|no"
  username = "user name">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfinsert](#), [cfqueryparam](#), [cfprocparam](#), [cfprocresult](#), [cftransaction](#), [cfquery](#), [cfupdate](#); Optimizing database use in the *Developing ColdFusion Applications*

## History

ColdFusion MX 7: Added the `result` attribute.

ColdFusion MX: Deprecated the `connectString`, `dbName`, `dbServer`, `dbtype`, `provider`, and `providerDSN` attributes. They do not work, and might cause an error, in releases later than ColdFusion 5. (Releases starting with ColdFusion MX use Type 4 JDBC drivers.)

## Attributes

Attribute	Req/Opt	Default	Description
<code>dataSource</code>	Required		Name of data source that points to database that contains stored procedure.
<code>procedure</code>	Required		Name of stored procedure on database server.
<code>blockFactor</code>	Optional	1	Maximum number of rows to get at a time from server. Range is 1 to 100.
<code>cachedAfter</code>	Optional		A date value (for example, April 16, 2008, 4-16-2008). If the date of original query is after this date, ColdFusion uses cached query data. To use cached data, the current query must use same SQL statement, data source, query name, user name, and password.  A date/time object is in the range 100 AD–9999 AD.  When specifying a date value as a string, enclose it in quotation marks.
<code>cachedWithin</code>	Optional		A time span, created using the <code>CreateTimeSpan</code> function. If the original query date falls within the time span, cached query data is used. <code>CreateTimeSpan</code> defines a period from the present, back. Takes effect only if query caching is enabled in the Administrator.  To use cached data, the current query must use the same SQL statement, data source, query name, user name, and password.
<code>debug</code>	Optional	no	<ul style="list-style-type: none"><li>• <code>yes</code>: lists debug information on each statement.</li><li>• <code>no</code></li></ul>
<code>password</code>	Optional		Overrides password in data source setup.
<code>result</code>	Optional		Specifies a name for the structure in which <code>cfstoredproc</code> returns the <code>statusCode</code> and <code>ExecutionTime</code> variables. If set, this value replaces <code>cfstoredproc</code> as the prefix to use when accessing those variables. For more information, see <i>Usage</i> .
<code>returnCode</code>	Optional	no	<ul style="list-style-type: none"><li>• <code>yes</code>: populates <code>cfstoredproc.statusCode</code> with status code returned by the stored procedure.</li><li>• <code>no</code></li></ul>
<code>username</code>	Optional		Overrides username in data source setup.

## Usage

Use this tag to call a database stored procedure. Within this tag, you code “`cfprocresult`” on page 530 and “`cfprocparam`” on page 525 tags as follows:

- “`cfprocresult`” on page 530: If the stored procedure returns one or more result sets, code one `cfprocresult` tag per result set.
- “`cfprocparam`” on page 525: If the stored procedure uses input or output parameters, code one `cfprocparam` tag per parameter, ensuring that you include every parameter in the stored procedure definition.

If you set `returnCode = "Yes"`, this tag sets the variable `prefix.statusCode`, which holds the status code for a stored procedure. Status code values vary by DBMS. For the meaning of code values, see your DBMS documentation.

This tag sets the variable *prefix.ExecutionTime*, which contains the execution time of the stored procedure, in milliseconds.

The value of *prefix* is either `cfstoredproc` or the value specified by the `result` attribute, if it is set. The `result` attribute provides a way for stored procedures that are called from multiple pages, possibly at the same time, to avoid overwriting the results of one call with another. If you set the `result` attribute to `myResult`, for example, you would access `ExecutionTime` as `myResult.ExecutionTime`. Otherwise, you would access it as `cfstoredproc.ExecutionTime`.

Before implementing this tag, ensure that you understand stored procedures and their usage.

The following examples use a Sybase stored procedure; for an example of an Oracle 8 or 9 stored procedure, see "[cfprocparam](#)" on page 525.

### Example

```
<cfset ds = "sqltst">

<!---
If submitting a new book,
insert the record and display
confirmation --->
<cfif isDefined("form.title")>

<cfstoredproc procedure="Insert_Book" datasource="#ds#">

<cfprocparam
    cfsqltype="cf_sql_varchar"
    value="#form.title#">

<cfprocparam
    cfsqltype="cf_sql_numeric"
    value="#form.price#">

<cfprocparam
    cfsqltype="cf_sql_date"
    value="#form.publishDate#">

<cfprocparam
    cfsqltype="cf_sql_numeric"
    type="out"
    variable="bookId">

</cfstoredproc>

<cfoutput>
<h3>'#form.title#' inserted into database.The ID is #bookId#.</h3>
</cfoutput>

</cfif>

<cfform action="#CGI.SCRIPT_NAME#" method="post">
<h3>Insert a new book</h3>

Title:
<cfinput type="text" size="20" required="yes" name="title"/>
<br/>
```

```

Price:
<cfinput type="text" size="20" required="yes" name="price" validate="float" />
<br/>

Publish Date:
<cfinput type="text" size="5" required="yes" name="publishDate" validate="date" />
<br/>

<input type="submit" value="Insert Book"/>

</cfform>

<!---
    This view-only example executes a Sybase stored procedure that
    returns three result sets, two of which we want. The stored
    procedure returns the status code and one output parameter,
    which we display. We use named notation for the parameters.
--->
<!---
<cfstoredproc procedure = "foo_proc"
    dataSource = "MY_SYBASE_TEST" username = "sa"
    password = "" dbServer = "scup" dbName = "pubs2"
    returnCode = "Yes" debug = "Yes">
    <cfprocresult name = RS1>
    <cfprocresult name = RS3 resultSet = 3>

    <cfprocparam type = "IN" CFSQLType = CF_SQL_INTEGER
        value = "1" dbVarName = @param1>
    <cfprocparam type = "OUT" CFSQLType = CF_SQL_DATE
        variable = FOO dbVarName = @param2>
</cfstoredproc>
--->
<!---
<cfoutput>The output param value: '#foo#'  
</cfoutput>
<h3>The Results Information</h3>
<cfoutput query = RS1>#name#,#DATE_COL#<br></cfoutput><p>
<cfoutput>
    <hr>
    <p>Record Count: #RS1.recordCount# >p>Columns: #RS1.columnList#<hr>
</cfoutput>
<cfoutput query = RS3>#col1#,#col2#,#col3#<br>
</cfoutput><p>
<cfoutput>
    <hr>
    <p>Record Count: #RS3.recordCount# <p>Columns: #RS3.columnList#<hr>
    The return code for the stored procedure is: '#cfstoredproc.statusCode#'<br>
</cfoutput>
--->

```

## cfswitch

### Description

Evaluates a passed expression and passes control to the `cfcase` tag that matches the expression result. You can, optionally, code a `cfdefaultcase` tag, which receives control if there is no matching `cfcase` tag value.

## Category

### Flow-control tags

## Syntax

```
<cfswitch  
    expression = "expression">  
    one or more cfcase tags  
    zero or one cfdefaultcase tags  
</cfswitch>
```

## See also

[cfcase](#), [cfdefaultcase](#), [cfabort](#), [cfloop](#), [cfbreak](#), [cfexecute](#), [cfexit](#), [cfif](#), [cflocation](#), [cfrethrow](#), [cfthrow](#), [cftry](#); [cfswitch](#), [cfcase](#), and [cfdefaultcase](#) in the *Developing ColdFusion Applications*

## History

ColdFusion 8: Changed the way the ColdFusion parses `<cfcase>` values. Previously, `<cfcase>` tags with numeric value dates did not return expected results. For example, `<cfcase value="00">` and `<cfcase value="0A">` were both evaluated to 0. The value "0A" was treated as a date and converted to 0 number of days from 12/30/1899. The value "00" was also evaluated to the value 0. This caused the exception "Context validation error for tag CFCASE. The CFSWITCH has a duplicate CFCASE for value "0.0"." The `<cfswitch>` tag now returns the expected result.

ColdFusion MX: Changed `cfdefaultcase` tag placement requirements: you can put the `cfdefaultcase` tag at any position within a `cfswitch` statement; it is not required to be the last item.

## Attributes

Attribute	Req/Opt	Default	Description
expression	Required		ColdFusion expression that yields a scalar value. ColdFusion converts integers, real numbers, Booleans, and dates to numeric values. For example, <code>true</code> , 1, and 1.0 are all equal.

## Usage

This tag requires an end tag. All code within this tag must be within a `cfcase` or `cfdefaultcase` tag. Otherwise, ColdFusion throws an error.

Use this tag followed by one or more `cfcase` tags. Optionally, include a `cfdefaultcase` tag. This tag selects the matching alternative from the `cfcase` and `cfdefaultcase` tags, jumps to the matching tag, and executes the code between the `cfcase` start and end tags.

The `cfswitch` tag provides better performance than a series of `cfif/cfelseif` tags, and the code is easier to read.

### Example

```
<!---
    This example shows the use of cfswitch and cfcase to
    exercise a case statement in CFML.
-->

<cfquery name = "GetEmployees" dataSource = "cfdocexamples">
    SELECT Emp_ID, FirstName, LastName, EMail, Phone, Department
    FROM Employees
</cfquery>

<h3>cfswitch Example</h3>
<!--- By outputting the query and using cfswitch, we classify the
    output without using a cfloop construct. --->
<p>Each time the case is fulfilled, the specific information is printed;
if the case is not fulfilled, the default case is output </p>
<cfoutput query="GetEmployees">
<cfswitch expression="#Trim(Department)#">
    <cfcase value="Sales">
        #FirstName# #LastName# is in <b>sales</b><br><br>
    </cfcase>
    <cfcase value="Accounting">
        #FirstName# #LastName# is in <b>accounting</b><br><br>
    </cfcase> <cfcase value="Administration">
        #FirstName# #LastName# is in <b>administration</b><br><br>
    </cfcase>
    <cfdefaultcase>
        #FirstName# #LastName# is not in Sales, Accounting, or
        Administration.<br><br>
    </cfdefaultcase>
</cfswitch>
</cfoutput>
```

## Tags t

### cfTable

#### Description

Builds a table in a ColdFusion page. This tag renders data as preformatted text, or, with the `HTMLTable` attribute, in an HTML table. If you don't want to write HTML table tag code, or if your data can be presented as preformatted text, use this tag.

Preformatted text (defined in HTML with the `<pre>` and `</pre>` tags) displays text in a fixed-width font. It displays white space and line breaks exactly as they are written within the pre tags. For more information, see an HTML reference guide.

To define table column and row characteristics, use the `cfcol` tag within this tag.

#### Category

[Data output tags](#)

## Syntax

```
<cfTable
    query = "query name"
    border
    colHeaders
    colSpacing = "number of spaces"
    headerLines = "number of lines"
    HTMLTable
    maxRows = "maxrows table"
    startRow = "row number">
    ...
</cfTable>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfcol](#), [cfcontent](#), [cflog](#), [cfoutput](#), [cfprocessingdirective](#); Retrieving data in the *Developing ColdFusion Applications*

## Attributes

Attribute	Req/Opt	Default	Description
query	Required		Name of <code>cfquery</code> from which to draw data.
border	Optional		Displays a border around the table.  If you use this attribute (regardless of its value), ColdFusion displays a border around the table.  Use this only if you use the <code>HTMLTable</code> attribute.
colHeaders	Optional		Displays column heads. If you use this attribute, also use the <code>cfcol</code> tag header attribute to define them.  If you use this attribute (regardless of its value), ColdFusion displays column heads.
colSpacing	Optional	2	Number of spaces between columns.
headerLines	Optional	2	Number of lines to use for table header (the default leaves one line between header and first row of table).
HTMLTable	Optional		Renders data in an HTML 3.0 table.  If you use this attribute (regardless of its value), ColdFusion renders data in an HTML table.
maxRows	Optional		Maximum number of rows to display in the table.
startRow	Optional	1	The query result row to put in the first table row.

## Usage

This tag aligns table data, sets column widths, and defines column heads.

At least one `cfcol` tag is required within this tag. Put `cfcol` and `cfTable` tags adjacent in a page. The only tag that you can nest within this tag is the `cfcol` tag. You cannot nest `cfTable` tags.

To display the `cfcolheader` text, specify the `cfcolheader` and the `cfTablecolHeader` attribute. If you specify either attribute without the other, the header does not display and no error is thrown.

### Example

```
<!--- This example shows the use of cfcol and cftable to align information
       returned from a query. --->
<!--- This query selects employee information from cfdocexamples datasource. --->
<cfquery name = "GetEmployees" dataSource = "cfdocexamples">
    SELECT Emp_ID, FirstName, LastName, EMail, Phone, Department
    FROM Employees
</cfquery>

<html>
<body>
<h3>cftable Example</h3>

<!--- Note use of HTMLTable attribute to display cftable as an HTML table,
       rather than as PRE formatted information. --->
<cftable query = "GetEmployees"
    startRow = "1" colSpacing = "3" HTMLTable>
<!--- Each cfcol tag sets width of a column in table, and specifies header
       information and text/CFML with which to fill cell. --->
    <cfcol header = "<b>ID</b>"
        align = "Left"
        width = 2
        text= "#Emp_ID#">

    <cfcol header = "<b>Name/Email</b>"
        align = "Left"
        width = 15
        text= "<a href = 'mailto:#Email#'>#FirstName# #LastName#</A>">

    <cfcol header = "<b>Phone Number</b>"
        align = "Center"
        width = 15
        text= "#Phone#">
</cftable>
</body>
</html>
```

## cftextarea

### Description

Puts a multiline text entry box in a `cfform` tag and controls its display characteristics. Optionally, displays a rich text editor with configurable controls for formatting HTML text.

### Category

[Forms tags](#)

## Syntax

```
<cftextarea
    name="name"
    basepath="path"
    bind="bind expression"
    bindAttribute="attribute name"
    bindOnLoad="false|true"
    disabled="true|false" or no attribute value
    enabled="yes|no"
    fontFormats="comma separated list"
    fontNames="comma separated list"
    fontSizes="comma separated list"
    height="number of pixels"
    html="no|yes"
    label="text"
    maxlength="number"
    message="text"
    onBindError = "JavaScript function name"
    onChange="JavaScript or ActionScript"
    onClick="JavaScript or ActionScript"
    onError="script name"
    onKeyDown="JavaScript or ActionScript"
    onKeyUp="JavaScript or ActionScript"
    onMouseDown="JavaScript or ActionScript"
    onMouseUp="JavaScript or ActionScript"
    onValidate="script name"
    pattern="regexp"
    range="minimum value, maximum value"
    required="yes|no"
    richtext="no|yes"

    style="style specification"
    stylesXML="path"
    templatesXML="path"
    toolbar="Default|Basic|custom toolbar"
    toolbarOnFocus="no|yes"
    tooltip="tip text"
    validate="data type"
    validateAt= one or more of "onBlur, onServer, onSubmit"
    value="text"
    visible="yes|no"
    width="number of pixels"
    wrap="off|hard|soft|virtual|physical">

    text

</cftextarea>
```

Some attributes apply to only specific display formats. For details see the Attributes table.

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

**See also**

[cfajaximport](#), [cfapplet](#), [cfcalendar](#), [cform](#), [cformgroup](#), [cformitem](#), [cfgrid](#), [cfinput](#), [cfselect](#), [cfslider](#), [cftree](#); Introduction to Retrieving and Formatting Data and Using Ajax form controls and features in the *Developing ColdFusion Applications*

**History**

ColdFusion 8:

- Added support for the `bind` attribute in HTML format forms, including the `bindAttribute`, `bindOnLoad`, and `onBindError` attributes.
- Added support for tool tips in HTML format, including the `sourceForTooltip` attribute.
- Added support for a rich text editor in HTML format, including the `richtext`, `basepath`, `fontFormats`, `fontNames`, `fontSizes`, `skin`, `stylesXML`, `templatesXML`, `toolbar`, and `toolbarOnFocus` attributes and support for the `height` and `width` attributes.

ColdFusion MX 7: Added this tag.

**Attributes**

The following table lists attributes that ColdFusion uses directly. In HTML format, the tag also supports all HTML `textarea` tag attributes that are not on this list, and passes them directly to the browser.

**Note:** Attributes that are not marked as *All* or *XML* are not handled by the skins provided with ColdFusion. They are, however, included in the generated XML.

Attribute	Req/Opt;  Format	Default	Description
<code>name</code>	Required;  All		Name of the <code>cfTextInput</code> control.
<code>basepath</code>	Optional; HTML	<code>/CFIDE/scripts/ajax/FCKE ditor</code>	Path to the directory that contains the rich text editor. The editor configuration files are at the top level of this directory.  Meaningful only if the <code>richText</code> attribute is <code>true</code> .
<code>bind</code>	Optional;  Flash, HTML		A bind expression that dynamically sets an attribute of the control. For details, see Usage.
<code>bindAttribute</code>	Optional;  HTML	<code>value</code>	Specifies the HTML tag attribute whose value is set by the <code>bind</code> attribute. You can only specify attributes in the browser's HTML DOM tree, not ColdFusion-specific attributes.  Ignored if there is no <code>bind</code> attribute.
<code>bindOnLoad</code>	Optional;  HTML	<code>no</code>	A Boolean value that specifies whether to execute the <code>bind</code> attribute expression when first loading the form. Ignored if there is no <code>bind</code> attribute.
<code>disabled</code>	Optional;  All	<code>not disabled</code>	Disables user input, making the control read-only. To disable input, specify <code>disabled</code> without an attribute, or <code>disabled="Yes"</code> (or any ColdFusion positive Boolean value, such as <code>True</code> ). To enable input, omit the attribute or specify <code>disabled="No"</code> (or any ColdFusion negative Boolean value, such as <code>False</code> ).

Attribute	Req/Opt; Format	Default	Description
enabled	Optional; Flash	yes	Boolean value that specifies whether the control is enabled. A disabled control appears in light gray. The inverse of the <code>disabled</code> attribute.
fontFormats	Optional; HTML	All valid formats	A comma-separated list of the font names to display in the rich text editor Formats selector. The formats specify the HTML tags to apply to typed or selected text. You can specify any subset of the following list: "p,div,pre,address,h1,h2,h3,h4,h5,h6".
fontNames	Optional; HTML	All valid font names	A comma-separated list of the font names to display in the rich text editor Font selector. You can specify any subset of the following list: "Arial,Comic Sans MS,Courier New,Tahoma,Times New Roman,Verdana".
fontSizes	Optional; HTML	See Description	A comma-separated list of the font sizes to display in the rich text editor Size selector. List entries must have the format of <i>numeric font size/descriptive text</i> . For example, to display the text "small font" to indicate a font size of 1, specify "1/small font". By default, the following values appear in the selector: 1/xx-small,2/x-small,3/small,4/medium,5/large,6/x-large,7/xx-large.
height	Optional; Flash, HTML		In Flash forms, height of the control, in pixels.  In HTML forms, this attribute has an effect only if you specify <code>richtext="true"</code> ; in this case, it is the height, in pixels, of the control, including the control bar and text box.
html	Optional; Flash	no	Boolean value that specifies whether the text area contains HTML.
label	Optional; Flash and XML		Label to put beside the control on a form.
maxLength	Optional; All		The maximum length of text that can be entered. ColdFusion uses this attribute only if you specify <code>maxLength</code> in the <code>validate</code> attribute.
message	Optional; All		Message text to display if validation fails.
onBindError	Optional; HTML	See Description	The name of a JavaScript function to execute if evaluating a bind expression results in an error. The function must take two attributes: an HTTP status code and a message. (The status code is -1 if the error is not an HTTP error.)  If you omit this attribute, and have specified a global error handler (by using the <code>ColdFusion.setGlobalErrorHandler</code> function), it displays the error message; otherwise a default error pop-up displays.
onChange	Optional; All		JavaScript (HTML/XML) or ActionScript (Flash) to run when the control changes due to user action.
onClick	Optional; HTML and XML		JavaScript to run when the user clicks the control.

Attribute	Req/Opt; Format	Default	Description
onError	Optional; HTML and XML		Custom JavaScript function to execute if validation fails.
onKeyDown	Optional; All		JavaScript (HTML/XML) or ActionScript (Flash) ActionScript to run when the user presses a keyboard key in the control.
onKeyUp	Optional; All		JavaScript (HTML/XML) or ActionScript (Flash) to run when the user releases a keyboard key in the control.
onMouseDown	Optional; All		JavaScript (HTML/XML) or ActionScript (Flash) to run when the user releases a mouse button in the control.
onMouseUp	Optional; All		JavaScript (HTML/XML) or ActionScript (Flash) to run when the user presses a mouse button in the control.
onValidate	Optional; HTML and XML		Custom JavaScript function to validate user input. The JavaScript DOM form object, input object, and input object value are passed to the function, which must return <code>True</code> if validation succeeds, <code>False</code> otherwise. If you specify this attribute, ColdFusion ignores the <code>validate</code> attribute.
pattern	Required if <code>validate = "regular_expression"</code> HTML and XML.		JavaScript regular expression pattern to validate input. Omit leading and trailing slashes. ColdFusion uses this attribute only if you specify <code>regex</code> in the <code>validate</code> attribute. For examples and syntax, see <i>Building Dynamic Forms with cform Tags</i> in the <i>Developing ColdFusion Applications</i> .
range	Optional; All		Minimum and maximum allowed numeric values. ColdFusion uses this attribute only if you specify <code>range</code> in the <code>validate</code> attribute.  If you specify a single number or a single number followed by a comma, it is treated as a minimum, with no maximum. If you specify a comma followed by a number, the maximum is set to the specified number, with no minimum.
required	Optional; All	no	<ul style="list-style-type: none"> <li>yes: the field must contain text.</li> <li>no: the field can be empty.</li> </ul>
richText	Optional; HTML	no	A Boolean value specifying whether this control is a rich text editor with tool bars to control the text formatting. For detailed information on using the rich text editor, see <i>Using the rich text editor</i> in the <i>Developing ColdFusion Applications</i> .
skin	Optional; HTML	default	Specifies the skin to be used for the rich text editor. By default, the valid values are <code>default</code> , <code>silver</code> , and <code>office2003</code> . You can also create custom skins that you can then specify in this attribute. For more information, see <i>Using the rich text editor</i> in the <i>Developing ColdFusion Applications</i> .
sourceForTooltip	Optional; HTML		The URL of a page to display as a tool tip. The page can include CFML and HTML to control the contents and format, and the tip can include images.  If you specify this attribute, an animated icon appears with the text "Loading..." while the tip is being loaded.

Attribute	Req/Opt; Format	Default	Description
style	Optional; All		In HTML or XML format forms, ColdFusion passes the <code>style</code> attribute to the browser or XML.  In Flash format forms, must be a style specification in CSS format, with the same syntax and contents as used in Flex for the corresponding Flash element.
stylesXML	Optional; HTML	/CFIDE/scripts/ajax/FCKEditor/fckstyles.xml	The path of the file that defines the styles in the rich text editor Styles selector. Relative paths start at the directory that contains the <code>fckeditor.html</code> file, normally <code>cf_webRoot/CFIDE/scripts/ajax/FCKEditor/editor</code> . You can specify an absolute path starting at the web root, such as <code>/myApps/RTEditor.mystyles.xml</code> . For information on configuring styles, see Using the rich text editor in the <i>Developing ColdFusion Applications</i> .
templatesXML	Optional; HTML	/CFIDE/scripts/ajax/FCKEditor/fcktemplates.xml	The path of the file that defines the templates that are displayed when you click the rich text editor Templates icon. For pathing details, see <code>stylesXML</code> . For information on configuring templates, see Using the rich text editor in the <i>Developing ColdFusion Applications</i> .
toolbar	Optional; HTML	Default	Specifies the rich text editor toolbar. By default, the valid values for this attribute are: <code>Default</code> , a complete set of controls, and <code>Basic</code> , a minimal configuration. You can add configurations; for details see Using the rich text editor in the <i>Developing ColdFusion Applications</i> .  <b>Note:</b> This attribute's value is case sensitive.
toolbarOnFocus	Optional; HTML	no	A Boolean value that specifies whether the rich text editor toolbar expands and displays its controls only when the rich text editor has the focus.
tooltip	Optional; Flash, HTML		Text to display when the mouse pointer hovers over the control. Can include HTML formatting.  Ignored if you specify a <code>sourceForTooltip</code> attribute.
validate	Optional; All		The type or types of validation to perform. Available validation types and algorithms depend on the format. For details, see the Usage section of the <a href="#">cfinput</a> tag reference.
validateAt	Optional; HTML and XML	onSubmit	How to do the validation; one or more of the following: <ul style="list-style-type: none"> <li><code>onSubmit</code></li> <li><code>onServer</code></li> <li><code>onBlur</code></li> </ul> For Flash format forms, <code>onSubmit</code> and <code>onBlur</code> are identical; for both, validation is done when the user submits the form. For multiple values, use a comma-delimited list.  For details, see the Usage section of the <a href="#">cfinput</a> tag reference.

Attribute	Req/Opt;  Format	Default	Description
value	Optional;  All		Initial value to display in text control. You can specify an initial value as an attribute or in the tag body, but not in both places. If you specify the value as an attribute, put the closing <code>cftextarea</code> tag immediately after the opening <code>cftextarea</code> tag, with no spaces or line feeds between, or place a closing slash at the end of the opening <code>cftextarea</code> tag; for example <code>&lt;cftextareaname="description"value="Enteradescrip tion." /&gt;</code> .
visible	Optional;  Flash	yes	Boolean value that specifies whether to show the control. Space that would be occupied by an invisible control is blank.
width	Optional;  Flash, HTML		The width of the control, in pixels.  In HTML forms, this attribute has an effect only if you specify <code>richtext="true"</code> .
wrap	Optional  All		<ul style="list-style-type: none"> <li>• hard: wraps long lines, and sends the carriage return to the server.</li> <li>• off: does not wrap long lines.</li> <li>• physical: wraps long lines, and transmits the text at all wrap points.</li> <li>• soft: wraps long lines, but does not send the carriage return to the server.</li> <li>• virtual: wraps long lines, but does not send the carriage return to the server.</li> </ul>

### Usage

For this tag to work properly in HTML format, the browser must be JavaScript-enabled.

If you put text in the tag body, the control displays all text characters between the `cftextarea` opening and closing tags; therefore, if you use line feeds or white space to format your source text, they appear in the control.

If the `cfform preserveData` attribute is "yes", and the form posts back to the same page, the posted value (not the value of the `value` attribute) of the `cftextinput` control is used.

### Validation

For a detailed description of the `validation` attribute and the types of validation supported by ColdFusion, see the Usage section of the [cfinput](#) tag reference. For more details on ColdFusion validation techniques, see *Validating Data in the Developing ColdFusion Applications*.

### Flash form data binding

The `bind` attribute lets you populate form fields using the contents of other form fields. To specify text from another Flash form field in a `cftextareabind` attribute, use the following format:

```
{sourceTagName.text}
```

For example, the following line uses the value of the text that the user enters in the from the `userName` field in the greeting in the comment text box. The user can change or replace this message with a typed entry.

```
<cfform format="flash" height="300">
  <cfformitem type="text">
    Enter your name here</cfformitem>
  <cftextarea name="userName" height="20" Width="500"/>
  <cftextarea name="comment" height="100" Width="500"
    bind="Hello {userName.text}! Enter your comments here." />
</cfform>
```

### HTML form data binding

The `bind` attribute lets you set any `cftextarea` attribute dynamically from the value of another form control or by calling a CFC or JavaScript function. By default it sets the control's `value` attribute, but you can specify a different attribute to set by using the `bindAttribute` attribute. For more information on binding, see *Binding data to form fields in the Developing ColdFusion Applications*.

### Example

This example has two `cftextarea` controls. When you submit the form, ColdFusion copies the text from the first control into the second. The `onBlur` `maxlength` validation prevents you from entering more than 100 characters. The `>` character that closes the `cftextarea` opening tag, the text in the tag body, and the `cftextarea` closing tag are on a single line to ensure that only the desired text displays, but the line is split in this example for formatting purposes.

```
<h3>cftextarea Example</h3>
<cfparam name="text2" default="">
<cfif isdefined("form.textarea1") AND (form.textarea1 NEQ "")>
  <cfset text2=form.textarea1>
</cfif>

<cfform name="form1">
  <cftextarea name="textarea1" wrap="virtual" rows="5" cols="25"
    validate="maxlength" validateAt="onBlur" maxlength="100"
    >Replace this text. Maximum length is 100 Characters, and this text is
    currently 99 characters long.</cftextarea>
  <cftextarea name="textarea2" wrap="virtual" rows="5" cols="50" value="#text2#" /><br><br>
  <input type="submit" value="submit field"><br>
</cfform>
```

## cftextinput

### Description

Puts a single-line text entry box in a `cfform` tag and controls its display characteristics.

This tag is deprecated, and is not supported in XML format forms. In its place, you must use a `cfinput` or `cftextarea` tag and use a cascading style sheet (CSS) to specify the text style characteristics.

### History

ColdFusion MX 7: This tag is deprecated. In later releases it might not work, and might cause an error.

ColdFusion MX 6.1: Changed the `validate = "creditcard"` option requirements: the text entry must have 13-16 digits.

## cfthread

### Description

The `cfthread` tag enables you to create *threads*, independent streams of code execution, in your ColdFusion application. You use this tag to run or end a thread, temporarily stop thread execution, or join together multiple threads.

### Category

[Application framework tags](#)

### Syntax

```
join
    <cfthread
    required
    name="thread name[, thread name]..."
    optional
    action="join"
    timeout="milliseconds"/>

run
    <cfthread
    required
    name="thread name"
    optional
    action="run"
    priority="NORMAL|HIGH|LOW"
    zero or more application-specific attributes>

    Thread code

    </cfthread>

sleep
    <cfthread
    required
    action="sleep"
    duration="milliseconds"/>

terminate
    <cfthread
    required
    action="terminate"
    name="thread name"/>
```

For all actions except `run`, the `cfthread` tag must have an empty body and be followed immediately by a `</cfthread>` end tag, or must have no end tag and have a slash before the tag closure, as in `<cfthread action="sleep" duration="1000"/>`.

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## History

ColdFusion 8: Added this tag

## Attributes

Attribute	Req/Opt	Default	Applies to	Description
action	Optional	run	All	<p>The action to take, one of the following values:</p> <ul style="list-style-type: none"><li>• <b>join</b>: Makes the current thread wait until the thread or threads specified in the <b>name</b> attribute complete processing, or until the period specified in the <b>timeout</b> attribute passes, before continuing processing. If you don't specify a timeout and the thread you are joining to doesn't finish, the current thread also cannot finish processing.</li><li>• <b>run</b>: Creates a thread and starts it processing. Code in the <b>cfthread</b> tag body runs simultaneously and independently of page-level code and code in other <b>cfthread</b> tags.</li><li>• <b>sleep</b>: Suspends the current thread's processing for the time specified by the <b>duration</b> attribute. Equivalent to the <a href="#">Sleep</a> function.</li><li>• <b>terminate</b>: Stops processing of the thread specified in the <b>name</b> attribute. If you terminate a thread, the thread scope includes an <b>ERROR</b> metadata structure with information about the termination.</li></ul>
duration	Required		sleep	The number of milliseconds for which to suspend thread processing.
name	Optional, Required, if action = "join" or "terminate"		join run terminat e	<p>The name of the thread to which the action applies:</p> <ul style="list-style-type: none"><li>• <b>terminate</b>: The name of the thread to stop.</li><li>• <b>join</b>: The name of the thread or threads to join to the current thread. To specify multiple threads, use a comma-delimited list.</li><li>• <b>run</b>: The name to use to identify the thread being created.</li></ul>
priority	Optional	NORMAL	run	<p>The priority level at which to run the thread. The following values are valid:</p> <ul style="list-style-type: none"><li>• HIGH</li><li>• LOW</li><li>• NORMAL</li></ul> <p>Higher priority threads get more processing time than lower priority threads. Page-level code, the code that is outside of <b>cfthread</b> tags, always has <b>NORMAL</b> priority.</p>
timeout	Optional	0	join	<p>The number of milliseconds that the current thread waits for the thread or threads being joined to finish. If any thread does not finish by the specified time, the current thread proceeds.</p> <p>If the attribute value is 0, the following action occurs:</p> <ul style="list-style-type: none"><li>• The current thread continues waiting until all joining threads finish.</li><li>• If the current thread is the page thread, the page continues waiting until the threads are joined, even if you specify a page time-out.</li></ul>

## Usage

Page-level code (code outside any **cfthread** tags) executes in its own thread, referred to as the *page thread*. Only the page thread can create other threads. A thread that you create cannot create a child thread.

**Note:** If a thread never completes processing (is hung), it continues to occupy system resources. You can use the ColdFusion Sever Monitor to check for and terminate hung threads.

ColdFusion makes a complete (deep) copy of all the attribute variables before passing them to the thread, so the values of the variables inside the thread are independent of the values of any corresponding variables in other threads, including the page thread. Thus, the values passed to threads are thread safe because the attribute values cannot be changed by any other thread.

### Thread scopes

Each thread has three special scopes:

- The thread-local scope is an implicit scope that contains variables that are available only to the thread, and exist only for the life of the thread.
- The Thread scope is available to the page and to all other threads started from the page. Its data remains available until the page and all threads started from the page finish, even if the page finishes before the threads complete processing.
- The Attributes scope contains attributes that are passed to the scope, and is available only within the thread and only for the life of the thread.

For detailed information about using ColdFusion scopes in threads, see Using ColdFusion Threads in the *Developing ColdFusion Applications*.

All threads in a page share a single Variables scope, so you can use it for data that is common across all threads. You must be careful to lock access to the variables, if necessary, to prevent deadlocks or race conditions between threads.

**Note:** When ColdFusion uses a connector to access the web server, after the page gets completed, the CGI and Request scopes are not accessible to threads that you create by using the `cfthread` tag. This limitation does not apply if you use the integrated web server or if you run ColdFusion as a J2EE application.

### Metadata variables

The thread scope contains the following variables that provide information about the thread (metadata):

Variable	Description
ElapsedTime	The amount of processor time that was spent handling the thread.
Error	The structure that is generated if an error occurs during thread execution. The structure contains the keys that you can access in a <code>cfcatch</code> tag.  If an error occurs in a thread, page-level processing is not affected, and ColdFusion does not generate an error message. The thread with the error terminates and the page-level code or other threads can get the error information from the Error field and handle the error appropriately. For detailed information, see Handling ColdFusion thread errors in the <i>Developing ColdFusion Applications</i> .
Name	The thread name.
Output	Output that is generated by the thread. A thread cannot display output; page-level code must use this variable to display thread results. For detailed information, see Handling thread output in the <i>Developing ColdFusion Applications</i> .

Variable	Description
Priority	The thread processing priority, as specified in the <code>cfthreadpriority</code> attribute. The following values are valid: <ul style="list-style-type: none"><li>• HIGH</li><li>• LOW</li><li>• <i>NORMAL</i></li></ul>
Starttime	The time at which the thread began processing, in ColdFusion date-time format.
Status	The current status of the thread; one of the following values: <ul style="list-style-type: none"><li>• NOT_STARTED: The thread has been queued but is not processing yet.</li><li>• RUNNING: The thread is running normally.</li><li>• TERMINATED: The thread stopped running due to a <code>cfthread</code> tag with a <code>terminate</code> action, an error, or an administrator action.</li><li>• COMPLETED: The thread ended normally.</li><li>• WAITING: The thread has executed a <code>cfthread</code> tag with <code>action="join"</code>, but one or more threads being joined has not completed.</li></ul>

### Example

The following example uses three threads to get the results of three RSS feeds. The user must submit the form with all three feeds specified. The application joins the threads with a time-out of 6 seconds, and displays the feed titles and the individual item titles as links.

```
<!--- Run this code if the feed URL form has been submitted. --->
<cfif isDefined("Form.submit")>
    <cfloop index="i" from="1" to="3">
        <!--- Use array notation and string concatenation to create a variable
             for this feed. --->
        <cfset theFeed = Form["Feed"&i]>
        <cfif theFeed NEQ "">
            <!--- Use a separate thread to get each of the feeds. --->
            <cfthread action="run" name="t#i#" feed="#theFeed#">
                <cffeed source="#feed#"
                    properties="thread.myProps"
                    query="thread.myQuery">
            </cfthread>
        <cfelse>
            <!--- If the user didn't fill all fields, show an error message. --->
            <h3>This example requires three feeds.<br />
            Click the Back button and try again.</h3>
            <cfabort>
        </cfif>
    </cfloop>

    <!--- Join the three threads. Use a 6 second time-out. --->
    <cfthread action="join" name="t1,t2,t3" timeout="6000" />

    <!--- Use a loop to display the results from the feeds. --->
    <cfloop index="i" from="1" to="3">
        <!--- Use the cfthread scope and associative array notation to get the
             Thread scope dynamically. --->
```

```
<cfset feedResult=cfthread["t#i#"]>
<!--- Display feed information only if you got items,
      for example the feed must complete before the join. --->
<cfif isDefined("feedResult.myQuery")>
    <cfoutput><h2>#feedResult.myProps.title#</h2></cfoutput>
    <cfoutput query="feedResult.myQuery">
        <p><a href="#RSSLINK#">#TITLE#</a></p>
    </cfoutput>
</cfif>
</cfloop>

</cfif>

<!--- The form for entering the feeds to aggregate. --->
<cfform>
    <h3>Enter three RSS Feeds</h3>
    <cfinput type="text" size="100" name="Feed1" validate="url"
        value="http://rss.adobe.com/events.rss?locale=en"><br />
    <cfinput type="text" size="100" name="Feed2" validate="url"
        value="http://weblogs.macromedia.com/dev_center/index.rdf"><br />
    <cfinput type="text" size="100" name="Feed3" validate="url"
        value="http://rss.adobe.com/studio.rss?locale=en"><br />
    <cfinput type="submit" name="submit">
</cfform>
```

## cfthrow

### Description

Throws a developer-specified exception, which can be caught with a `cfcatch` tag that has any of the following `type` attribute options:

- `type = "custom_type"`
- `type = "Application"`
- `type = "Any"`

### Category

[Exception handling tags](#), [Flow-control tags](#)

### Syntax

```
<cfthrow
    message = "message"
    type = "exception type"
    detail = "detail description"
    errorCode = "error code"
    extendedInfo = "additional information"
    object = "java except object">
```

OR

```
<cfthrow
    object = #object_name#>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cferror](#), [cfrethrow](#), [cftry](#), [onError](#); Handling Errors in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed thrown exceptions: this tag can throw ColdFusion component method exceptions.

### Attributes

Attribute	Req/Opt	Default	Description
detail	Optional		Description of the event. ColdFusion appends error position to description; server uses this parameter if an error is not caught by your code.
errorCode	Optional		A custom error code that you supply.
extendedInfo	Optional		A custom error code that you supply.
message	Optional		Message that describes exception event.
object	Optional		Requires the value of the <code>cfobject</code> tag name attribute.  Throws a Java exception from a CFML tag.  This attribute is mutually exclusive with all other attributes of this tag.
type	Optional	Application	<ul style="list-style-type: none"><li>A custom type</li><li>Application</li></ul> Do not enter another predefined type; types are not generated by ColdFusion applications. If you specify Application, you need not specify a type for <code>cfcatch</code> .

### Usage

Use this tag within a `cftry` block, to throw an error. The `cfcatch` block can access accompanying information, as follows:

- Message, with `cfcatch.message`
- Detail, with `cfcatch.detail`
- Error code, with `cfcatch.errorcode`

To get more information, use `cfcatch.tagContext`. This array shows where control switches from one page to another in the tag stack (for example, `cfinclude`, `cfmodule`).

To display the information displayed by `tagContext` variable, select the “Enable Robust Exception Information” option on the Debugging & Logging > Debug Output Settings page of the ColdFusion Administrator.

To use this tag with the `object` parameter, first use a `cfobject` tag that specifies a valid Java exception class. For example, the following `cfobject` tag defines an object, `obj`, of the exception class `myException` (which you must create in Java):

```
<cfobject
  type="java"
  action="create"
  class="myException"
  name="obj">
```

If your exception class has constructors that take parameters, such as a message, you can use the special `init` method to invoke the constructor, as in the following line. If you do not need to specify any constructor attributes, you can omit this step.

```
<cfset obj.init("You must save your work before preceding")>
```

You can then use the, the `cfthrow` statement to throw the exception as follows:

```
<cfthrow object=#obj#>
```

For more information on using Java objects in ColdFusion, see Integrating J2EE and Java Elements in CFML Applications in the *Developing ColdFusion Applications*.

### Example

```
<h3>cfthrow Example</h3>
<!-- Open a cftry block. -->
<cftry>
<!-- Define a condition upon which to throw the error. -->
<cfif NOT IsDefined("URL.myID")>
    <!-- throw the error -->
    <cfthrow message = "ID is not defined">
</cfif>
<!-- Perform the error catch. -->
<cfcatch type = "application">
<!-- Display your message. -->
    <h3>You've Thrown an <b>Error</b></h3>
<cfoutput>
    <!-- And the diagnostic feedback from the application server. -->
<p>#cfcatch.message#</p>
    <p>The contents of the tag stack are:</p>
    <cfloop
        index = i
        from = 1 to = #ArrayLen(cfcatch.tagContext)#>
        <cfset sCurrent = #cfcatch.tagContext[i]#>
        <br>#i# #sCurrent["ID"]#
        (#sCurrent["LINE"]#, #sCurrent["COLUMN"]#)
        #sCurrent["TEMPLATE"]#
    </cfloop>
</cfoutput>
</cfcatch>
</cftry>
```

The following example shows how to throw an exception from a component method:

```
<cfcomponent>
  <cffunction name="getEmp">
    <cfargument name="lastName" required="yes">
      <cfquery name="empQuery" datasource="cfdocexamples" >
        SELECT LASTNAME, FIRSTNAME, EMAIL
        FROM tblEmployees
        WHERE LASTNAME LIKE '#arguments.lastName#'
      </cfquery>
      <cfif empQuery.recordcount LT 1>
        <cfthrow type="noQueryResult"
          message="No results were found. Please try again.">
      <cfelse>
        <cfreturn empQuery>
      </cfif>
    </cffunction>
  </cfcomponent>
```

For an explanation of the example and more information, see [Building and Using ColdFusion Components](#) in the *Developing ColdFusion Applications*.

## cftimer

### Description

Displays execution time for a specified section of CFML code. ColdFusion displays the timing information along with any output produced by the timed code.

**Note:** To permit this tag to execute, enable the *Enable Debugging* and the *Timer Information* options on the *Debugging Settings* page in the ColdFusion Administrator. Also, the IP address of the machine that runs ColdFusion must be added to the list of debugging IP addresses in the *Debugging IP Addresses* page if the request is sent by a remote machine. If the request is from a localhost, the IP address 127.0.0.1 must be present in the list of debugging IP addresses.

### Category

[Debugging tags](#)

### Syntax

```
<cftimer
  label= "text"
  type = "inline|outline|comment|debug" >

  CFML statement(s)

</cftimer>
```

**Note:** You can specify this tag's attributes in an *attributeCollection* attribute whose value is a structure. Specify the structure name in the *attributeCollection* attribute and use the tag's attribute names as structure keys.

### See also

[cfdump](#), [cftrace](#); [Debugging and Troubleshooting Applications](#) in the *Developing ColdFusion Applications*

### History

ColdFusion MX 7: Added this tag.

### Attributes

Attribute	Req/Opt	Default	Description
label	Optional	" "	Label to display with timing information.
type	Optional	debug	<ul style="list-style-type: none"><li>• <b>inline</b>: displays timing information inline, following the resulting HTML.</li><li>• <b>outline</b>: displays timing information and also displays a line around the output produced by the timed code. The browser must support the FIELDSET tag to display the outline.</li><li>• <b>comment</b>: displays timing information in an HTML comment in the format <code>&lt;!-- label: elapsed-time ms --&gt;</code>. The default label is <code>cftimer</code>.</li><li>• <b>debug</b>: displays timing information in the debug output under the heading CFTimer Times.</li></ul>

### Usage

Use this tag to determine how long it takes for a block of code to execute. You can nest `cftimer` tags.

This tag is useful for debugging CFML code during application development. In production, you can leave `cftimer` tags in your code as long as you have disabled the debugging option in the ColdFusion Administrator.

### Example

```
...
<!--- type="inline" --->
    <cftimer label="Query and Loop Time Inline" type="inline">
        <cfquery name="empquery" datasource="cfdocexamples">
            SELECT *
            FROM Employees
        </cfquery>

        <cfloop query="empquery">
            <cfoutput>#lastname#, #firstname#</cfoutput><br>
        </cfloop>
    </cftimer>
<hr><br>

<!--- type="outline" --->
    <cftimer label="Query and CFOUTPUT Time with Outline" type="outline">
        <cfquery name="coursequery" datasource="cfdocexamples">
            SELECT *
            FROM CourseList
        </cfquery>
        <table border="1" width="100%">
            <cfoutput query="coursequery">
                <tr>
                    <td>#Course_ID#</td>
                    <td>#CorName#</td>
                    <td>#CorLevel#</td>
                </tr>
            </cfoutput>
        </table>
    </cftimer>
<hr><br>

<!--- type="comment" --->
```

```
<cftimer label="Query and CFOUTPUT Time in Comment" type="comment">
  <cfquery name="parkquery" datasource="cfdocexamples">
    SELECT *
    FROM Parks
  </cfquery>
<p>Select View &gt; Source to see timing information</p>
<table border="1" width="100%">
  <cfoutput query="parkquery">
    <tr>
      <td>#Parkname#</td>
    </tr>
  </cfoutput>
</table>
</cftimer>
<hr><br>

<!--- type="debug" --->
  <cftimer label="Query and CFOUTPUT Time in Debug Output" type="debug">
    <cfquery name="deptquery" datasource="cfdocexamples">
      SELECT *
      FROM Departments
    </cfquery>
<p>Scroll down to CFTimer Times heading to see timing information</p>
<table border="1" width="100%">
  <cfoutput query="deptquery">
    <tr>
      <td>#Dept_ID#</td>
      <td>#Dept_Name#</td>
    </tr>
  </cfoutput>
</table>
</cftimer>
...
```

## cftooltip

### Description

Specifies tool tip text that displays when the user hovers the mouse pointer over the elements in the tag body. This tag does not require a form and is not used inside Flash forms.

### Category

[Display management tags](#)

## Syntax

```
<cftooltip
    autoDismissDelay="5000"
    hideDelay="250"
    preventOverlap="true|false"
    showDelay="200"
    sourceForTooltip="URL"
    style="CSS style specification"
    tooltip="text">
```

*Display tags*

```
</cftooltip>
```

This tag must have an end tag.

**Note:** You can specify this tag's attribute in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute name as structure key.

## See also

[cfajaximport](#), Using Ajax User Interface Components and Features in the *Developing ColdFusion Applications*

## History

ColdFusion 8: Added this tag

## Attributes

Attribute	Req/Opt	Default	Description
autoDismissDelay	Optional	5000	The number of milliseconds between the time when the user moves the mouse pointer over the component (and leaves it there) and when the tool tip disappears.
hideDelay	Optional	250	The number of milliseconds to delay between the time when the user moves the mouse pointer away from the component and when the tool tip disappears.
preventOverlap	Optional	true	A Boolean value specifying whether to prevent the tool tip from overlapping the component that it describes.
showDelay	Optional	200	The number of milliseconds to delay between the time when the user moves the mouse over the component and when the tool tip appears.
sourceForTooltip	Optional		The URL of a page with the tool tip contents. The page can include HTML markup to control the format, and the tip can include images.  If you specify this attribute, an animated icon appears with the text "Loading..." while the tip is being loaded.
style	Optional		A CSS style specification for the tooltip. Use this attribute to set the width, text color, background color, padding, and other style properties.
tooltip	Optional		Tip text to display. The text can include HTML formatting.  Ignored if you specify a <code>sourceForTooltip</code> attribute.

## Usage

Specify a `tooltip` or a `sourceForTooltip` attribute; otherwise, this tag has no effect.

If you specify the path to a CFML page in the `sourceForTooltip` attribute, ColdFusion processes the page and uses its output in the tip text. You can therefore use CFML programming, in addition to HTML formatting, to control the contents and appearance of the tip text.

You must use the `cftooltip` tag for text and simple components, such as images, not for complex Ajax components such as windows, pods, or layout areas. If you use the `cftooltip` tag with complex components, you might get unexpected behavior; for example, the tool tip might overlap window contents, even if you specify the `preventoverlap` attribute.

You can nest tool tips within the `cfinput`, `cfgrid`, and `cfform` tags, although this may result in multiple tool tips obscuring one another.

### Example

The following simple example can dynamically display different tool-tip text based on the value of the `theItem` variable on the main CFML page.

The main CFML page:

```
<!--- These variables could be set dynamically --->
<cfset theItem="left-handed & other specialty wrenches">
<cfset theImage="lhbwrench.jpg">

<!--- The theItem string has an ampersand, so you must URL-encode it. --->
<cftooltip sourceForTooltip="tiptext.cfm?itemid=#URLEncodedFormat(theItem)#">
    <cfoutput>
        <b>Try this one!</b>
        
    </cfoutput>
</cftooltip>
```

The `tiptext.cfm` page could have a single CFML tag:

```
<cfoutput><b> Click to find more about #URL.itemid# </b></cfoutput>
```

## cftrace

### Description

Displays and logs debugging data about the state of an application at the time the `cftrace` tag executes. Tracks run-time logic flow, variable values, and execution time. Displays output at the end of the request or in the debugging section at the end of the request; or, in Dreamweaver MX and later, in the Server Debug tab of the Results window.

ColdFusion logs `cftrace` output to the file `logs\cftrace.log`, in the ColdFusion installation directory.

**Note:** To permit this tag to execute, enable debugging in the ColdFusion Administrator. Optionally, to report trace summaries, enable the Trace section

### Category

Debugging tags, Variable manipulation tags

## Syntax

```
<cftrace
    var = "variable name"
    text = "string"
    type = "format"
    category = "string"
    inline = "yes|no"
    abort = "yes|no">
</cftrace>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

## History

ColdFusion MX: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
abort	Optional	no	<ul style="list-style-type: none"> <li>yes: calls a <code>cfabort</code> tag when the tag is executed.</li> <li>no</li> </ul>
category	Optional		User-defined string that identifies trace groups.
inline	Optional	no	<ul style="list-style-type: none"> <li>yes: displays trace code inline on the page in the location of the <code>cftrace</code> tag, in addition to the debugging information output.</li> <li>no</li> </ul>
text	Optional		User-defined string, which can include simple variables, but not complex variables such as arrays. Outputs to the <code>cflogtext</code> attribute.
type	Optional	Information	Corresponds to the <code>cflogtype</code> attribute; displays an appropriate icon: <ul style="list-style-type: none"> <li>Information</li> <li>Warning</li> <li>Error</li> <li>Fatal Information</li> </ul>
var	Optional		The name of a simple or complex variable to display.  Useful for displaying a temporary value, or a value that does not display on any CFM page.

## Usage

You cannot put application code within this tag. (This avoids problems that can occur if you disable debugging.)

This tag is useful for debugging CFML code during application development.

You can display `cftrace` tag output in the following ways:

- As a section in the debugging output

- Inline in an application page, and as a section in debugging output. If you specify inline tracing, ColdFusion flushes all output up to the `cftrace` tag, and displays the trace output when it encounters the tag.

The following is an example of a log file entry:

```
"Information","web-4","04/08/02","23:21:30", , "[30 ms (1st trace)]  
[C:\CFusion\wwwroot\generic.cfm @ line: 9] -  
    [thisPage = /generic.cfm] "  
"Information","web-0","04/08/02","23:58:58", , "[5187 ms (10)]  
[C:\CFusion\wwwroot\generic.cfm @ line: 14] - [category]  
    [thisPage = /generic.cfm] [ABORTED] thisPage "
```

For a complex variable, ColdFusion lists the variable name and the number of elements in the object; it does not log the contents of the variable.

### Example

The following example traces a FORM variable that is evaluated by a `cfif` block:

```
<cftrace var="FORM.variable"  
    text="doing equivalency check for FORM.variable"  
    category="form_vars"  
    inline="true">  
<cfif isDefined("FORM.variable") AND #FORM.variable# EQ 1>  
    <h1>Congratulations, you're a winner!</h1>  
<cfelse>  
    <h1>Sorry, you lost!</h1>  
</cfif>
```

## cftransaction

### Description

For enterprise database management systems that support transaction processing, instructs the database management system to treat multiple database operations as a single transaction. Provides database commit and rollback processing. See the documentation for your database management system to determine whether it supports SQL transaction processing.

### Category

[Database manipulation tags](#)

### Syntax

```
<cftransaction  
    action = "begin|commit|rollback|setsavepoint"  
    isolation = "read_uncommitted|read_committed|repeatable_read"  
    savepoint = "savepoint name">  
</cftransaction>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## History

ColdFusion 8: Added the `setsavepoint` value to the `action` attribute. Added the `savepoint` attribute.

## Attributes

Attribute	Req/Opt	Default	Description
<code>action</code>	Optional	<code>begin</code>	<ul style="list-style-type: none"> <li><code>begin</code>: The start of the block of code to execute.</li> <li><code>commit</code>: Commits a pending transaction.</li> <li><code>rollback</code>: Rolls back a pending transaction.</li> <li><code>setsavepoint</code>: Saves a specific state within a transaction</li> </ul>
<code>isolation</code>	Optional		<p>Isolation level, which indicates which type of read can occur during the execution of concurrent SQL transactions. The possible read actions include <i>dirty read</i>, in which a second SQL transaction reads a row before the first SQL transaction executes a COMMIT; <i>non-repeatable read</i>, in which a SQL transaction reads a row and then a second SQL transaction modifies or deletes the row and executes a COMMIT; and <i>phantom</i>, in which a SQL transaction reads rows that meet search criteria, a second SQL transaction then generates at least one row that meets the first transaction's search criteria, and then the first transaction repeats the search, resulting in a different result set.</p> <ul style="list-style-type: none"> <li><code>read_uncommitted</code>: Allows dirty read, non-repeatable read, and phantom</li> <li><code>read_committed</code>: Allows non-repeatable read and phantom. Does not allow dirty read.</li> <li><code>repeatable_read</code>: Allows phantom. Does not allow dirty read or non-repeatable read.</li> <li><code>serializable</code>: Does not allow dirty read, non-repeatable read, or phantom.</li> </ul>
<code>savepoint</code>	Optional		The name of the savepoint in the transaction. Setting savepoints lets you roll back portions of a transaction. For example, if your transaction includes an insert, an update, and a delete, and you set a savepoint after the update, you can roll back the transaction to exclude the delete.
<code>nested</code>	Optional	<code>true</code>	This attribute specifies whether the <code>cftransaction</code> tag can be nested inside another <code>cftransaction</code> tag. If the attribute value is false and there is a parent <code>cftransaction</code> tag, ColdFusion generates an error.

## Usage

If you do not specify a value for the `action` attribute, automatic transaction processing proceeds as follows:

- If the `cfquery` operations within the transaction block complete without an error, the transaction is committed.
- If a `cfquery` tag generates an error within a `cftransaction` block, all `cfquery` operations in the transaction roll back.

If you do not specify a value for the `isolation` attribute, ColdFusion uses the default isolation level for the associated database.

By using CFML error handling and the `action` attribute, however, you can explicitly control whether a transaction is committed or rolled back, based on the success or failure of the database query. In a transaction block, you can do the following:

- Commit a database transaction by nesting the `<cftransaction action = "commit"/>` tag in the block.
- Roll back a transaction by nesting the `<cftransaction action = "rollback"/>` tag in the block.

(In these examples, the slash is an alternate syntax that is the equivalent of an end tag.)

In a transaction block, you can write queries to more than one database, but you must commit or roll back a transaction to one database before writing a query to another.

To control how the database engine performs locking during the transaction, use the `isolation` attribute.

The `cftransaction` tag does not work as expected if you use the `cfthread` tag in it to make query calls.

- You can now nest `cftransaction` tags. Typically, ColdFusion 9 does not support nested transactions, but you can embed one `cftransaction` tag inside another. If you nest these tags, only the outermost `cftransaction` tag takes effect.

This feature lets you write functions that must run in a transaction without considering whether the function is called by code that is inside a `cftransaction` tag. Use a `cftransaction` tag in the function. If the calling code is in a transaction, the tag has no effect. If the calling code is not in a transaction, the tag starts the transaction.

The following code shows nested transaction tags.

```
<cftransaction>
<cfquery name="iquery" datasource="dsn">
insert into region(regionid, regiondescription) values('111', 'YPR')
</cfquery>
<cftransaction>
<cfquery name="iquery" datasource="dsn">
update region set regiondescription = 'new' where regionid='111'
</cfquery>
</cftransaction>
</cftransaction>
```

**Note:** In a realistic situation, the second `cftransaction` and `cfquery` can be written in a CFC that are, in turn, called by the first `cftransaction` and `cfquery` by passing the `regionid` value.

### Example

<p>The `cftransaction` tag can be used to group multiple queries that use the `cfquery` tag into one business event. Changes to data that is requested by the queries are not committed to the `datasource` until all actions within the transaction block have executed successfully.

<p>This a view-only example.

```
<!---
<cftransaction>
    <cfquery name='makeNewCourse' datasource='Snippets'>
        INSERT INTO Courses
            (Number, Descript)
        VALUES
            ('#myNumber#', '#myDescription#')
    </cfquery>

    <cfquery name='insertNewCourseToList' datasource='Snippets'>
        INSERT INTO CourseList
            (CorNumber, CorDesc, Dept_ID,
            CorName, CorLevel, LastUpdate)
        VALUES
            ('#myNumber#', '#myDescription#', '#myDepartment#',
            '#myDescription#', '#myCorLevel#', #Now()#)
    </cfquery>
</cftransaction>
-->
```

You can set savepoints at the completion of insert, update, and delete actions of a transaction. You then use error handling logic to determine whether it is necessary to roll back to a previous savepoint.

### Example

```
<!--- This example performs batch processing of withdrawals --->
<!--- from a bank account. The withdrawal amounts are stored --->
<!--- in an array. --->
<!--- There is a CFC named bank.cfc whose contains appear --->
<!--- after the example. --->

<cftransaction>
    <!--- Get the account balance. --->
    <cfinvoke component="bank" method="getBalance"
        returnvariable="getacctbalance" accountnum=1>

<cfloop index="withdrawnum" from="1" to="#ArrayLen(withdrawals)#">
    <!--- Set a savepoint before making the withdrawal. --->
    <cfset noxfer = "point" & #withdrawnum#>
    <cftransaction action = "setsavepoint" savepoint = "#noxfer#" />

    <!--- Make the withdrawal. --->
    <cfinvoke component="bank" method="makewithdrawal"
        returnvariable="getacctbalance" accountnum=1
        withdrawamount="#withdrawals[withdrawnum]#">

    <!--- Get the account balance. --->
    <cfinvoke component="bank" method="getBalance"
        returnvariable="getacctbalance" accountnum=1>

    <!--- If the balance is negative, roll back the transaction. --->
    <cfif getacctbalance.balance lt 0>
        <cftransaction action="rollback" savepoint="#noxfer#" />
    </cfif>
</cfloop>
</cftransaction>

<!--- The bank.cfc contains the following:

cfcomponent>
    <cffunction name="getBalance" access="public" returntype="query">
        <cfargument name="accountnum" type="numeric" required="yes">
```

```
<cfquery name="getacctbalance" datasource="testsqlserver">
    SELECT * FROM dbo.mybank
    WHERE accountid = #accountnum#
</cfquery>
<cfreturn getacctbalance>
</cffunction>

<cffunction name="makewithdrawal" access="public" returntype="query">
    <cfargument name="accountnum" type="numeric" required="yes">
    <cfargument name="withdrawamount" type="numeric" required="yes">
    <cfquery name="withdrawfromacct" datasource="testsqlserver">
        UPDATE dbo.mybank SET balance = balance - #withdrawamount#
        WHERE accountid = 1
    </cfquery>
    <cfinvoke method="getBalance" returnvariable="getacctbalance"
accountnum=1>
    <cfreturn getacctbalance>
</cffunction>
</cfcomponent>
--->
```

## cftree

### Description

Inserts a tree control in a form. Validates user selections. Used within a `cfform` tag block. Use a ColdFusion query to supply data to the tree.

### Category

[Forms tags](#)

## Syntax

```
<cftree
    name="name"
    align="top|left|bottom|baseline|texttop|absbottom|
        middle|absmiddle|right"
    appendKey="yes|no"
    bold="yes|no"
    border="yes|no"
    cache="yes|no"
    completePath="yes|no"
    delimiter="delimiter"
    enabled="yes|no"
    font="font"
    fontSize="size"
    format="applet|flash|html|object|xml"
    height="integer"
    highlightHref="yes|no"
    hScroll="yes|no"
    hSpace="integer"
    italic="yes|no"
    lookAndFeel="motif|windows|metal"
    message="text"
    notSupported="text">
    onBlur="ActionScript to invoke"
    onChange="ActionScript to invoke"
    onError="text"
    onFocus="Actionscript to invoke"
    onValidate="script name"
    required="yes|no"
    style="style specification"
    tooltip="text"
    visible="yes|no"
    vScroll="yes|no"
    vSpace="integer"
    width="integer">
</cftree>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfajaximport](#), [cfapplet](#), [cfcalendar](#), [cform](#), [cformgroup](#), [cformitem](#), [cfgrid](#), [cfinput](#), [cfselect](#), [cfslider](#), [cftextarea](#), [cftreeitem](#); Working with action pages, Building tree controls with the `cftree` tag, and Using HTML trees in the *Developing ColdFusion Applications*

## History

ColdFusion 8: Added support for Ajax based HTML trees, including the `cache` attribute and the `html` value for `format` attribute.

ColdFusion MX7.01: Added support for `onBlur` and `onFocus` events.

ColdFusion MX 7:

- Added the `format` attribute and support for generating Flash and XML and object output.
- Added `enabled`, `onChange`, `style`, `tooltip`, and `visible` attributes (Flash format only).

ColdFusion MX: Changed behavior: ColdFusion renders a tree control regardless of whether there are any `treeitem`s within it.

### Attributes

**Note:** In XML format, ColdFusion passes all attributes to the XML. The supplied XSLT skins do not handle or display XML format trees, but do display applet and Flash format trees.

Attribute	Req/Opt Format	Default	Description
name	Required; All		Name for a tree control.
align	Optional; Applet, object		<ul style="list-style-type: none"> <li>• top</li> <li>• left</li> <li>• bottom</li> <li>• baseline</li> <li>• texttop</li> <li>• absbottom</li> <li>• middle</li> <li>• absmiddle</li> <li>• right</li> </ul>
appendKey	Optional; All	yes	<ul style="list-style-type: none"> <li>• yes: if you use <code>cftreeitemhref</code> attributes, ColdFusion appends a <code>CFTREEITEMKEY</code> query string variable with the value of the selected tree item to the <code>cfform</code> action URL.</li> <li>• no: does not append the tree item value to the URL.</li> </ul>
bold	Optional; Applet, Flash, HTML	no	<ul style="list-style-type: none"> <li>• yes: displays tree control text in bold.</li> <li>• no</li> </ul>
border	Optional; Applet, object	yes	<ul style="list-style-type: none"> <li>• yes: displays a border around the tree control.</li> <li>• no</li> </ul>
cache	Optional; HTML	yes	<p>Applies only if the tree's child <code>treeitem</code> tag uses a bind expression.</p> <p>A Boolean value that specifies whether to get new data each time the user expands tree nodes, as follows:</p> <ul style="list-style-type: none"> <li>• yes: fetches a node's child items only once, when the node is first expanded</li> <li>• no: fetches child items each time the node is expanded.</li> </ul>

Attribute	Req/Opt  Format	Default	Description
completePath	Optional;  Applet, HTML, object	no	<ul style="list-style-type: none"> <li>• <b>yes</b>: starts the <code>Form.treename.path</code> variable with the root of the tree path when <code>cftree</code> is submitted.</li> <li>• <b>no</b>: omits the root level from the <code>Form.treename.path</code> variable; the value starts with the first child node in the tree.</li> </ul> <p>For the <code>preserveData</code> attribute of <code>cfForm</code> to work with the tree, set this attribute to <b>yes</b>.</p> <p>For tree items populated by a query, if you use the <code>cftreeitemqueryasroot</code> attribute to specify a root name, that value is returned. If you do not specify a root name, ColdFusion returns the query name.</p>
delimiter	Optional;  All	\\	Character to separate elements in the <code>Form.treename.path</code> variable of the action page.
enabled	Optional;  Flash	yes	Flash format only: Boolean value that specifies whether the control is enabled. A disabled control appears in light gray.
font	Optional;  Applet, HTML		Font name for text in the tree control.
fontSize	Optional;  Applet, Flash, HTML		Font size for text in the tree control, in pixels.
format	Optional;  All	applet	<ul style="list-style-type: none"> <li>• <b>applet</b>: displays the tree using a Java applet in the browser.</li> <li>• <b>flash</b>: displays the tree using a Flash control</li> <li>• <b>html</b>: displays the tree uses Ajax-based HTML</li> <li>• <b>object</b>: returns the tree as a ColdFusion structure with the name specified by the <code>name</code> attribute. For details of the structure contents, see the section <i>object format</i>.</li> <li>• <b>xml</b>: generates an XML representation of the tree. In XML format forms, includes the generated XML in the form. In HTML format forms, puts the XML in a string variable with the name specified by the <code>name</code> attribute.</li> </ul>
height	Optional;  Applet, Flash	320(applet only)	Tree control height, in pixels. If you omit this attribute in Flash format, Flash automatically sizes the tree.
highlightHref	Optional;  Applet, Object	yes	<ul style="list-style-type: none"> <li>• <b>yes</b>: highlights as a link the displayed value for any <code>cftreeitem</code> tag that specifies an <code>href</code> attribute.</li> <li>• <b>no</b>: disables highlighting.</li> </ul>
hScroll	Optional;  Applet, object	yes	<ul style="list-style-type: none"> <li>• <b>yes</b>: permits horizontal scrolling.</li> <li>• <b>no</b></li> </ul>
hSpace	Optional;  Applet		Horizontal spacing to left and right of tree control, in pixels.

Attribute	Req/Opt Format	Default	Description
<code>italic</code>	Optional; Applet, Flash, HTML	<code>no</code>	<ul style="list-style-type: none"> <li><code>yes</code>: displays tree control text in italics.</li> <li><code>no</code></li> </ul>
<code>label</code>	Optional; HTML,		
<code>lookAndFeel</code>	Optional; Applet, object	<code>windows</code>	<ul style="list-style-type: none"> <li><code>motif</code>: renders the tree in Motif style.</li> <li><code>windows</code>: renders the tree in Windows style.</li> <li><code>metal</code>: renders the tree in Java Swing style.</li> </ul> <p>If the platform does not support a style option, the tag uses the default style for the platform.</p>
<code>message</code>	Optional; Applet, HTML		Message to display if validation fails.
<code>notSupported</code>	Optional; Applet	See Description	<p>Text to display if a page that contains a Java applet-based <code>cfform</code> control is opened by a browser that does not support Java or has Java support disabled, for example;</p> <pre>"&lt;b&gt; Browser must support Java to view ColdFusion Java Applets&lt;/b&gt;"</pre> <p>Default message:</p> <pre>&lt;b&gt;Browser must support Java to &lt;br&gt;view ColdFusion Java Applets!&lt;/b&gt;</pre>
<code>onBlur</code>	Optional; Flash		ActionScript to run when the tree loses focus.
<code>onChange</code>	Optional; Flash		<p>ActionScript to run when the control changes due to user action.</p> <p>If you specify an <code>onChange</code> event handler, the Form scope of the ColdFusion action page does not automatically get information about selected items. The ActionScript <code>onChange</code> event handler must handle all changes and selections.</p>
<code>onError</code>	Optional; Applet, HTML		A JavaScript function to run if validation fails.
<code>onFocus</code>	Optional; Flash		ActionScript to run when the tree gets focus. The JavaScript DOM form object, value of the <code>name</code> attribute, value that failed validation, and any error text specified by the <code>message</code> attribute are passed to the method.
<code>onValidate</code>	Optional; Applet, HTML		JavaScript function to validate user input. The JavaScript DOM form object, input object, and input object value are passed to the specified routine, which must return <code>true</code> if validation succeeds; <code>false</code> , otherwise.
<code>required</code>	Optional; Applet, Flash, HTML	<code>no</code>	<ul style="list-style-type: none"> <li><code>yes</code>: users must select an item in the tree control.</li> <li><code>no</code></li> </ul>

Attribute	Req/Opt  Format	Default	Description
style	Optional;  Flash, HTML		Must be a style specification in CSS format. In HTML format, this attribute corresponds to the value of an HTML <code>style</code> attribute. In Flash format, use the same syntax and contents as used in Flex for the corresponding Flash element.
tooltip	Optional;  Flash		Flash format only: Text to display when the mouse pointer hovers over the control.
value	Optional;  HTML,		
visible	Optional;  Flash	yes	Flash format only: Boolean value that specifies whether to show the control. Space that would be occupied by an invisible control is blank.
vScroll	Optional;  Applet, object	yes	<ul style="list-style-type: none"><li>• yes: permits vertical scrolling.</li><li>• no</li></ul>
vSpace	Optional;  Applet		Vertical margin above and below tree control, in pixels.
width	Optional;  Applet, Flash	200 (applet only)	Tree control width, in pixels. If you omit this attribute in Flash format, Flash automatically sizes the tree.

**Note:** All attributes are passed to the XML generated in XML format, but no ColdFusion skin interprets `cftree` XML.

## Usage

This tag must be in a `cfform` tag block.

The applet format tree requires the client to download a Java applet. Also, if the client does not have an up-to-date Java plug-in installed, the system might also have to download an updated Java plug-in to display an applet format tree. The Flash format tree uses a Flash control, and can be embedded in an HTML format `cfform` tag. For this tag to work properly in Flash, HTML, or applet format, the browser must also be JavaScript-enabled.

**Note:** If you specify Flash format for this tag in an HTML format form, and you do not specify `height` and `width` attributes, Flash takes up more than the remaining visible area on the screen. If any other output follows the tree, including any form controls, users must scroll to see it. Therefore, if you follow a Flash tree in an HTML form with additional output, specify `height` and `width` values.

If the following conditions are true, a user's selection from query data that populates this tag's options continues to display after the user submits the form:

- The `cfformpreserveData` attribute is set to "yes"
- The `cfformaction` attribute posts to the same page as the form itself (this is the default), or the action page has a form that contains controls with the same names as corresponding controls on the user entry form

For more information, see the [cfform](#) tag entry.

## Form variables

When you select a tree item and submit the form that contains the tree, ColdFusion creates a structure with two variables in the action page Form scope. The structure name is the tree name. The following table lists the fields:

Field	Value
path	The path through the tree to the selected node, in the form [root\]node_1\node_2\.... In applet format, the path includes the root node only if the completePath attribute is true. In Flash format, the path always includes the root node.
node	The value of the selected tree node.

### object format

If you specify `object` in the `format` attribute, ColdFusion returns the tree as a ColdFusion structure, and does not send the tree to the browser. You can, for example, loop over the structure to populate a menu, generate “breadcrumb” links for page navigation, or create a DHTML tree.

**Note:** If you specify an object format tree in an XML format form, ColdFusion does not generate the tree.

The structure variable name is specified by the `cftreename` attribute. The top level of the structure has two types of entries:

- Attribute settings
- A children array

### Attribute settings

The structure has top-level entries with the values of the following `cftree` attributes:

<code>align</code>	<code>completePath</code>	<code>highlightHref</code>	<code>lookAndFeel</code>
<code>appendKey</code>	<code>delimiter</code>	<code>hScroll</code>	<code>name</code>
<code>bold</code>	<code>fontWeight</code>	<code>italic</code>	<code>vscroll</code>
<code>border</code>			

### Children array

The top-level children entry is an array of items entries. Each item has the following entries:

Field	Value
children	This item’s child items; an array of item structures.
display	Tree item label, as determined by the <code>cftreeitemdisplay</code> attribute.
expand	Whether to expand the item to display any children; value of <code>cftreeitemexpand</code> attribute.
href	The URL to link to when the user selects the item; value of the <code>cftreeitemhref</code> attribute.
img	The tree image icon Image to display as an icon for the tree item; value of <code>cftreeitemimg</code> attribute. You can use the <code>img</code> attribute to display custom icons only in the Applet version; not in the Flash version.
imgOpen	Image to display when the tree item is open (expanded); value of <code>cftreeitemimgopen</code> attribute.
parent	Value of this item’s parent item in the tree.
path	The node path from the tree root to the current element.
queryAsRoot	Whether the query is the root of the item; value of <code>cftreeitemqueryAsRoot</code> attribute.
target	The link target, such as <code>_blank</code> ; value of the item’s <code>cftreeitemtarget</code> attribute.
value	The item’s value, as determined by the <code>cftreeitemvalue</code> attribute.

### Example

The following example creates a tree that shows available courses from the CourseList table of the cfdocexamples database, and puts each department's courses in a folder. This example is displayed in Flash and uses the Departments list to get department names.

```
<cfquery name="getCourses" datasource="cfdocexamples">
    SELECT d.dept_name, c.course_id, c.CorName, c.CorLevel, c.corName || ' ( ' || c.corLevel || '
)' AS corLabel
    FROM CourseList c, Departments d
    WHERE d.Dept_ID = c.Dept_ID
    ORDER BY d.dept_Name, c.corName, c.corLevel
</cfquery>

<cfform name="studentForm" format="flash" width="400" height="450">
    <cftree name="courseTree" width="350" height="400">
        <cftreeitem
            query="getCourses"
            value="dept_name,Course_id"
            display="dept_name,CorLabel" queryasroot="NO" expand="yes,no">
        </cftreeitem>
    </cftree>
</cfform>
```

The following example creates a tree that shows the basic information about all employees in an organization, organized by department. The departments are expanded to show all employees. You click the + signs to display additional information. If you click the employee name, ColdFusion links back to the same page and displays the Path and node values for the selection.

```
<!--- Query the datasource to get employee information. --->
<!--- Group the output by Department.
      (All fields are required in Group By clause.) --->
<cfquery name = "GetEmployees" dataSource = "cfdocexamples">
    SELECT Emp_ID, FirstName, LastName, EMail, Phone, Department
    FROM Employees
    GROUP BY Department, Emp_ID, FirstName, LastName, EMail, Phone
</cfquery>
<html>
<body>
<h3>cftree Example</h3>

<!--- The following runs if the user clicked on a link in the tree.
      A complete application would use the ID for additional processing. --->

<cfif isdefined("Form.fieldnames")>
    <b>Selected item information</b><br>
    <cfoutput>
    <b>Path: </b>#form.Employees.Path#<br>
    <b>node: </b>#form.Employees.node#<br>
    <br>
    </cfoutput>
</cfif>

<!--- Display the tree. The cftree tag must be in a cfform. --->
<cfform action="#cgi.script_name#" preservedata="Yes" format="Flash">
    <cftree name = "Employees" height = "400" width = "400"
        font = "Arial Narrow" italic="yes" highlightref="No" HScroll="no" VScroll="no"
        completepath="no" lookandfeel="windows" border="No" required="yes">
    <!--- cfoutput tag with a group attribute loops over the departments. --->
```

```
<cfoutput group="Department" query = "GetEmployees">
  <cfreeitem value="#Department#" parent="Employees" expand="yes">
  <!--- This cfoutput tag loops over the records for the department.
    The cfoutput tag does not need any attributes. --->
  <cfoutput>
    <!--- Create an item for each employee in the department.
      Do not expand children. Each employee name links to this page,
      and sends the employee ID in the query string.--->
    <cfreeitem value = "#LastName#, #FirstName#"
      parent = "#Department#" expand="false" img="cd"
      href="#cgi.script_name#?user_id=#emp_id#">
    <!--- Each Employee entry has Id, and contact info children. --->
    <cfreeitem value = "#Emp_ID#" display = "Employee ID: #Emp_ID#"
      parent = "#LastName#, #FirstName#" img="remote">
    <!--- Each node must be unique value, so use Emp_ID om value. --->
    <cfreeitem value = "#Emp_ID#_ContactInfo" img="computer"
      display = "Contact Information"
      parent = "#LastName#, #FirstName#" expand = "false">
    <!--- ContacInfo has two children --->
    <cfreeitem value = "#Phone#" parent = "#Emp_ID#_ContactInfo">
    <cfreeitem value = "#Email#" parent = "#Emp_ID#_ContactInfo">
  </cfoutput>
</cfoutput>
</cfree>
<cfinput type="Submit" name="submitit" value="Submit" width="100">
</cfform>
```

## cfreeitem

### Description

Populates a form tree control, created with the `cfree` tag, with one or more elements.

### Category

[Forms tags](#)

### Syntax

```
<cfreeitem
  value = "text"
  bind = "bind expression"
  display = "text"
  expand = "yes|no"
  href = "URL"
  img = "filename"
  imgopen = "filename"
  parent = "parent name"
  query = "queryname"
  queryAsRoot = "yes|no"
  target = "URL target">
```

OR

```
<cfreeitem
  bind = "bind expression">
  onBindError = "JavaScript function name"
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## History

ColdFusion 8: Added the `bind` and `onBindError` attributes.

## See also

Building tree controls with the `cftree` tag and Using HTML trees in the *Developing ColdFusion Applications*

## Attributes

**Note:** In XML format, ColdFusion passes all attributes to the XML. The supplied XSLT skins do not handle or display XML format trees, but do display applet and Flash format trees.

Attribute	Req/Opt;  Format	Default	Description
value	Required for applet, Flash, XML.  value or bind is required for HTML.		Value passed when the form containing the tree is submitted. When populating a tree with data from a <code>cfquery</code> , you can specify multiple columns to use in a delimited list; for example, <code>value="dept_id,emp_id"</code> . In this case, each column generates an item that is a child of the column that precedes it in the list.
bind	value or bind is required for HTML		A bind expression specifying a CFC function, JavaScript function, or URL that dynamically gets all tree nodes. You can use this attribute only at the top level of the tree, and in this case, the tree can have only <code>cftreeitem</code> tag.  If you use the <code>bind</code> attribute, the only other allowed attribute is <code>onBindError</code> .  For details creating trees that using binding, see Using HTML trees in the <i>Developing ColdFusion Applications</i>
display	Optional; All	value	Tree item label. When populating a tree with data from a query, specify names in a delimited list, for example:  <code>display = "dept_name,emp_name"</code>
expand	Optional; All	yes	<ul style="list-style-type: none"> <li>yes: expands tree to show tree item children.</li> <li>no: keeps tree item collapsed.</li> </ul>
href	Optional; All		URL to link to if the user clicks the tree item. If you use a <code>query</code> attribute, the <code>href</code> attribute can specify a query column that contains URLs. If <code>href</code> is not a query column, the attribute text must be a URL or list of URLs.  When populating a tree with data from a query, specify the URLs in a comma-delimited list, for example:  <code>href = "http://dept_svr,http://emp_svr"</code>

Attribute	Req/Opt;  Format	Default	Description
img	Optional;  Applet, HTML, object	folder	<p>Image name, filename, or file URL for tree item icon.</p> <p>The following values are provided:</p> <ul style="list-style-type: none"> <li>• cd</li> <li>• computer</li> <li>• document</li> <li>• element</li> <li>• folder</li> <li>• floppy</li> <li>• fixed</li> <li>• remote</li> </ul> <p>You can also specify a custom image. To do so, include path and file extension; for example:</p> <pre>img = "../images/page1.gif"</pre> <p>You can also specify a path relative to the web root.</p> <p>Custom images are not supported for Flash format.</p> <p>To specify more than one image in a tree, or an image at the second or subsequent level, use commas to separate names, corresponding to level; for example:</p> <pre>img = "folder,document"</pre> <pre>img = ",document" (example of second level)</pre>
imgopen	Optional;  Applet, HTML, object		Icon displayed with open tree item, as described for the <code>img</code> attribute.
onBindError	Optional;  HTML	see Description	<p>The name of a JavaScript function to execute if evaluating a bind expression results in an error. The function must take two attributes: an HTTP status code and a message.</p> <p>If you omit this attribute, and you specified a global error handler (by using the <a href="#">ColdFusion.setGlobalErrorHandler</a> function), it displays the error message; otherwise a default error pop-up appears.</p>
parent	Optional;  All		Value of the tree item parent. Determines the item's placement in the tree hierarchy. If omitted, the item is placed at the tree root level, or if the <code>queryAsRoot</code> attribute is <code>True</code> , directly under the query.

Attribute	Req/Opt;  Format	Default	Description
query	Optional; All		Query name to use to populate the treeitem. ColdFusion generates an item for each field value in the query column list specified by the value attribute. The fields in each row are hierarchically linked to the first column.
queryAsRoot	Optional; All	yes	<p>Applies only if you specify a query attribute. Defines the query as the root level for all items generated by this tag. This attribute lets you avoid creating a parent cftreeitem.</p> <ul style="list-style-type: none"><li>• <b>yes:</b> generates a parent (root) item for all other items generated by the tag, with the query name as its value; if you specify a parent attribute, the root item is a child of the specified parent.</li><li>• <b>no:</b> uses the item specified by the parent attribute as the immediate parent of all items generated by this tag. If there is no parent attribute, use the query as the parent.</li><li>• <b>A string:</b> creates a root item and uses the specified string as the item name; if you specify a parent attribute, the root item is a child of the specified parent.</li></ul>
target	Optional; All		<p>Target attribute of href URL. When populating a tree with data from a query, specify targets in a comma-delimited list, for example:</p> <p>target = "FRAME_BODY,_blank"</p>

### Usage

For this tag to work properly, the browser must be JavaScript-enabled. This tag must be a child of a cftree tag.

The cftreeitem tag has three basic formats:

- If you do not use a query or bind attribute to populate this tag, it creates a single tree item.
- If you use a query, it creates multiple items; each row of the query creates a hierarchically nested set of items with one item per column.
- If you use the bind attribute, the client side tree dynamically gets the data for the tree item's immediate children, and creates the child items, when a tree item expands. For detailed information on using the bind attribute to populate an HTML format tree, see Using HTML trees in the *Developing ColdFusion Applications*.

### Example

The following example creates a simple tree by using a single cftreeitem tag and a query:

```
<cform action = "#cgi.script_name#">
  <cftree name = "Employees" height = "400" width = "200">
    <cftreeitem value="LastName, FirstName, Emp_ID" query="getEmployees"
      queryAsRoot="False">
    </cftreeitem>
  </cftree>
</cform>
```

The following example creates a tree that shows the basic information about all employees in an organization, organized by department. The departments are expanded to show all employees. You click the + signs to display additional information. If you click the employee name, ColdFusion links back to the same page and displays the selected employee's ID.

```

<!--- Query the datasource to get employee information.--->
<!--- Group the output by Department.
      (All fields are required in Group By clause.) --->
<cfquery name = "GetEmployees" dataSource = "cfdocexamples">
    SELECT Emp_ID, FirstName, LastName, EMail, Phone, Department
    FROM Employees
    GROUP BY Department, Emp_ID, FirstName, LastName, EMail, Phone
</cfquery>
<html>
<body>
<h3>cftreeitem Example</h3>

<!--- The following runs if the user clicked on a link in the tree.
      A complete application would use the ID for additional processing. --->
<cfif isdefined("URL.user_ID")>
    <cfoutput>
        <!--- URL.cftreeitemkey is the selected tree item's value attribute. --->
        You Requested information on #URL.cftreeitemKey#; User ID #URL.user_ID#
    </cfoutput>
    <br><br>
</cfif>
<!--- Display the tree. The cftree tag must be in a cfform. --->
<cfform>
    <cftree name = "Employees" height = "400" width = "200"
        font = "Arial Narrow" highlightref="No" hscroll="No">
        <!--- cfoutput tag with a group attribute loops over the departments. --->
        <cfoutput group="Department" query = "GetEmployees">
            <cftreeitem value="#Department#" parent="Employees" expand="yes">
                <!--- This cfoutput tag loops over the records for the department.
                      The cfoutput tag does not need any attributes. --->
                <cfoutput>
                    <!--- Create an item for each employee in the department.
                          Do not expand children. Each employee name links to this page,
                          and sends the employee ID in the query string.--->
                    <cftreeitem value = "#LastName#, #FirstName#"
                        display = "#LastName#, #FirstName#"
                        parent = "#Department#" expand="no"
                        href="#cgi.script_name#?user_id=#emp_id#">
                    <!--- Each Employee entry has ID and ContactInfo children. --->
                    <cftreeitem value = "#Emp_ID#" display = "Employee ID: #Emp_ID#"
                        parent = "#LastName#, #FirstName#">
                    <!--- Each node must be unique value, so use Emp_ID om value. --->
                    <cftreeitem value = "#Emp_ID#_ContactInfo"
                        display = "Contact Information"
                        parent = "#LastName#, #FirstName#" expand = "No">
                    <!--- ContactInfo has two children. --->
                    <cftreeitem value = "#Phone#" parent = "#Emp_ID#_ContactInfo">
                    <cftreeitem value = "#Email#" parent = "#Emp_ID#_ContactInfo">
                </cfoutput>
            </cftreeitem>
        </cfoutput>
    </cftree>
</cfform>

```

## cftry

### Description

Used with one or more [cfcatch](#) tags. Together, they catch and process exceptions in ColdFusion pages. *Exceptions* are events that disrupt the normal flow of instructions in a ColdFusion page, such as failed database operations, missing include files, and developer-specified events.

### Category

[Exception handling tags](#)

### Syntax

```
<cftry>
    Code that might throw an exception
    One or more cfcatch blocks
</cftry>
```

### See also

[cfcatch](#), [cffinally](#), [cferror](#), [cfrethrow](#), [cfthrow](#), [onError](#); *Handling Errors in the Developing ColdFusion Applications*

### History

ColdFusion MX: Changed [cfscript](#) to include `try` and `catch` statements that are equivalent to the `cftry` and `cfcatch` tags.

### Usage

Within a `cftry` block, put the code that might throw an exception, followed by one or more `cfcatch` tags that catch and process exceptions. This tag requires an end tag.

### Example

```
<!--- cftry example, using TagContext to display the tag stack. --->
<h3>cftry Example</h3>
<!--- Open a cftry block. --->
<cftry>
    <!--- Note misspelled tablename "employees" as "employeeas". --->
    <cfquery name = "TestQuery" dataSource = "cfdocexamples">
        SELECT *
        FROM EMPLOYEEAS
    </cfquery>

    <!--- <p>... other processing goes here --->
    <!--- specify the type of error for which we search --->
    <cfcatch type = "Database">
        <!--- the message to display --->
        <h3>You've Thrown a Database <b>Error</b></h3>
        <cfoutput>
            <!--- and the diagnostic message from the ColdFusion server --->
            <p>#cfcatch.message#</p>
            <p>Caught an exception, type = #CFCATCH.TYPE# </p>
            <p>The contents of the tag stack are:</p>
            <cfloop index = i from = 1
                to = #ArrayLen(CFCATCH.TAGCONTEXT)#>
                <cfset sCurrent = #CFCATCH.TAGCONTEXT[i]#>
                <br>#i# #sCurrent["ID"]#
                (#sCurrent["LINE"]#,#sCurrent["COLUMN"]#)
                #sCurrent["TEMPLATE"]#
            </cfloop>
        </cfoutput>
    </cfcatch>
</cftry>
```

## Tags u-z

### cfupdate

#### Description

Updates records in a data source from data in a ColdFusion form or form Scope.

#### Category

[Database manipulation tags](#)

#### Syntax

```
<cfupdate
    dataSource = "ds_name"
    tableName = "table_name"
    formFields = "field_names"
    password = "password"
    tableOwner = "name"
    tableQualifier = "qualifier"
    username = "username">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[cfinsert](#), [cfprocparam](#), [cfprocresult](#), [cfquery](#), [cfqueryparam](#), [cfstoredproc](#), [cftransaction](#); Creating an update action page with `cfupdate` in the *Developing ColdFusion Applications*.

### History

ColdFusion MX: Deprecated the `connectString`, `dbName`, `dbServer`, `dbtype`, `provider`, and `providerDSN` attributes. They do not work, and might cause an error, in releases later than ColdFusion 5.

### Attributes

Attribute	Req/Opt	Default	Description
<code>dataSource</code>	Required		Name of the data source that contains the table.
<code>tableName</code>	Required		Name of table to update. <ul style="list-style-type: none"> <li>For Oracle drivers, must be uppercase.</li> <li>For Sybase driver, case sensitive; must be in same case as used when the table was created.</li> </ul>
<code>formFields</code>	Optional	(all on form, except keys)	Comma-delimited list of form fields to update. If a form field is not matched by a column name in the database, ColdFusion throws an error. The <code>formFields</code> list must include the database table primary key field, which must be present in the form. It can be hidden.
<code>password</code>	Optional		Overrides the <code>password</code> value specified in ODBC setup.
<code>tableOwner</code>	Optional		For data sources that support table ownership (for example, SQL Server, Oracle, Sybase SQL Anywhere), the table owner.
<code>tableQualifier</code>	Optional		For data sources that support table qualifiers. The purpose of table qualifiers is as follows: <ul style="list-style-type: none"> <li>SQL Server and Oracle: name of the database that contains the table</li> <li>Intersolv dBASE driver: directory of DBF files</li> </ul>
<code>username</code>	Optional		Overrides <code>username</code> value specified in ODBC setup.

**Example**

```
<!--- This example lets you update a person's telephone number in the employee table. --->
<cfif isDefined("form.phone")>
    <cfupdate datasource="cfdocexamples" tablename="EMPLOYEES">
</cfif>

<cfquery name="empTable" datasource="cfdocexamples">
    SELECT * FROM EMPLOYEES
</cfquery>

<!--- This code shows the contents of the employee table and allows you to choose a row for
updating. --->
<table border="1">
<cfoutput query="empTable">
    <tr>
        <td>#firstName#</td>
        <td>#lastName#</td>
        <td>#phone#</td>
        <td><a href="cfupdate.cfm?id=#emp_id#">Edit</a></td>
    </tr>
</cfoutput>
</table>

<cfif isDefined("url.id")>
    <cfquery name="phoneQuery" datasource="cfdocexamples">
        SELECT * FROM employees WHERE emp_id=#url.id#
    </cfquery>
<!--- This code displays the row to edit for update. --->
    <cfoutput query="phoneQuery">
        <form action="cfupdate.cfm" method="post">
            #phoneQuery.firstName# #phoneQuery.lastName#
            <input name="phone" type="text" value="#phone#" size="12">
            <input type="submit" value="Update">
            <input name="emp_id" type="hidden" value="#emp_id#">
            <!--- The emp_id is passed as a hidden field to be used as a primary
                key in the CFUPDATE. --->
        </form>
    </cfoutput>
</cfif>
```

**Note:** The `cfupdate` tag internally uses parameterized queries.

## cfwddx

**Description**

Serializes and deserializes CFML data structures to the XML-based WDDX format. The WDDX is an XML vocabulary for describing complex data structures in a standard, generic way. Implementing it lets you use the HTTP protocol to such information among application server platforms, application servers, and browsers.

This tag generates JavaScript statements to instantiate JavaScript objects equivalent to the contents of a WDDX packet or CFML data structure. Interoperates with Unicode.

**Category**

Extensibility tags

## Syntax

```
<cfwddx
    action = "cfml2wddx|wddx2cfml|cfml2js|wddx2js"
    input = "inputdata"
    output = "result variable name"
    topLevelVariable = "top-level variable name for JavaScript"
    useTimeZoneInfo = "yes|no"
    validate = "yes|no" >
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfcollection](#), [cfdump](#), [cfexecute](#), [cfindex](#), [cfobject](#), [cfreport](#), [cfsearch](#), [ToScript](#); Using XML and WDDX in the *Developing ColdFusion Applications*

## History

### ColdFusion MX

- Changed column name case behavior: ColdFusion preserves the case of column names in JavaScript. (Earlier releases converted query column names to lowercase.)
- Changed encoding format support: this tag supports several encoding formats. The default encoding format is UTF-8. The tag interoperates with Unicode.

## Attributes

Attribute	Req/Opt	Default	Description
action	Required		<ul style="list-style-type: none"> <li>• <code>cfml2wddx</code>: serializes CFML to WDDX.</li> <li>• <code>wddx2cfml</code>: deserializes WDDX to CFML.</li> <li>• <code>cfml2js</code>: serializes CFML to JavaScript.</li> <li>• <code>wddx2js</code>: deserializes WDDX to JavaScript.</li> </ul>
input	Required		A value to process.
output	Required if <code>action="wddx2cfml"</code>		Name of variable for output. If <code>action="WDDX2JS"</code> or <code>"CFML2JS"</code> , and this attribute is omitted, result is output in HTML stream.
topLevelVariable	Required if <code>action="wddx2js"</code> or <code>"cfml2js"</code>		Name of top-level JavaScript object created by deserialization. The object is an instance of the <code>WddxRecordset</code> object.
useTimeZoneInfo	Optional	yes	Whether to output time-zone information when serializing CFML to WDDX. <ul style="list-style-type: none"> <li>• <code>yes</code>: the hour-minute offset, represented in ISO8601 format, is output.</li> <li>• <code>No</code>: the local time is output.</li> </ul>
validate	Optional	no	Applies if <code>action="wddx2cfml"</code> or <code>"wddx2js"</code> . <ul style="list-style-type: none"> <li>• <code>yes</code>: validates WDDX input with an XML parser using WDDX DTD. If parser processes input without error, packet is deserialized. Otherwise, an error is thrown.</li> <li>• <code>no</code>: does not perform input validation.</li> </ul>

## Usage

ColdFusion preserves the case of column names cases in JavaScript.

The `wddx2js` and `cfml2js` actions create a `WddxRecordset` javascript object when they encounter a `RecordSet` java object. The serialized JavaScript code requires a `wddx.js` file.

This tag performs the following conversions:

From	To
CFML	WDDX
CFML	JavaScript
WDDX	CFML
WDDX	JavaScript

For more information, and a list of the ColdFusion array and structure functions that you can use to manage XML document objects and functions, see Using XML and WDDX in the *Developing ColdFusion Applications*.

**Note:** The `cfwddx` tag throws an exception if you attempt to serialize a CFC or user-defined function (UDF).

## Example

```
<!-- This example shows basic use of the cfwddx tag. -->
<html>
<body>
<!-- Create a simple query. -->
<cfquery name = "q" dataSource = "cfdocexamples">
    SELECT Message_Id, Thread_id, Username FROM messages
</cfquery>

The recordset data is:...<p>
<cfoutput query = q>
    #Message_ID# #Thread_ID# #Username#<br>
</cfoutput><p>

<!-- Serialize data to WDDX format. -->
Serializing CFML data...<p>
<cfwddx action = "cfml2wddx" input = #q# output = "wddxText">

<!-- Display WDDX XML packet. -->
Resulting WDDX packet is:
<xmp><cfoutput>#wddxText#</cfoutput></xmp>

<!-- Deserialize to a variable named wddxResult. -->
Deserializing WDDX packet...<p>
<cfwddx action = "wddx2cfml" input = #wddxText# output = "qnew">

The recordset data is:...<p>
<cfoutput query = qnew>
    #Message_ID# #Thread_ID# #Username#<br>
</cfoutput><p>
```

## cfwindow

### Description

Creates a pop-up window in the browser. Does not create a separate browser pop-up instance.

### Category

[Display management tags](#)

### Syntax

```
<cfwindow
    bodyStyle = "CSS style specification"
    center="true|false"
    closable="true|false"
    destroyOnClose = "true|false"
    draggable="true|false"
    headerStyle = "CSS style specification"
    height="number of pixels"
    initShow="false|true"
    minHeight="number of pixels"
    minWidth="number of pixels"
    modal="true|false"
    name="string"
    onBindError = "JavaScript function name"
    refreshOnShow = "false|true"
    resizable="true|false"
    source="path"
    title="string"
    width="number of pixels"
    x="numeric pixel coordinate"
    y="numeric pixel coordinate">

    window contents

</cfwindow>
```

If you use the `source` attribute, ColdFusion ignores any tag body contents. If you do not have a tag body and omit the `</window>` end tag, close the `cfwindow` tag with the `/>` character combination.

**Note:** You can specify this tag's attribute in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute name as structure key.

### History

ColdFusion 8: Added this tag.

## Attributes

Attribute	Req/Opt	Default	Description
bodyStyle	Optional		A CSS style specification for the window body. As a general rule, use this attribute to set color and font styles. Using this attribute to set the height and width, for example, can result in distorted output.
center	Optional	false	A Boolean value that specifies whether to center the window over the browser window. <ul style="list-style-type: none"> <li>If <code>true</code>, ColdFusion ignores the <code>x</code> and <code>y</code> attribute values.</li> <li>If <code>false</code>, and you do not specify <code>x</code> and <code>y</code> attributes, ColdFusion centers the window.</li> </ul>
closable	Optional	true	A Boolean value that specifies whether the user can close the window. If <code>true</code> , the window has an X close icon.
destroyOnClose	Optional	false	If <code>true</code> , destroys the window when it is closed.
draggable	Optional	true	A Boolean value that specifies whether the user can drag the window. To drag the window, click the mouse on the title bar and hold the button down while dragging. If the window does not have a title, users cannot drag it.
headerStyle	Optional		A CSS style specification for the window header. As a general rule, use this attribute to set color and font styles. Using this attribute to set the height and width, for example, can result in distorted output.
height	Optional	300	Height of the window in pixels. If you specify a value greater than the available space, the window occupies the available space and the resize handles do not appear.
initShow	Optional	false	A Boolean value that specifies whether to display the window when the containing page first appears. If this value is <code>false</code> , use the <code>ColdFusion.Window.show</code> JavaScript function to display the window.
minHeight	Optional	0	The minimum height, in pixels, to which users can resize the window.
minWidth	Optional	0	The minimum width, in pixels, to which users can resize the window.
modal	Optional	false	A Boolean value that specifies whether the window is modal, that is, whether the user can interact with the main window while this window is displayed. If <code>true</code> , the user <i>cannot</i> interact with the main window.
name	Optional		The name of the window. Must be unique on the pages. This attribute is required to interact with the window, including to dynamically show or hide it.
onBindError	Optional	see Description	The name of a JavaScript function to execute if evaluating a bind expression results in an error. The function must take two attributes: an HTTP status code and a message. <p>If you omit this attribute, and specified a global error handler (by using the <code>ColdFusion.setGlobalErrorHandler</code> function), it displays the error message; otherwise a default error pop-up appears.</p>

Attribute	Req/Opt	Default	Description
overflow	Optional	auto	<p>Specifies how to display child content whose size would cause the control to overflow the window boundaries. The following values are valid:</p> <ul style="list-style-type: none"> <li><code>auto</code> Show scroll bars when necessary.</li> <li><code>hidden</code> Do not allow access to overflowing content.</li> <li><code>scroll</code> Always show horizontal and vertical scroll bars, even if they are not needed.</li> <li><code>visible</code> Content can display outside the bounds of the window.</li> </ul> <p><b>Note:</b> In Internet Explorer, windows with the <code>visible</code> setting expand to fit the size of the contents, rather than having the contents extend beyond the layout area.</p>
refreshOnShow	Optional	false	<ul style="list-style-type: none"> <li><code>true</code> Refresh the contents of the window by running the <code>source</code> bind expression whenever the window shows (for example, by calling the <code>ColdFusion.Window.show</code> JavaScript function), in addition to when bind events occur</li> <li><code>false</code> Refresh the window only when the bind expression is triggered by its bind event.</li> </ul> <p>To use this attribute, you must also specify a <code>source</code> attribute.</p>
resizable	Optional	true	A Boolean value specifying whether the user can resize the window.
source	Optional		<p>A URL that returns the window contents. This attribute can use URL parameters to pass data to the page. ColdFusion uses standard page path resolution rules to locate the page.</p> <p>You can use a bind expression in this attribute; for more information see Usage.</p> <p><b>Note:</b> If a CFML page specified in this attribute contains tags that use Ajax features, such as <code>cfform</code>, <code>cfgrid</code>, and <code>cfpod</code>, you must use a <code>cfajaximport</code> tag on the page with the <code>cfwindow</code> tag. For more information, see <a href="#">cfajaximport</a>.</p>
title	Optional		The text to display in the window's title bar. You can use HTML mark-up to control the title appearance; for example, to show the text in red italic font.
width	Optional	500	Width of the window in pixels. If you specify a value greater than the available space, the window occupies the available space and the resize handles do not appear.
x	Optional		<p>The X (horizontal) coordinate of the upper-left corner of the window, relative to the browser window.</p> <p>ColdFusion ignores this attribute if the <code>center</code> attribute value is <code>true</code> and if you do not set the <code>y</code> attribute value.</p>
y	Optional		<p>The Y (vertical) coordinate of the upper-left corner of the window, relative to the browser window.</p> <p>ColdFusion ignores this attribute if the <code>center</code> attribute value is <code>true</code> and if you do not set the <code>x</code> attribute value.</p>

## Usage

You cannot use this tag in a form or as a child of a `cflayout`, or `cflayoutarea` tag.

Define the `cfwindow` tag on the page that displays it (or a page that is included by using the `cfinclude` tag). So, you cannot use the `cfwindow` tag on a page that is specified by a `cfmenuitem` tag `http` attribute, `cfdiv` tag `bind` attribute, or `cflayoutarea` or `cfpod` tag `source` attribute. Instead, for example, you can display a window when a user clicks a menu item by defining the window on the same page as your menu and using a JavaScript function in the `cfmenuitem` tag `http` attribute to call the window's `show` function. The `cfwindow` tag uses its `source` attribute to get its contents from another page.

You can use a `source` attribute or a tag body to specify the window contents; if you specify both, ColdFusion uses the contents specified by the `source` attribute and ignores the tag body. If you use a `source` attribute, an animated icon and the text "Loading..." appears while the contents is being fetched.

If the `source` attribute specifies a page that defines JavaScript functions, the function definitions on that page must have the following format:

```
functionName = function(arguments) {function body}
```

Function definitions that use the following format may not work:

```
function functionName (arguments) {function body}
```

However, Adobe recommends that you include all custom JavaScript in external JavaScript files and import them on the application's main page, and not write them inline in code that you get by using the `source` attribute. Imported pages do not have this function definition format restriction.

If you use the `source` attribute, you can use a *bind expression* to include form field values or other form control attributes as part of the source specification. You can bind to HTML format form controls only. For detailed information on using bind expressions, see *Binding data to form fields in the Developing ColdFusion Applications*.

### JavaScript functions

You can use the following JavaScript functions to manage an HTML format window:

Function	Description
<code>ColdFusion.Window.create</code>	Creates a window without using a <code>cfwindow</code> tag.
<code>ColdFusion.Window.getWindowObject</code>	Gets the underlying Ext JS - JavaScript Library object for the specified HTML format <code>cfwindow</code> control.
<code>ColdFusion.Window.hide</code>	Closes a window.
<code>ColdFusion.Window.onHide</code>	Specifies a function to run each time a specific window closes.
<code>ColdFusion.Window.onShow</code>	Specifies a function to run each time a specific window opens.
<code>ColdFusion.Window.show</code>	Opens a window.

### Example

The following example shows several features of the `cfwindow` tag and dynamic binding of the `cfwindow` tag `source` attribute to form controls. It shows how you can use `x` and `y` attributes to position the windows and how several attributes, such as `closable` and `resizable` affect the window appearance. It also shows how you can use bind expressions to dynamically update window contents when form control values change, including different ways to trigger updating the window contents.

```
<html>
<head>
</head>

<body>
<cfform name="myform">
    <cfinput type="hidden" name="hiddentext"
        value="This is hidden text from the main page">

    Click the mouse on the control to show its text in window 1.
    <cfinput name="text1"><br />

    Click the button to show the input control text in window 2.
    <cfinput name="text2">
    <cfinput type="button" name="mybutton" value="Show Text"
        onclick="javascript:ColdFusion.Window.show('mywindow2')"><br />

    Click the Checkbox to change and show its status in window 3
    <cfinput name="check1" type="checkbox"><br />

    Click the button to open a window containing the page
        specified by the input control.
    <cfinput name="text3" value="windowsource.cfm">
    <cfinput type="button" name="mybutton3" value="Open Window"
        onclick="javascript:ColdFusion.Window.show('mywindow4')">
</cfform>

<!-- This window shows initially and cannot be closed, dragged, or resized.
    The value of the text URL parameter, and therefore, the contents of the
    text displayed in the window changes each time the user clicks the
    mouse over the text1 control. -->
<cfwindow x="0" y="100" width="200" height="150"
    name="mywindow" title="My First Window"
    closable="false" draggable="false" resizable="false" initshow="true"
    source="windowsource.cfm?text={myform:text1@mousedown}" />

<!-- This window shows initially and cannot be dragged, or resized, but can
    be closed.
    The text URL parameter represents the text2 input control value. -->
<cfwindow x="0" y="250" width="200" height="150"
    name="mywindow2" title="My Second Window"
    initshow="true" draggable="false" resizable="false"
    source="windowsource.cfm?text={myform:text2}" />

<!-- This window shows initially and cannot be resized, but can be dragged
    or closed.
    The value of the text URL parameter, and therefore, Boolean value
    displayed in the window changes each time the user clicks the mouse
```

```
in the check1 control to change the check box status.
The bind expression binds to the check box checked attribute;
it specifies a click event because Internet Explorer does not
generate a change event when the user clicks the box.--->
<cfwindow x="0" y="400" width="200" height="150"
name="mywindow3" title="My Third Window"
initshow="true" resizable="false"
source="windowsource.cfm?text=<b>Checkbox: </b>{myform:check1.checked@click}" />

<!--- This window does not display initially.
The Open Window button control opens it.
It can be closed, dragged, and resized.
The value text URL parameter represents the value of a hidden text
field. --->
<cfwindow x="210" y="100" width="500" height="480" name="mywindow4"
minHeight="400" minWidth="400"
title="My Fourth Window" initshow="false"
source="{myform:text3}?text={myform:hiddentext}" />
</body>
</html>
```

The windowsource.cfm page that the cfwindow tag source attributes specify to display in the windows contains the following code:

```
<h3>Main page input:</h3>
<cfoutput>
    #url.text#
</cfoutput>
```

## cfxml

### Description

Creates a ColdFusion XML document object that contains the markup in the tag body. This tag can include XML and CFML tags. ColdFusion processes the CFML code in the tag body, and then assigns the resulting text to an XML document object variable, which is always stored in Unicode.

### Category

[Extensibility tags](#)

### Syntax

```
<cfxml
    variable="xmlVarName"
    caseSensitive="yes|no">
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

### See also

[IsXmlDoc](#), [IsXmlElement](#), [IsXmlRoot](#), [ToString](#), [XmlChildPos](#), [XmlNew](#), [XmlParse](#), [XmlSearch](#), [XmlTransform](#); Using XML and WDDX in the *Developing ColdFusion Applications*

### History

ColdFusion MX 7: Added support for using an XML declaration at the start of the text.

ColdFusion MX: Added this tag.

### Attributes

Attribute	Req/Opt	Default	Description
variable			Name of the document object.
caseSensitive	Optional	no	<ul style="list-style-type: none"><li>• yes: maintains the case of document elements and attributes.</li><li>• no</li></ul>

### Usage

If your XML object is case sensitive, you cannot use dot notation to reference an element or attribute name. Use the name in associative array (bracket) notation, or a reference that does not use the case-sensitive name (such as `xmlChildren[1]`) instead. In the following code, the first line works with a case-sensitive XML object. The second and third lines cause errors:

```
MyDoc.xmlRoot.XmlAttributes["Version"] = "12b";  
MyDoc.xmlRoot.XmlAttributes.Version = "12b";  
MyDoc.MyRoot.XmlAttributes["Version"] = "12b";
```

Use the `XmlFormat` function to escape special characters such as `&`, `>` and `<`.

To convert an XML document object back into a string, use the [ToString](#) function, at which time ColdFusion automatically prepends the `<?xml version="1.0" encoding="UTF-8" ?>` XML declaration.

To change the declaration to specify another encoding, use the `Replace` function. To specify the encoding of the text that is returned to a browser or other application, use the `cfcontent` tag.

The following example illustrates this process:

```
<cfprocessingdirective suppresswhitespace="Yes">  
<cfcontent type="text/xml; charset=utf-16">  
<cfxml variable="xmlobject">  
<breakfast_menu>  
  <food>  
    <name quantity="50">Belgian Waffles</name>  
    <description>Our famous Belgian Waffles</description>  
  </food>  
</breakfast_menu>  
</cfxml>  
  
<!--- <cfdump var="#xmlobject#">--->  
  
<cfset myvar=toString(xmlobject)>  
<cfset mynewvar=replace(myvar, "UTF-8", "utf-16")>  
  
<!---<cfdump var="#mynewvar#">--->  
  
<cfoutput>#mynewvar#</cfoutput>  
</cfprocessingdirective>
```

The `cfprocessingdirective` tag prevents ColdFusion from putting white space characters in front of the XML declaration.

### Example

The following example creates a document object whose root element is MyDoc. The object includes text that displays the value of the ColdFusion variable testVar. The code creates four nested child elements, which are generated by an indexed cfloop tag. The cfdump tag displays the XML document object.

```
<cfset testVar = True>
<cfxml variable="MyDoc">
  <?xml version='1.0' encoding='utf-8' ?>
  <MyDoc>
    <cfif testVar IS True>
      <cfoutput>The value of testVar is True.</cfoutput>
    <cfelse>
      <cfoutput>The value of testVar is False.</cfoutput>
    </cfif>
    <cfloop index = "LoopCount" from = "1" to = "4">
      <childNodes>
        This is Child node <cfoutput>#LoopCount#.</cfoutput>
      </childNodes>
    </cfloop>
  </MyDoc>
</cfxml>
<cfdump var=#MyDoc#>
```

## cfzip

### Description

Manipulates ZIP and Java Archive (JAR) files. In addition to the basic zip and unzip functions, use the cfzip tag to delete entries from an archive, filter files, read files in binary format, list the contents of an archive, and specify an entry path used in an executable JAR file.

### History

ColdFusion 8: Added this tag.

### Category

[File management tags](#)

## Syntax

### delete

```
<cfzip
    required
    action = "delete"
    file = "absolute pathname"
    optional
    entrypath = "full pathname"
    filter = "file filter"
    recurse = "yes|no">
```

### list

```
<cfzip
    required
    action = "list"
    file = "absolute pathname"
    name = "recordset name"
    optional
    filter = "file filter"
    recurse = "yes|no"
    showDirectory= "yes|no">
```

### read

```
<cfzip
    required
    action = "read"
    entrypath = "full pathname"
    file = "absolute pathname"
    variable = "variable name"
    optional
    charset = "encoding type">
```

### readBinary

```
<cfzip
    required
    action = "readBinary"
    entrypath = "full pathname"
    file = "absolute pathname"
    variable = "variable name">
```

### unzip

#### Attributes

Attribute	Action	Req/Opt	Default	Description
action	N/A	Optional	zip	Action to take. Must be one of the following: <ul style="list-style-type: none"> <li>• delete</li> <li>• list</li> <li>• read</li> <li>• readBinary</li> <li>• unzip</li> <li>• zip</li> </ul> If you do not specify an action, ColdFusion applies the default action, zip.
charset	read	Optional	default encoding of the host machine	Character set used to translate the ZIP or JAR entry into a text string. Examples of character sets: <ul style="list-style-type: none"> <li>• JIS</li> <li>• RFC1345</li> <li>• UTF-16</li> </ul>
destination	unzip	Required		Destination directory where the ZIP or JAR file is extracted.

Attribute	Action	Req/Opt	Default	Description
entryPath	delete read readBinary unzip	Optional		Pathname on which the action is performed.
file	delete list read readBinary unzip zip	Required		Absolute pathname of the file on which the action is performed; for example, the full pathname of the ZIP file: c:\temp\log.zip.  If you do not specify the full pathname (for example, file="log.zip"), ColdFusion creates the file in a temporary directory. You can use the <a href="#">GetTempDirectory</a> function to access the ZIP or JAR file.
filter	delete list unzip zip	Optional		File filter applied to the action. The action applies to all files in the specified pathname that match the filter.
name	list	Required		Record set name in which the result of the <code>list</code> action is stored. The record set columns are the following: <ul style="list-style-type: none"> <li>• <b>name:</b> Filename of the entry in the JAR file. For example, if the entry is help/docs/index.htm, the name is index.htm.</li> <li>• <b>directory:</b> Directory containing the entry. For the preceding example, the directory is help/docs. You can obtain the full entry name by concatenating directory and name. If an entry is at the root level, the directory is empty ("").</li> <li>• <b>size:</b> Uncompressed size of the entry, in bytes.</li> <li>• <b>compressedSize:</b> Compressed size of the entry, in bytes.</li> <li>• <b>type:</b> Type of entry (directory or file).</li> <li>• <b>dateLastModified:</b> Last modified date of the entry, cfdate object.</li> <li>• <b>comment:</b> Any comment, if present, for the entry.</li> <li>• <b>crc:</b> Crc-32 checksum of the uncompressed entry data.</li> </ul>
overwrite	unzip zip	Optional	no	unzip: Specifies whether to overwrite the extracted files: <ul style="list-style-type: none"> <li>• <b>yes:</b> If the extracted file exists at the destination specified, the file is overwritten.</li> <li>• <b>no:</b> If the extracted file exists at the destination specified, the file is not overwritten and that entry is not extracted. The remaining entries are extracted.</li> </ul> zip: Specifies whether to overwrite the contents of a ZIP or JAR file: <ul style="list-style-type: none"> <li>• <b>yes:</b> Overwrites all of the content in the ZIP or JAR file if it exists.</li> <li>• <b>no:</b> Updates existing entries and adds new entries to the ZIP or JAR file if it exists.</li> </ul>
prefix	zip	Optional		String added as a prefix to the ZIP or JAR entry. The string is the name of a subdirectory in which the entries are added.

Attribute	Action	Req/Opt	Default	Description
recurse	delete list unzip zip	Optional	yes	Specifies whether the action applies to subdirectories: <ul style="list-style-type: none"><li>• yes: Includes subdirectories.</li><li>• no: Does not include subdirectories.</li></ul>
showDirectory	list	Optional	no	Specifies whether to show the directory structure: <ul style="list-style-type: none"><li>• yes: Lists the directories.</li><li>• no: Does not list directories.</li></ul>
source	zip	Required (see description)		Source directory to be zipped. Not required if the <code>cfzipparam</code> tag is specified.
storePath	unzip zip	Optional	yes	<code>unzip</code> : Specifies whether files are stored at the entry path: <ul style="list-style-type: none"><li>• yes: The files are extracted to the entry path.</li><li>• no: The entry path is ignored and all the files are extracted at the root level.</li></ul> <code>zip</code> : Specifies whether pathnames are stored in the ZIP or JAR file: <ul style="list-style-type: none"><li>• yes: Pathnames of entries are stored in the ZIP or JAR file.</li><li>• no: Pathnames of the entries are not stored in the ZIP or JAR file. All the files are placed at the root level. In case of a name conflict, the last file in the iteration is added.</li></ul>
variable	read readBinary	Required		Variable in which the content is stored.

### Usage

Use the `cfzip` tag to zip and unzip files and manipulate existing ZIP or JAR files in ColdFusion. You can use the `cfzip` tag independently or with one or more `cfzipparam` tags to manipulate multiple files or directories. The `cfzip` tag is the parent tag of the `cfzipparam` tag.

The ZIP format is the standard format for file archiving and compression. The JAR format is based on the ZIP format. JAR files are platform-independent.

**Note:** The `cfzip` tag does not create directories. If you specify a directory that does not exist, ColdFusion generates an error.

Use the following syntax to specify an in-memory file or directory in any attribute that takes a path. In-memory files are not written to disk and speed processing of transient data.

```
ram:///filepath
```

The filepath can include multiple directories, for example `ram:///petStore/images/dogImages.zip`. You must create the directories in the path before you specify the file. For more information on using in-memory files, see Working with in-memory files in the *Developing ColdFusion Applications*.

### delete action

Use the `delete` action to delete entries from a ZIP or JAR file.

```
<!-- This example shows how to delete all the properties in a JAR file.
--->
<cfzip file="e:\work\soure.jar" action="delete" filter="*.properties, *.props">
<!-- This example shows how to delete all of the entries in a ZIP file with a JPG, GIF, or
PNG extension, including entries in subdirectories. --->
<cfzip file="c:\myApp\images.zip" action="delete" filter="*.jpg, *.gif, *.png" recurse="yes">
<!-- This example shows how to delete the "images" subdirectory (and its contents) from the
"myApp.zip" file. --->
<cfzip action="delete" file="c:\myApp.zip" entrypath="images">
<!-- This example shows how to delete all Java source entries in the "work/source" directory
and images (*.gif, *.jpg, *.jpeg) from a JAR file. --->
<cfzip file="C:\downloads\source.jar" action="delete">
    <cfzipparam entrypath="work/source" filter="*.java">
    <cfzipparam filter="*.gif,*.jpg,*.jpeg">
</cfzip>
```

### list action

Use the `list` action to list the entries of a ZIP or JAR file. The following table shows the types of information you can retrieve for entries in the archive:

Field	Description
comment	Text string description saved with the entry source.
compressedSize	Compressed size of the entry in bytes.
crc	Checksum for the entry source.
dateLastModified	Date and time when the source was last modified.
directory	Name of the directory where the entry is stored.
name	Entry pathname.
size	Uncompressed size of the entry source in bytes.
type	Source type for the entry, for example, <i>file</i> .

You can use the `cfdump` tag to list all of the information in a ZIP or JAR file, as the following example shows:

```
<cfzip file="c:/myApp.jar" action="list" name="entry">
<cfdump var="#entry#">
```

You can use the `cfoutput` tag to list individual fields for the entries in an archive, as the following example shows:

```
<cfzip file="c:\zipTest\Test.zip" action="list" name="entry">
<table>
    <cfoutput>
        <tr>
            <td><b>Entry Name:</b> #entry.name#</td>
            <td><b>Last Modified Date:</b>
#dateFormat(entry.dateLastModified) #, #timeFormat(entry.dateLastModified) #</td>
            <td><b>Size (uncompressed) :</b> #numberFormat(entry.size/1000) # KB
<br></td>
        </cfoutput>
    </tr>
</table>
```

**read action**

Use the `read` action to read the content of the ZIP or JAR file entry in human-readable format. The `read` action uses the `charset` value to create the string.

```
<!-- This example shows how to read a text file in a JAR file. -->
<cfzip action="read" file="/home/sam/work/util.jar" entrypath="info.txt" variable="text">
```

**readBinary action**

Use the `readBinary` action to read the content of a ZIP or JAR file in binary format.

```
<!-- This example shows how to use the readBinary action to copy a ZIP entry from one ZIP
file to another ZIP file. -->
<cfzip file="c:\work\instr.zip" action="readBinary"
    entryPath="com/test/abc.jpg" variable="xyz">
<cfzip file="c:\work\copy_instr.zip">
    <cfzipparam entryPath="com/test/xyz.jpg" content="#xyz#">
</cfzip>
```

**unzip action**

Use the `unzip` action to extract the entries from a ZIP or JAR file.

```
<!-- This example shows how to extract the class files of a JAR file and save the files to a
local drive. -->
<cfzip file="e:\work\tools.jar" action="unzip" filter="*.class"
destination="c:\temp\tools\classes"/>
<!-- This example shows how to extract files from a JAR file in multiple directories. -->
<cfzip file="e:\work\images.jar" action="unzip" destination="c:\images">
    <cfzipparam entryPath="toWork\small">
    <cfzipparam entryPath="final\large">
</cfzip>
```

**zip action**

Use the `zip` action to create or update a ZIP or JAR file. This is the default action; you do not have to specify it explicitly. If you specify a ZIP or JAR file that does not exist, ColdFusion creates it. If the ZIP or JAR file exists, ColdFusion adds new entries from the source and updates existing entries if they have changed. If you set the `overwrite` attribute to `yes`, all of the entries in the ZIP or JAR file are replaced by the new content.

```
<!-- This example shows how to zip the directory "c:\temp" into the ZIP file
"e:\work\abc.zip". -->
<cfzip file="e:\work\abc.zip" source="c:\temp">
<!-- This example shows how to zip all the class files in a directory and add a subdirectory
named "classes" to the JAR file entry name. -->
<cfzip file="e:\work\util.jar" action="zip" source="c:\src\util\" prefix="classes"
filter="*.class">
<!-- This example shows how to zip all of the log files in the ColdFusion directory and create
a subdirectory called exception where zipped files are archived.
<cfzip file="c:\zipTest\log2.zip" action="zip" source="c:\ColdFusion\" prefix="exception"
filter="*.log">
<!-- This example shows how to overwrite all of the content of a ZIP file with the entries
specified in the source. -->
<cfzip file="c:\currentApp.zip" source="c:\myApp\work" overwrite="yes">
```

**Example**

The following example shows how to zip image files chosen from a form and e-mail the ZIP file to the person requesting the images.

The first ColdFusion page populates a pop-up menu with the names of artists generated from a database query:

```
<!--- Create a query to extract artist names from the cfartgallery database. --->
<cfquery name="artist" datasource="cfartgallery">
    SELECT FIRSTNAME || ' ' || LASTNAME AS FULLNAME, ARTISTS.ARTISTID
    FROM ARTISTS
</cfquery>

<!--- Create a form that lists the artists generated by the query. --->
<cfform action="zipArt_action.cfm" method="post">
<h3>Choose an Artist</h3>
<p>Please choose an artist:</p>
<cfselect name="artistName" query="artist" display="FULLNAME" value="ARTISTID" required="yes"
multiple="no" size="8">
</cfselect>
<br/><cfinput type="submit" name="submit" value="OK">
</cfform>
```

The first action page displays the images by the selected artist, zips the files, and writes the ZIP file to a temporary directory. Also, it includes a form to e-mail the ZIP file:

```
<!--- Create a query to extract artwork for the selected artist from the cfartgallery database.
--->
<cfquery name="artwork" datasource="cfartgallery">
    SELECT FIRSTNAME, LASTNAME, LARGEIMAGE
    FROM ARTISTS, ART
    WHERE ARTISTS.ARTISTID = ART.ARTISTID
    AND ARTISTS.ARTISTID=<cfqueryparam value="#form.artistName#">
    ORDER BY ARTNAME
</cfquery>

<cfoutput>
<p>You have chosen the work of #artwork.FirstName# #artwork.LastName#.</p>
<cfset thisDir = ExpandPath(".")>
<cfset imgDir = ExpandPath("../")>
</cfoutput>
<cfset xctr = 1>
<table border="0" cellpadding="15" cellspacing="0" bgcolor="#FFFFFF">
<cfoutput query="artwork">
    <cfif xctr mod 3 eq 1>
    <tr>
        </cfif>
        <!--- Use the IsImageFile function to verify that the image files
            extracted from the database are valid. Use the ImageNew function to
            create a ColdFusion image from valid image files. --->
        <cfif IsImageFile("#imgdir#/cfdocs/images/artgallery/
            #artwork.largeImage#")>
        <cfset myImage=ImageNew("#imgdir#/cfdocs/images/artgallery/
            #artwork.largeImage#")>
            <td valign="top" align="center" width="200">
                <cfset xctr = xctr + 1>
            
```

```
        </td>

<!--- Zip the files by the specified artist. --->
    <cfzip source="#imgDir#/cfdocs/images/artgallery/#artwork.LARGEIMAGE#"
          action="zip" file="#thisDir/#artwork.lastname#.zip">
    </cfif>
    </cfoutput>
</tr>
</table>
<h3>Mail the ZIP File</h3>
<p>Please enter your e-mail address so we can send you the ZIP file as an attachment.</p>
<cfform action = "zipArt_action2.cfm" method="post">
Your e-mail address: <cfinput type = "Text" name = "MailTo">
<!--- Specify the required field. --->
    <cfinput type = "hidden" name = "MailTo_required" value = "You must enter
        your email address">
    <cfinput type="hidden" name="zipPath"
        value="#thisDir/#artwork.lastname#.zip">
    <p><cfinput type = "Submit" name = "OK" label="Mail">
</cfform>
```

The second action page mails the ZIP file as an attachment:

```
<h3>Mail the ZIP file</h3>
<p>Your file has been mailed to you.</p>
<cfset eMail="#form.MailTo#">
<cfset zipPath="#form.zipPath#">
<cfmail from="coldfusion@adobe.com" to="#eMail#" subject="see zipped attachment">
    The images you requested are enclosed in a ZIP file.
    <cfmailparam file="#zipPath#">
</cfmail>
```

## cfzipparam

### Description

Provides additional information to the [cfzip](#) tag.

The `cfzipparam` tag is always a child tag of the `cfzip` tag.

### History

ColdFusion 8: Added this tag.

### Category

[File management tags](#)

## Syntax

```
<cfzip ..>
  <cfzipparam
    charset = "encoding type"
    content = "variable name"
    entryPath = "full pathname"
    filter = "file filter"
    prefix = "string"
    recurse = "yes|no"
    source = "source directory">
</cfzip>
```

**Note:** You can specify this tag's attributes in an `attributeCollection` attribute whose value is a structure. Specify the structure name in the `attributeCollection` attribute and use the tag's attribute names as structure keys.

## See also

[cfzip](#)

## Attributes

Attribute	Req/Opt	Default	Description
charset	Optional	default encoding of the host machine	Converts string content into binary data before putting it into a ZIP or JAR file. Used only when <code>cfzip action="zip"</code> and the <code>cfzipparam</code> content is a string.  Examples of character sets: <ul style="list-style-type: none"> <li>• JIS</li> <li>• RFC1345</li> <li>• UTF-16</li> </ul>
content	Optional		Content written to the ZIP or JAR entry. Used only when <code>cfzip action="zip"</code> .  Valid content data types are <code>binary</code> and <code>string</code> . If you specify the <code>content</code> attribute, specify the <code>entryPath</code> attribute.
entryPath	Optional		Pathname used: <ul style="list-style-type: none"> <li>• For <code>cfzip action="zip"</code>, it is the entry path used. This is valid only when the <code>source</code> is a file. The entry path creates a subdirectory in the ZIP or JAR file.</li> <li>• For <code>cfzip action="unzip"</code>, it is the pathname to unzip.</li> <li>• For <code>cfzip action="delete"</code>, it is the pathname to delete from the ZIP or JAR file.</li> </ul>
filter	Optional		File filter applied to the action. For example, for the <code>zip</code> action, all the files in the <code>source</code> directory that match the filter are zipped.

Attribute	Req/Opt	Default	Description
prefix	Optional		String added as a prefix to the ZIP or JAR entry. Used only when <code>cfzip action="zip"</code> .
recurse	Optional	yes	Include the directory to be zipped, unzipped, or deleted, as specified by the <code>cfzip</code> parent tag.
source	Optional		Source directory or file. Used only when <code>cfzip action="zip"</code> .  Specified files are added to the ZIP or JAR file: <ul style="list-style-type: none"><li>• If you specify <code>source</code> attribute for the <code>cfzip</code> tag, the <code>cfzipparam source</code> is relative to it.</li><li>• If you do not specify a <code>source</code> attribute for the <code>cfzip</code> tag, the <code>cfzipparam source</code> must be an absolute pathname.</li></ul>

### Usage

Use the `cfzipparam` tag with the `cfzip` tag to zip, extract, or delete multiple files or directories. For example, to zip multiple directories, specify a `cfzipparam` tag for each source directory.

### Example

#### Example 1

```
<!--- This example shows how to zip class files from one subdirectory and class and property
files from another directory into a JAR file. --->
<cfzip file="c:\util.jar" source="c:\myproj\classes">
  <cfzipparam source="com\abc\util" filter="*.class">
  <cfzipparam source="com\abc\io" filter="*.class, *.properties">
</cfzip>
```

#### Example 2

```
<!--- This example shows how to update a ZIP file with files from multiple locations, each
with a different filter. --->
<cfzip file="e:\work\test.jar" action="zip">
  <cfzipparam source="c:\temp\abc.txt" prefix="com\abc">
  <cfzipparam source="c:\src\classes" recurse="yes"
    filter="*.class,*.properties" prefix="classes">
  <cfzipparam source="c:\src\Manifest.MF" entrypath="META-INF\MANIFEST">
</cfzip>
```

#### Example 3

```
<!--- This example shows how to insert the string format for a programmatically generated XML
file into a ZIP file. --->
<!--- Create a variable that specifies a time-out period. --->
<cfset myDoc="<system-config><timeout>1500</timeout><pool-max-size>30
  </pool-max-size></system-config>">
<!--- Zip the file. --->
<cfzip file="e:\work\test.zip" action="zip">
  <cfzipparam source="c:\src\Manifest.MF" entrypath="META-INF\MANIFEST">
  <cfzipparam content="#myDoc#" entrypath="system-config.xml">
</cfzip>
```

#### Example 4

```
<!-- This example shows how to update a JAR file with a new version of the file and add some
new files to the JAR file. -->
<cfzip file="e:\work\admin.jar">
    <cfzipparam source="c:\src\classes" recurse="yes"
        filter="*.class,*.properties">
    <cfzipparam source="c:\src\Manifest.MF" entrypath="META-INF\MANIFEST">
</cfzip>
```

#### Example 5

The following example shows how to zip multiple image files chosen from a form and e-mail the ZIP file to the person requesting the images.

The first ColdFusion page populates a pop-up menu with the names of artists generated from a database query:

```
<!-- The following code creates a form for selecting images. -->
<h3>Select the images</h3>
<p>Please choose the images you would like sent to you.</p>
<!-- Create the ColdFusion form to select the images. -->
<table>
<cfform action="zip2_action.cfm" method="post"
    enctype="multipart/form-data">
    <tr>
        <td><br/>
        <cfinput type="checkbox" name="ck1" Value=1>Cube</td>
        <td><br/>
        <cfinput type="checkbox" name="ck2" Value=1>Pentagon</td>
        <td><br/>
        <cfinput type="checkbox" name="ck3" Value=1>Surfer Dude</td>
        <td><br/>
        <cfinput type="checkbox" name="ck4" Value=1>Surfer Girl</td></tr>
        <tr><td><cfinput type="Submit" name="OK" label="OK"></td></tr>
    </table>
</cfform>
```

The first action page zips the files selected from the form, and writes the ZIP file to the hard drive. Also, it includes a form to e-mail the ZIP file:

```
<!-- Determine the absolute pathname on the server. -->
<cfset thisDir = ExpandPath(".")>

<!-- Create a ZIP file based on the selections from the form. Use the cfzipparam tag to specify
the source for each check box selection. -->
<cfzip file="c:\images.zip" source="#thisDir#" action="zip" overwrite="yes">
    <cfif IsDefined("form.ck1")>
        <cfzipparam source="../cfdocs/images/artgallery/elecia01.jpg">
    </cfif>
    <cfif IsDefined("form.ck2")>
        <cfzipparam source="../cfdocs/images/artgallery/elecia02.jpg">
    </cfif>
    <cfif IsDefined("form.ck3")>
        <cfzipparam source="../cfdocs/images/artgallery/elecia03.jpg">
    </cfif>
    <cfif IsDefined("form.ck4")>
        <cfzipparam source="../cfdocs/images/artgallery/elecia04.jpg">
    </cfif>
</cfzip>
<h3>Mail the ZIP File</h3>
```

```
<p>Please enter your e-mail address so we can send you the ZIP file as an attachment.</p>
<cfif IsDefined("form.mailto")>
    <cfif form.mailto is not "" >
        <cfoutput>
            <cfmail from="coldfusion@adobe.com" to="#form.mailto#"
                subject="see zipped attachment">
                The images you requested are enclosed in a ZIP file.
            <cfmailparam file="#thisDir#/images.zip">
        </cfmail>
        </cfoutput>
    </cfif>
</cfif>

<cfform action = "zipArt_action2.cfm" method="post">
    Your e-mail address: <cfinput type = "Text" name = "MailTo">
    <!-- Specify the required field. -->
    <cfinput type = "hidden" name = "MailTo_required"
        value = "You must enter your email address">
    <cfinput type = "hidden" name="zipPath" value = "c:\images.zip">
    <p><cfinput type = "Submit" name = "OK" label="Mail">
</cfform>
```

The second action page mails the ZIP file as an attachment:

```
<h3>Mail the ZIP file</h3>
<p>Your file has been mailed to you.</p>
<cfset eMail="#form.MailTo#">
<cfset zipPath="#form.zipPath#">
<cfmail from="coldfusion@adobe.com" to="#eMail#"
    subject="see zipped attachment">
    The images you requested are enclosed in a ZIP file.
    <cfmailparam file="#zipPath#">
</cfmail>
```

# Chapter 4: ColdFusion Functions

The following tables list and categorize ColdFusion Markup Language (CFML) functions.

## New Functions in ColdFusion 9 and ColdFusion 9.0.1

<a href="#">ApplicationStop</a>	<a href="#">IsSpreadsheetFile</a>	<a href="#">SpreadsheetFormatColumn</a>
<a href="#">ArrayContains</a>	<a href="#">IsSpreadsheetObject</a>	<a href="#">SpreadsheetFormatColumns</a>
<a href="#">ArrayDelete</a>	<a href="#">Location</a>	<a href="#">SpreadsheetFormatRow</a>
<a href="#">ArrayFind</a>	<a href="#">ObjectLoad</a>	<a href="#">SpreadsheetFormatRows</a>
<a href="#">ArrayFindNoCase</a>		<a href="#">SpreadsheetGetCellComment</a>
<a href="#">CacheGetAllIds</a>	<a href="#">ObjectSave</a>	<a href="#">SpreadsheetGetCellFormula</a>
<a href="#">CacheGetMetadata</a>	<a href="#">ORMClearSession</a>	<a href="#">SpreadsheetGetCellValue</a>
<a href="#">CacheGetProperties</a>	<a href="#">ORMCloseSession</a>	<a href="#">SpreadsheetInfo</a>
<a href="#">CacheGet</a>	<a href="#">ORMEvictQueries</a>	<a href="#">SpreadsheetMergeCells</a>
<a href="#">CachePut</a>	<a href="#">ORMEvictCollection</a>	<a href="#">SpreadsheetNew</a>
<a href="#">CacheRemove</a>	<a href="#">ORMEvictEntity</a>	<a href="#">SpreadsheetRead</a>
<a href="#">CacheSetProperties</a>	<a href="#">ORMEvictQueries</a>	<a href="#">SpreadsheetReadBinary</a>
<a href="#">DirectoryCreate</a>	<a href="#">ORMExecuteQuery</a>	<a href="#">SpreadsheetRemoveSheet</a>
<a href="#">DirectoryDelete</a>	<a href="#">ORMFlush</a>	<a href="#">SpreadsheetSetActiveSheetNumber</a>
<a href="#">DirectoryExists</a>	<a href="#">ORMGetSession</a>	<a href="#">SpreadsheetSetCellComment</a>
		<a href="#">SpreadsheetSetCellFormula</a>
<a href="#">DirectoryList</a>	<a href="#">ORMGetSessionFactory</a>	<a href="#">SpreadsheetSetCellValue</a>
<a href="#">DirectoryRename</a>	<a href="#">ORMReload</a>	<a href="#">SpreadsheetSetActiveSheet</a>
<a href="#">EntityDelete</a>	<a href="#">ObjectEquals</a>	<a href="#">SpreadsheetSetFooter</a>
<a href="#">EntityLoad</a>	<a href="#">SpreadsheetAddColumn</a>	<a href="#">SpreadsheetSetHeader</a>
<a href="#">EntityLoadByExample</a>	<a href="#">SpreadsheetAddFreezePane</a>	<a href="#">SpreadsheetSetColumnWidth</a>
<a href="#">EntityLoadByPK</a>	<a href="#">SpreadsheetAddImage</a>	<a href="#">SpreadsheetShiftColumns</a>
<a href="#">EntityMerge</a>	<a href="#">SpreadsheetAddInfo</a>	<a href="#">SpreadsheetShiftRows</a>
<a href="#">EntityNew</a>	<a href="#">SpreadsheetAddRow</a>	<a href="#">SpreadsheetSetRowHeight</a>
<a href="#">EntityReload</a>	<a href="#">SpreadsheetAddRows</a>	<a href="#">SpreadsheetWrite</a>
<a href="#">EntitySave</a>	<a href="#">SpreadsheetAddSplitPane</a>	<a href="#">Trace</a>

<a href="#">FileDelete</a>	<a href="#">SpreadsheetCreateSheet</a>	<a href="#">TransactionCommit</a>
<a href="#">FileSeek</a>	<a href="#">SpreadsheetDeleteColumn</a>	<a href="#">TransactionRollback</a>
<a href="#">FileSkipBytes</a>	<a href="#">SpreadsheetDeleteColumns</a>	<a href="#">TransactionSetSavePoint</a>
<a href="#">FileUpload</a>	<a href="#">SpreadsheetDeleteRow</a>	<a href="#">ThreadTerminate</a>
<a href="#">FileUploadAll</a>	<a href="#">SpreadsheetDeleteRows</a>	<a href="#">ThreadJoin</a>
<a href="#">FileWriteLine</a>	<a href="#">SpreadsheetFormatCell</a>	<a href="#">Throw</a>
<a href="#">GetFunctionCalledName</a>	<a href="#">SpreadsheetFormatCellRange</a>	<a href="#">WriteDump</a>
<a href="#">GetVFSMetaData</a>		<a href="#">WriteLog</a>
<a href="#">IsIPv6</a>		
<a href="#">IsNull</a>		

## Functions by category

The following tables list functions by their category or purpose.

### Array functions

<a href="#">ArrayAppend</a>	<a href="#">ArrayIsDefined</a>	<a href="#">ArrayNew</a>	<a href="#">ArraySum</a>
<a href="#">ArrayAvg</a>	<a href="#">ArrayIsEmpty</a>	<a href="#">ArrayPrepend</a>	<a href="#">ArraySwap</a>
<a href="#">ArrayClear</a>	<a href="#">ArrayLen</a>	<a href="#">ArrayResize</a>	<a href="#">ArrayToList</a>
<a href="#">ArrayDeleteAt</a>	<a href="#">ArrayMax</a>	<a href="#">ArraySet</a>	<a href="#">IsArray</a>
<a href="#">ArrayInsertAt</a>	<a href="#">ArrayMin</a>	<a href="#">ArraySort</a>	<a href="#">ListToArray</a>
<a href="#">ArrayContains</a>	<a href="#">ArrayDelete</a>	<a href="#">ArrayFind</a>	<a href="#">ArrayFindNoCase</a>

### Cache functions

<a href="#">CacheGet</a>	<a href="#">CacheGetMetadata</a>	<a href="#">CachePut</a>	<a href="#">CacheSetProperties</a>
<a href="#">CacheGetAllIds</a>	<a href="#">CacheGetProperties</a>	<a href="#">CacheRemove</a>	

### Conversion functions

<a href="#">ArrayToList</a>	<a href="#">DotNetToCFType</a>	<a href="#">ToBinary</a>	<a href="#">XmlFormat</a>
<a href="#">BinaryDecode</a>	<a href="#">Hash</a>	<a href="#">ToScript</a>	<a href="#">XmlParse</a>
<a href="#">BinaryEncode</a>	<a href="#">LCase</a>	<a href="#">ToString</a>	<a href="#">XmlTransform</a>
<a href="#">CharsetDecode</a>	<a href="#">ListToArray</a>	<a href="#">URLDecode</a>	
<a href="#">CharsetEncode</a>	<a href="#">SerializeJSON</a>	<a href="#">URLEncodedFormat</a>	
<a href="#">DeserializeJSON</a>	<a href="#">ToBase64</a>	<a href="#">Val</a>	

## Date and time functions

<a href="#">CreateDate</a>	<a href="#">DateFormat</a>	<a href="#">GetTimeZoneInfo</a>	<a href="#">MonthAsString</a>
<a href="#">CreateDateTime</a>	<a href="#">DatePart</a>	<a href="#">Hour</a>	<a href="#">Now</a>
<a href="#">CreateODBCDate</a>	<a href="#">Day</a>	<a href="#">IsDate</a>	<a href="#">ParseDateTime</a>
<a href="#">CreateODBCDateTime</a>	<a href="#">DayOfWeek</a>	<a href="#">IsLeapYear</a>	<a href="#">Quarter</a>
<a href="#">CreateODBCTime</a>	<a href="#">DayOfWeekAsString</a>	<a href="#">IsNumericDate</a>	<a href="#">Second</a>
<a href="#">CreateTime</a>	<a href="#">DayOfYear</a>	<a href="#">LSDateFormat</a>	<a href="#">TimeFormat</a>
<a href="#">CreateTimeSpan</a>	<a href="#">DaysInMonth</a>	<a href="#">LSIsDate</a>	<a href="#">Week</a>
<a href="#">DateAdd</a>	<a href="#">DaysInYear</a>	<a href="#">LSParseDateTime</a>	<a href="#">Year</a>
<a href="#">DateCompare</a>	<a href="#">FirstDayOfMonth</a>	<a href="#">LSTimeFormat</a>	
<a href="#">DateConvert</a>	<a href="#">GetHttpTimeString</a>	<a href="#">Minute</a>	
<a href="#">DateDiff</a>	<a href="#">GetTickCount</a>	<a href="#">Month</a>	

## Data output functions

<a href="#">WriteDump</a>	<a href="#">WriteLog</a>	<a href="#">WriteOutput</a>
---------------------------	--------------------------	-----------------------------

## Debugging functions

<a href="#">Trace</a>
-----------------------

## Decision functions

<a href="#">DirectoryExists</a>	<a href="#">IsDefined</a>	<a href="#">IsPDFFile</a>	<a href="#">IsXmlElem</a>
<a href="#">FileExists</a>	<a href="#">IsInstanceOf</a>	<a href="#">IsPDFObject</a>	<a href="#">IsXmlNode</a>
<a href="#">FileIsEOF</a>	<a href="#">IsJSON</a>	<a href="#">IsQuery</a>	<a href="#">IsXmlRoot</a>
<a href="#">IIf</a>	<a href="#">IsK2ServerABroker</a>	<a href="#">IsSimpleValue</a>	<a href="#">LSIsCurrency</a>
<a href="#">IsArray</a>	<a href="#">IsK2ServerDocCountExceeded</a>	<a href="#">IsStruct</a>	<a href="#">LSIsDate</a>
<a href="#">IsBinary</a>	<a href="#">IsK2ServerOnline</a>	<a href="#">IsUserInAnyRole</a>	<a href="#">LSIsNumeric</a>
<a href="#">IsBoolean</a>	<a href="#">IsLeapYear</a>	<a href="#">IsValid</a>	<a href="#">StructIsEmpty</a>
<a href="#">IsCustomFunction</a>	<a href="#">IsNumeric</a>	<a href="#">IsWDDX</a>	<a href="#">StructKeyExists</a>
<a href="#">IsDate</a>	<a href="#">IsNumericDate</a>	<a href="#">IsXML</a>	<a href="#">YesNoFormat</a>
<a href="#">IsDebugMode</a>	<a href="#">IsObject</a>	<a href="#">IsXmlAttribute</a>	
<a href="#">IsDDX</a>	<a href="#">IsNull</a>	<a href="#">IsXmlDoc</a>	

## Display and formatting functions

<a href="#">AjaxLink</a>	<a href="#">GetLocaleDisplayName</a>	<a href="#">LSIsDate</a>	<a href="#">ParagraphFormat</a>
<a href="#">AjaxOnLoad</a>	<a href="#">HTMLCodeFormat</a>	<a href="#">LSNumberFormat</a>	<a href="#">RJustify</a>
<a href="#">CJustify</a>	<a href="#">HTMLEditFormat</a>	<a href="#">LSParseCurrency</a>	<a href="#">StripCR</a>
<a href="#">DateFormat</a>	<a href="#">LJustify</a>	<a href="#">LSParseDateTime</a>	<a href="#">TimeFormat</a>
<a href="#">DecimalFormat</a>	<a href="#">LSCurrencyFormat</a>	<a href="#">LSParseEuroCurrency</a>	<a href="#">YesNoFormat</a>

			<a href="#">SpreadsheetWrite</a>

## String functions

### History-

ColdFusion MX: ColdFusion now supports the Java UCS-2 representation of Unicode character values 0–65535. (Earlier releases supported ASCII values.)

String-processing functions process any of these characters (including ASCII 0 (NUL) characters), and continue counting subsequent characters of the string, if any. (In earlier releases, some string-processing functions processed the ASCII 0 (NUL) character, but did not process subsequent characters of the string.)

<a href="#">SetLocale</a>	locale = "Spanish (Mexican)" value	ColdFusion MX. Use Spanish (Standard).

## Obsolete functions, parameters, and values

The following functions, parameters, and values are obsolete. Do not use them in ColdFusion applications. They do not work in releases later than ColdFusion 5.

Function	Parameter or value	Obsolete as of this ColdFusion release
AuthenticatedContext	All	ColdFusion MX
AuthenticatedUser	All	ColdFusion MX
isAuthenticated	All	ColdFusion MX
isAuthorized	All	ColdFusion MX
isProtected	All	ColdFusion MX

## Functions a-b

### Abs

#### Description

Absolute-value function. The absolute value of a number is the number without its sign.

#### Returns

The absolute value of a number.

#### Category

[Mathematical functions](#)

#### Function syntax

*Abs (number)*

#### See also

[Sgn](#)

#### Parameters

Parameter	Description
number	A number

#### Example

```
<h3>Abs Example</h3>
<p>The absolute value of the following numbers:
1,3,-4,-3.2,6 is
<cfoutput>
#Abs(1)#,#Abs(3)#,#Abs(-4)#,#Abs(-3.2)#,#Abs(6)#
</cfoutput>

<p>The absolute value of a number is the number without its sign.</p>
```

## ACos

### Description

Arccosine function. The arccosine is the angle whose cosine is *number*.

### Returns

The arccosine, in radians, of a number.

### Category

[Mathematical functions](#)

### Function syntax

`ACos (number)`

### See also

[Cos](#), [Sin](#), [ASin](#), [Tan](#), [Atn](#), [Pi](#)

### Parameters

Parameter	Description
number	Cosine of an angle. The value must be between -1.0 and 1.0, inclusive.

### Usage

The range of the result is 0 to  $\pi$ .

To convert degrees to radians, multiply degrees by  $\pi/180$ . To convert radians to degrees, multiply radians by  $180/\pi$ .

### Example

```
<h3>ACos Example</h3>
<!--- Output the arccosine value. --->
<cfif IsDefined("FORM.CosNum")>
    <cfif IsNumeric(FORM.CosNum)>
        <cfif Abs(FORM.CosNum) LESS THAN OR EQUAL TO 1>
            <cfoutput>ACos (#FORM.CosNum#) = #ACos(FORM.cosNum) # Radians </cfoutput>
            <br>or<br>
            <cfoutput>ACos (#FORM.CosNum#) = #ACos(FORM.cosNum) * 180/PI()#</cfoutput>
        <cfelse>
            <!--- If it is empty, output an error message. --->
            <h4>Enter a number between -1 and 1</h4>
        </cfif>
    </cfif>
</cfif>

<form method="post" action = "acos.cfm">
    <p>Enter a number to get its arccosine in Radians and Degrees.
    <br><input type = "Text" name = "cosNum" size = "25">
    <p><input type = "Submit" name = ""> <input type = "RESET">
</form>
```

## AddSOAPRequestHeader

### Description

Adds a SOAP header to a web service request before making the request.

### Returns

Nothing.

### Category

[XML functions](#)

### Function syntax

```
AddSOAPRequestHeader(webService, namespace, name, value [, mustUnderstand])
```

### See also

[AddSOAPResponseHeader](#), [GetSOAPRequest](#), [GetSOAPRequestHeader](#), [GetSOAPResponse](#), [GetSOAPResponseHeader](#), [IsSOAPRequest](#); Basic web service concepts in the *Developing ColdFusion Applications*

### History

ColdFusion MX 7: Added this function.

### Parameters

Parameter	Description
webService	A web service object as returned from the <code>cfoject</code> tag or the <code>CreateObject</code> function.
namespace	A string that is the namespace for the header.
name	A string that contains the name of the SOAP header in the request.
value	The value for the SOAP header; this can be a CFML XML value.
mustUnderstand	Optional. True or False (default). Sets the SOAP mustUnderstand value for this header.

### Usage

Used within CFML code by a consumer of a web service *before* it calls the web service.

If you pass XML in the `value` parameter, ColdFusion ignores the namespace and name parameters. If you require a namespace, define it within the XML itself.

### Example

There are two parts to this example. The first part is the web service CFC that this function (as well as the other ColdFusion SOAP functions) uses to demonstrate its interaction with a web service. To implement the web service for this function, see the example for [AddSOAPResponseHeader](#).

Execute the following example as a client to see how the `AddSOAPRequestHeader` function operates.

```
<!--- Note that you might need to modify the URL in the CreateObject function
      to match your server and the location of the headerservice.cfc file if it is
      different than shown here. Likewise for the cfinvoke tag at the end. --->

<h3>AddSOAPRequestHeader Example</h3>
<cfscript>
    // Create the web service object.
    ws = CreateObject("webservice", "http://localhost/soapheaders/headerservice.cfc?WSDL");

    // Set the username header as a string.
    addSOAPRequestHeader(ws, "http://mynamespace/", "username", "tom", false);

    // Set the password header as a CFML XML object.
    doc = XmlNew();
    doc.password = XmlElemNew(doc, "http://mynamespace/", "password");
    doc.password.XmlText = "My Voice is my Password";
    doc.password.XmlAttributes["xsi:type"] = "xsd:string";
    addSOAPRequestHeader(ws, "ignoredNameSpace", "ignoredName", doc);

    // Invoke the web service operation.
    ret = ws.echo_me("argument");

    // Get the first header as an object (string) and as XML.
    header = getSOAPResponseHeader(ws, "http://www.tomj.org/myns", "returnheader");
    XMLheader = getSOAPResponseHeader(ws, "http://www.tomj.org/myns", "returnheader", true);

    // Get the second header as an object (string) and as XML.
    header2 = getSOAPResponseHeader(ws, "http://www.tomj.org/myns", "returnheader2");
    XMLheader2 = getSOAPResponseHeader(ws, "http://www.tomj.org/myns", "returnheader2",
true);
</cfscript>
<hr>
<cfoutput>
    Soap Header value: #HTMLCodeFormat(header)#<br>
    Soap Header XML value: #HTMLCodeFormat(XMLheader)#<br>
    Soap Header 2 value: #HTMLCodeFormat(header2)#<br>
    Soap Header 2 XML value: #HTMLCodeFormat(XMLheader2)#<br>
    Return value: #HTMLCodeFormat(ret)#<br>
</cfoutput>
<hr>

<cfinvoke component="soapheaders.headerservice" method="echo_me" returnvariable="ret"
in_here="hi">
</cfinvoke>
<cfoutput>The cfinvoke tag returned: #ret#</cfoutput>
```

## AddSOAPResponseHeader

### Description

Adds a SOAP response header to a web service response. Call only from within a CFC web service function that is processing a request as a SOAP web service.

### Returns

Nothing

## Category

[XML functions](#)

## Function syntax

```
AddSOAPResponseHeader(namespace, name, value[, mustunderstand])
```

## See also

[AddSOAPRequestHeader](#), [GetSOAPRequest](#), [GetSOAPRequestHeader](#), [GetSOAPResponse](#), [GetSOAPResponseHeader](#), [IsSOAPRequest](#); Basic web service concepts in the *Developing ColdFusion Applications*

## History

ColdFusion MX 7: Added this function.

## Parameters

Parameter	Description
namespace	A string that is the namespace for the header.
name	A string that contains the name of the SOAP header in the request.
value	The value for the SOAP header; this can be a CFML XML value.
mustunderstand	Optional. True or False (default). Sets the SOAP mustunderstand value for this header.

## Usage

Call this function only from within a CFC web service function. It throws an error if it is invoked in a context that is not a web service request.

If you pass XML in the `value` parameter, ColdFusion ignores the namespace and name parameters. If you require a namespace, define it within the XML itself.

Use the `IsSOAPRequest` function to determine if the CFC is running as a web service.

## Example

This example creates a CFC web service that illustrates the operation of the `AddSOAPResponseHeader` function and also provides a web service that illustrates the operation of other ColdFusion SOAP functions.

Save the following code as `headerservice.cfc` in a folder called `soapheaders` under your web root. Test its operation, and specifically the operation of the `AddSOAPResponseHeader` function, by executing the examples that invoke this web service. For example, see the example for [AddSOAPRequestHeader](#).

```
<h3>AddSOAPResponseHeader Example</h3>
<!-- The headerservice.cfc CFC Web Service. -->
<cfcomponent displayName="tester" hint="Test for SOAP headers">
<cffunction name="echo_me"
    access="remote"
    output="false"
    returntype="string"
    displayname="Echo Test" hint="Header test">

<cfargument name="in_here" required="true" type="string">

<cfset isSOAP = isSOAPRequest()>
<cfif isSOAP>
    <!-- Get the first header as a string and as XML. -->
    <cfset username = getSOAPRequestHeader("http://mynamespace/", "username")>
    <cfset return = "The service saw username: " & username>
    <cfset xmlusername = getSOAPRequestHeader("http://mynamespace/", "username", "TRUE")>
    <cfset return = return & "<br> as XML: " & xmlusername>

    <!-- Get the second header as a string and as XML. -->
    <cfset password = getSOAPRequestHeader("http://mynamespace/", "password")>
    <cfset return = return & "The service saw password: " & password>
    <cfset xmlpassword = getSOAPRequestHeader("http://mynamespace/", "password", "TRUE")>
    <cfset return = return & "<br> as XML: " & xmlpassword>

    <!-- Add a header as a string. -->
    <cfset addSOAPResponseHeader("http://www.tomj.org/myns",
        "returnheader", "AUTHORIZED VALUE", false)>

    <!-- Add a second header using a CFML XML value. -->
    <cfset doc = XmlNew()>
    <cfset x = XmlElemNew(doc, "http://www.tomj.org/myns", "returnheader2")>
    <cfset x.XmlText = "hey man, here I am in XML">
    <cfsetx.XmlAttributes["xsi:type"] = "xsd:string">
    <cfset tmp = addSOAPResponseHeader("ignoredNameSpace", "ignoredName", x)>
<cfelse>
    <!-- Add a header as a string - Must generate error!
    <cfset addSOAPResponseHeader("http://www.tomj.org/myns",
        "returnheader", "AUTHORIZED VALUE", false)>
    -->
    <cfset return = "Not invoked as a web service">
</cfif>

<cfreturn return>
</cffunction>
</cfcomponent>
```

## AjaxLink

### Description

Causes an HTML `href` attribute to display link results in the current Ajax container. When the browser follows a link that is specified by this function, the HTTP response does not replace the current page; instead, it populates the containing `cfdiv`, `cflayoutarea`, `cfpod`, or `cfwindow` control.

### Returns

Code that causes the linked page to be displayed in the containing control.

### Category

[Display and formatting functions](#)

### Function syntax

```
AjaxLink (URL)
```

### See also

[cfdiv](#), [cflayoutarea](#), [cfpod](#), [cfwindow](#), Using Ajax User Interface Components and Features in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
URL	The URL of the link.

### Usage

This function has an effect only when it is used to specify the URL of an `href` attribute when the HTML `a` tag is inside a `cfdiv`, `cflayoutarea`, `cfpod`, or `cfwindow` control. Otherwise, the link has its normal effect.

To prevent cross-site scripting, ColdFusion does not load a remote web page.

### Example

```
<cfpod height="600" width="600" name="podTest">  
  <a href="#AjaxLink('HelloWorld.cfm')#</cfoutput>">Click me</a>  
</cfpod>
```

## AjaxOnLoad

### Description

Causes the specified JavaScript function to run when the page loads.

### Returns

This function does not return a value.

### Category

[Display and formatting functions](#)

### Function syntax

```
AjaxOnLoad (functionName)
```

**See also**

[cfdiv](#), [cflayoutarea](#), [cfpod](#), [cfwindow](#), Using Ajax User Interface Components and Features in the *Developing ColdFusion Applications*

**History**

ColdFusion 8: Added this function.

**Parameters**

Parameter	Description
functionName	The name of the function to run when the page loads. The specified function does not take a parameter.

**Usage**

This function causes a JavaScript function to run when a page loads in the browser. The JavaScript function can perform any initialization actions that are required for the page to function properly. For example, a login window might open on a page if the user is not already logged in. You can use the `AjaxOnLoad` function to specify a JavaScript function that determines the login status and opens the window only if needed.

You can use this function on top-level pages, or on pages that you dynamically include in your application by using the `source` attribute of the `cfpod` and `cfwindow` tags.

**Example**

The following example uses the `AjaxOnLoad` function to call an `init` function each time the page loads. The `init` function displays a login window.

```
<html>
<head>
<title>Enter Mail Login Details</title>

<script>
init = function() {
    ColdFusion.Window.show('loginwindow');
}
</script>
</head>

<body>
<cfwindow name="loginwindow" title="Enter Login Details"
    draggable="false" closable="false" resizable="false"
    width="450" height="200">
<cfoutput>
<form action="#cgi.script_name#" method="post" name="loginform">
    <table width="400" class="loginTable" cellpadding="5">
        <tr>
            <td style="text-align: right">mail server:</td>
            <td><input type="text" name="server"></td>
        </tr>
```

```
<tr>
  <td style="text-align: right">username:</td>
  <td><input type="text" name="username"></td>
</tr>
<tr>
  <td style="text-align: right">password:</td>
  <td><input type="password" name="password"></td>
</tr>
<tr>
  <td>&nbsp;</td>
  <td><input type="submit" name="login" value="Login"></td>
</tr>
</table>
</form>
</cfoutput>
</cfwindow>

<cfset AjaxOnLoad("init")>
</body>
</html>
```

## ApplicationStop

### Description

Stops or resets the current application. The application is restarted on the next request to the application.

### Returns

void

### Category

“[Other functions](#)” on page 694

### Function Syntax

applicationstop()

### History

Added in ColdFusion 9.

### Example

```
<!--- get artist by id --->
<cftry>
...
...
<!---stops the application to reset the artistid, if the artworks for the artist do not exist-->
<cfset applicationstop()/>
<cfset artist = EntityLoad( "artist", url.artistid, True ) />
<cfoutput>
<h2>#artist.getFullName()#</h2>
<table width="400">
  <tr>
    <th>Item</th>
    <th>Price</th>
    <th>Sold</th>
  </tr>
  <cfloop array="#artist.getArt()" index="index">
    <tr>
      <td>#index.getArtName()#</td>
      <td>#index.getPrice()#</td>
      <td>#index.getIsSold()#</td>
    </tr>
  </cfloop>
</table>
<p><a href="index.cfm">View list</a></p>
</cfoutput>
  <cfcatch type = "any">
    <cfoutput>Artworks for the selected artists are not available</cfoutput>
  </cfcatch>
</cftry>
```

## ArrayAppend

### Description

Appends an array element to an array.

### Returns

True, on successful completion.

### Category

[Array functions](#)

### Function syntax

```
ArrayAppend(array, value)
```

### See also

[ArrayPrepend](#); Adding elements to an array in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

### Parameters

Parameter	Description
array	Name of an array
value	Value to add at end of array

### Example

```
<h3>ArrayAppend Example</h3>
<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
    SELECT FirstName, LastName FROM Employees
</cfquery>
<!--- Create an array> --->
<cfset myArray = ArrayNew(1)>
<!--- Set element one to show where we are. --->
<cfset myArray[1] = "Test Value">
<!--- Loop through the query; append these names successively to the last
      element. --->
<cfloop query = "GetEmployeeNames">
    <cfoutput>#ArrayAppend(myArray, "#FirstName# #LastName#")#
    </cfoutput>, Array was appended<br>
</cfloop>
<!--- Show the resulting array as a list. --->
<cfset myList = ArrayToList(myArray, ",")>
<!--- Output the array as a list. --->
<cfoutput>
    <p>The contents of the array are as follows:</p>
    <p>#myList#</p>
</cfoutput>
```

## ArrayAvg

### Description

Calculates the average of the values in an array.

### Returns

Number. If the array parameter value is an empty array, returns zero.

### Category

[Array functions](#), [Mathematical functions](#)

### Function syntax

```
ArrayAvg(array)
```

### See also

[ArraySum](#); Basic array techniques in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
array	Name of an array

## Usage

The following example uses the ColdFusion built-in variable `Form.fieldNames`, which is available on the action page of a form. It contains a comma-delimited list of the names of the fields on the form.

## Example

```
<!--- This example shows the use of ArrayAvg. --->
<!-- The following lines of code keep track of the form fields that can
be dynamically generated on the screen. It uses the Fieldnames variable
with the ListLen function to determine the number of fields on the form. --->
<cfset FormElem = 2>
    <cfif Isdefined("Form.Submit")>
        <cfif Form.Submit is "More">
            <cfset FormElem = ListLen(Form.Fieldnames)>
        </cfif>
    </cfif>

<html>
<head>
<title>ArrayAvg Example</title>
</head>
<body>
<h3>ArrayAvg Example</h3>
<p> This example uses ArrayAvg to find the average of the numbers that you enter
into an array.<br>
To enter more than two numbers click the <b>more</b> button.
</p>
<form action = "arrayavg.cfm">
<!--- The following code initially creates two fields. It adds fields if the
user presses MORE. FormElem is initialized to two at the beginning of this
code to show that the form has two fields. ----->
<input type = "submit" name = "submit" value = "more">
<table cellpadding = "2" cellspacing = "2" border = "0">
<cfloop index = "LoopItem" from = "1" to = "#FormElem#">
    <tr>
        <cfoutput>
            <th align = "left">Number #LoopItem#</th>
            <td><input type = "text" name = "number#LoopItem#"></td>
        </cfoutput>
    </tr>
</cfloop>
</table>
<input type = "submit" name = "submit" value = "get the average">
</form>

<!--- Create an array. --->
<cfif IsDefined("FORM.submit")>
```

```
<cfset myNumberArray = ArrayNew(1)>
<cfset Count = 1>
<cfloop index = "ListItem" list = "#Form.Fieldnames#">
    <cfif Left(ListItem,3) is "Num">
        <cfset myNumberArray[Count] = Val("number#Count#")>
        <cfset count = IncrementValue(Count)>
    </cfif>
</cfloop>

<cfif Form.Submit is "get the average">
    <!-- use ArrayAvg to get the average of the two numbers --->
    <p>The average of the numbers that you entered is
    <cfoutput>#ArrayAvg(myNumberArray)#.</cfoutput>
<cfelse>
    <cfoutput>Try again. You must enter at least two numeric values.
    </cfoutput>
</cfif>
</cfif>
</body>
</html>
```

## ArrayClear

### Description

Deletes the data in an array.

### Returns

True, on successful completion.

### Category

[Array functions](#)

### Function syntax

```
ArrayClear(array)
```

### See also

[ArrayDeleteAt](#); Functions for XML object management in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed behavior: This function can be used on XML objects.

### Parameters

Parameter	Description
array	Name of an array

### Example

```
<h3>ArrayClear Example</h3>
<!--- Create a new array. --->
<cfset MyArray = ArrayNew(1)>
<!--- Populate an element or two. --->
<cfset MyArray[1] = "Test">
<cfset MyArray[2] = "Other Test">
<!--- Output the contents of the array. --->
<p>Your array contents are:
<cfoutput>#ArrayToList(MyArray)#</cfoutput>
<!--- Check to see if the array is empty. --->
<p>Is the array empty?:
<cfoutput>#ArrayIsEmpty(MyArray)#</cfoutput>
<p>Now, clear the array:
<!--- Now clear the array. --->
<cfset Temp = ArrayClear(MyArray)>
<!--- Check to see if the array is empty. --->
<p>Is the array empty?:
<cfoutput>#ArrayIsEmpty(MyArray)#</cfoutput>
```

## ArrayContains

### Description

Searches an array for the presence of a specified object. The function searches simple objects such as strings and numbers or complex objects such as structures. String searches are case-sensitive. This function does not support searches for COM and CORBA objects.

### Returns

Yes, if the specified object exists in the array.

### Category

[Array functions](#)

### Function Syntax

```
#ArrayContains(array,object)
```

### See Also

[ArrayFind](#), [ArrayFindNoCase](#)

### Parameters

Parameter	Description
array	Name of the array.
object	Object to search

### Example

```
<h3>ArrayContains Example</h3>
<h3>2-dimensional array example</h3>
<!--Creating a 2-dimensional array- ->

<cfset dayarray = ArrayNew(2)>
<cfset dayarray[1][1] = "Sunday">
<cfset dayarray[1][2] = "Monday">
<cfset dayarray[1][3] = "Tuesday">
<cfset dayarray[2][1] = "Wednesday">
<cfset dayarray[2][2] = "Thursday">
<cfset dayarray[2][3] = "Friday">

<cfoutput>
  <p>Array contains</p>
  #dayarray[1][1]#, #dayarray[1][2]#, #dayarray[1][3]#, #dayarray[2][1]#,
  #dayarray[2][2]#, #dayarray[2][3]#
  <p>Checking value in the array</p>
  #ArrayContains(dayarray[1], "Tuesday")#</cfoutput>
<!--Creating a one-dimensional array-->
<h3>1-dimensional array example</h3>
<cfset montharray = ArrayNew(1)>
<cfset montharray[1] = "April">
<cfset montharray[2] = "July">
<cfset montharray[3] = "October">
<cfset montharray[4] = "December">
<p>Checking if value exists</p>
<cfoutput>
  #ArrayContains(montharray, "December")#
</cfoutput>
```

## ArrayDelete

### Description

Deletes an element from an array. It does not support COM and CORBA objects.

### Returns

Yes, on successful deletion of the array element.

### Category

[Array functions](#)

### Function syntax

ArrayDelete(array, object)

### See Also

[ArrayDeleteAt](#), [ArrayClear](#)

### Parameters

Parameter	Description
array	Name of the array
object	Object to be deleted

### Example

```
<cfset MyNewArray=ArrayNew(1)>
<cfloop index="i" from="1" to="20" step="1">
<cfset MyNewArray[i] = i*5>
</cfloop>
<cfloop index="i" from="1" to="20" step="1">
<cfoutput># MyNewArray[i] # ,</cfoutput>
</cfloop>
<cfoutput>
<br />
Checkvalue 25:#ArrayContains(MyNewArray,"25")#<br />
Delete value 25:#ArrayDelete(MyNewArray,"25")#<br />
Checkvalue 25:#ArrayContains(MyNewArray,"25")#<br />
</cfoutput>
```

## ArrayDeleteAt

### Description

Deletes an element from a specified position in an array.

When an element is deleted, ColdFusion recalculates index positions. For example, in an array that contains the months of the year, deleting the element at position 5 removes the entry for May. After this, to delete the entry for June, you would delete the element at position 5 (not 6).

### Returns

True, on successful completion.

### Category

[Array functions](#)

### Function syntax

```
ArrayDeleteAt(array, position)
```

### See also

[ArrayInsertAt](#); Functions for XML object management in the *Developing ColdFusion Applications*

### History

ColdFusion MX:

- Changed behavior: This function can be used on XML objects.
- Changed thrown exceptions: This function can throw the `InvalidArrayIndexException` error.

### Function syntax

`ArrayFind(array, object)`

### See Also

[ArrayFindNoCase](#)

### Parameters

Parameter	Description
array	Name of an array
object	Object to search

### Example

```
<cfoutput>
    #ArrayFind(MyArray, 2) #
</cfoutput>
```

## ArrayFindNoCase

### Description

This function performs a case-insensitive search on an array for a specified object. The function can search for simple objects such as strings or numbers and complex objects such as structures. It does not support COM and CORBA objects.

### Returns

Index in the array of the first match, or 0, if there is no match.

### Category

[Array functions](#)

### Function syntax

`ArrayFindNoCase(array, object)`

### See Also

[ArrayFind](#)

### Parameters

Parameter	Description
array	Name of an array
object	Object to search

### Example

```
<cfoutput>
    #ArrayFindNoCase(MyArray, 2) #
</cfoutput>
```

## ArrayInsertAt

### Description

Inserts a value into an array. Array elements whose indexes are equal to or greater than the new position are incremented by one. The array length increases by one.

### Returns

True, on successful completion.

### Category

[Array functions](#)

### Function syntax

```
ArrayInsertAt(array, position, value)
```

### See also

[ArrayDeleteAt](#); Functions for XML object management in the *Developing ColdFusion Applications*

### History

ColdFusion MX:

- Changed behavior: This function can be used on XML objects.
- Changed thrown exceptions: This function can throw the `InvalidArrayIndexException` error.

### Parameters

Parameter	Description
array	Name of an array
position	Index position at which to insert value
value	Value to insert

### Usage

To apply the `ArrayInsertAt()` function to a multidimensional array, you must specify all but the last index in the `array` parameter. The following example inserts an element at `myarray[2][4]`:

```
<cfset ArrayInsertAt(myarray[2], 4, "test")>
```

### Throws

If this function attempts to insert an element at position 0, or specifies a value for `position` that is greater than the size of `array`, this function throws an `InvalidArrayIndexException` error.

### Example

```
<h3>ArrayInsertAt Example</h3><p>
<!-- Create a new array. -->
<cfset DaysArray = ArrayNew(1)>
<!-- Populate an element or two. -->
<cfset DaysArray[1] = "Monday">
<cfset DaysArray[2] = "Tuesday">
<cfset DaysArray[3] = "Thursday">
<!-- Add an element before position 3. -->
<p>Add an element before position 3:
    <cfoutput>#ArrayInsertAt(DaysArray,3,"Wednesday")#</cfoutput>
<p>Now output the array as a list:
<cfoutput>#ArrayToList(DaysArray)#</cfoutput>
<!-- The array now has four elements. Element 3, "Thursday", has become element four. -->
```

## ArrayIsDefined

### Description

Determines whether an array element is defined.

### Returns

True, if the array element is defined (exists); false, otherwise.

### Category

[Array functions](#)

### Function syntax

```
ArrayIsDefined(array, elementIndex)
```

### See also

[ArrayIsEmpty](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
array	Name of a one-dimensional array, or the array name and indexes into higher-order dimensions of a multidimensional array.
elementIndex	Index of the element in a one-dimensional array, or the index of the element in the final dimension of a multidimensional array.

### Usage

The index value of an element must be less than the length of the array.

To test the existence of an element in a multidimensional array, specify all but the last dimension of the array in the first parameter. For example, the following line tests the existence of element `MyArray[2][4][1]`:

```
ArrayIsDefined(MyArray[2][4], 1)
```

### Example

```
<h3>ArrayIsDefined Example</h3>
<!--- Create a sparse new array. --->
<cfset MyArray = ArrayNew(1)>
<!--- Populate an element or two. --->
<cfset MyArray[1] = "Test">
<cfset MyArray[3] = "Other Test">

<cfoutput>
  <!--- Display the contents of the array. --->
  <p>Your array contents are:
  <cfdump var="#MyArray#"></p>

  <!--- Check if an existing element is defined. --->
  <p>Does element 3 exist?:&nbsp;
  #ArrayIsDefined(MyArray, 3)#</p>

  <!--- Check if a non-existent element is defined. --->
  <p>Does element 2 exist?:&nbsp;
  #ArrayIsDefined(MyArray, 2)#
</cfoutput>
```

## ArrayIsEmpty

### Description

Determines whether an array is empty of data elements.

### Returns

True, if the array is empty; False, otherwise.

### Category

[Array functions](#)

### Function syntax

```
ArrayIsEmpty(array)
```

### See also

[ArrayIsDefined](#), [ArrayLen](#), Functions for XML object management in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

### Parameters

Parameter	Description
array	Name of an array

### Usage

You can test whether an element of a higher level dimension of a multidimensional array is empty by specifying the element in the `ArrayIsEmpty` function. To test whether the first row of the two-dimensional array `MyArray` is empty, use the following function:

```
ArrayIsEmpty(MyArray2[1])
```

### Example

```
<h3>ArrayIsEmpty Example</h3>
<!-- Create a new array. -->
<cfset MyArray = ArrayNew(1)>
<!-- Populate an element or two. -->
<cfset MyArray[1] = "Test">
<cfset MyArray[2] = "Other Test">
<!-- Output the contents of the array. -->
<p>Your array contents are:
<cfoutput>#ArrayToList(MyArray) #</cfoutput>
<!-- Check to see if the array is empty. -->
<p>Is the array empty?:
<cfoutput>#ArrayIsEmpty(MyArray) #</cfoutput>
<p>Now, clear the array:
<!-- Now clear the array. -->
<cfset Temp = ArrayClear(MyArray)>
<!-- Check to see if the array is empty. -->
<p>Is the array empty?:
<cfoutput>#ArrayIsEmpty(MyArray) #</cfoutput>
```

## ArrayLen

### Description

Determines the number of elements in an array.

### Returns

The number of elements in an array.

### Category

[Array functions](#)

### Function syntax

```
ArrayLen(array)
```

### See also

[ArrayIsEmpty](#); Functions for XML object management in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed behavior: This function can be used on child XML objects.

### Parameters

Parameter	Description
array	Name of an array

### Example

```
<h3>ArrayLen Example</h3>
<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
    SELECT FirstName, LastName FROM Employees
</cfquery>
<!--- Create an array. --->
<cfset myArray = ArrayNew(1)>
<!--- Set element one to show where we are. --->
<cfset myArray[1] = "Test Value">
<!--- Loop through the query and append these names
    successively to the last element. --->
<cfloop query = "GetEmployeeNames">
    <cfset temp = ArrayAppend(myArray, "#FirstName# #LastName#")>
</cfloop>
<!--- Show the resulting array as a list. --->
<cfset myList = ArrayToList(myArray, ",")>
<!--- Output the array as a list. --->
<cfoutput>
    <p>The contents of the array are as follows:</p>
    <p>#myList#</p>
    <p>This array has #ArrayLen(MyArray)# elements.</p>
</cfoutput>
```

## ArrayMax

### Description

Array maximum function.

### Returns

The largest numeric value in an array. If the array parameter value is an empty array, returns zero.

### Category

[Array functions](#)

### Function syntax

```
ArrayMax(array)
```

### Parameters

Parameter	Description
array	Name of an array

### Example

```
<h3>ArrayMax Example</h3>
<p>This example uses ArrayMax to find the largest number in an array.<br> </p>
<!-- After checking whether the form has been submitted, the code creates an array
      and assigns the form fields to the first two elements in the array. ---->
<cfif IsDefined("FORM.submit")>
    <cfset myNumberArray = ArrayNew(1)>
    <cfset myNumberArray[1] = number1>
    <cfset myNumberArray[2] = number2>
    <cfif Form.Submit is "Maximum Value">
        <!-- Use ArrayMax to find the largest number in the array. --->
        <p>The largest number that you entered is
        <cfoutput>#ArrayMax(myNumberArray)#.</cfoutput>
    </cfif>
</cfif>
<!-- The following form provides two numeric fields that are compared when the
      form is submitted. --->
<form action = "arraymax.cfm">
    <input type = "hidden" name = "number1_Float">
    <input type = "hidden" name = "number2_Float">
    <input type = "text" name = "number1"><br>
    <input type = "text" name = "number2"><br>
    <input type = "submit" name = "submit" value = "Maximum Value">
</form>
```

## ArrayMin

### Description

Array minimum function.

### Returns

The smallest numeric value in an array. If the array parameter value is an empty array, returns zero.

### Category

[Array functions](#)

### Function syntax

```
ArrayMin(array)
```

### Parameters

Parameter	Description
array	Name of an array

### Example

```
<h3>ArrayMin Example</h3>
<p>This example uses ArrayMin to find the smallest number in an array.<br></p>
<!-- After checking whether the form has been submitted, this code creates an
      array and assigns the form fields to the first two elements. ----->
<cfif IsDefined("FORM.submit")>
    <cfset myNumberArray = ArrayNew(1)>
    <cfset myNumberArray[1] = FORM.number1>
    <cfset myNumberArray[2] = FORM.number2>
    <cfif Form.Submit is "Minimum Value">
        <!-- Use ArrayMin to find the smallest number in the array. --->
        <p>The smallest number that you entered is
        <cfoutput>#ArrayMin(myNumberArray)#.</cfoutput>
    </cfif>
</cfif>
<!-- The following form provides two numeric fields that are compared when the form is
      submitted. ----->
<form action = "arraymin.cfm">
    <input type = "hidden" name = "number1_Float">
    <input type = "hidden" name = "number2_Float">
    <input type = "text" name = "number1"><br>
    <input type = "text" name = "number2"><br>
    <input type = "submit" name = "submit" value = "Minimum Value">
</form>
```

## ArrayNew

### Description

Creates an array of 1–3 dimensions. Index array elements with square brackets: [ ].

ColdFusion arrays expand dynamically as data is added.

### Returns

An array

### Category

[Array functions](#)

### Function syntax

`ArrayNew(dimension)`

### Parameters

Parameter	Description
dimension	Number of dimensions in new array: 1, 2, or 3

### Example

```
<h3>ArrayNew Example</h3>
<!--- Create an array. --->
<cfset MyNewArray = ArrayNew(1)>
<!--- ArrayToList does not function properly if the Array is not initialized with
      ArraySet --->
<cfset temp = ArraySet(MyNewArray, 1,6, "")>

<!--- Set some elements. --->
<cfset MyNewArray[1] = "Sample Value">
<cfset MyNewArray[3] = "43">
<cfset MyNewArray[6] = "Another Value">

<!--- Is it an array? --->
<cfoutput>
    <p>Is this an array? #isArray(MyNewArray)#</p>
    <p>It has #ArrayLen(MyNewArray)# elements.</p>
    <p>Contents: #ArrayToList(MyNewArray)#</p>
<!--- The array has expanded dynamically to six elements with the use of ArraySet,
      even though we only set three values. --->
</cfoutput>
```

## ArrayPrepend

### Description

Inserts an array element at the beginning of an array.

### Returns

True, on successful completion.

### Category

[Array functions](#)

### Function syntax

```
ArrayPrepend(array, value)
```

### See also

[ArrayAppend](#); Adding elements to an array in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
array	Name of an array
value	Value to insert at beginning of array

### Example

```
<h3>ArrayPrepend Example</h3>
<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
    SELECT FirstName, LastName FROM Employees
</cfquery>
<!--- Create an array. --->
<cfset myArray = ArrayNew(1)>
<!--- Set element one to show where we are. --->
<cfset myArray[1] = "Test Value">
<!--- Loop through query. Append names successively before last element.
      (The list reverses itself from the standard queried output, because it keeps
      prepending the array entry.) --->
<cfloop query = "GetEmployeeNames">
    <cfoutput>#ArrayPrepend(myArray, "#FirstName# #LastName#")#
    </cfoutput>, Array was prepended<br>
</cfloop>
<!--- Show the resulting array as a list. --->
<cfset myList = ArrayToList(myArray, ",")>
<!--- Output the array as a list. --->
<cfoutput>
    <p>The contents of the array are as follows:
    <p>#myList#
</cfoutput>
```

## ArrayResize

### Description

Resets an array to a specified minimum number of elements. Resetting can improve performance, if used to size an array to its expected maximum. For more than 500 elements, use `ArrayResize` immediately after using the `ArrayNew` tag.

ColdFusion arrays expand dynamically as data is added.

### Returns

True, on successful completion.

### Category

[Array functions](#)

### Function syntax

```
ArrayResize(array, minimum_size)
```

### Parameters

Parameter	Description
array	Name of an array
minimum_size	Minimum array size

### Example

```
<h3>ArrayResize Example</h3>
<!--- Perform a query to get the list. --->
<cfquery name = "GetCourses" datasource = "cfdocexamples">
    SELECT * FROM Courses
</cfquery>
<!--- Create a new array. --->
<cfset MyArray = ArrayNew(1)>
<!--- Resize that array to the number of records in the query. --->
<cfset temp = ArrayResize(MyArray, GetCourses.RecordCount)>
<cfoutput>
    The array is now #ArrayLen(MyArray)# elements, to match
    the query of #GetCourses.RecordCount# records.
</cfoutput>
```

## ArraySet

### Description

In a one-dimensional array, sets the elements in a specified index range to a value. Useful for initializing an array after a call to [ArrayNew](#).

### Returns

True, on successful completion.

### Category

[Array functions](#)

### Function syntax

```
ArraySet(array, start_pos, end_pos, value)
```

### See also

[ArrayNew](#); Populating arrays with data in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed behavior: This function can be used on XML objects.

### Parameters

Parameter	Description
array	Name of an array.
start_pos	Starting index position of range to set.
end_pos	Ending index position of range to set. If this value is greater than array length, ColdFusion adds elements to array.
value	Value to which to set each element in the range.

### Example

```
<h3>ArraySet Example</h3>

<!-- Create an array. -->
<cfset MyNewArray = ArrayNew(1)>
<!-- ArrayToList does not function properly if the Array has not been initialized
    with ArraySet. -->
<cfset temp = ArraySet(MyNewArray, 1,6, "Initial Value")>

<!-- Set some elements. -->
<cfset MyNewArray[1] = "Sample Value">
<cfset MyNewArray[3] = "43">
<cfset MyNewArray[6] = "Another Value">
...
```

## ArraySort

### Description

Sorts array elements numerically or alphanumerically.

### Returns

True, if sort is successful; False, otherwise.

### Category

[Array functions](#), [List functions](#)

### Function syntax

```
ArraySort(array, sort_type[, sort_order])
```

### History

ColdFusion MX:

- Changed thrown exceptions: This function can throw the `ArraySortSimpleValueException` error and `ValueNotNumeric` error.
- Changed the order in which sorted elements are returned: In a `textnocase`, descending sort, this function might return elements in a different sort order than in earlier releases. If `sort_type = "textnocase"` and `sort_order = "desc"`, ColdFusion processes elements that *differ only in case* differently from earlier releases, as follows:
  - ColdFusion reverses the elements' original order.
  - Releases earlier than ColdFusion MX do not change the elements' original order.

For example, in a `textnocase`, `desc` sort of `d, a, a, b, A`, the following occurs:

- ColdFusion MX and later returns `d, b, A, a, a`
- Releases earlier than ColdFusion MX return `d, b, a, a, A`

### Parameters

Parameter	Description
array	Name of an array
sort_type	<ul style="list-style-type: none"><li>• numeric: sorts numbers</li><li>• text: sorts text alphabetically, taking case into account (also known as case sensitive). All letters of one case precede the first letter of the other case:<ul style="list-style-type: none"><li>- aabzABZ, if sort_order = "asc" (ascending sort)</li><li>- ZBAzbaa, if sort_order = "desc" (descending sort)</li></ul></li><li>• textnocase: sorts text alphabetically, without regard to case (also known as case-insensitive). A letter in varying cases precedes the next letter:<ul style="list-style-type: none"><li>- aAaBbBzzZ, in an ascending sort; preserves original intra-letter order</li><li>- ZzzBbBaAa, in a descending sort; reverses original intra-letter order</li></ul></li></ul>
sort_order	<ul style="list-style-type: none"><li>• asc - ascending sort order. Default.<ul style="list-style-type: none"><li>- aabzABZ or aAaBbBzzZ, depending on value of sort_type, for letters</li><li>- from smaller to larger, for numbers</li></ul></li><li>• desc - descending sort order.<ul style="list-style-type: none"><li>- ZBAzbaa or ZzzBbBaAa, depending on value of sort_type, for letters</li><li>- from larger to smaller, for numbers</li></ul></li></ul>

### Throws

If an array element is something other than a simple element, this function throws an `ArraySortSimpleValueException` error. If `sort_type` is numeric and an array element is not numeric, this function throws a `ValueNotNumeric` error.

### Example

```
<!--- This example shows ArraySort. --->
<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
    SELECT FirstName, LastName FROM Employees
</cfquery>
<!--- Create an array. --->
<cfset myArray = ArrayNew(1)>
<!--- Loop through the query and append these names successively to the last element. --->
<cfloop query = "GetEmployeeNames">
    <cfset temp = ArrayAppend(myArray, "#FirstName# #LastName#")>
</cfloop>
<!--- Show the resulting array as a list. --->
<cfset myList = ArrayToList(myArray, ",")>
<!--- Sort that array in descending order alphabetically. --->
<cfset isSuccessful = ArraySort(myArray, "textnocase", "desc">
...
```

## ArraySum

### Description

Array sum function.

**Returns**

The sum of values in an array. If the array parameter value is an empty array, returns zero.

**Category**

[Array functions](#), [Mathematical functions](#)

**Function syntax**

`ArraySum(array)`

**Parameters**

Parameter	Description
array	Name of an array

**Example**

```
<h3>ArraySum Example</h3>
<p>This example uses ArraySum to add two numbers.<br> </p>
<!-- After checking whether the form has been submitted, the code creates
      an array and assigns the form fields to the first two elements in the array. -->
<cfif IsDefined("FORM.submit")>
    <cfset myNumberArray = ArrayNew(1)>
    <cfset myNumberArray[1] = number1>
    <cfset myNumberArray[2] = number2>

    <cfif Form.Submit is "Add">
        <!-- Use ArraySum to add the number in the array. -->
        <p>The sum of the numbers is
        <cfoutput>#ArraySum(myNumberArray)#.</cfoutput>
    </cfif>
</cfif>
<!-- This form provides two numeric fields that are added when the form is submitted. -->
<form action = "arraysum.cfm" method="post">
    <input type = "hidden" name = "number1_Float">
    <input type = "hidden" name = "number2_Float">
    <input type = "text" name = "number1">
    <br>
    <input type = "text" name = "number2">
    <br>
    <input type = "submit" name = "submit" value = "Add">
</form>
```

## ArraySwap

**Description**

Swaps array values of an array at specified positions. This function is more efficient than multiple `cfset` tags.

**Returns**

True, on successful completion.

**Category**

[Array functions](#)

### Function syntax

```
ArraySwap(array, position1, position2)
```

### See also

Functions for XML object management in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
array	Name of an array
position1	Position of first element to swap
position2	Position of second element to swap

### Example

```
<h3>ArraySwap Example</h3>

<cfset month = ArrayNew(1)>
<cfset month[1] = "February">
<cfset month[2] = "January">
<cfset temp = ArraySwap(month, 1, 2)>
<cfset temp = ArrayToList(month)>

<p>Show the results: <cfoutput>#temp#</cfoutput>
```

## ArrayToList

### Description

Converts a one-dimensional array to a list.

### Returns

Delimited list, as a string.

### Category

[Array functions](#), [Conversion functions](#), [List functions](#)

### Function syntax

```
ArrayToList(array[, delimiter])
```

### Parameters

Parameter	Description
array	Name of array
delimiter	Character or multicharacter string to separate list elements. The default value is comma.

### Example

```
<h3>ArrayToList Example</h3>

<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
    SELECT FirstName, LastName FROM Employees
</cfquery>

<!--- Create an array. --->
<cfset myArray = ArrayNew(1)>

<!--- Loop through the query, append names successively to the last element. --->
<cfloop query = "GetEmployeeNames">
    <cfset temp = ArrayAppend(myArray, "#FirstName# #LastName#")>
</cfloop>

<!--- Show the resulting array as a list. --->
<cfset myList = ArrayToList(myArray, ",")>

<!--- Sort that array in descending order alphabetically. --->
<cfset myAlphaArray = ArraySort(myArray, "textnocase", "desc")>

<!--- Show the resulting alphabetized array as a list. --->
<cfset myAlphaList = ArrayToList(myArray, ",")>

<!--- Output the array as a list. --->
<cfoutput>
    <p>The contents of the array are as follows:
    <p>#myList#
    <p>This array, alphabetized by first name (descending):
    <p>#myAlphaList#
    <p>This array has #ArrayLen(MyArray)# elements.
</cfoutput>
```

## Asc

### Description

Determines the value of a character.

### Returns

The value of the first character of a string; if the string is empty, returns zero.

### Category

[String functions](#)

### Function syntax

*Asc(string)*

### See also

[Chr](#)

## History

ColdFusion MX: Changed Unicode support: ColdFusion supports the Java UCS-2 representation of Unicode characters, up to a value of 65536. (Earlier releases supported 1-255.)

## Parameters

Parameter	Description
string	A string

## Example

```
<h3>Asc Example</h3>
<!-- If the character string is not empty, output its ASCII value. -->
<cfif IsDefined("FORM.charVals")>

    <cfif FORM.charVals is not "">
        <cfoutput>#Left(FORM.charVals,1)# =
        #Asc(FORM.charVals)#</cfoutput>
    <cfelse>
<!-- If it is empty, output an error message. -->
        <h4>Enter a character</h4>
    </cfif>
</cfif>

<form action = "asc.cfm" method=post>
    <p>Enter a character to see its ASCII value
    <br><input type = "Text" name = "CharVals" size = "1" maxlength = "1"></p>
    <p><input type = "Submit" name = ""> <input type = "RESET"></p>
</form>
```

# ASin

## Description

Determines the arcsine of a number. The arcsine is the angle whose sine is *number*.

## Returns

The arcsine, in radians, of a number.

## Category

[Mathematical functions](#)

## Function syntax

ASin(*number*)

## See also

[Sin](#), [Cos](#), [ACos](#), [Tan](#), [Atn](#), [Pi](#)

### Parameters

Parameter	Description
number	Sine of an angle. The value must be between -1 and 1, inclusive.

### Usage

The range of the result is  $-p/2$  to  $p/2$  radians. To convert degrees to radians, multiply degrees by  $p/180$ . To convert radians to degrees, multiply radians by  $180/p$ .

### Example

```
<h3>ASin Example</h3>
<!-- Output its arcsine value. -->
<cfif IsDefined("FORM.SinNum")>
    <cfif IsNumeric(FORM.SinNum)>
        <cfif FORM.SinNum LESS THAN OR EQUAL TO 1>
            <cfif FORM.SinNum GREATER THAN OR EQUAL TO -1>
                ASin(<cfoutput>#FORM.SinNum#</cfoutput>) =
                <cfoutput>#ASin(FORM.sinNum)# Radians</cfoutput>
                <br> or <br>ASin(<cfoutput>#FORM.SinNum#</cfoutput>) =
                <cfoutput>
                    #ASin(FORM.sinNum) * 180/Pi()# Degrees
                </cfoutput>
            <cfelse>
<!-- If it is less than negative one, output an error message. -->
                <h4>Enter the sine of the angle to calculate, in degrees and radians.
                The value must be between 1 and -1, inclusive.</h4>
            </cfif>
        <cfelse>
<!-- If it is greater than one, output an error message. -->
                <h4>Enter the sine of the angle to calculate, in degrees and radians. The
                value must be between 1 and -1, inclusive.</h4>
            </cfif>
        <cfelse>
<!-- If it is empty, output an error message. -->
                <h4>Enter the sine of the angle to calculate, in degrees and radians. The
                value must be between 1 and -1,inclusive.</h4>
            </cfif>
        </cfif>
    </cfif>
    <form action = "./evaltest.cfm" method="post">
    <p>Enter a number to get its arcsine in Radians and Degrees.

    <p><input type = "Submit" name = ""> <input type = "RESET">
    </form>
```

## Atn

### Description

Arctangent function. The arctangent is the angle whose tangent is *number*.

### Returns

The arctangent, in radians, of a number.

## Category

[Mathematical functions](#)

## Function syntax

`Atn(number)`

## See also

[Sin](#), [ASin](#), [Cos](#), [ACos](#), [Pi](#)

## Parameters

Parameter	Description
number	Tangent of an angle

## Usage

The range of the result is -p/2 to p/2 radians. To convert degrees to radians, multiply degrees by p/180. To convert radians to degrees, multiply radians by 180/p.

## Example

```
<h3>Atn Example</h3>
<!-- Output its Atn value. -->
<cfif IsDefined("FORM.AtnNum")>
    <cfif IsNumeric(FORM.AtnNum)>
        Atn(<cfoutput>#FORM.AtnNum#</cfoutput>) is
        <cfoutput>#Atn(FORM.AtnNum)# radians is #Atn(FORM.AtnNum * 180/PI())# Degrees</cfoutput>
    <cfelse>
<!-- If it is empty, output an error message. -->
        <h4>Enter a number</h4>
    </cfif>
</cfif>
<form action = "evaltest.cfm" method="post">
    <p>Enter a number to get its arctangent in Radians and Degrees
    <br><input type = "Text" name = "atnNum" size = "25"></p>
    <p><input type = "Submit" name = ""> <input type = "RESET"></p>
</form>
```

## AuthenticatedContext

### Description

This function is obsolete. Use the newer security tools; see “[Conversion functions](#)” on page 689 and *Securing Applications in the Developing ColdFusion Applications*.

### History

ColdFusion MX: This function is obsolete. It does not work in ColdFusion MX and later ColdFusion releases.

## AuthenticatedUser

### Description

This function is obsolete. Use the newer security tools; see “[Conversion functions](#)” on page 689 and *Securing Applications in the Developing ColdFusion Applications*.

### History

ColdFusion MX: This function is obsolete. It does not work in ColdFusion MX and later ColdFusion releases.

## BinaryDecode

### Description

Converts a string to a binary object. Used to convert binary data that has been encoded into string format back into binary data.

### Returns

A binary object.

### Category

[Conversion functions](#), [String functions](#)

### Function syntax

```
BinaryDecode(string, binaryencoding)
```

### See also

[BinaryEncode](#), [CharsetEncode](#), [CharsetDecode](#)

### History

ColdFusion MX 7: Added this function.

### Parameters

Parameter	Description
string	A string containing encoded binary data.
binaryencoding	A string that specifies the algorithm used to encode the original binary data into a string; must be one of the following: <ul style="list-style-type: none"><li>Hex: the characters 0-9 and A-F represent the hexadecimal value of each byte; for example, 3A.</li><li>UU: data is encoded using the UNIX UUencode algorithm.</li><li>Base64: data is encoded using the Base64 algorithm, as specified by IETF RFC 2045, at <a href="http://www.ietf.org/rfc/rfc2045.txt">www.ietf.org/rfc/rfc2045.txt</a>.</li></ul>

### Usage

Use this function to convert a binary-encoded string representation of binary data back to a binary object for use in your application. Binary data is often encoded as a string for transmission over many Internet protocols, such as HTTP and SMTP, or for storage in a database.

Adobe recommends that you use the `BinaryDecode` function, not the `ToBinary(base64data)` function, to convert Base64-encoded data to binary data in all new applications.

See the following pages for additional information on handling binary data:

- [cffile](#) for loading and reading binary data in files
- [cfwddx](#) for serializing and deserializing binary data
- [IsBinary](#) for checking variables for binary format
- [Len](#) for determining the length of a binary object

### Example

The following example reads a GIF file as binary data, converts it to a binary-encoded string, converts the binary-encoded data back to binary data and writes the result to a file. It displays the encoded string and the image in the output file.

```
<h3>Binary Encoding Conversion Example</h3>

<!-- Do the following if the form has been submitted. -->
<cfif IsDefined("Form.binEncoding")>

    <!-- Read in a binary data file. -->
    <cffile action="readbinary" file="C:\images\help.gif" variable="binimage">

    <!-- Convert the read data to binary encoding and back to binary data. -->
    <cfscript>
        binencode=BinaryEncode(binimage, Form.binEncoding);
        bindecode=BinaryDecode(binencode, Form.binEncoding);
    </cfscript>

    <!--Write the converted results to a file. -->
    <cffile action="write" file="C:\temp\help.gif" output="#bindecode#" addnewline="No" >

    <!-- Display the results. -->
    <cfoutput>
        <p><b>The binary encoding:</b> #Form.binEncoding#</p>

        <p><b>The image converted into a binary-encoded string by BinaryEncode
        </b><br>
        #binencode#</p>
        <p><b>The image as written back to a file after converting back to binary
        using BinaryDecode</b><br>
        <br>
    </cfoutput>
</cfif>

<!-- The input form. -->
<form action="#CGI.SCRIPT_NAME#" method="post">
    <b>Select binary encoding</b><br>
    <select size="1" name="binEncoding" >
        <option selected>UU</option>
        <option>Base64</option>
        <option>Hex</option>
    </select><br>
    <br>
    <input type = "Submit" value = "convert my data">
</form>
```

## BinaryEncode

### Description

Converts binary data to a string.

### Returns

An encoded string representing the binary data.

### Category

[Conversion functions](#), [String functions](#)

### Function syntax

```
BinaryEncode(binarydata, encoding)
```

### See also

[BinaryDecode](#), [CharsetEncode](#), [CharsetDecode](#)

### History

ColdFusion MX 7: Added this function.

### Parameters

Parameter	Description
<code>binarydata</code>	A variable containing the binary data to encode.
<code>encoding</code>	A string that specifies the encoding method to use to represent the data; one of the following: <ul style="list-style-type: none"><li>Hex: use the characters 0-9 and A-F to represent the hexadecimal value of each byte; for example, 3A.</li><li>UU: use the UNIX UUencode algorithm to convert the data.</li><li>Base64: use the Base64 algorithm to convert the data, as specified by IETF RFC 2045, at <a href="http://www.ietf.org/rfc/rfc2045.txt">www.ietf.org/rfc/rfc2045.txt</a>.</li></ul>

### Usage

Binary objects and, in some cases, 8-bit characters, cannot be transported over many Internet protocols, such as HTTP and SMTP, and might not be supported by some database systems. By Binary encoding the data, you convert the data into a format that you can transfer over any Internet protocol or store in a database as character data. To convert the data back to a binary format, use the [BinaryDecode](#) function.

Adobe recommends that you use the `BinaryEncode` function, and not the `ToBase64` (*binarydata*) function, to convert binary data to Base64 data in all new applications.

This function provides a superset of the functionality of the `ToBase64` (*binarydata*) function.

See the following pages for additional information on handling binary data:

- [cffile](#) for loading and reading binary data
- [cfwddx](#) for serializing and deserializing binary data
- [IsBinary](#) for checking variables for binary format
- [Len](#) for determining the length of a binary object

### Example

The following example reads a GIF file as binary data, converts it to a binary-encoded string, converts the binary-encoded data back to binary data, and writes the result to a file. It displays the encoded string and the image in the output file.

```
<h3>Binary Encoding Conversion Example</h3>

<!-- Do the following if the form has been submitted. -->
<cfif IsDefined("Form.binEncoding")>

    <!-- Read in a binary data file. -->
    <cffile action="readbinary"
        file="C:\images\help.gif"
        variable="binimage">

    <!-- Convert the read data to binary encoding and back to binary data. -->
    <cfscript>
        binencode=BinaryEncode(binimage, Form.binEncoding);
        bindecode=BinaryDecode(binencode, Form.binEncoding);
    </cfscript>

    <!-- Write the converted results to a file. -->
    <cffile action="write" file="C:\temp\help.gif" output="#bindecode#" addnewline="No" >

    <!-- Display the results. -->
    <cfoutput>
        <p><b>The binary encoding:</b> #Form.binEncoding#</p>

        <p><b>The image converted into a binary-encoded string by BinaryEncode
            </b><br>
            #binencode#</p>
        <p><b>The image as written back to a file after converting back to binary
            using BinaryDecode</b><br>
            <br></p>
    </cfoutput>
</cfif>

<!-- The input form. -->
<form action="#CGI.SCRIPT_NAME#" method="post">
    <b>Select binary encoding</b><br>
    <select size="1" name="binEncoding" >
        <option selected>UU</option>
        <option>Base64</option>
        <option>Hex</option>
    </select><br>
    <br>
    <input type = "Submit" value = "convert my data">
</form>
```

## BitAnd

### Description

Performs a bitwise logical AND operation.

### Returns

The bitwise AND of two long integers.

### Category

[Mathematical functions](#)

### Function syntax

```
BitAnd(number1, number2)
```

### See also

[BitNot](#), [BitOr](#), [BitXor](#)

### Parameters

Parameter	Description
<i>number1</i>	32-bit signed integer
<i>number2</i>	32-bit signed integer

### Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

### Example

```
<h3>BitAnd Example</h3>
```

```
<p>Returns the bitwise AND of two long integers.</p>
```

```
<p>BitAnd(5,255): <cfoutput>#BitAnd(5,255)#</cfoutput></p>
```

```
<p>BitAnd(5,0): <cfoutput>#BitAnd(5,0)#</cfoutput></p>
```

```
<p>BitAnd(128,128): <cfoutput>#BitAnd(128,128)#</cfoutput></p>
```

## BitMaskClear

### Description

Performs a bitwise mask clear operation.

### Returns

A number, bitwise cleared, with *length* bits beginning at *start*.

### Category

[Mathematical functions](#)

### Function syntax

```
BitMaskClear(number, start, length)
```

### See also

[BitMaskRead](#), [BitMaskSet](#)

### Parameters

Parameter	Description
number	32-bit signed integer
start	Integer, in the range 0-31, inclusive; start bit for mask
length	Integer, in the range 0-31, inclusive; length of mask

### Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

### Example

```
<h3>BitMaskClear Example</h3>
```

<p>Returns number bitwise cleared with length bits beginning from start.</p>

<p>BitMaskClear(255, 4, 4): <cfoutput>#BitMaskClear(255, 4, 4)#</cfoutput></p>

<p>BitMaskClear(255, 0, 4): <cfoutput>#BitMaskClear(255, 0, 4)#</cfoutput></p>

<p>BitMaskClear(128, 0, 7): <cfoutput>#BitMaskClear(128, 0, 7)#</cfoutput></p>

## BitMaskRead

### Description

Performs a bitwise mask read operation.

### Returns

An integer, created from *length* bits of *number*, beginning at *start*.

### Category

[Mathematical functions](#)

### Function syntax

```
BitMaskRead(number, start, length)
```

### See also

[BitMaskClear](#), [BitMaskSet](#)

### Parameters

Parameter	Description
number	32-bit signed integer to mask
start	Integer, in the range 0-31, inclusive; start bit for read
length	Integer, in the range 0-31, inclusive; length of mask

### Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

### Example

```
<h3>BitMaskRead Example</h3>
<p>Returns integer created from <em>length</em> bits of <em>number</em>, beginning
    with <em>start</em>.</p>

<p>BitMaskRead(255, 4, 4): <cfoutput>#BitMaskRead(255, 4, 4)#</cfoutput></p>
<p>BitMaskRead(255, 0, 4): <cfoutput>#BitMaskRead(255, 0, 4)#</cfoutput></p>
<p>BitMaskRead(128, 0, 7): <cfoutput>#BitMaskRead(128, 0, 7)#</cfoutput></p>
```

## BitMaskSet

### Description

Performs a bitwise mask set operation.

### Returns

A number, bitwise masked with *length* bits of *mask* beginning at *start*.

### Category

[Mathematical functions](#)

### Function syntax

```
BitMaskSet(number, mask, start, length)
```

### See also

[BitMaskClear](#), [BitMaskRead](#)

### Parameters

Parameter	Description
number	32-bit signed integer
mask	32-bit signed integer; mask
start	Integer, in the range 0-31, inclusive; start bit for mask
length	Integer, in the range 0-31, inclusive; length of mask

### Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

### Example

```
<h3>BitMaskSet Example</h3>
<p>Returns number bitwise masked with length bits of mask beginning at start.</p>

<p>BitMaskSet(255, 255, 4, 4): <cfoutput>#BitMaskSet(255, 255, 4, 4)#</cfoutput></p>
<p>BitMaskSet(255, 0, 4, 4): <cfoutput>#BitMaskSet(255, 0, 4, 4)#</cfoutput></p>
<p>BitMaskSet(0, 15, 4, 4): <cfoutput>#BitMaskSet(0, 15, 4, 4)#</cfoutput></p>
```

## BitNot

### Description

Performs a bitwise logical NOT operation.

### Returns

A number; the bitwise NOT of a long integer.

### Category

[Mathematical functions](#)

### Function syntax

```
BitNot (number)
```

### See also

[BitAnd](#), [BitOr](#), [BitXor](#)

### Parameters

Parameter	Description
number	32-bit signed integer

### Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

### Example

```
<h3>BitNot Example</h3>
<p>Returns the bitwise NOT of a long integer.</p>

<p>BitNot (0): <cfoutput>#BitNot (0)#</cfoutput></p>
<p>BitNot (255): <cfoutput>#BitNot (255)#</cfoutput></p>
```

## BitOr

### Description

Performs a bitwise logical OR operation.

### Returns

A number; the bitwise OR of two long integers.

### Category

[Mathematical functions](#)

### Function syntax

```
BitOr (number1, number2)
```

### See also

[BitAnd](#), [BitNot](#), [BitXor](#)

### Parameters

Parameter	Description
number1	32-bit signed integer
number2	32-bit signed integer

### Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

### Example

```
<h3>BitOr Example</h3>
<p>Returns the bitwise OR of two long integers.</p>

<p>BitOr(5,255): <cfoutput>#BitOr(5,255)#</cfoutput></p>
<p>BitOr(5,0): <cfoutput>#BitOr(5,0)#</cfoutput></p>
<p>BitOr(7,8): <cfoutput>#BitOr(7,8)#</cfoutput></p>
```

## BitSHLN

### Description

Performs a bitwise shift-left, no-rotation operation.

### Returns

A number, bitwise shifted without rotation to the left by *count* bits.

### Category

[Mathematical functions](#)

### Function syntax

```
BitSHLN(number, count)
```

### See also

[BitSHRN](#)

### Parameters

Parameter	Description
number	32-bit signed integer
count	Integer, in the range 0-31, inclusive; number of bits to shift the number

### Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

### Example

```
<h3>BitSHLN Example</h3>
<p>Returns the number, bitwise shifted, without rotation, to the left by count bits.</p>

<p>BitSHLN(1,1): <cfoutput>#BitSHLN(1,1)#</cfoutput></p>
<p>BitSHLN(1,30): <cfoutput>#BitSHLN(1,30)#</cfoutput></p>
<p>BitSHLN(1,31): <cfoutput>#BitSHLN(1,31)#</cfoutput></p>
<p>BitSHLN(2,31): <cfoutput>#BitSHLN(2,31)#</cfoutput></p>
```

## BitSHRN

### Description

Performs a bitwise shift-right, no-rotation operation.

### Returns

A number, bitwise shifted, without rotation, to the right by *count* bits.

### Category

[Mathematical functions](#)

### Function syntax

```
BitSHRN(number, count)
```

### See also

[BitSHLN](#)

### Parameters

Parameter	Description
number	32-bit signed integer
count	Integer, in the range 0-31, inclusive. Number of bits to shift the number

### Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

### Example

```
<h3>BitSHRN Example</h3>
<p>Returns a number, bitwise shifted, without rotation, to the right, by count bits.</p>

<p>BitSHRN(1,1): <cfoutput>#BitSHRN(1,1)#</cfoutput></p>
<p>BitSHRN(255,7): <cfoutput>#BitSHRN(255,7)#</cfoutput></p>
<p>BitSHRN(-2147483548,1): <cfoutput>#BitSHRN(-2147483548,1)#</cfoutput></p>
```

## BitXor

### Description

Performs a bitwise logical XOR operation.

### Returns

Bitwise XOR of two long integers.

### Category

[Mathematical functions](#)

### Function syntax

```
BitXor(number1, number2)
```

### See also

[BitAnd](#), [BitNot](#), [BitOr](#)

### Parameters

Parameter	Description
<i>number1</i>	32-bit signed integer
<i>number2</i>	32-bit signed integer

### Usage

Bit functions operate on 32-bit signed integers, in the range -2147483648 – 2147483647.

### Example

```
<h3>BitXor Example</h3>
```

```
<p>Returns the bitwise XOR of two long integers.</p>
```

```
<p>BitXor(5,255): <cfoutput>#BitXor(5,255)#</cfoutput></p>
```

```
<p>BitXor(5,0): <cfoutput>#BitXor(5,0)#</cfoutput></p>
```

```
<p>BitXor(128,128): <cfoutput>#BitXor(128,128)#</cfoutput></p>
```

## Functions c-d

### CacheGet

#### Description

Gets an object that is stored in the cache.

#### Returns

The object stored in the cache.

#### Category

[Cache functions](#)

#### Function syntax

```
CacheGet(id)
```

#### See also

[cfcache](#), [CachePut](#), [CacheGetAllIds](#), [CacheGetMetadata](#), [CacheGetProperties](#), [CacheRemove](#), [CacheSetProperties](#)

#### History

ColdFusion 9: Added the function.

#### Parameters

Parameter	Description
id	The ID value assigned to the cache object when it was created.

## CacheGetAllIds

#### Description

Gets the IDs of all objects stored in the cache.

#### Returns

An array containing the IDs of all the objects that are stored in the cache.

#### Category

[Cache functions](#)

#### Function syntax

```
CacheGetAllIds()
```

#### See also

[cfcache](#), [CachePut](#), [CacheGet](#), [CacheGetMetadata](#), [CacheGetProperties](#), [CacheRemove](#), [CacheSetProperties](#)

#### History

ColdFusion 9: Added the function.

## CacheGetMetadata

#### Description

Gets the metadata values for a cached object and template caches.

#### Returns

A structure containing the cached object metadata. The structure has the following fields:

Structure element	Description
cache_hitcount	The number of cache entries have been used.
cache_misscount	Number of times the object was requested, but was not in the cache or was not up to date (was stale).
createdtime	The time when the element or object was cached.

Structure element	Description
hitcount	Number of times the cached object has been used.
idletime	The remaining time, in seconds, after which the cached object is purged if it is idle.
lasthit	The time the cached object was last used, as a date-time object, or the empty string.
lastupdated	The time the cached object was last modified, as a date-time object, or the empty string.
size	The number of bytes the object takes up when serialized.
timespan	The remaining time, in seconds, during which the cached object is valid.

## Category

[Cache functions](#)

## Function syntax

```
CacheGetMetadata(id, template)
```

## See also

[cfcache](#), [CachePut](#), [CacheGet](#), [CacheGetAllIds](#), [CacheGetProperties](#), [CacheRemove](#), [CacheSetProperties](#)

## History

ColdFusion 9.0.1: Added the parameter `template`.

ColdFusion 9: Added the function.

## Parameters

Parameter	Description
<code>id</code>	The ID of the cached object.
<code>template</code>	Gets metadata for template caches.

## Example

`cacheTemp.cfm`

```
<cfcache action="cache" timespan="#CreateTimeSpan(0,0,10,0)#" useQueryString="true"
metadata="cachemetadata">
<cfoutput>-This date/time IS cached: #Now()#-<br /></cfoutput>
</cfcache>
```

`getMetaDataTemplate.cfm`

```
<cfcache action="flush">
<!--- construct the templatecacheid to pass to the getcachemetadata function --->
<cfset baseurl =
"http://#cgi.server_name#:#cgi.server_port##getDirectoryFromPath(cgi.script_name)#cacheTemp.
cfm">
<cfset pageid = hash(expandpath('cacheTemp.cfm'))>
<cfset lineno = 1>
<cfset templateCacheId = trim(ucase("#baseurl#_PAGEID:#pageid#_LINE:#lineno#"))>
<!--- cache the template --->
<cfhttp url="#baseurl#" />
<cfdump var="#getAllTemplateCacheIds()#"><br>
<!--- work with the returned metadata --->
<cfset templateMetaData = cachegetmetadata(templatecacheid,'Template')>
<cfdump var="#templateMetaData#">
```

## CacheGetProperties

### Description

Gets the cache properties for the object cache, the page cache, or both. The information is application-specific.

### Returns

An Array of structures containing the cache properties. Each structure has the properties for the cache type: object or page. If you specify either type in the parameter, the array has a single structure entry. Each structure has the following fields:

Structure element	Description
diskpersistent	A Boolean value specifying whether to persist caches stored on disk through JVM restarts.
eternal	A Boolean value specifying whether <i>no</i> timeout or idletime applies. A true value indicates that the object or page is cached without any timespan being specified.
maxelementsinmemory	The maximum number of objects that can be cached in memory. If the number is exceeded and <i>overflowtodisk</i> is false, the new objects entered replace old elements using algorithm specified in the <i>memoryevictionpolicy</i> entry.
maxelementsondisk	The maximum number of objects that can be stored on disk if <i>overflowtodisk</i> is true.
memoryevictionpolicy	The algorithm to used to evict old entries when maximum limit is reached, such as LRU (least recently used) or LFU (least frequently used).
objecttype	The cache type: <i>object</i> or <i>template</i> .
overflowtodisk	A Boolean value specifying whether when the maximum number of elements allowed in memory is reached, objects can be moved to disk, as determined by the <i>memoryevictionpolicy</i> value.
timetoidleconds	The idle time in seconds. Used if a <i>cfcache</i> tag does not specify an <i>idleTime</i> attribute.
timetolivecond	The timeout time in seconds. Used if a <i>cfcache</i> tag does not specify a <i>timespan</i> attribute.

### Category

[Cache functions](#)

### Function syntax

```
CacheGetProperties([type])
```

### See also

[cfcache](#), [CachePut](#), [CacheGet](#), [CacheGetAllIds](#), [CacheGetMetadata](#), [CacheRemove](#), [CacheSetProperties](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
<code>type</code>	(Optional) The cache type: <ul style="list-style-type: none"><li><code>template</code> - Get properties for the page cache, which contains cached pages and page segments.</li><li><code>object</code> - Get properties for the object cache.</li><li>no parameter - Get properties for both cache types.</li></ul>

## cacheGetSession

### Description

Lets you retrieve the underlying cache object to access additional cache functionality that is not implemented in the tag `cfcache`.

### Returns

The underlying cache object.

### Syntax

```
cacheGetSession()
```

### Parameters

Parameter	Description
<code>objectType</code>	Any of the following values: <ul style="list-style-type: none"><li><code>object</code></li><li><code>template</code></li><li>name of the user-defined cache</li></ul>
<code>isKey</code>	Set to <code>true</code> if <code>objectType</code> is user-defined cache. The default value is <code>false</code> .

### Category

[Cache functions](#)

### See also

[cfcache](#), [CachePut](#), [CacheGet](#), [CacheGetAllIds](#), [CacheGetMetadata](#), [CacheRemove](#), [CacheSetProperties](#)

### History

ColdFusion 9.0.1: Added this function

### Example 1

The following example shows how to create a user-defined cache by adding an entry in ehCache.xml:

```
<cache
name="customcache"
maxElementsInMemory="1000"
eternal="false"
timeToIdleSeconds="720"
timeToLiveSeconds="720"
overflowToDisk="true"
diskSpoolBufferSizeMB="10"
maxElementsOnDisk="100000"
diskPersistent="true"
diskExpiryThreadIntervalSeconds="3600"
memoryStoreEvictionPolicy="LRU"/>
```

After you specify the details in the ehCache.xml, you can use the user-defined cache as shown here:

```
<!-- put an object into user-defined object cache -->
<cfset cachePut("cache1","hello",15,15,customCache)>

<!-- get underlying user-defined object cache -->
<cfset objectCache = cachegetSession(customCache,true)>

<!-- get/print user-defined object cache properties -->
<cfset config = objectCache.getCacheConfiguration()>
<cfoutput>
    getMaxElementsInMemory() :: #config.getMaxElementsInMemory()#<br>
    isEternal() :: #config.isEternal()#<br>
    getTimeToIdleSeconds() :: #config.getTimeToIdleSeconds()#<br>
    getTimeToLiveSeconds() :: #config.getTimeToLiveSeconds()#<br>
    isOverflowToDisk() :: #config.isOverflowToDisk()#<br>
    getDiskSpoolBufferSizeMB() :: #config.getDiskSpoolBufferSizeMB()#<br>
    getMaxElementsOnDisk() :: #config.getMaxElementsOnDisk()#<br>
    isDiskPersistent() :: #config.isDiskPersistent()#<br>
    getDiskExpiryThreadIntervalSeconds() ::
#config.getDiskExpiryThreadIntervalSeconds()#<br>
    getMemoryStoreEvictionPolicy() :: #config.getMemoryStoreEvictionPolicy()#<br>
    isClearOnFlush() :: #config.isClearOnFlush()#<br>
</cfoutput>
```

### Example 2

The following example shows how to use the function cachegetSession to operate on default caches:

```
<!-- put an object into user-defined object cache -->
<cfset cachePut("cache1","hello",15,15)>

<!-- get underlying user-defined object cache -->
<cfset objectCache = cachegetSession("object",true)>

<!-- get/print user-defined object cache properties -->
<cfset config = objectCache.getCacheConfiguration()>
```

## CachePut

### Description

Stores an object in the cache.

### Returns

Nothing

### Category

[Cache functions](#)

### Function syntax

```
CachePut(id, value[, timeSpan[, idleTime]])
```

### See also

[cfcache](#), [CacheGet](#), [CacheGetAllIds](#), [CacheGetProperties](#), [CacheRemove](#), [CacheSetProperties](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
<i>id</i>	The ID for the cache object.
<i>value</i>	The value of the object. Can be any data type supported by ColdFusion
<i>timeSpan</i>	(Optional) The interval until the object is flushed from the cache, as a decimal number of days. One way to set the value is to use the return value from the <a href="#">CreateTimeSpan</a> function. The default is to not time out the object.
<i>idleTime</i>	(Optional) A decimal number of days after which the object is flushed from the cache if it is not accessed during that time. One way to set the value is to use the return value from the <a href="#">CreateTimeSpan</a> function.

## CacheRemove

### Description

Removes an object from the cache.

### Returns

Nothing.

### Category

[Cache functions](#)

### Function syntax

```
CacheRemove(ids, [throwOnError])
```

### See also

[cfcache](#), [CacheGet](#), [CachePut](#), [CacheGetAllIds](#), [CacheGetProperties](#), [CacheGetMetadata](#), [CacheSetProperties](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
ids	A comma delimited string of IDs of the cached objects to remove.
throwOnError	A Boolean value specifying whether to throw an exception if any ID does not specify a cached element. The default value is <code>false</code> .

## CacheSetProperties

### Description

Sets the cache properties for the object cache, the page cache, or both. If a cache does not yet exist, creates it. The cache and properties are application-specific.

### Returns

Nothing

### Category

[Cache functions](#)

### Function syntax

`CacheSetProperties(propStruct)`

### See also

[cfcache](#), [CacheGet](#), [CachePut](#), [CacheGetAllIds](#), [CacheGetProperties](#), [CacheGetMetadata](#), [CacheRemove](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
propStruct	A structure specifying the cache properties plus identifying information

The `propStruct` structure can have any or all of the following fields:

Structure element	Description
diskstore	The disk store.
diskpersistent	A Boolean value specifying whether to persist caches stored on disk through JVM restarts.
eternal	A Boolean value specifying whether <i>no</i> timeout or idletime applies. A true value indicates that the object or page is cached without any timespan being specified.
maxelementsinmemory	The maximum number of objects that can be cached in memory. If the number is exceeded and <code>overflowtodisk</code> is false, the new objects entered replace old elements using algorithm specified in the <code>memoryevictionpolicy</code> entry.
maxelementsondisk	The maximum number of objects that can be stored on disk if <code>overflowtodisk</code> is true.
memoryevictionpolicy	The algorithm to used to evict old entries when maximum limit is reached, such as LRU (least recently used) or LFU (least frequently used).
objecttype	The cache type: <code>object</code> or <code>template</code> .
overflowtodisk	A Boolean value specifying whether when the maximum number of elements allowed in memory is reached, objects can be moved to disk, as determined by the <code>memoryevictionpolicy</code> value.
timetoidoleconds	The idle time in seconds. Used if a <code>cfcache</code> tag does not specify an <code>idleTime</code> attribute.
timetolivesecond	The timeout time in seconds. Used if a <code>cfcache</code> tag does not specify a <code>timespan</code> attribute.
objecttype	<p>The type of cache: one of the following:</p> <ul style="list-style-type: none"> <li>• <code>template</code> - Set properties for the page cache, which contains cached pages and page segments.</li> <li>• <code>object</code> - Set properties for the object cache.</li> <li>• <code>all</code> - Set properties for both cache types.</li> </ul>

## Ceiling

### Description

Determines the closest integer that is greater than a specified number.

### Returns

The closest integer that is greater than a given number.

### Category

[Mathematical functions](#)

### Function syntax

`Ceiling(number)`

### See also

[Int](#), [Fix](#), [Round](#)

### Parameters

Parameter	Description
number	A real number

### Example

```
<h3>Ceiling Example</h3>

<cfoutput>
    <p>The ceiling of 3.4 is #ceiling(3.4)#</p>
    <p>The ceiling of 3 is #ceiling(3)#</p>
    <p>The ceiling of 3.8 is #ceiling(3.8)#</p>
    <p>The ceiling of -4.2 is #ceiling(-4.2)#</p>
</cfoutput>
```

## CharsetDecode

### Description

Converts a string to a binary representation.

### Returns

A binary object that represents the string.

### Category

[Conversion functions](#), [String functions](#)

### Function syntax

```
CharsetDecode(string, encoding)
```

### See also

[BinaryDecode](#), [BinaryEncode](#), [CharsetEncode](#); Determining the page encoding of server output in the *Developing ColdFusion Applications*

### History

ColdFusion MX 7: Added this function.

**Parameters**

Parameter	Description
string	A string containing data to encode in binary format.
encoding	<p>A string that specifies encoding of the input data. Must be a character encoding name recognized by the Java runtime. The following list includes commonly used values:</p> <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> <p>For a complete list of character encoding names supported by Sun Java runtimes, see <a href="http://java.sun.com/j2se/1.3/docs/guide/intl/encoding.doc.html">http://java.sun.com/j2se/1.3/docs/guide/intl/encoding.doc.html</a> and <a href="http://java.sun.com/j2se/1.4/docs/guide/intl/encoding.doc.html">http://java.sun.com/j2se/1.4/docs/guide/intl/encoding.doc.html</a>.</p>

**Usage**

This function converts a string directly to a binary object. In releases of ColdFusion through ColdFusion MX 6.1, you had to use the `ToBase64` function to convert the string to Base64 and then use the `ToBinary` function to convert strings to binary data.

**Example**

The following example uses the `CharsetDecode` function to convert a string from a form to a binary object, and uses the `CharsetEncode` function to convert it back to the original value. You can change the character encoding that ColdFusion uses for the conversion. If you select the Asian language encodings, characters that are not in the specified character set are successfully converted.

```
<h3>Character Encoding Conversion Example</h3>
<!-- Do the following if the form has been submitted. --->
<cfif IsDefined("Form.myString")>

    <!-- Do the conversions. --->
    <cfscript>
        chardecode=CharsetDecode(Form.myString, Form.charEncoding);
        charencode=CharsetEncode(chardecode, Form.charEncoding);
    </cfscript>

    <!-- Display the input values and results. --->
    <cfoutput>
        <h3>Parameter Settings</h3>
        <p><b>The string:</b><br>
            #Form.myString#</p>
        <p><b>The character encoding:</b> #Form.charEncoding#</p>

        <h3>Results of the operations:</h3>
        <p><b>Dump of the string converted to a binary object by CharsetDecode:
            </b><br>
            <cfdump var="#chardecode#"></p>
        <p><b>The binary object converted back to a string by CharsetEncode:
            </b><br>
            #charencode#</p>
    </cfoutput>
</cfif>

<!-- The input form. --->
<form action="#CGI.SCRIPT_NAME#" method="post">
    <b>Select the character encoding</b><br>
    <!-- This is a subset, additional encodings are available. --->
    <select size="1" name="charEncoding" >
        <option selected>UTF-8</option>
        <option>ASCII</option>
        <option>ISO8859_1</option>
        <option>CP1252</option>
        <option>SJIS</option>
        <option>MS932</option>
        <option>EUC_CN</option>
        <option>Big5</option>
    </select><br>
    <br>
    <b>Enter a string</b><br>
    <textarea name = "myString" cols = "40" rows = "5" WRAP = "VIRTUAL">
        The following four characters are not in all character encodings: %âç+
    </textarea><br>
    <br>
    <input type = "Submit" value = "convert my data">
</form>
```

## CharsetEncode

### Description

Uses the specified encoding to convert binary data to a string.

### Returns

A string representation of the binary object.

### Category

[Conversion functions](#), [String functions](#)

### Function syntax

```
CharsetEncode(binaryobject, encoding)
```

### See also

[BinaryDecode](#), [BinaryEncode](#), [CharsetDecode](#); Determining the page encoding of server output in the *Developing ColdFusion Applications*

### History

ColdFusion MX 7: Added this function.

### Parameters

Parameter	Description
<code>binaryobject</code>	A variable containing binary data to decode into text.
<code>encoding</code>	<p>The character encoding that was used to encode the string into binary format. It must be a character encoding name recognized by the Java runtime. The following list includes commonly used values:</p> <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> <p>For a complete list of character encoding names supported by Sun Java runtimes, see <a href="http://java.sun.com/javase/6/docs/technotes/guides/intl/encoding.doc.html">http://java.sun.com/javase/6/docs/technotes/guides/intl/encoding.doc.html</a>.</p>

### Usage

Adobe recommends that you use this function, and not the [ToString](#) function, to convert binary data to strings in all new applications.

### Example

The following example uses the `CharsetDecode` function to convert a string from a form to a binary object, and uses the `CharsetEncode` function to convert it back to the original value. You can change the character encoding that ColdFusion uses for the conversion. If you select the Asian language encodings, characters that are not in the specified character set are successfully converted.

```
<h3>Character Encoding Conversion Example</h3>
<!-- Do the following if the form has been submitted. -->
<cfif IsDefined("Form.myString")>

    <!-- Do the conversions. -->
    <cfscript>
        chardecode=CharsetDecode(Form.myString, Form.charEncoding);
        charencode=CharsetEncode(chardecode, Form.charEncoding);
    </cfscript>

    <!-- Display the input values and results. -->
    <cfoutput>
        <h3>Parameter Settings</h3>
        <p><b>The string:</b><br>
            #Form.myString#</p>
        <p><b>The character encoding:</b> #Form.charEncoding#</p>

        <h3>Results of the operations:</h3>
        <p><b>Dump of the string converted to a binary object by CharsetDecode:
            </b><br>
            <cfdump var="#chardecode#"></p>
        <p><b>The binary object converted back to a string by CharsetEncode:
            </b><br>
            #charencode#</p>
    </cfoutput>
</cfif>

<!-- The input form. -->
<form action="#CGI.SCRIPT_NAME#" method="post">
    <b>Select the character encoding</b><br>
    <!-- This is a subset, additional encodings are available. -->
    <select size="1" name="charEncoding" >
        <option selected>UTF-8</option>
        <option>ASCII</option>
        <option>ISO8859_1</option>
        <option>CP1252</option>
        <option>SJIS</option>
        <option>MS932</option>
        <option>EUC_CN</option>
        <option>Big5</option>
    </select><br>
    <br>
    <b>Enter a string</b><br>
    <textArea name = "myString" cols = "40" rows = "5" WRAP = "VIRTUAL">
        The following four characters are not in all character encodings: %a%+
    </textArea><br>
    <br>
    <input type = "Submit" value = "convert my data">
</form>
```

## Chr

### Description

Converts a numeric value to a UCS-2 character.

### Returns

A character with the specified UCS-2 character code.

### Category

[String functions](#)

### Function syntax

`Chr (number)`

### See also

[Asc](#)

### History

ColdFusion MX: Changed Unicode support: ColdFusion supports the Java UCS-2 representation of Unicode characters, up to a value of 65535. (Earlier releases supported 1-255.)

### Parameters

Parameter	Description
number	A value (a number in the range 0 - 65535, inclusive)

### Usage

The values 0 – 31 are standard, nonprintable codes. For example:

- `Chr (10)` returns a linefeed character
- `Chr (13)` returns a carriage return character
- The two-character string `Chr (13) & Chr (10)` returns a Windows newline

**Note:** For a complete list of the Unicode characters and their codes, see [www.unicode.org/charts/](http://www.unicode.org/charts/)

### Example

```
<!--- If the character string is not empty, output its Chr value. --->
<cfif IsDefined("form.charVals")>
    <cfoutput>#form.charVals# = #Chr(form.charVals)#</cfoutput>
</cfif>

<cfform action="#CGI.script_name#" method="POST">
    <p>Type an integer character code from 1 to 65535<br>
    to see its corresponding character.<br>
    <cfinput type="Text"
        name="CharVals"
        range="1,65535"
        message="Enter an integer from 1 to 65535"
        validate="integer"
        required="Yes"
        size="5"
        maxlength="5"
    >
    <p><input type="Submit" name=""> <input type="RESET">
</cfform>
```

## CJustify

### Description

Centers a string in a field length.

### Returns

String, center-justified by adding spaces before or after the input parameter. If *length* is less than the length of the input parameter string, the string is returned unchanged.

### Category

[Display and formatting functions](#), [String functions](#)

### Function syntax

Cjustify(*string*, *length*)

### See also

[LJustify](#), [RJustify](#)

### Parameters

Parameter	Description
string	A string or a variable that contains one. May be empty. If it is a variable that is defined as a number, the function processes it as a string.
length	<p>A positive integer or a variable that contains one. Length of field.</p> <p>Can be coded as:</p> <ul style="list-style-type: none"><li>• A number; for example, 6</li><li>• A string representation of a number; for example, "6"</li></ul> <p>Any other value causes ColdFusion to throw an error.</p>

### Example

```
<!--- This example shows how to use CJustify. --->
<CFPARAM name = "jstring" DEFAULT = "">

<cfif IsDefined("FORM.submit")>
<cfdump var="#Form#">
    <cfset jstring = Cjustify("#FORM.justifyString#", 35)>
</cfif>
<html>
<head>
<title>CJustify Example</title>
</head>
<body>
<h3>CJustify</h3>
<p>Enter a string; it will be center-justified within the sample field.
<form action = "cjustify.cfm" method="post">
<p><input type = "Text" value = "<cfoutput>#jString#</cfoutput>"
    size = 35 name = "justifyString">
<p><input type = "Submit" name = "submit">
<input type = "RESET">
</form>
</body>
</html>
```

## Compare

### Description

Performs a case sensitive comparison of two strings.

### Returns

- -1, if *string1* is less than *string2*
- 0, if *string1* is equal to *string2*
- 1, if *string1* is greater than *string2*

### Category

[String functions](#)

## Function syntax

`Compare(string1, string2)`

## See also

[CompareNoCase](#), [Find](#)

## Parameters

Parameter	Description
string1	A string or a variable that contains one
string2	A string or a variable that contains one

## Usage

Compares the values of corresponding characters in *string1* and *string2*.

## Example

```
<h3>Compare Example</h3>
<p>The compare function performs a <I>case-sensitive</I> comparison of two strings.</p>

<cfif IsDefined("FORM.string1")>
    <cfset comparison = Compare(FORM.string1, FORM.string2)>
    <!-- Switch on the variable to give various responses. --->
    <cfswitch expression = #comparison#>
        <cfcase value = "-1">
            <h3>String 1 is less than String 2</h3>
            <I>The strings are not equal</I>
        </cfcase>
        <cfcase value = "0">
            <h3>String 1 is equal to String 2</h3>
            <I>The strings are equal!</I>
        </cfcase>
        <cfcase value = "1">
            <h3>String 1 is greater than String 2</h3>
            <I>The strings are not equal</I>
        </cfcase>
        <cfdefaultcase>
            <h3>This is the default case</h3>
        </cfdefaultcase>
    </cfswitch>
</cfif>

<form action = "compare.cfm" method="post">
    <p>String 1
    <br><input type = "Text" name = "string1">
    <p>String 2
    <br><input type = "Text" name = "string2">
    <p><input type = "Submit" value = "Compare these Strings" name = "">
        <input type = "RESET">
</form>
```

## CompareNoCase

### Description

Performs a case-insensitive comparison of two strings.

### Returns

An indicator of the difference:

- A negative number, if *string1* is less than *string2*
- 0, if *string1* is equal to *string2*
- A positive number, if *string1* is greater than *string2*

### Category

[String functions](#)

### Function syntax

```
CompareNoCase(string1, string2)
```

### See also

[Compare](#), [FindNoCase](#); Evaluation and type conversion issues in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
<i>string1</i>	A string or a variable that contains one
<i>string2</i>	A string or a variable that contains one

### Example

```
<H3>CompareNoCase Example</H3>
<P>This function performs a <I>case-insensitive</I> comparison of two strings.
<cfif IsDefined("form.string1")>
<cfset comparison = Comparenocase(form.string1, form.string2)>
<!-- switch on the variable to give various responses -->
<cfswitch expression=#comparison#>
    <cfcase value="-1">
        <H3>String 1 is less than String 2</H3>
        <I>The strings are not equal</I>
    </cfcase>
    <cfcase value="0">
        <H3>String 1 is equal to String 2</H3>
        <I>The strings are equal!</I>
    </cfcase>
    <cfcase value="1">
        <H3>String 1 is greater than String 2</H3>
        <I>The strings are not equal</I>
    </cfcase>
    <cfdefaultcase>
        <H3>This is the default case</H3>
    </cfdefaultcase>
</cfswitch>
</cfif>
<form action="comparenocase.cfm" method="POST">
<P>String 1
<BR><input type="Text" name="string1">
<P>String 2
<BR><input type="Text" name="string2">
<P><input type="Submit" value="Compare these Strings" name="">
    <input type="RESET">
</form>
```

## Cos

### Description

Calculates the cosine of an angle that is entered in radians.

### Returns

A number; the cosine of the angle.

### Category

[Mathematical functions](#)

### Function syntax

`Cos (number)`

### See also

[ACos](#), [Sin](#), [ASin](#), [Tan](#), [Atn](#), [Pi](#)

**See also**

[CreateDateTime](#), [CreateODBCDate](#); Evaluation and type conversion issues in the *Developing ColdFusion Applications*

**Parameters**

Parameter	Description
year	Integer in the range 0-9999. Integers in the range 0-29 are converted to 2000-2029. Integers in the range 30-99 are converted to 1930-1999. You cannot specify dates before AD 100.
month	Integer in the range 1 (January)-12 (December)
day	Integer in the range 1-31

**Usage**

CreateDate is a subset of [CreateDateTime](#).

The time in the returned object is set to 00:00:00.

**Example**

```
<h3>CreateDate Example</h3>
<cfif IsDefined("form.year")>
<p>Your date value, generated with CreateDate:</p>
<cfset yourDate = CreateDate(form.year, form.month, form.day)>
<cfoutput>
<ul>
  <li>Formatted with CreateDate: #CreateDate(form.year, form.month, form.day)#</li>
  <li>Formatted with CreateDateTime: #CreateDateTime(form.year, form.month,
    form.day, 12,13,0)#</li>
  <li>Formatted with CreateODBCDate: #CreateODBCDate(yourDate)#</li>
  <li>Formatted with CreateODBCDateTime: #CreateODBCDateTime(yourDate)#</li>
</ul>

<p>The same value can be formatted with DateFormat:
<ul>
  <li>Formatted with CreateDate and DateFormat:
    #DateFormat(CreateDate(form.year, form.month, form.day), "mmm-dd-yyyy")#</li>
  <li>Formatted with CreateDateTime and DateFormat:
    #DateFormat(CreateDateTime(form.year, form.month, form.day, 12,13,0))#</li>
  <li>Formatted with CreateODBCDate and DateFormat:
    #DateFormat(CreateODBCDate(yourDate), "mmm d, yyyy")#</li>
  <li>Formatted with CreateODBCDateTime and DateFormat:
    #DateFormat(CreateODBCDateTime(yourDate), "d/m/yy")#</li>
</ul>
</cfoutput>
</cfif>
<cfform action="createdate.cfm" METHOD="POST">
<p>Enter the year, month, and day, as integers:
<pre>
Year<cfinput type="Text" name="year" value="1998" validate="integer" required="Yes">
Month<cfinput type="Text" name="month" value="6" validate="integer" required="Yes">
Day<cfinput type="Text" name="day" value="8" validate="integer" required="Yes">
</pre>
<p><input type="Submit" name=""> <input type="RESET">
</cfform>
```

## CreateDateTime

### Description

Creates a date-time object.

### Returns

A date/time value.

### Category

[Date and time functions](#)

### Function syntax

`CreateDateTime(year, month, day, hour, minute, second)`

### See also

[CreateDate](#), [CreateTime](#), [CreateODBCDateTime](#), [Now](#); Evaluation and type conversion issues in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
year	Integer in the range 0-9999. Integers in the range 0-29 are converted to 2000-2029. Integers in the range 30-99 are converted to 1930-1999. You cannot specify dates before AD 100.
month	Integer in the range 1 (January)–12 (December)
day	Integer in the range 1–31
hour	Integer in the range 0–23
minute	Integer in the range 0–59
second	Integer in the range 0–59

### Example

```
<h3>CreateDateTime Example</h3>

<cfif IsDefined("form.year")>
Your date value, generated with CreateDateTime:
<cfset yourDate = CreateDateTime(form.year, form.month, form.day,
    form.hour, form.minute, form.second)>

<cfoutput>
<ul>
    <li>Formatted with CreateDate: #CreateDate(form.year, form.month, form.day)#</li>
    <li>Formatted with CreateDateTime: #CreateDateTime(form.year, form.month,
form.day, form.hour, form.minute, form.second)#</li>
    <li>Formatted with CreateODBCDate: #CreateODBCDate(yourDate)#</li>
    <li>Formatted with CreateODBCDateTime: #CreateODBCDateTime(yourDate)#</li>

```

## CreateObject

### Description

Creates a ColdFusion object, of a specified type.

### Returns

An object, of the specified type.

### Category

[Extensibility functions](#)

### History

ColdFusion 9:

- ColdFusion 9 does not require the type argument.

ColdFusion 8:

- Added the .NET/dotnet type
- For web service object, added the `WSDL2Java` and `argstruct` parameters

ColdFusion MX 7: For web service object: added the `portName` parameter, which specifies a port named in the `service` element of the WSDL.

ColdFusion MX:

- 1 Changed instantiation behavior: this function, and the `cfobject` tag, can instantiate ColdFusion components and web services. Executing operations on a CFC object executes CFML code that implements the CFC's method in the CFC file.

For more information, see the *Developing ColdFusion Applications*.

- 2 For CORBA object: changed the Naming Service separator format for addresses from a dot to a forward slash. For example, if "context=NameService", for a class, use either of the following formats for the `class` parameter:

- `"/Eng/CF"`
- `".current/Eng.current/CF"`

(In earlier releases, the format was `".Eng.CF"`.)

- 3 For CORBA object: changed the `locale` parameter; it specifies the Java config that contains the properties file.

### CreateObject object types

For information about using this function, see these sections:

- [CreateObject: .NET object](#)
- [CreateObject: COM object](#)
- [CreateObject: component object](#)
- [CreateObject: CORBA object](#)
- [CreateObject: Java or EJB object](#)
- [CreateObject: web service object](#)

**Note:** On UNIX, this function does not support COM objects.

## CreateObject: .NET object

### Description

Creates a .NET object, that is, a ColdFusion proxy for accessing a class in a local or remote .NET assembly.

### Returns

A .NET object, that is, a ColdFusion reference to a local or remote .NET assembly class.

### Function syntax

```
CreateObject(type, class, assembly[, server, port, protocol, secure])
```

### See also

[cfobject: .NET object, DotNetToCFType](#), Using Microsoft .NET Assemblies in the *Developing ColdFusion Applications*

### Parameters

Attribute	Default	Description
type		Object type. Must be <code>.NET</code> or <code>dotnet</code> for .NET objects.
class		Name of the .NET class to represent as an object.
assembly	<code>mscorlib.dll</code> which contains the .NET core classes	<p><b>For local .NET assemblies</b>, the absolute path or paths to the assembly or assemblies (.exe or .dll files) from which to access the .NET class and its supporting classes. If a class in an assembly requires supporting classes that are in other assemblies, specify those assemblies also. You can, however, omit the supporting assemblies for the following types of supporting classes:</p> <ul style="list-style-type: none"><li>• .NET core classes (classes in <code>mscorlib.dll</code>)</li><li>• classes in assemblies that are in the global assembly cache (GAC)</li></ul> <p>To specify multiple assemblies, use a comma-delimited list.</p> <p><b>For remote .NET assemblies</b>, specify the absolute path or paths of the local proxy JAR file or files that represent the assemblies.</p> <p>If you omit this parameter, and there is no local .NET installation, the function fails without generating an error. If you omit this parameter, there is a local .NET installation, and the specified class is not in the .NET core classes, ColdFusion generates an error.</p>
server	<code>localhost</code>	<p>Host name or IP address of the server where the .NET-side agent is running. Can be in any of these forms:</p> <ul style="list-style-type: none"><li>• server name (for example, <code>myserver</code>)</li><li>• IP address (for example, <code>127.0.0.1</code>)</li></ul> <p>Specify this attribute to access .NET components on a remote server.</p>
port	<code>6086</code>	Port number at which the .NET-side agent is listening.
protocol	<code>tcp</code>	<p>Protocol to use for communication between ColdFusion and .NET. Must be one of the following values:</p> <ul style="list-style-type: none"><li>• <code>http</code>: Use HTTP/SOAP communication protocol. This option is slower than <code>tcp</code>, but might be required for access through a firewall.</li><li>• <code>tcp</code>: Use binary TCP/IP protocol. This method is more efficient than HTTP.</li></ul>
secure	<code>false</code>	Whether to secure communications with the .NET-side agent. If <code>true</code> , ColdFusion uses SSL to communicate with .NET.

### Usage

The `CreateObject` function and `cfobject` tag differ only in syntax. For more information on creating ColdFusion .NET objects, see “[cfobject: .NET object](#)” on page 436. For detailed information on using the .NET assemblies in ColdFusion, see *Using Microsoft .NET Assemblies* in the *Developing ColdFusion Applications*.

## CreateObject: COM object

### Description

The `CreateObject` function can create a Component Object Model (COM) object.

To create a COM object, provide the following information:

- The object’s program ID or filename
- The methods and properties available to the object through the `IDispatch` interface
- The arguments and return types of the object’s methods

For most objects, you can get this information from the `OLEView` utility.

**Note:** *On UNIX, this function does not support COM objects.*

### Returns

A COM object.

### Function syntax

```
CreateObject(type, class, context, serverName)
```

### See also

[ReleaseComObject](#), [cfobject](#); Integrating COM and CORBA Objects in CFML Applications in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
type	Type of object to create. <ul style="list-style-type: none"><li>• com</li><li>• corba</li><li>• java</li><li>• component</li><li>• webservice</li></ul>

Parameter	Description
class	Component ProgID for the object to invoke.
context	<ul style="list-style-type: none"><li>• InProc</li><li>• Local</li><li>• Remote</li></ul>
serverName	Server name, using UNC or DNS convention, in one of these forms: <ul style="list-style-type: none"><li>• \\lanserver</li><li>• lanserver</li><li>• http://www.servername.com</li><li>• www.servername.com</li><li>• 127.0.0.1</li></ul> If context = "remote", this parameter is required.

### Usage

The following example creates the Windows Collaborative Data Objects (CDO) for NTS NewMail object to send mail. You use this code in a `cfscript` tag.

```
Mailer = CreateObject("COM", "CDONTS.NewMail");
```

## CreateObject: component object

### Description

The `CreateObject` function can create an instance of a ColdFusion component (CFC) object.

### Returns

A component object.

### Function syntax

```
CreateObject(type, component-name)
```

### See also

Building and Using ColdFusion Components in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
type	Type of object to create. <ul style="list-style-type: none"><li>• com</li><li>• corba</li><li>• java</li><li>• component</li><li>• webservice</li></ul>
component-name	The CFC name; corresponds to the name of the file that defines the component; for example, use engineComp to specify the component defined in the engineComp.cfc file

### Usage

On UNIX systems, ColdFusion searches first for a file with a name that matches the specified component name, but is all lowercase. If it does not find the file, it looks for a filename that matches the component name exactly, with the identical character casing.

In the following example, the CFScript statements assign the `tellTimeCFC` variable to the `tellTime` component using the `CreateObject` function. The `CreateObject` function references the component in another directory. To invoke component methods, you use function syntax.

```
<b>Server's Local Time:</b>
<cfscript>
    tellTimeCFC=CreateObject("component","appResources.components.
        tellTime");
    tellTimeCFC.getLocalTime();
</cfscript>
<br>
<b>Calculated UTC Time:</b>
<cfscript>
    tellTimeCFC.getUTCTime();
</cfscript>
```

## CreateObject: CORBA object

### Description

The `CreateObject` function can call a method on a CORBA object. The object must be defined and registered for use.

### Returns

A handle to a CORBA interface.

### Function syntax

```
CreateObject(type, context, class, locale)
```

### See also

Integrating COM and CORBA Objects in CFML Applications in the *Developing ColdFusion Applications*

## History

See the History section of the main [CreateObject](#) function page.

## Parameters

Parameter	Description
type	Type of object to create. <ul style="list-style-type: none"><li>• com</li><li>• corba</li><li>• java</li><li>• component</li><li>• webservice</li></ul>
context	<ul style="list-style-type: none"><li>• IOR: ColdFusion uses IOR to access CORBA server</li><li>• NameService: ColdFusion uses naming service to access server. Valid only with the InitialContext of a VisiBroker ORB.</li></ul>
class	<ul style="list-style-type: none"><li>• If context = "ior": absolute path of file that contains string version of the Interoperable Object Reference (IOR). ColdFusion must be able to read file; it must be local to ColdFusion server or accessible on network</li><li>• If context = "nameservice": forward slash-delimited naming context for naming service. For example: Allaire//Doc/empobject.</li></ul>
locale	The name of the Java config that holds the properties file. For more information, see <i>Configuring and Administering ColdFusion</i> .

## Usage

In the *class* parameter, if "context=NameService", use a dot separator for the first part of the string. Use either of the following formats:

- "/Eng/CF"
- ".current/Eng.current/CF"

ColdFusion supports CORBA through the Dynamic Invocation Interface (DII). To use this function with CORBA objects, provide the name of the file that contains a string version of the IOR, or the object's naming context in the naming service. Provide the object's attributes, method names, and method signatures.

This function supports user-defined types (structures, arrays, and sequences).

## Example

```
myobj = CreateObject("corba", "d:\temp\tester.ior", "ior",  
    "visibroker") // uses IOR  
  
myobj = CreateObject("corba", "/Eng/CF", "nameservice",  
    "visibroker") // uses nameservice  
  
myobj = CreateObject("corba", "d:\temp\tester.ior", "nameservice")  
    // uses nameservice and default configuration
```

## CreateObject: Java or EJB object

### Description

The `CreateObject` function can create a Java object, and, by extension, an EJB object.

### Returns

A Java object.

### Function syntax

```
CreateObject(type, class)
```

### Parameters

Parameter	Description
<code>type</code>	Type of object to create. <ul style="list-style-type: none"><li>• <code>com</code></li><li>• <code>corba</code></li><li>• <code>java</code></li><li>• <code>component</code></li><li>• <code>webservice</code></li></ul>
<code>class</code>	A Java class name

### Usage

Any Java class available in the class path that is specified in the ColdFusion Administrator can be loaded and used from ColdFusion with the `CreateObject` function.

To access Java methods and fields:

- 1 Call the `CreateObject` function or the `cfobject` tag to load the class.
- 2 Use the `init` method, with appropriate arguments, to call an instance of the class. For example:

```
<cfset ret = myObj.init(arg1, arg2)>
```

Calling a public method on the object without first calling the `"init"` method invokes a static method. Arguments and return values can be any Java type (simple, array, object). If strings are passed as arguments, ColdFusion does the conversions; if strings are received as return values, ColdFusion does no conversion.

Overloaded methods are supported if the number of arguments is different. Future enhancements will let you use cast functions that allow method signatures to be built more accurately.

## CreateObject: web service object

### Description

This function can create a web service object.

### Returns

A web service object.

### Function syntax

```
CreateObject(type, urltowsdl[, portname, wsdl2JavaArgs])
```

OR

```
CreateObject(type, urltowsdl, argStruct)
```

### Parameters

Parameter	Description
type	Type of object to create. <ul style="list-style-type: none"> <li>• com</li> <li>• corba</li> <li>• java</li> <li>• component</li> <li>• webservice</li> </ul>
urltowsdl	Specifies the URL to web service WSDL file. One of the following: <ul style="list-style-type: none"> <li>• The absolute URL of the web service</li> <li>• The Name (string) assigned in the ColdFusion Administrator to the web service</li> </ul>
portname	The port name for the web service. This value is case-sensitive and corresponds to the <code>port</code> element's <code>name</code> attribute under the <code>service</code> element. Specify this parameter if the web service contains multiple ports. If no port name is specified, ColdFusion uses the first port found in the WSDL.
wsdl2JavaArgs	A string containing a space-delimited list of arguments to pass to the WSDL2Java tool that generates Java stubs for the web services. Useful arguments include the following: <ul style="list-style-type: none"> <li>• <code>-W</code> or <code>--noWrapped</code>: Turns off the special treatment of wrapped document/literal style operations.</li> <li>• <code>-a</code> or <code>--all</code>: Generates code for all elements in the WSDL, even unreferenced ones.</li> <li>• <code>-w</code> or <code>--wrapArrays</code>: Prefers building beans to straight arrays for wrapped XML array types. This switch is not included in the Axis documentation.</li> </ul> For detailed information on valid arguments, see the <a href="#">Apache Axis WSDL2Java Reference</a> .
argStruct	A structure containing web service configuration arguments. For more information see Usage

### Usage

You can use the `CreateObject` function to create a web service.

The `argStruct` structure can contain any combination of the following values:

Name	Default	Description
password	Password set in the Administrator, if any	The password to use to access the web service. If the <code>webservice</code> attribute specifies a web service name configured in the Administrator, overrides any user name specified in the Administrator entry.
port		See <code>portname</code> in the Syntax Parameter table.
proxyPassword	<code>http.proxyPassword</code> system property, if any	The user's password on the proxy server.

Name	Default	Description
proxyPort	http.proxyPort system property, if any	The port to use on the proxy server.
proxyServer	http.proxyHost system property, if any	The proxy server required to access the webservice URL.
proxyUser	http.proxyUser system property, if any	The user ID to send to the proxy server.
refreshWSDL	no	<ul style="list-style-type: none"> <li>• yes: Reload the WSDL file and regenerate the artifacts used to consume the web service</li> <li>• no</li> </ul>
saveJava	no	<ul style="list-style-type: none"> <li>• yes: Save the Java generated by the WSDL2Java converter that generates Java web service stubs. This code can be useful in debugging errors.</li> <li>• no</li> </ul>
timeout	0 (no time-out)	The time-out for retrieving the web service WSDL, in seconds.
username	User name set in the Administrator, if any	The user name to use to access the web service. If the <code>webservice</code> attribute specifies a web service name configured in the Administrator, overrides any user name specified in the Administrator entry.
wsdl2javaArgs		See the Syntax parameter table.

### Example

```
<cfscript>
    ws = CreateObject("webservice",
        "http://www.xmethods.net/sd/2001/TemperatureService.wsdl");
    xlatstring = ws.getTemp(zipcode = "55987");
    writeoutput("The temperature at 55987 is " & xlatstring);
</cfscript>
```

## CreateODBCDate

### Description

Creates an ODBC date object.

### Returns

A date object, in normalized ODBC date format.

### Category

[Date and time functions](#)

### Function syntax

`CreateODBCDate (date)`

### See also

[CreateDate](#), [CreateODBCDateTime](#)

### Parameters

Parameter	Description
date	Date or date/time object in the range 100 AD–9999 AD.

### Usage

This function does not parse or validate values. To ensure that dates are entered and processed correctly (for example, to ensure that a day/month/year entry is not confused with a month/day/year entry, and so on), Adobe recommends that you parse entered dates with the `DateFormat` function, using the `mm-dd-yyyy` mask, into three elements. Ensure that values are within appropriate ranges; for example, to validate a month value, use the attributes `validate = "integer"` and `range = "1,12"`.

### Example

```
<h3>CreateODBCDate Example</h3>
<cfif IsDefined("form.year")>
<p>Your date value, generated with CreateDateTime:</p>
<cfset yourDate = CreateDateTime(form.year, form.month, form.day, form.hour,
    form.minute, form.second)>
<cfoutput>
<ul>
    <li>Formatted with CreateDate: #CreateDate(form.year, form.month, form.day)#</li>
    <li>Formatted with CreateDateTime:
        #CreateDateTime(form.year, form.month, form.day, form.hour, form.minute,
        form.second)#</li>
    <li>Formatted with CreateODBCDate: #CreateODBCDate(yourDate)#</li>
    <li>Formatted with CreateODBCDateTime: #CreateODBCDateTime(yourDate)#</li>
</ul>
<p>The same value can be formatted with DateFormat:
<ul>
    <li>Formatted with CreateDate and DateFormat:
        #DateFormat(CreateDate(form.year,form.month, form.day), "mmm-dd-yyyy")#</li>
    <li>Formatted with CreateDateTime and DateFormat:
        #DateFormat(CreateDateTime(form.year, form.month, form.day, form.hour,
        form.minute, form.second))#</li>
    <li>Formatted with CreateODBCDate and DateFormat:
        #DateFormat(CreateODBCDate(yourDate), "mmm d, yyyy")#</li>
    <li>Formatted with CreateODBCDateTime and DateFormat:
        #DateFormat(CreateODBCDateTime(yourDate), "d/m/yy")#</li>
</ul>
</cfoutput>
</cfif>
<cfform action="createodbcdate.cfm" method="POST">
<p>Enter the year, month and day, as integers:
<pre>
```

```
Year    <cfinput type="Text" name="year" value="1998" validate="integer"
        required="Yes">
Month   <cfinput type="Text" name="month" value="6" range="1,12"
        message="Please enter a month (1-12)" validate="integer"
        required="Yes">
Day     <cfinput type="Text" name="day" value="8" range="1,31"
        message="Please enter a day of the month (1-31)" validate="integer"
        required="Yes">
Hour    <cfinput type="Text" NAME="hour" value="16" range="0,23"
        message="You must enter an hour (0-23)" validate="integer"
        required="Yes">
Minute  <cfinput type="Text" name="minute" value="12" range="0,59"
        message="You must enter a minute value (0-59)" validate="integer"
        required="Yes">
Second  <cfinput type="Text" name="second" value="0" range="0,59"
        message="You must enter a value for seconds (0-59)" validate="integer"
        required="Yes">

</pre>
<p><input type="Submit" name=""> <input type="Reset">
</cfform>
```

## CreateODBCDateTime

### Description

Creates an ODBC date-time object.

### Returns

A date-time object, in ODBC timestamp format.

### Category

[Date and time functions](#)

### Function syntax

```
CreateODBCDateTime (date)
```

### See also

[CreateDateTime](#), [CreateODBCDate](#), [CreateODBCTime](#), [Now](#); Evaluation and type conversion issues in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
date	Date-time object in the range 100 AD–9999 AD.

### Usage

When passing a date-time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date-time object.

### Example

```
<!--- This example shows how to use CreateDate, CreateDateTime, CreateODBCDate, and
CreateODBCDateTime --->
<h3>CreateODBCDateTime Example</h3>

<cfif IsDefined("form.year")>
Your date value, generated using CreateDateTime:
<cfset yourDate = CreateDateTime (form.year, form.month, form.day,
    form.hour,form.minute, form.second)>
<cfoutput>
<ul>
    <li>Formatted with CreateDate: #CreateDate(form.year, form.month,form.day)#
    <li>Formatted with CreateDateTime: #CreateDateTime(form.year,form.month,
        form.day,form.hour,form.minute,form.second)#
    <li>Formatted with CreateODBCDate: #CreateODBCDate(yourDate)#
    <li>Formatted with CreateODBCDateTime: #CreateODBCDateTime(yourDate)#
</ul>
<p>The same value can be formatted with DateFormat:
<ul>
    <li>Formatted with CreateDate and DateFormat:
        #DateFormat(CreateDate(form.year,form.month,form.day), "mmm-dd-yyyy")#
    <li>Formatted with CreateDateTime and DateFormat:
        #DateFormat(CreateDateTime(form.year,form.month,form.day,
            form.hour,form.minute,form.second))#
    <li>Formatted with CreateODBCDate and DateFormat:
        #DateFormat(CreateODBCDate(yourDate), "mmm d, yyyy")#
    <li>Formatted with CreateODBCDateTime and DateFormat:
        #DateFormat(CreateODBCDateTime(yourDate), "d/m/yy")#
</ul>
</cfoutput>
</cfif>
<CFFORM ACTION="createodbcdatetime.cfm" METHOD="POST">
<p>Enter a year, month and day, as integers:
<PRE>

Year    <CFINPUT
        TYPE="Text" NAME="year" VALUE="1998" VALIDATE="integer" REQUIRED="Yes">

Month   <CFINPUT
        TYPE="Text" NAME="month" VALUE="6" RANGE="1,12"
        MESSAGE="Enter a month (1-12)" VALIDATE="integer" REQUIRED="Yes">

Day     <CFINPUT TYPE="Text" NAME="day" VALUE="8" RANGE="1,31"
        MESSAGE="Enter a day of the month (1-31)" VALIDATE="integer" REQUIRED="Yes">

Hour    <CFINPUT TYPE="Text" NAME="hour" VALUE="16" RANGE="0,23"
        MESSAGE="You must enter an hour (0-23)" VALIDATE="integer" REQUIRED="Yes">

Minute  <CFINPUT TYPE="Text" NAME="minute" VALUE="12" RANGE="0,59"
        MESSAGE="You must enter a minute value (0-59)" VALIDATE="integer" REQUIRED="Yes">

Second  <CFINPUT TYPE="Text" NAME="second" VALUE="0" RANGE="0,59"
        MESSAGE="You must enter a seconds value (0-59)" VALIDATE="integer" REQUIRED="Yes">
</PRE>
<p><INPUT TYPE="Submit" NAME=""> <INPUT TYPE="RESET">
</cform>
```

## CreateODBCTime

### Description

Creates an ODBC time object.

### Returns

A time object, in ODBC timestamp format.

### Category

[Date and time functions](#)

### Function syntax

```
CreateODBCTime (date)
```

### See also

[CreateODBCDateTime](#), [CreateTime](#), Evaluation and type conversion issues in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
date	Date/time object in the range 100 AD–9999 AD.

### Usage

When passing a date-time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date-time object.

### Example

```
<h3>CreateODBCTime Example</h3>
<CFIF IsDefined("form.hour")>
Your time value, created with CreateTime...
<CFSET yourTime = CreateTime(form.hour, form.minute, form.second)>
<cfoutput>
<ul>
  <li>Formatted with CreateODBCTime: #CreateODBCTime(yourTime)#
  <li>Formatted with TimeFormat: #TimeFormat(yourTime)#
</ul></cfoutput>
</CFIF>
<CFFORM action="createodbctime.cfm" METHOD="post">
<PRE>
Hour    <CFINPUT TYPE="Text" NAME="hour" VALUE="16" RANGE="0,23" MESSAGE="You must
        enter an hour (0-23)" VALIDATE="integer" REQUIRED="Yes">
Minute  <CFINPUT TYPE="Text" NAME="minute" VALUE="12" RANGE="0,59" MESSAGE="You must
        enter a minute value (0-59)" VALIDATE="integer" REQUIRED="Yes">
Second  <CFINPUT TYPE="Text" NAME="second" VALUE="0" RANGE="0,59" MESSAGE="You must
        enter a value for seconds (0-59)" VALIDATE="integer" REQUIRED="Yes">
</PRE>
<p><INPUT TYPE="Submit" NAME=""> <INPUT TYPE="RESET">
</cform>
```

## CreateTime

### Description

Creates a time variable.

### Returns

A time variable.

### Category

[Date and time functions](#)

### Function syntax

```
CreateTime(hour, minute, second)
```

### See also

[CreateODBCTime](#), [CreateDateTime](#); Evaluation and type conversion issues in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
hour	Number in the range 0–23
minute	Number in the range 0–59
second	Number in the range 0–59

### Usage

CreateTime is a subset of [CreateDateTime](#).

A time variable is a special case of a date-time variable. The date part of a time variable is set to December 30, 1899.

### Example

```
<h3>CreateTime Example</h3>
<cfif IsDefined("FORM.hour")>
Your time value, presented using CreateTime time function:
<cfset yourTime = CreateTime(FORM.hour, FORM.minute, FORM.second)>
<cfoutput><ul>
    <li>Formatted with timeFormat: #TimeFormat(yourTime)#</li>

```

## CreateTimeSpan

### Description

Creates a date/time object that defines a time period. You can add or subtract it from other date-time objects and use it with the `cachedWithin` attribute of [cfquery](#).

### Returns

A date-time object. (A Java Double)

### Category

[Date and time functions](#)

### Function syntax

`CreateTimeSpan(days, hours, minutes, seconds)`

### See also

[CreateDateTime](#), [DateAdd](#), [DateConvert](#); Defining application-level settings and variables in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
days	Integer in the range 0–32768; number of days in time period

Parameter	Description
hours	Number of hours in time period
minutes	Number of minutes in time period
seconds	Number of seconds in time period

### Usage

Creates a special date-time object that should be used only to add and subtract from other date-time objects or with the `cfquery` `cachedWithin` attribute.

If you use the `cachedWithin` attribute of `cfquery`, and the original query date falls within the time span you define, cached query data is used. In this case, the `CreateTimeSpan` function is used to define a period of time from the present backwards. The `cachedWithin` attribute takes effect only if you enable query caching in the ColdFusion Administrator. For more information, see `cfquery`.

### Example

```
<!--- This example shows the use of CreateTimeSpan with cfquery --->
<h3>CreateTimeSpan Example</h3>
<!--- define startrow and maxrows to facilitate 'next N' style browsing --->
<CFPARAM name = "MaxRows" default = "10">
<CFPARAM name = "StartRow" default = "1">
<!--- Query database for information, if cached database information has not been updated in
the last six hours. ----->
<cfoutput>
<cfquery name = "GetParks" datasource = "cfdocexamples"
    cachedWithin = "#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT PARKNAME, REGION, STATE
    FROM Parks
    ORDER by ParkName, State
</cfquery>
</cfoutput>
<!--- build HTML table to display query --->
<TABLE cellpadding = 1 cellspacing = 1>
<TR>
    <TD colspan = 2 bgcolor = f0f0f0>
        <B><I>Park Name</I></B>
    </TD>
    <TD bgcolor = f0f0f0>
        <B><I>Region</I></B>
    </TD>
    <TD bgcolor = f0f0f0>
        <B><I>State</I></B>
    </TD>
</TR>
<!--- Output query, define startrow and maxrows. Use query variable CurrentCount to track the
row you are displaying. --->
<cfoutput query = "GetParks" StartRow = "#StartRow#"
    MAXROWS = "#MaxRows#">
<TR>
    <TD valign = top bgcolor = fffffd>
        <B>#GetParks.CurrentRow#</B>
    </TD>
    <TD valign = top>
        <FONT SIZE = "-1">#ParkName#</FONT>
```

```
</TD>
<TD valign = top>
<FONT SIZE = "-1">#Region#</FONT>
</TD>
<TD valign = top>
<FONT SIZE = "-1">#State#</FONT>
</TD>
</TR>
</cfoutput>
<!-- If number of records is less than or equal to number of rows, offer link to same page,
with startrow value incremented by maxrows (in this example,
incremented by 10). -->
<TR>
<TD colspan = 4>
<cfif (StartRow + MaxRows) LTE GetParks.RecordCount>
<a href = "cfquery.cfm?startrow = <cfoutput>#StartRow + MaxRows#
</cfoutput>">See next <cfoutput>#MaxRows#</cfoutput> rows</A>
</cfif>
</TD>
</TR>
</TABLE>
```

## CreateUUID

### Description

Creates a Universally Unique Identifier (UUID). A UUID is a 35-character string representation of a unique 128-bit integer.

### Returns

A ColdFusion format UUID, in the format xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxxxxxx, where x is a hexadecimal digit (0-9 or A-F). (The character groups are 8-4-4-16.)

### Category

[Other functions](#)

### Function syntax

CreateUUID()

### Usage

The ColdFusion UUID generation algorithm uses the unique time-of-day value, the IEEE 802 Host ID, and a cryptographically strong random number generator to generate UUIDs that conform to the principles laid out in the draft IEEE RFC "*UUIDs and GUIDs*."

The ColdFusion UUID format is as follows:

xxxxxxxx-xxxx-xxxx-xxxxxxxxxxxxxxxx (8-4-4-16).

This does not conform to the Microsoft/DCE standard, which is as follows:

xxxxxxxx-xxxx-xxxx-xxxx-xxxxxxxxxxxx (8-4-4-4-12)

There are UUID test tools and a user-defined function called CreateGUID, which converts CFML UUIDs to UUID/Microsoft GUID format, available on the web at [www.cflib.org](http://www.cflib.org).

Use this function to generate a persistent identifier in a distributed environment. To a very high degree of certainty, this function returns a unique value; no other invocation on the same or any other system returns the same value.

UUIDs are used by distributed computing frameworks, such as DCE/RPC, COM+, and CORBA. In ColdFusion, you can use UUIDs as primary table keys for applications in which data is stored in shared databases. In such cases, using numeric keys can cause primary-key constraint violations during table merges. Using UUIDs, you can eliminate these violations.

### Example

```
<h3>CreateUUID Example</h3>
<p> This example uses CreateUUID to generate a UUID when you submit the form.
    You can submit the form more than once. </p>
<!-- Checks whether the form was submitted; if so, creates UUID. --->
<cfif IsDefined("Form.CreateUUID") Is True>
    <hr>
    <p>Your new UUID is: <cfoutput>#CreateUUID()#</cfoutput></p>
</cfif>
<form action = "createuuid.cfm">
<p><input type = "Submit" name = "CreateUUID"> </p>
</form>
```

## DateAdd

### Description

Adds units of time to a date.

### Returns

A date/time object.

### Category

[Date and time functions](#)

### Function syntax

```
DateAdd("datepart", number, "date")
```

### See also

[DateConvert](#), [DatePart](#), [CreateTimeSpan](#)

### History

ColdFusion MX 6.1: Added the *datepart* character L or l to represent milliseconds.

### Parameters

Parameter	Description
datepart	String: <ul style="list-style-type: none"><li>• yyyy: Year</li><li>• q: Quarter</li><li>• m: Month</li><li>• y: Day of year</li><li>• d: Day</li><li>• w: Weekday</li><li>• ww: Week</li><li>• h: Hour</li><li>• n: Minute</li><li>• s: Second</li><li>• l: Millisecond</li></ul>
number	Number of units of <i>datepart</i> to add to <i>date</i> (positive, to get dates in the future; negative, to get dates in the past). Number must be an integer.
date	Date/time object, in the range 100 AD–9999 AD.

### Usage

The *datepart* specifiers *y*, *d*, and *w* add a number of days to a date.

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

### Example

```
<cfset date="{ts '2433-09-01 23:59:59'}">
  <cfoutput>#date#</cfoutput>
  <cfset diff=30>
    <cfset posdateresult=DateAdd("s",diff,date1)>
    <cfoutput>#posdateresult#</cfoutput>
```

### Example

```
<!--- This example shows the use of DateAdd --->
<cfparam name="value" default="70">
<cfparam name="type" default="m">

<!--- If numbers passed, then use those. --->
<cfif IsDefined("form.value")>
    <cfset value = form.value>
</cfif>
<cfif IsDefined("form.type")>
    <cfset type = form.type>
</cfif>

<cfquery name="GetMessages" datasource="cfdocexamples">
    SELECT UserName, Subject, Posted
    FROM Messages
</cfquery>

<p>This example uses DateAdd to determine when a message in
the database will expire. Currently, messages older
than <cfoutput>#value#</cfoutput>

<cfswitch expression="#type#">
    <cfcase value="yyyy">years</cfcase>

    <option value="n">minutes
    <option value="s">seconds
</select>

<input type="Submit" value="Submit">
</cfform>
```

## DateCompare

### Description

Performs a full date/time comparison of two dates.

### Returns

- -1, if *date1* is earlier than *date2*
- 0, if *date1* is equal to *date2*
- 1, if *date1* is later than *date2*

### Category

[Date and time functions](#)

### Function syntax

```
DateCompare("date1", "date2" [, "datePart"])
```

### See also

[CreateDateTime](#), [DatePart](#)

### Parameters

Parameter	Description
date1	Date/time object, in the range 100 AD–9999 AD.
date2	Date/time object, in the range 100 AD–9999 AD.
datePart	Optional. String. Precision of the comparison. <ul style="list-style-type: none"><li>• s   Precise to the second (default)</li><li>• n   Precise to the minute</li><li>• h   Precise to the hour</li><li>• d   Precise to the day</li><li>• m   Precise to the month</li><li>• yyyy   Precise to the year</li></ul>

### Usage

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

### Example

```
<h3>DateCompare Example</h3>
<p>The DateCompare function compares two date/time values.
<cfif IsDefined("FORM.date1")>
    <cfif IsDate(FORM.date1) and IsDate(FORM.date2)>
        <cfset comparison = DateCompare(FORM.date1, FORM.date2, FORM.precision)>

<!-- Switch on the variable to give various responses. -->
    <cfswitch expression = #comparison#>
        <cfcase value = "-1">
            <h3><cfoutput>#DateFormat(FORM.date1)#
            #TimeFormat(FORM.date1)#</cfoutput> (Date 1) is
            earlier than <cfoutput>#DateFormat(FORM.date2)#
            #TimeFormat(FORM.date2)#</cfoutput> (Date 2)</h3>

<p><input type = "Submit" value = "Compare these dates" name = "">
<input type = "reset">
</form>

```

## DateConvert

### Description

Converts local time to Coordinated Universal Time (UTC), or UTC to local time. The function uses the daylight savings settings in the executing computer to compute daylight savings time, if necessary.

### Returns

UTC- or local-formatted time object.

### Category

[Date and time functions](#)

## Function syntax

```
DateConvert("conversion-type", "date")
```

## See also

[GetTimeZoneInfo](#), [CreateDateTime](#), [DatePart](#)

## Parameters

Parameter	Description
conversion-type	<ul style="list-style-type: none"><li>local2Utc: Converts local time to UTC time.</li><li>utc2Local: Converts UTC time to local time.</li></ul>
date	Date and time string or a variable that contains one.  To create, use <a href="#">CreateDateTime</a> .

## Usage

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the [CreateDate](#) or [Now](#) function as the date parameter of this function; for example:

```
#DateConvert(CreateDate(2007, 4, 10))#
```

## Example

```
<h3>DateConvert Example</h3>
<!-- This shows conversion of current date - time to UTC and back. --->
<cfset curDate = Now()>
<p><cfoutput>The current date and time: #curDate#. </cfoutput></p>
<cfset utcDate = DateConvert("local2utc", curDate)>
<cfoutput>
  <p>The current date and time converted to UTC time: #utcDate#. </p>
</cfoutput>
<!-- This code checks whether form was submitted. If so, the code generates
the CFML date with the CreateDateTime function. --->
<cfif IsDefined("FORM.submit")>
  <cfset yourDate = CreateDateTime(FORM.year, FORM.month, FORM.day,
    FORM.hour, FORM.minute, FORM.second)>
  <p><cfoutput>Your date value, presented as a ColdFusion date/time
    string: #yourdate#. </cfoutput></p>
  <cfset yourUTC = DateConvert("local2utc", yourDate)>
  <p><cfoutput>Your date and time value, converted to Coordinated Universal Time
    (UTC): #yourUTC#. </cfoutput></p>
  <p><cfoutput>Your UTC date and time, converted back to local date and time:
    #DateConvert("utc2local", yourUTC)#.
  </cfoutput></p>
<cfelse>
  Type the date and time, and press Enter to see the conversion.
</cfif>
<Hr size = "2" color = "#0000A0">
<form action = "dateconvert.cfm" method="post">
<p>Enter year, month and day in integer format for date value to view:
<table cellpadding = "2" cellspacing = "2" border = "0">
<tr>
<td>Year</td>
```

```
<td><input type = "Text" name = "year" value = "1998"
        validate = "integer" required = "Yes"></td></tr>
<tr>
<td>Month</td>
<td><input type = "Text" name = "month" value = "6"
        range = "1,12" message = "Enter a month (1-12)"
        validate = "integer" required = "Yes"></td></tr>
<tr>
<td>Day</td>
<td><input type = "Text" name = "day" value = "8"
        range = "1,31"
        message = "Enter a day of the month (1-31)"
        validate = "integer" required = "Yes"></td></tr>
<tr>
<td>Hour</td>
<td><input type = "Text" name = "hour" value = "16"
        range = "0,23"
        message = "You must enter an hour (0-23)"
        validate = "integer" required = "Yes"></td></tr>
<tr>
<td>Minute</td>
<td><input type = "Text" name = "minute" value = "12"

        validate = "integer" required = "Yes"></td></tr>
<tr>
<td><input type = "Submit" name = "submit" value = "Submit"></td>
<td><input type = "RESET"></td></tr>
</table>
```

## DateDiff

### Description

Determines the integer number of units by which *date1* is less than *date2*.

### Returns

A number of units, of type *datepart*.

### Category

[Date and time functions](#)

### Function syntax

```
DateDiff("datepart", "date1", "date2")
```

### See also

[DateAdd](#), [DatePart](#), [CreateTimeSpan](#)

## History

ColdFusion MX:

- Changed how negative date differences are calculated: this function calculates negative date differences correctly; its output may be different from that in earlier releases.
- Changed the `w` and `ww` masks; they determine the number of full weeks between the two dates.

## Parameters

Parameter	Description
<code>datepart</code>	String that specifies the units in which to count; for example <code>yyyy</code> requests a date difference in whole years. <ul style="list-style-type: none"> <li>• <code>yyyy</code>: Years</li> <li>• <code>q</code>: Quarters</li> <li>• <code>m</code>: Months</li> <li>• <code>y</code>: Days of year (same as <code>d</code>)</li> <li>• <code>d</code>: Days</li> <li>• <code>w</code>: Weekdays (same as <code>ww</code>)</li> <li>• <code>ww</code>: Weeks</li> <li>• <code>h</code>: Hours</li> <li>• <code>n</code>: Minutes</li> <li>• <code>s</code>: Seconds</li> </ul>
<code>date1</code>	Date/time object, in the range 100 AD–9999 AD.
<code>date2</code>	Date/time object, in the range 100 AD–9999 AD.

## Usage

The `DateDiff` function determines the number of complete *datepart* units between the two dates; for example, if the *datepart* parameter is `"m"` and the dates differ by 55 days, the function returns 1.

Enclose string constant dates in quotation marks. If the text contains only numbers (such 1932), and is not surrounded by quotation marks, ColdFusion interprets it as a date/time object, resulting in an incorrect value.

**Example**

```
<cfif IsDefined("form.value")>
    <cfset value = form.value>
</cfif>
<cfif IsDefined("form.type")>
    <cfset type = form.type>
</cfif>

<cfif IsDefined("form.date1") and IsDefined("form.date2")>

    <cfif IsDate(form.date1) and IsDate(form.date2)>

        <p>This example uses DateDiff to determine the difference
        in
        <cfswitch expression = "#form.type#">
            <cfcase value="yyyy">years</cfcase>
            <cfcase value="q">quarters</cfcase>
            <cfcase value="m">months</cfcase>
            <cfcase value="y">days</cfcase>
            <cfcase value="d">days</cfcase>
            <cfcase value="w">weekdays</cfcase>

</form>
```

## DateFormat

### Description

Formats a date value using U.S. date formats. For international date support, use [LSDateFormat](#).

### Returns

A text string representing the date formatted according to the mask. If no mask is specified, returns the value in *dd-mm-yy* format.

### Category

[Date and time functions](#)

### Function syntax

```
DateFormat("date" [, "mask" ])
```

### See also

[Now](#), [CreateDate](#), [LSDateFormat](#), [LSParseDateTime](#), [LSTimeFormat](#), [TimeFormat](#), [ParseDateTime](#)

### History

ColdFusion MX: Added support for the following `mask` parameter options: `short`, `medium`, `long`, and `full`.

## Parameters

Parameter	Description
date	Date/time object, in the range 100 AD–9999 AD.
mask	<p>Characters that show how ColdFusion displays a date:</p> <ul style="list-style-type: none"><li>• d: Day of the month as digits; no leading zero for single-digit days.</li><li>• dd: Day of the month as digits; leading zero for single-digit days.</li><li>• ddd: Day of the week as a three-letter abbreviation.</li><li>• dddd: Day of the week as its full name.</li><li>• m: Month as digits; no leading zero for single-digit months.</li><li>• mm: Month as digits; leading zero for single-digit months.</li><li>• mmm: Month as a three-letter abbreviation.</li><li>• mmmm: Month as its full name.</li><li>• yy: Year as last two digits; leading zero for years less than 10.</li><li>• yyyy: Year represented by four digits.</li><li>• gg: Period/era string. Ignored. Reserved. The following masks tell how to format the full date and cannot be combined with other masks:</li><li>• short: equivalent to m/d/y</li><li>• medium: equivalent to mmm d, yyyy</li><li>• long: equivalent to mmmm d, yyyy</li><li>• full: equivalent to dddd, mmmm d, yyyy</li></ul>

## Usage

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the [CreateDate](#) function or [Now](#) function as the date parameter of this function; for example:  
`#DateFormat(CreateDate(2001, 3, 3))#`

Date and time values in database query results can vary in sequence and formatting unless you use functions to format them. To ensure that application users correctly understand displayed dates and times, Adobe recommends that you use this function and the [LSDateFormat](#), [TimeFormat](#), and [LSTimeFormat](#) functions to format resultset values. For more information and examples, see TechNote, "ColdFusion Server (5 and 4.5.x) with Oracle: Formatting Date and Time Query Results," on the website at [go.adobe.com/kb/ts\\_tn\\_18070\\_en-us](http://go.adobe.com/kb/ts_tn_18070_en-us).

**Note:** The `DateFormat` function is best used for formatting output, not for formatting input. For formatting input, use one of the date/time creation functions (for example, [CreateDate](#)) instead.

### Example

```
<cfset todayDate = Now()>
<body>
<h3>DateFormat Example</h3>
<p>Today's date is <cfoutput>#todayDate#</cfoutput>.
<p>Using DateFormat, we can display that date in different ways:
<cfoutput>
<ul>
  <li>#DateFormat(todayDate)#
  <li>#DateFormat(todayDate, "mmm-dd-yyyy")#
  <li>#DateFormat(todayDate, "mmm d, yyyy")#
  <li>#DateFormat(todayDate, "mm/dd/yyyy")#
  <li>#DateFormat(todayDate, "d-mmm-yyyy")#
  <li>#DateFormat(todayDate, "ddd, mmmm dd, yyyy")#
  <li>#DateFormat(todayDate, "short")#
  <li>#DateFormat(todayDate, "medium")#
  <li>#DateFormat(todayDate, "long")#
  <li>#DateFormat(todayDate, "full")#
</ul>
</cfoutput>
```

## DatePart

### Description

Extracts a part from a date value.

### Returns

Part of a date, as an integer.

### Category

[Date and time functions](#)

### Function syntax

```
DatePart("datepart", "date")
```

### See also

[DateAdd](#), [DateConvert](#)

### History

ColdFusion MX 6.1: Added the *datepart* character L or l to represent milliseconds.

### Parameters

Parameter	Description
datepart	String: <ul style="list-style-type: none"><li>• yyyy: Year</li><li>• q: Quarter</li><li>• m: Month</li><li>• y: Day of year</li><li>• d: Day</li><li>• w: Weekday</li><li>• ww: Week</li><li>• h: Hour</li><li>• n: Minute</li><li>• s: Second</li><li>• l: Millisecond</li></ul>
date	Date/time object, in the range 100 AD–9999 AD.

### Usage

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

### Example

```
<!--- This example shows information available from DatePart --->
<cfset todayDate = Now()>
<h3>DatePart Example</h3>
<p>Today's date is <cfoutput>#todayDate#</cfoutput>.
<p>Using datepart, we extract an integer representing the dateparts from that value
<cfoutput>
<ul>
  <li>year: #DatePart("yyyy", todayDate)#</li>
  <li>quarter: #DatePart("q", todayDate)#</li>
  <li>month: #DatePart("m", todayDate)#</li>
  <li>day of year: #DatePart("y", todayDate)#</li>
  <li>day: #DatePart("d", todayDate)#</li>
  <li>weekday: #DatePart("w", todayDate)#</li>
  <li>week: #DatePart("ww", todayDate)#</li>
  <li>hour: #DatePart("h", todayDate)#</li>
  <li>minute: #DatePart("n", todayDate)#</li>
  <li>second: #DatePart("s", todayDate)#</li>
</ul>
</cfoutput>
```

## Day

### Description

Determines the day of the month, in a date.

### Returns

The ordinal for the day of the month, ranging from 1 to 31.

### Category

[Date and time functions](#)

### Function syntax

```
Day("date")
```

### See also

[DayOfWeek](#), [DayOfWeekAsString](#), [DayOfYear](#), [DaysInMonth](#), [DaysInYear](#), [FirstDayOfMonth](#)

### Parameters

Parameter	Description
date	Date/time object, in the range 100 AD–9999 AD.

### Usage

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the [CreateDate](#) function or [Now](#) function as the date parameter of this function; for example:

```
#Day(CreateDate(2001, 3, 3))#
```

### Example

```
<h3>Day Example</h3>
<cfif IsDefined("FORM.year")>
    <p>More information about your date:
    <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
    <cfoutput>
        <p>Date: #DateFormat(yourDate)#. <br>
        It is #DayOfWeekAsString(DayOfWeek(yourDate))#,
        day #DayOfWeek(yourDate)# in the week.
        <br>This is day #Day(YourDate)#
        in the month of #MonthAsString(Month(yourDate))#,
        which has #DaysInMonth(yourDate)# days.
        <br>We are in week #Week(yourDate)# of #Year(YourDate)#
        (day #DayOfYear(yourDate)# of #DaysInYear(yourDate)#).
        <br><cfif IsLeapYear(Year(yourDate))>This is a leap year
        <cfelse>This is not a leap year</cfif>
    </cfoutput>
</cfif>
```

## DayOfWeek

### Description

Determines the day of the week, in a date.

### Returns

The ordinal for the day of the week, as an integer in the range 1 (Sunday) to 7 (Saturday).

### Category

[Date and time functions](#)

### Function syntax

```
DayOfWeek("date")
```

### See also

[Day](#), [DayOfWeekAsString](#), [DayOfYear](#), [DaysInMonth](#), [DaysInYear](#), [FirstDayOfMonth](#)

### Parameters

Parameter	Description
date	Date/time object, in the range 100 AD–9999 AD.

### Usage

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the [CreateDate](#) function or [Now](#) function as the date parameter of this function; for example, `#DayOfWeek(CreateDate(2001, 3, 3))#`

### Example

```
<h3>DayOfWeek Example</h3>
<cfif IsDefined("FORM.year")>
    More information about your date:
    <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
    <cfoutput>
        <p>Your date, #DateFormat(yourDate)#.
        <br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day
            #DayOfWeek(yourDate)# in the week.
        <br>This is day #Day(yourDate)# in the month of
            #MonthAsString(Month(yourDate))#, which has
            #DaysInMonth(yourDate)# days.
        <br>We are in week #Week(yourDate)# of #Year(yourDate)# (day
            #DayOfYear(yourDate)# of #DaysInYear(yourDate)#).
        <br><cfif IsLeapYear(Year(yourDate))>This is a leap year
            <cfelse>This is not a leap year</cfif>
    </cfoutput>
</cfif>
```

## DayOfWeekAsString

### Description

Determines the day of the week, in a date, as a string function.

### Returns

The day of the week, as a string in the current locale, that corresponds to *day\_of\_week*.

### Category

[Date and time functions](#), [String functions](#)

### Function syntax

```
DayOfWeekAsString(day_of_week [, locale])
```

### See also

[Day](#), [DayOfWeek](#), [DayOfYear](#), [DaysInMonth](#), [DaysInYear](#), [FirstDayOfMonth](#)

### History

ColdFusion 8: Added the *locale* parameter.

ColdFusion MX 7: Changed behavior. The returned string is now in the language of the current locale.

### Parameters

Parameter	Description
<i>day_of_week</i>	Integer, in the range 1 (Sunday) - 7 (Saturday).
<i>locale</i>	Locale to use instead of the locale of the page when processing the function

### Example

The following example shows the use of the `DayOfWeekAsString` function. It is the action page for a form that submits year, month, and day fields.

```
<h3>DayOfWeekAsString Example</h3>
<cfif IsDefined("FORM.year")>
More information about your date:
<cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>

<cfoutput>
<p>Your date, #DateFormat(yourDate)#.
<br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day
    #DayOfWeek(yourDate)# in the week.
<br>This is day #Day(YourDate)# in the month of
    #MonthAsString(Month(yourDate))#, which has
    #DaysInMonth(yourDate)# days.
<br>We are in week #Week(yourDate)# of #Year(YourDate)# (day #DayOfYear(yourDate)#
    of #DaysInYear(yourDate)#).
<br><cfif IsLeapYear(Year(yourDate))>This is a leap year
    <cfelse>This is not a leap year</cfif>
</cfoutput>
</cfif>
```

## DayOfYear

### Description

Determines the day of the year, in a date.

### Returns

The ordinal value of day of the year, as an integer.

### Category

[Date and time functions](#)

### Function syntax

```
DayOfYear("date")
```

### See also

[Day](#), [DayOfWeek](#), [DayOfWeekAsString](#), [DaysInMonth](#), [DaysInYear](#), [FirstDayOfMonth](#)

### Parameters

Parameter	Description
date	Date/time object, in the range 100 AD–9999 AD.

### Usage

This function accounts for leap years.

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the [CreateDate](#) function or [Now](#) function as the date parameter of this function; for example, `#DayOfYear(CreateDate(2001, 3, 3))#`

### Example

```
<h3>Day7OfYear Example</h3>
<cfif IsDefined("FORM.year")>
    More information about your date:
    <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
    <cfoutput>
        <p>Your date, #DateFormat(yourDate)#.
        <br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#,
            day #DayOfWeek(yourDate)# in the week.
        <br>This is day #Day(yourDate)# in the month of
            #MonthAsString(Month(yourDate))#, which has
            #DaysInMonth(yourDate)# days.
        <br>We are in week #Week(yourDate)# of #Year(yourDate)#
            (day #DayOfYear(yourDate)# of #DaysInYear(yourDate)#).
        <br><cfif IsLeapYear(Year(yourDate))>This is a leap year
            <cfelse>This is not a leap year</cfif>
    </cfoutput>
</cfif>
```

## DaysInMonth

### Description

Determines the number of days in a month.

### Returns

The number of days in the month in *Date*.

### Category

[Date and time functions](#)

### Function syntax

```
DaysInMonth("date")
```

### See also

[Day](#), [DayOfWeek](#), [DayOfWeekAsString](#), [DayOfYear](#), [DaysInYear](#), [FirstDayOfMonth](#)

### Parameters

Parameter	Description
date	Date/time object, in the range 100 AD–9999 AD.

### Usage

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the [Now](#) function or the [CreateDate](#) function as the date parameter of this function; for example:  
`#DaysInMonth(CreateDate(2001, 3, 3))#`

### Example

```
<h3>DaysInMonth Example</h3>
<cfif IsDefined("FORM.year")>
    More information about your date:
    <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
    <cfoutput>
        <p>Your date, #DateFormat(yourDate)#.
        <br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day
            #DayOfWeek(yourDate)# in the week.
        <br>This is day #Day(yourDate)# in the month of
            #MonthAsString(Month(yourDate))#, which has
            #DaysInMonth(yourDate)# days.
        <br>We are in week #Week(yourDate)# of #Year(yourDate)#
            (day #DayOfYear(yourDate)# of #DaysInYear(yourDate)#).
        <br><cfif IsLeapYear(Year(yourDate))>This is a leap year
            <cfelse>This is not a leap year</cfif>
    </cfoutput>
</cfif>
```

## DaysInYear

### Description

Determines the number of days in a year.

### Returns

The number of days in a year.

### Category

[Date and time functions](#)

### Function syntax

```
DaysInYear("date")
```

### See also

[Day](#), [DayOfWeek](#), [DayOfWeekAsString](#), [DayOfYear](#), [DaysInMonth](#), [FirstDayOfMonth](#), [IsLeapYear](#)

### Parameters

Parameter	Description
date	Date/time object, in the range 100 AD–9999 AD.

### Usage

DaysInYear accounts for leap years.

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a numeric representation of a date/time object.

**Note:** You can pass the [CreateDate](#) function or the [Now](#) function as the date parameter of this function; for example:  
`#DaysInYear(CreateDate(2001, 3, 3))#`

### Example

```
<h3>DaysInYear Example</h3>
<cfif IsDefined("FORM.year")>
    More information about your date:
    <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
    <cfoutput>
        <p>Your date, #DateFormat(yourDate)#.
        <br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day
            #DayOfWeek(yourDate)# in the week.
        <br>This is day #Day(yourDate)# in the month of
            #MonthAsString(Month(yourDate))#, which has
            #DaysInMonth(yourDate)# days.
        <br>We are in week #Week(yourDate)# of #Year(yourDate)# (day
            #DayOfYear(yourDate)# of #DaysInYear(yourDate)#).
    </cfoutput>
</cfif>
```

## DE

### Description

Escapes any double-quotation marks in the parameter and wraps the result in double-quotation marks.

### Returns

Parameter, surrounded by double-quotation marks, with any inner double-quotation marks escaped.

### Category

[Dynamic evaluation functions](#)

### Function syntax

`DE(string)`

### See also

[Evaluate](#), [IIf](#), [PrecisionEvaluate](#), Using Expressions and Number Signs in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
string	String to evaluate, after delay

### Usage

The `DE` function postpones evaluation of a string that is passed as a parameter to the [IIf](#), [Evaluate](#), or [PrecisionEvaluate](#) functions.

This function is especially useful with the `IIf` function, which automatically evaluates its second and third parameters as expressions. You can use the `DE` function to prevent the function from evaluating a string parameter that is to be output as a variable, and must not be treated as an expression. The following example shows this use; it uses `IIf` to alternate table-row background colors, white and gray, and uses the `DE` function to prevent ColdFusion from evaluating the color strings.

```
<cfoutput>
<table border="1" cellpadding="3">
<cfloop index="i" from="1" to="10">
    <tr bgcolor="#IIf( i mod 2 eq 0, DE("white"), DE("gray") )#">
        <td>
            hello #i#
        </td>
    </tr>
</cfloop>
</table>
</cfoutput>
```

The `DE` function does not delay evaluation of variable names that are surrounded by number signs (`#`). The ColdFusion function evaluates the variable regardless of whether the `DE` function is present.

The following example shows how you can use the `DE` function and number signs together, and shows how the function works with an `IIf` function:

```
<cfoutput>
<cfset var1="Blue">
<cfset var2="Green">
<cfset myresult=IIf( 1 eq 2, DE(#Var1#), DE(#Var2#))>
The expression is #myresult#
</cfoutput>
```

ColdFusion processes this code as follows:

- 1 ColdFusion sets the variables `var1` and `var2` to be the strings Blue and Green.
- 2 In the fourth line, ColdFusion evaluates the variables surrounded by number signs first, replacing them with the strings Blue and Green, the values of the variables.
- 3 The `IIF` function evaluates the test expression, determines that it is False, and then evaluates the third parameter.
- 4 The third parameter is a `DE` function, which takes the string Green and surrounds it in quotation marks
- 5 The `IIF` function returns the string "Green", including the quotation marks.
- 6 The `cfset` tag gets the expression `result="Green"`, and sets the value of the `myresult` variable to the string Green.
- 7 ColdFusion evaluates `#myresult#` in the output text, replaces the variable with its value, the string Green, and displays the result.

### Example

```
<!--- This example shows the use of DE and Evaluate --->
<h3>DE Example</h3>
<cfif IsDefined("FORM.myExpression")>
    <cftry>
        <!--- Show the expression and the results of evaluating it --->
        <cfoutput>
            <h3>Evaluate the Expression #FORM.MyExpression#</h3>
        </cfoutput>
        The code:<br>
        #Evaluate(FORM.myExpression)#
        <br><br>
        The result:<br>
        <cfoutput>
            #Evaluate(FORM.myExpression)#
        </cfoutput>

        <h3>Use DE to prevent the Evaluate function from evaluating</h3>
        The code:<br>
        #Evaluate(DE(FORM.MyExpression))#<br><br>
        The result:<br>
        <cfoutput>
```

```
        #Evaluate(DE(FORM.MyExpression))#
    </cfoutput>
    <!--- Error handling code for bad expressions and any other error.--->
    <cfcatch type = "Any">
    <!--- the message to display --->
        <h3>Sorry, there's been an <B>Error</B>.
        Try a simple expression, such as "2+2".</h3>
        <cfoutput>
        <!--- Display the diagnostic message from ColdFusion. --->
            <p>#cfcatch.message#
        </cfoutput>
    </cfcatch>
    </cftry>
</cfif>

<h3>Enter any valid ColdFusion expression</h3>
<cfform>
    <cfinput name="myExpression" type="Text" size="40">
    <cfinput type="submit" name="submitit">
</cfform>
```

## DecimalFormat

### Description

Converts a number to a decimal-formatted string.

### Returns

A *number* as a string formatted with two decimal places and a thousands separator.

### Category

[Display and formatting functions](#)

### Function syntax

DecimalFormat (*number*)

### See also

[DollarFormat](#), [NumberFormat](#)

### Parameters

Parameter	Description
number	Number to format

### Example

```
<h3>DecimalFormat Function</h3>
<p>Returns a number to two decimal places.
<p>
<cfloop FROM = 1 TO = 20 INDEX = "counter">
    <cfoutput>
        #counter# * Square Root of 2:
        #DecimalFormat(counter * sqr(2))#
    </cfoutput>
    <br>
</cfloop>
```

## DecrementValue

### Description

Decrements the integer part of a number.

### Returns

Integer part of *number*, decremented by one.

### Category

[Mathematical functions](#)

### Function syntax

DecrementValue (*number*)

### See also

[IncrementValue](#)

### Parameters

Parameter	Description
number	Number to decrement

### Example

```
<h3>DecrementValue Example</h3>
<p>Returns the integer part of a number decremented by one.</p>
<p>DecrementValue(0) :
    <cfoutput>#DecrementValue(0)#</cfoutput></p>
<p>DecrementValue("1") :
    <cfoutput>#DecrementValue("1")#</cfoutput></p>
<p>DecrementValue(123.35) :
    <cfoutput>#DecrementValue(123.35)#</cfoutput></p>
```

## Decrypt

### Description

Decrypts a string that is encrypted using a standard encryption technique, including strings encrypted by the `Encrypt` function.

### Returns

An unencrypted string.

### Category

[Security functions](#), [String functions](#)

### Function syntax

```
Decrypt(encrypted_string, key[, algorithm, encoding, IVorSalt, iterations])
```

### See also

[Duplicate](#), [Encrypt](#)

### History

ColdFusion 8: Added support for encryption using the RSA BSafe Crypto-J library on Enterprise Edition.

ColdFusion MX 7.01: Added the *IVorSalt* and *iterations* parameters.

ColdFusion MX 7: Added the *algorithm* and *encoding* parameters.

### Parameters

Parameter	Description
<code>encrypted_string</code>	String to decrypt.
<code>key</code>	String. For the CFMX_COMPAT algorithm, the seed that was used to encrypt the string; for all other algorithms, the string generated by the <code>generateSecretKey()</code> method.
<code>algorithm</code>	<p>(Optional) The Enterprise Edition of ColdFusion installs the RSA BSafe Crypto-J library, which provides FIPS-140 Compliant Strong Cryptography. For a list of algorithms, see the <a href="#">Encrypt</a> function.</p> <p>The Standard Edition of ColdFusion installs a cryptography library with the following algorithms:</p> <ul style="list-style-type: none"><li>• CFMX_COMPAT: the algorithm used in ColdFusion MX and prior releases. This algorithm is the least secure option (default).</li><li>• AES: the Advanced Encryption Standard specified by the National Institute of Standards and Technology (NIST) FIPS-197.</li><li>• BLOWFISH: the Blowfish algorithm defined by Bruce Schneier.</li><li>• DES: the Data Encryption Standard algorithm defined by NIST FIPS-46-3.</li><li>• DESEDE: the "Triple DES" algorithm defined by NIST FIPS-46-3.</li></ul> <p>If you install a security provider with additional cryptography algorithms, you can also specify any of its string encryption and decryption algorithms.</p>

Parameter	Description
encoding	(Optional; if you specify this parameter, also specify the algorithm parameter.) The binary encoding used to represent the data as a string. Must be the same as the algorithm used to encrypt the string. <ul style="list-style-type: none"><li>• Base64: the Base64 algorithm, as specified by IETF RFC 2045.</li><li>• Hex: the characters A-F and 0-9 represent the hexadecimal byte values.</li><li>• UU: the UNIX standard UUEncode algorithm (default).</li></ul>
IVorSalt	(Optional) Specify this parameter to adjust ColdFusion encryption to match the details of other encryption software. If you specify this parameter, also specify the algorithm parameter. <ul style="list-style-type: none"><li>• For Block Encryption Algorithms: The binary Initialization Vector value to use with the algorithm. The algorithm must contain a Feedback Mode other than ECB. This must be a binary value that is exactly the same size as the algorithm block size.</li><li>• For Password Based Encryption Algorithms: The binary Salt value to transform the password into a key.</li></ul>
iterations	(Optional) The number of iterations to transform the password into a binary key. Specify this parameter to adjust ColdFusion encryption to match the details of other encryption software. If you specify this parameter, also specify the algorithm parameter with a Password Based Encryption (PBE) algorithm. Do not specify this parameter for Block Encryption Algorithms. Use the same value to encrypt and decrypt the data.

### Usage

This function uses a symmetric key-based algorithm, in which the same key is used to encrypt and decrypt a string. The parameter values must match the values used to encode string. The security of the encrypted string depends on maintaining the secrecy of the key.

ColdFusion uses the Java Cryptography Extension (JCE) and installs a Sun Java runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Adobe cannot provide technical support for third-party security providers.

### Example

```
<h3>Decrypt Example</h3>

<!-- Do the following if the form has been submitted. -->
<cfif IsDefined("Form.myString")>
    <cfscript>
        /* GenerateSecretKey does not generate key for the CFMX_COMPAT algorithm,
        so use the key from the form.
        */
        if (Form.myAlgorithm EQ "CFMX_COMPAT")
            theKey=Form.MyKey;
        // For all other encryption techniques, generate a secret key.
        else
            theKey=generateSecretKey(Form.myAlgorithm);
        //Encrypt the string
        encrypted=encrypt(Form.myString, theKey, Form.myAlgorithm,
            Form.myEncoding);
        //Decrypt it
        decrypted=decrypt(encrypted, theKey, Form.myAlgorithm, Form.myEncoding);
    </cfscript>

    <!-- Display the values used for encryption and decryption,
        and the results. -->
```

```
<cfoutput>
  <b>The algorithm:</b> #Form.myAlgorithm#<br>
  <b>The key:</b> #theKey#<br>
  <br>
  <b>The string:</b> #Form.myString# <br>

```

## DecryptBinary

### Description

Decrypts encrypted binary data with the specified key, value, algorithm, salt, and iterations.

### Returns

Unencrypted binary data.

### Category

[Security functions](#), [String functions](#)

### Function syntax

```
DecryptBinary(bytes, key[, algorithm, IVorSalt, iterations])
```

**See also**[Duplicate](#), [Encrypt](#), [Decrypt](#)**History**

ColdFusion 8: Added support for encryption using the RSA BSafe Crypto-J library on Enterprise Edition.

ColdFusion MX 7.01: Added this function.

**Parameters**

Parameter	Description
bytes	Binary data to decrypt.
key	String. For the CFMX_COMPAT algorithm, the seed that was used to encrypt the binary data; for all other algorithms, the string generated by the <code>generateSecretKey()</code> method.
algorithm	<p>(Optional) The Enterprise Edition of ColdFusion installs the RSA BSafe Crypto-J library, which provides FIPS-140 Compliant Strong Cryptography. For a list of algorithms, see the <a href="#">Encrypt</a> function.</p> <p>The Standard Edition of ColdFusion installs a cryptography library with the following algorithms:</p> <ul style="list-style-type: none"><li>• CFMX_COMPAT: the algorithm used in ColdFusion MX and prior releases. This algorithm is the least secure option (default).</li><li>• AES: the Advanced Encryption Standard specified by the National Institute of Standards and Technology (NIST) FIPS-197.</li><li>• BLOWFISH: the Blowfish algorithm defined by Bruce Schneier.</li><li>• DES: the Data Encryption Standard algorithm defined by NIST FIPS-46-3.</li><li>• DESEDE: the "Triple DES" algorithm defined by NIST FIPS-46-3.</li></ul> <p>If you install a security provider with additional cryptography algorithms, you can also specify any of its string encryption and decryption algorithms.</p>
IvorSalt	<p>(Optional) Specify this parameter to adjust ColdFusion encryption to match the details of other encryption software. If you specify this parameter, also specify the <code>algorithm</code> parameter.</p> <ul style="list-style-type: none"><li>• For Block Encryption Algorithms: The binary Initialization Vector value to use with the algorithm. The algorithm must contain a Feedback Mode other than ECB. This must be a binary value that is exactly the same size as the algorithm block size.</li><li>• For Password Based Encryption Algorithms:- This is the binary Salt value to transform the password into a key.</li></ul>
iterations	<p>(Optional) The number of iterations to transform the password into a binary key. Specify this parameter to adjust ColdFusion encryption to match the details of other encryption software. If you specify this parameter, also specify the <code>algorithm</code> parameter with a Password Based Encryption (PBE) algorithm. Do not specify this parameter for Block Encryption Algorithms. Use the same value to encrypt and decrypt the data.</p>

**Usage**

This function uses a symmetric key-based algorithm, in which the same key is used to encrypt and decrypt data. The parameter values must match the values used to encode the string. The security of the encrypted string depends on maintaining the secrecy of the key.

ColdFusion uses the Java Cryptography Extension (JCE) and installs a Sun Java runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Adobe cannot provide technical support for third-party security providers.

### Example

```
<h3>DecryptBinary Example</h3>
<!--- Do the following if the form has been submitted. --->
<cfif IsDefined("Form.myfile")>
<cffile file="#Form.myfile#" action="readBinary" variable="myData">
<cfscript>
/* GenerateSecretKey does not generate key for the CFMX_COMPAT algorithm,
so use the key from the form.
*/
if (Form.myAlgorithm EQ "CFMX_COMPAT")
theKey=Form.MyKey;
// For all other encryption techniques, generate a secret key.
else
theKey=generateSecretKey(Form.myAlgorithm);
//Encrypt the string
encrypted=encryptBinary(myData, theKey, Form.myAlgorithm);
//Decrypt it
decrypted=decryptBinary(encrypted, theKey, Form.myAlgorithm);
</cfscript>
<cfset encfile="#Form.myfile#" & "_enc">
<cfset decfile="#Form.myfile#" & "_dec">
<cffile file="#encfile#" action="write" output="#encrypted#">
<cffile file="#decfile#" action="write" output="#decrypted#">
<!--- Display the values used for encryption and decryption,
and the results. --->
<cfoutput>
<b>The algorithm:</b> #Form.myAlgorithm#<br>
<b>The key:</b> #theKey#<br>
<br>
<b>The InputFile:</b> #Form.myfile# <br>
<br>
<b>Encrypted:</b> #encfile#<br>
<br>
<b>Decrypted:</b> #decfile#<br>
</cfoutput>
</cfif>
<!--- The input form. --->
<form action="#CGI.SCRIPT_NAME#" method="post">
<b>Select the algorithm</b><br>
    <select size="1" name="myAlgorithm">
        <option selected>CFMX_COMPAT</option>
        <option>AES</option>
        <option>DES</option>
        <option>DESEDE</option>
    </select><br>
<br>
<b>Input your key</b> (used for CFMX_COMPAT encryption only)<br>
<input type = "Text" name = "myKey" value = "MyKey"><br>
<br>
<b>Enter filename to encrypt</b><br>
<input type="text" name="myfile" value="Enter the path of the file to encrypt"><br>
<input type = "Submit" value = "Encrypt file ">
</form>
```

## DeleteClientVariable

### Description

Deletes a client variable. (To test for the existence of a variable, use `IsDefined`.)

### Returns

True, if the variable is successfully deleted; false, otherwise.

### Category

[Other functions](#)

### Function syntax

```
DeleteClientVariable("name")
```

### See also

[GetClientVariablesList](#)

### History

ColdFusion MX: Changed behavior: if the variable is not present, this function now returns False. (In earlier releases, it threw an error.)

### Parameters

Parameter	Description
name	Name of a client variable to delete, surrounded by double-quotation marks

### Example

```
<!--- This view-only example shows DeleteClientVariable --->
<h3>DeleteClientVariable Example</h3>

<p>This view-only example deletes a client variable called "User_ID", if it
    exists in the list of client variables returned by GetClientVariablesList.
<p>This example requires the existence of an Application.cfm file and client
    management to be in effect.
<!---
<cfset client.somevar = "">
<cfset client.user_id = "">
<p>Client variable list:<cfoutput>#GetClientVariablesList()#</cfoutput>
<cfif ListFindNoCase(GetClientVariablesList(), "User_ID") is not 0>

    <cfset temp = DeleteClientVariable("User_ID")>
    <p>Was variable "User_ID" Deleted? <cfoutput>#temp#</cfoutput>
</cfif>
<p>Amended Client variable list:<cfoutput>#GetClientVariablesList()#
</cfoutput>
--->
```

## DeserializeJSON

### Description

Converts a JSON (JavaScript Object Notation) string data representation into CFML data, such as a CFML structure or array.

### Returns

The data value in ColdFusion format: a structure, array, query, or simple value.

### Category

[Conversion functions](#)

### Syntax

```
DeserializeJSON(JSONVar[, strictMapping])
```

### See also

[IsJSON](#), [SerializeJSON](#), [cfajaxproxy](#), Using Ajax Data and Development Features in the *Developing ColdFusion Applications*, <http://www.json.org>

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
JSONVar	A string that contains a valid JSON construct, or variable that represents one.
strictMapping	A Boolean value that specifies whether to convert the JSON strictly, as follows: <ul style="list-style-type: none"><li>• <b>true:</b> (Default) Convert the JSON string to ColdFusion data types that correspond directly to the JSON data types.</li><li>• <b>false:</b> Determine if the JSON string contains representations of ColdFusion queries, and if so, convert them to queries.</li></ul>

### Usage

This function is useful any time a ColdFusion page receives data as JSON strings. It is useful in ColdFusion applications that use Ajax to represent data on the client browser, and lets you consume on the server JSON format data from the client-side Ajax JavaScript. You can also use it on pages that get data from services that supply data as JavaScript function calls with JSON parameters; the example shows this use case.

The `DeserializeJSON` function converts each JSON data type directly into the equivalent ColdFusion data type, as follows:

- If the `strictMapping` parameter is `true` (the default), all JSON objects become CFML structures.
- If the `strictMapping` parameter is `false`, ColdFusion determines if JSON objects represent queries and, if so, converts them to ColdFusion query object. All other JSON objects become ColdFusion structures. The `DeserializeJSON` function recognizes a JSON structure as a query and converts it properly if the structure uses either of the two query representation formats described in the [SerializeJSON](#) reference.
- JSON Arrays, Strings, and Numbers become ColdFusion arrays, strings, and numbers.
- The JSON `null` value becomes the string `null`.

- JSON string representations of a dates and times remain strings, but ColdFusion date/time handling code can recognize them as representing dates and times.

### Example

This example displays weather information from a JSON-format data feed that is generated by the example for the [SerializeJSON](#) function. Similar code might consume data that is exported as a JavaScript page. The feed is in the form of a JavaScript function call where the parameter is a JSON string that contains the feed data. The example does the following operations:

- 1 Uses a `cfhttp` tag to get the feed (in the `cfhttp.fileContent` variable).
- 2 Strips the function call wrapper from the text.
- 3 Uses the `IsJSON` function to check whether the result of the previous step is a valid JSON format string. If it is not, it displays a message and stops processing.
- 4 If the string is valid JSON text, uses the `DeserializeJSON` function to convert the string to a ColdFusion variable; in this case, a structure that contains two arrays that represent a ColdFusion query. The first array has the query column names, the second has the query data.
- 5 Parses the object and displays the contents of its arrays.

To run this example, put this file and the example for the [SerializeJSON](#) function in an appropriate location under your ColdFusion web root, replace the URL with the correct URL for the serialization example, and run this page.

```
<!--- Get the JSON Feed --->
<cfhttp url="http://localhost:8500/My_Stuff/Ajax/Books/CreateJSON_NEW.cfm">

<!--- JSON data is sometimes distributed as a JavaScript function.
      The following REReplace functions strip the function wrapper. --->
<cfset theData=REReplace(cfhttp.FileContent,
    "^\\s*[[[:word:]]*\\s*\\(\\s*", "")>
<cfset theData=REReplace(theData, "\\s*\\)\\s*$", "")>

<!--- Test to make sure you have JSON data. --->
<cfif !IsJSON(theData)>
    <h3>The URL you requested does not provide valid JSON</h3>
    <cfdump var="#theData#">

<!--- If the data is in JSON format, deserialize it. --->
<cfelse>
    <cfset cfData=DeserializeJSON(theData)>
    <!--- Parse the resulting array or structure and display the data.
          In this case, the data represents a ColdFusion query that has been
          serialized by the SerializeJSON function into a JSON structure with
          two arrays: an array column names, and an array of arrays,
          where the outer array rows correspond to the query rows, and the
          inner array entries correspond to the column fields in the row. --->
```

```
<!--- First, find the positions of the columns in the data array. --->
<cfset colList=ArrayToList(cfData.COLUMNS)>
<cfset cityIdx=ListFind(colList, "City")>
<cfset tempIdx=ListFind(colList, "Temp")>
<cfset fcstIdx=ListFind(colList, "Forecasts")>
<!--- Now iterate through the DATA array and display the data. --->
<cfoutput>
    <cfloop index="i" from="1" to="#ArrayLen(cfData.DATA)#">
        <h3>#cfData.DATA[i][cityIdx]#</h3>
        Current Temperature: #cfData.DATA[i][tempIdx]#<br><br>
        <b>Forecasts</b><br><br>
        <cfloop index="j" from="1" to="#ArrayLen(cfData.DATA[i][fcstIdx])#">
            <b>Day #j#</b><br>
            Outlook: #cfData.DATA[i][fcstIdx][j].WEATHER#<br>
            High: #cfData.DATA[i][fcstIdx][j].HIGH#<br>
            Low: #cfData.DATA[i][fcstIdx][j].LOW#<br><br>
        </cfloop>
    </cfloop>
</cfoutput>
</cfif>
```

## DirectoryCreate

### Description

Creates on-disk or in-memory directory.

### Category

[System functions](#)

### Function Syntax

DirectoryCreate(path)

### See Also

[DirectoryDelete](#), [DirectoryExists](#), [DirectoryList](#), [DirectoryRename](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
path	Absolute path of the directory to be created. Alternatively, you can specify IP address, as in the following example: DirectoryCreate("//12.3.123.123/c_drive/test");

### Usage

Ensure that you have the required permissions to run this function.

### Example

The following code illustrates how to create a directory:

```
<h2>DirectoryCreate Example</h2>
<h3>Enter a directory to create.</h3>
<cfform action = "directorycreate.cfm" method="post" preservedata="true" >
    <cfinput type = "text" required="true" name = "createDirectory">
    <br>
    <cfinput type = "submit" value="submit" name = "submit">
</cfform>

<cfif IsDefined("FORM.createDirectory")>
    <cfif FORM.createDirectory is not "">
        <cfset createDirectory = FORM.createDirectory>
        <cftry>
            <cfset DirectoryCreate(createDirectory)>
            <cfoutput><b>Directory #createDirectory# successfully created.</b></cfoutput>
        <cfcatch>
            <b>Error Message:</b><cfoutput>#cfcatch.message#</cfoutput><br/>
            <b>Error Detail:</b><cfoutput>#cfcatch.Detail#</cfoutput>
        </cfcatch>
        </cftry>
    </cfif>
</cfif>
```

## DirectoryDelete

### Description

Deletes on-disk or in-memory directory.

### Category

[System functions](#)

### Function syntax

DirectoryDelete(path [, recurse])

### See also

[DirectoryCreate](#), [DirectoryExists](#), [DirectoryList](#), [DirectoryRename](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
path	Absolute path of the directory to be deleted. Alternatively, you can specify IP address, as in the following example: DirectoryDelete("//12.3.123.123/c_drive/test");.
recurse	This is an optional parameter and the default value is false.  If true, the directory and the sub-directories are deleted.  If the directory (being deleted) has sub-directories and you set recurse to false, an exception occurs.

## Usage

Ensure that you have the required permissions to run this function.

## Example

```
<h2>DirectoryDelete Example</h2>
<h3>Enter a directory to delete.</h3>
<form action = "directoryDelete.cfm" method="post">
  <label for="delDirectory">Directory Path: </label><input type = "text" id="delDirectory"
name = "delDirectory">
  <br>
  <label for="recurse">Recurse: </label><input id="recurse" type="checkbox" value="recurse"
name="recurse">
  <br>
  <input type = "submit" value="submit" name = "submit" onclick='return confirm("Are you sure
!!!");'>
</form>
<cfif IsDefined("FORM.delDirectory")>
  <cfif FORM.delDirectory is not "">
    <cfset delDirectory = FORM.delDirectory>
    <cfset recurse = false>
    <cfif isDefined("FORM.recurse")>
      <cfset recurse = true>
    </cfif>
    <cftry>
      <cfset DirectoryDelete(delDirectory,recurse)>
      <cfoutput><p>Directory <b>#delDirectory#</b> has been deleted.</cfoutput>
    <cfcatch>
      <b>Error Message:</b><cfoutput>#cfcatch.message#</cfoutput><br/>
      <b>Error Detail:</b><cfoutput>#cfcatch.Detail#</cfoutput>
    </cfcatch>
    </cftry>
  </cfif>
</cfif>
```

## DirectoryExists

### Description

Determines whether on-disk or in-memory directory exists.

### Returns

Yes, if the specified directory exists; No, otherwise.

### Category

[System functions](#)

### Function syntax

DirectoryExists(*absolute\_path*)

### See also

[DirectoryCreate](#), [DirectoryDelete](#), [DirectoryList](#), [DirectoryRename](#)

### Parameters

Parameter	Description
<code>absolute_path</code>	An absolute on-disk or in-memory path. Alternatively, you can specify IP address as in the following example: <code>DirectoryExists("//12.3.123.123/c_drive/test");</code>

### Example

```
<h3>DirectoryExists Example</h3>
<h3>Enter a directory to check for existence.</h2>
<form action = "directoryexists.cfm" method="post">
    <input type = "text" name = "yourDirectory">
    <br>
    <input type = "submit" name = "submit">
</form>

<cfif IsDefined("FORM.yourDirectory")>
    <cfif FORM.yourDirectory is not "">
        <cfset yourDirectory = FORM.yourDirectory>
        <cfif DirectoryExists(yourDirectory)>
            <cfoutput>
                <p>Your directory exists. Directory name: #yourDirectory#
            </cfoutput>
        <cfelse>
            <p>Your directory does not exist.</p>
        </cfif>
    </cfif>
</cfif>
```

## DirectoryList

### Description

Lists the contents of on-disk or in-memory directory. Also lists the contents of the sub-directories if `recurse` is set to `true`.

### Returns

Contents of the directory based on the parameter `listInfo`:

- If `listInfo="query"`, query object
- If `listInfo="name"`, array of names
- If `listInfo="path"`, array of path

### Category

[System functions](#)

### Function Syntax

```
DirectoryList(path [,recurse] [,listInfo] [,filter] [,sort])
```

### See Also

[DirectoryCreate](#), [DirectoryDelete](#), [DirectoryExists](#), [DirectoryRename](#)

### Parameters

Parameter	Description
path	The absolute path of the directory for which to list the contents. Alternatively, you can specify IP address as in the following example: <code>DirectoryList("//12.3.123.123/c_drive/test");</code> .
recurse	Whether ColdFusion performs the action on subdirectories:  If <code>true</code> , contents of all subdirectories are also listed.
listInfo	<ul style="list-style-type: none"> <li><code>name</code>: returns an array of names of files and directories.</li> <li><code>path</code>: returns an array of paths of files and directories.</li> <li><code>query</code>: returns a query.</li> </ul>
filter	File extension filter applied to returned names, for example, <code>*.cfm</code> . One filter can be applied.
sort	<p>Query columns by which to sort a directory listing. Delimited list of columns from query output.</p> <p>To qualify a column, use one of the following values:</p> <ul style="list-style-type: none"> <li><code>asc</code>: ascending (a to z) sort order.</li> <li><code>dec</code>: descending (z to a) sort order.</li> </ul> <p>For example:</p> <pre>sort = "directory ASC, size DESC, datelastmodified"</pre>

### Usage

Ensure that you have the required permissions to run this function.

### Example

The following code dumps the contents of a directory:

```
<h2>DirectoryList Example</h2>
<h3>Enter a directory for Listing.</h3>
<cfform action = "directoryList.cfm" method="post" preservedata="true" >
  <label for="listDirectory">Directory Path: </label><cfinput type = "text"
id="listDirectory" name = "listDirectory">
  <br />
  <label for="recurse">Recurse: </label><cfinput id="recurse" type="checkbox"
value="recurse" name="recurse">
  <br />
  <label for="listInfo">List Info: </label>
  <cfselect name="listInfo" id="listInfo">
    <option value="name">name</option>
    <option value="path">path</option>
    <option value="query">query</option>
  </cfselect>
  <br />
  <label for="filter">Filter: </label><cfinput id="filter" type="text" value=""
name="filter">
  <br />
  <input type = "submit" value="submit" name = "submit">
</cfform>
```

```
<cfif IsDefined("FORM.listDirectory")>
    <cfif FORM.listDirectory is not ">
    <cfset listDirectory = FORM.listDirectory>
    <cfset recurse = false>
    <cfif isDefined("FORM.recurse")>
        <cfset recurse = true>
    </cfif>
    <cfset listInfo = FORM.listInfo>
    <cfset filter = FORM.filter>
    <cftry>
        <cfset res= DirectoryList(listDirectory, recurse, listInfo, filter)>
        <cfoutput><b>Content of Directory #listDirectory#: </b></cfoutput>
        <cfdump var="#res#">
        <cfcatch>
            <b>Error Message:</b><cfoutput>#cfcatch.message#</cfoutput><br/>
            <b>Error Detail:</b><cfoutput>#cfcatch.Detail#</cfoutput>
        </cfcatch>
    </cftry>
</cfif>
</cfif>
```

## DirectoryRename

### Description

Renames on-disk or in-memory directory.

### Category

[System functions](#)

### Function Syntax

DirectoryRename(currentName, newName)

### See Also

[DirectoryCreate](#), [DirectoryDelete](#), [DirectoryExists](#), [DirectoryList](#)

### Usage

Ensure that you have the required permissions to run this function.

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
currentName	Absolute path of the directory to be renamed. Alternatively, you can specify IP address, for example, DirectoryRename("//12.3.123.123/c_drive/test");
newName	Name with which the directory has to be renamed.

### Example

```
<h2>DirectoryRename Example</h2>
<h3>Enter a directory to rename.</h3>
<cfform action = "directoryRename.cfm" method="post" preservedata="true" >
    <label for="renameDirectory">Directory to rename: </label><cfinput required="true" type =
"text" id="renameDirectory" name = "renameDirectory">
    <br/>
    <label for="newName">New Name: </label><cfinput required="true" type="text" id="newName"
name = "newName">
    <br/>
    <input type = "submit" value="submit" name="submit">
</cfform>

<cfif IsDefined("FORM.renameDirectory") and IsDefined("FORM.newName") >
    <cfif FORM.renameDirectory is not "" and FORM.newName is not "">
        <cfset renameDirectory = FORM.renameDirectory>
        <cfset newName = FORM.newName>
        <cftry>
            <cfset DirectoryRename(renameDirectory,newName)>
            <cfoutput><b>Directory #renameDirectory# renamed to newName</b></cfoutput>
        <cfcatch>
            <b>Error Message:</b><cfoutput>#cfcatch.message#</cfoutput><br/>
            <b>Error Detail:</b><cfoutput>#cfcatch.Detail#</cfoutput>
        </cfcatch>
        </cftry>
    </cfif>
</cfif>
```

## DollarFormat

### Description

Formats a string in U.S. format. (For other currencies, use [LSCurrencyFormat](#) or [LSEuroCurrencyFormat](#) .

### Returns

A number as a string, formatted with two decimal places, thousands separator, and dollar sign. If *number* is negative, the return value is enclosed in parentheses. If *number* is an empty string, returns zero.

### Category

[Display and formatting functions](#)

### Function syntax

DollarFormat (*number*)

### See also

[DecimalFormat](#), [NumberFormat](#)

### Parameters

Parameter	Description
number	Number to format

### Example

```
<!--- This example shows the use of DollarFormat --->
...
<h3>DollarFormat Example</h3>
<cfloop from = 8 to = 50 index = counter>
    <cfset full = counter>
    <cfset quarter = counter + (1/4)>
    <cfset half = counter + (1/2)>
    <cfset threefourth = counter + (3/4)>
    <cfoutput>
        <pre>
bill#DollarFormat(full)##DollarFormat(quarter)#
  #DollarFormat(half)# #DollarFormat(threefourth)#
18% tip#DollarFormat(full * (18/100))#
  #DollarFormat(quarter * (18/100))#
  #DollarFormat(half * (18/100))#
  #DollarFormat(threefourth * (18/100))#
        </pre>
    </cfoutput>
</cfloop>
...
```

## DotNetToCFType

### Description

Explicitly converts a value returned by a .NET method to the corresponding ColdFusion data type.

### Returns

A ColdFusion data value.

### Category

[Structure functions](#), [System functions](#)

### Function syntax

`DotNetToCFType(variable_name)`

### See also

[CreateObject](#): .NET object, [cfobject](#): .NET object, Converting between .NET and ColdFusion data types in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
variable_name	Name of the .NET variable to convert

### Usage

For detailed information on when and why you use this function, see *Working with complex .NET data types in the Developing ColdFusion Applications*.

### Example

The following example creates a .NET System.Data.DataTable object and converts it to a ColdFusion query.

```
<!---Create a SQL Command Object--->
<cfobject action="create" name="sqlCommandObject"
    class="System.Data.SqlClient.SqlCommand" type=".Net"
    assembly="#assemblyList#">

<cfset sqlCommandObject.init("SELECT [ID], [FriendlyName] FROM [Batch]",
    sqlConnectionObject)>

<cfset sqlDataReaderObject = sqlCommandObject.ExecuteReader()>

<cfset dataTable = createObject(".net", "System.Data.DataTable",
    assemblyList)>
<!--- populate the datatable --->
<cfset dataTable.load(sqlDataReaderObject)>

<!--- convert to cfquery --->
<cfset myquery=DotNetToCFType(dataTable)>
```

## Duplicate

### Description

Returns a clone, also known as a deep copy, of a variable. There is no reference to the original variable.

### Returns

A clone of a variable.

### Category

[Structure functions](#), [System functions](#)

### Function syntax

```
Duplicate(variable_name)
```

### See also

[StructCopy](#), other [Structure functions](#); Modifying a ColdFusion XML object in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Changed behavior: this function can duplicate CFCs.

ColdFusion MX: Changed behavior: this function can be used on XML objects.

### Parameters

Parameter	Description
variable_name	Name of a variable to duplicate

### Usage

Use this function to duplicate complex structures, such as nested structures and queries.

When you duplicate a CFC instance, the entire CFC contents is copied, including the values of the variables in the `this` scope at the time you call the `Duplicate` function. Thereafter, the two CFC instances are independent, and changes to one copy, for example by calling one of its functions, have no effect on the other copy.

**Note:** With this function, you cannot duplicate a COM, CORBA, or JAVA object returned from the `cfobject` tag or the `CreateObject` function. If an array element or structure field is a COM, CORBA, or JAVA object, you cannot duplicate the array or structure.

### Example

```
<h3>Duplicate Example</h3>
<cfset s1 = StructNew()>
<cfset s1.nested = StructNew()>
<cfset s1.nested.item = "original">
<cfset copy = StructCopy(s1)>
<cfset clone = Duplicate(s1)>
<!--- modify the original --->
<cfset s1.nested.item = "modified">
<cfoutput>
<p>The copy contains the modified value: #copy.nested.item#</p>
<p>The duplicate contains the original value: #clone.nested.item#</p>
</cfoutput>
```

## Functions e-g

### Encrypt

#### Description

Encrypts a string using a specific algorithm and encoding method.

#### Returns

String; can be much longer than the original string.

#### Category

[Security functions](#), [String functions](#)

#### Function syntax

```
Encrypt(string, key [, algorithm, encoding, IVorSalt, iterations])
```

#### See also

[Decrypt](#), [EncryptBinary](#), [DecryptBinary](#)

## History

ColdFusion 8: Added support for encryption using the RSA BSafe Crypto-J library on Enterprise Edition.

ColdFusion MX 7.01: Added the *IVorSalt* and *iterations* parameters.

ColdFusion MX 7: Added the *algorithm* and *encoding* parameters.

## Parameters

Parameter	Description
string	String to encrypt.
key	<p>String. Key or seed used to encrypt the string.</p> <ul style="list-style-type: none"> <li>For the CFMX_COMPAT algorithm, any combination of any number of characters; used as a seed used to generate a 32-bit encryption key.</li> <li>For all other algorithms, a key in the format used by the algorithm. For these algorithms, use the <a href="#">GenerateSecretKey</a> function to generate the key.</li> </ul>
algorithm	<p>(Optional) The algorithm to use to encrypt the string.</p> <p>The Enterprise Edition of ColdFusion installs the RSA BSafe Crypto-J library, which provides FIPS-140 Compliant Strong Cryptography. It includes the following algorithms:</p> <ul style="list-style-type: none"> <li>AES: the Advanced Encryption Standard specified by the National Institute of Standards and Technology (NIST) FIPS-197.</li> <li>DES: the Data Encryption Standard algorithm defined by NIST FIPS-46-3.</li> <li>DES-EDE: the "Triple DES" algorithm defined by NIST FIPS-46-3.</li> <li>DESX: The extended Data Encryption Standard symmetric encryption algorithm.</li> </ul>
	<ul style="list-style-type: none"> <li>RC2: The RC2 block symmetric encryption algorithm defined by RFC 2268.</li> <li>RC4: The RC4 symmetric encryption algorithm.</li> <li>RC5: The RC5 encryption algorithm.</li> <li>PBE: Password-based encryption algorithm defined in PKCS #5.</li> </ul>
	In addition to these algorithms, you can use the algorithms provided in the Standard Edition of ColdFusion.
	<p>The Standard Edition of ColdFusion installs a cryptography library with the following algorithms:</p> <ul style="list-style-type: none"> <li>CFMX_COMPAT: the algorithm used in ColdFusion MX and prior releases. This algorithm is the least secure option (default).</li> <li>AES: the Advanced Encryption Standard specified by the National Institute of Standards and Technology (NIST) FIPS-197.</li> <li>BLOWFISH: the Blowfish algorithm defined by Bruce Schneier.</li> <li>DES: the Data Encryption Standard algorithm defined by NIST FIPS-46-3.</li> <li>DESEDE: the "Triple DES" algorithm defined by NIST FIPS-46-3.</li> </ul> <p>If you install a security provider with additional cryptography algorithms, you can also specify any of its string encryption and decryption algorithms.</p>

Parameter	Description
encoding	(Optional; if you specify this parameter, also specify the algorithm parameter). The binary encoding in which to represent the data as a string. <ul style="list-style-type: none"><li>Base64: the Base64 algorithm, as specified by IETF RFC 2045.</li><li>Hex: the characters A-F0-9 represent the hexadecimal byte values.</li><li>UU: the UUEncode algorithm (default).</li></ul>
IVorSalt	(Optional) Specify this parameter to adjust ColdFusion encryption to match the details of other encryption software. If you specify this parameter, also specify the <code>algorithm</code> parameter. <ul style="list-style-type: none"><li>For Block Encryption algorithms: This is the binary Initialization Vector value to use with the algorithm. The algorithm must contain a Feedback Mode other than ECB. This must be a binary value that is exactly the same size as the algorithm block size. Use the same value in the <code>Decrypt</code> function to successfully decrypt the data.</li><li>For Password Based Encryption algorithms: This is the binary Salt value to transform the password into a key. The same value must be used to decrypt the data.</li></ul>
iterations	(Optional) The number of iterations to transform the password into a binary key. Specify this parameter to adjust ColdFusion encryption to match the details of other encryption software. If you specify this parameter, also specify the algorithm parameter with a Password Based Encryption (PBE) algorithm. Do not specify this parameter for Block Encryption algorithms. Use the same value to encrypt and decrypt the data.

### Usage

This function uses a symmetric key-based algorithm, in which the same key is used to encrypt and decrypt a string. The security of the encrypted string depends on maintaining the secrecy of the key.

The following are the FIPS-140 approved algorithms included in the RSA BSafe Crypto-J library that are used by ColdFusion. Some of these are *not* used with the `encrypt` function, but are used with other functions:

- AES – ECB, CBC, CFB (128), OFB (128) – [128, 192, 256-bit key sizes]
- AES – CTR
- Diffie-Hellman Key Agreement
- DSA
- FIPS 186-2 General Purpose [(x-Change Notice); (SHA-1)]
- FIPS 186-2 [(x-Change Notice); (SHA-1)]
- HMAC-SHAx (where x is 1, 224, 256, 384, or 512)
- RSA PKCS#1 v1.5 (sign, verify) (SHA-1,SHA-224,SHA-256,SHA-384,SHA-512)
- Secure Hash Standard (SHA-1, SHA-224, SHA-256, SHA-384, SHA-512)
- Triple DES - ECB, CBC, CFB (64 bit), and OFB (64 bit)

All algorithms included in the RSA BSafe Crypto-J library are available for use in the Enterprise Edition. In certain cases, you may want to disable some algorithms. To disable the DESX, RC5, and MD5PRNG algorithms, specify the following in the JVM arguments on the Java and JVM page of the ColdFusion Administrator:

```
-Dcoldfusion.enablefipscrypto=true
```

FIPS-140 approved cryptography is not available if you are running ColdFusion on WebSphere of JBoss.

To use the IBM/Lotus Sametime Instant Messaging Gateway in the Enterprise edition, disable the FIPS-140-only cryptography setting by specifying the following in the JVM arguments on the Java and JVM page of the ColdFusion Administrator:

```
-Dcoldfusion.disablejsafe=true
```

In Standard Edition, for all algorithms except the default algorithm, ColdFusion uses the Java Cryptography Extension (JCE) and installs a Sun Java runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Adobe cannot provide technical support for third-party security providers.

The default algorithm, which is the same one used in ColdFusion 5 and ColdFusion MX, uses an XOR-based algorithm that uses a pseudo-random 32-bit key, based on a seed passed by the user as a function parameter. This algorithm is less secure than the other available algorithms.

### Example

The following example encrypts and decrypts a text string. It lets you specify the encryption algorithm and encoding technique. It also has a field for a key seed to use with the CFMX\_COMPAT algorithm. For all other algorithms, it generates a secret key.

```
<h3>Encrypt Example</h3>
<!-- Do the following if the form has been submitted. -->
<cfif IsDefined("Form.myString")>
    <cfscript>
        /* GenerateSecretKey does not generate key for the CFMX_COMPAT algorithm,
        so use the key from the form.
        */
        if (Form.myAlgorithm EQ "CFMX_COMPAT")
            theKey=Form.MyKey;
        // For all other encryption techniques, generate a secret key.
        else
            theKey=generateSecretKey(Form.myAlgorithm);
        //Encrypt the string
        encrypted=encrypt(Form.myString, theKey, Form.myAlgorithm,
            Form.myEncoding);
        //Decrypt it
        decrypted=decrypt(encrypted, theKey, Form.myAlgorithm, Form.myEncoding);
    </cfscript>

    <!-- Display the values used for encryption and decryption,
    and the results. -->
    <cfoutput>
        <b>The algorithm:</b> #Form.myAlgorithm#<br>
        <b>The key:</b> #theKey#<br>
        <br>
        <b>The string:</b> #Form.myString# <br>
        <br>
        <b>Encrypted:</b> #encrypted#<br>
        <br>
        <b>Decrypted:</b> #decrypted#<br>
    </cfoutput>
</cfif>

<!-- The input form.-->
<form action="#CGI.SCRIPT_NAME#" method="post">
    <b>Select the encoding</b><br>

</form>
```

## EncryptBinary

### Description

Encrypts binary data using a specific algorithm and encoding method.

### Returns

Binary data.

### Category

[Security functions](#), [String functions](#)

### Function syntax

```
EncryptBinary(bytes, key [, algorithm, IVorSalt, iterations])
```

### See also

[Decrypt](#), [DecryptBinary](#), [Encrypt](#)

### History

ColdFusion 8: Added support for encryption using the RSA BSafe Crypto-J library on Enterprise Edition.

ColdFusion MX 7.01: Added this function.

### Parameters

Parameter	Description
bytes	Binary data to encrypt.
key	<p>String. Key or seed used to encrypt the string.</p> <ul style="list-style-type: none"><li>For the CFMX_COMPAT algorithm, any combination of any number of characters; used as a seed used to generate a 32-bit encryption key.</li><li>For all other algorithms, a key in the format used by the algorithm. For these algorithms, use the <a href="#">GenerateSecretKey</a> function to generate the key.</li></ul>
algorithm	<p>(Optional) The algorithm to use to decrypt the string.</p> <p>The Enterprise Edition of ColdFusion installs the RSA BSafe Crypto-J library, which provides FIPS-140 Compliant Strong Cryptography. For a list of algorithms, see the <a href="#">Encrypt</a> function.</p> <p>The Standard Edition of ColdFusion installs a cryptography library with the following algorithms:</p> <ul style="list-style-type: none"><li>CFMX_COMPAT: the algorithm used in ColdFusion MX and prior releases. This algorithm is the least secure option (default).</li><li>AES: the Advanced Encryption Standard specified by the National Institute of Standards and Technology (NIST) FIPS-197.</li><li>BLOWFISH: the Blowfish algorithm defined by Bruce Schneier.</li><li>DES: the Data Encryption Standard algorithm defined by NIST FIPS-46-3.</li><li>DESEDE: the "Triple DES" algorithm defined by NIST FIPS-46-3.</li></ul> <p>If you install a security provider with additional cryptography algorithms, you can also specify any of its string encryption and decryption algorithms.</p>
IVorSalt	<p>(Optional) Specify this parameter to adjust ColdFusion encryption to match the details of other encryption software. If you specify this parameter, also specify the <code>algorithm</code> parameter.</p> <ul style="list-style-type: none"><li>For Block Encryption algorithms: This is the binary Initialization Vector value to use with the algorithm. The algorithm must contain a Feedback Mode other than ECB. This must be a binary value that is exactly the same size as the algorithm block size. Use the same value in the <code>Decrypt</code> function to successfully decrypt the data.</li><li>For Password Based Encryption algorithms: This is the binary Salt value to transform the password into a key. The same value must be used to decrypt the data.</li></ul>
iterations	<p>(Optional) The number of iterations to transform the password into a binary key. Specify this parameter to adjust ColdFusion encryption to match the details of other encryption software. If you specify this parameter, also specify the <code>algorithm</code> parameter with a Password Based Encryption (PBE) algorithm. Do not specify this parameter for Block Encryption algorithms. Use the same value to encrypt and decrypt the data.</p>

### Usage

This function uses a symmetric key-based algorithm, in which the same key is used to encrypt and decrypt binary data. The security of the encrypted data depends on maintaining the secrecy of the key.

For all algorithms except the default algorithm, ColdFusion uses the Java Cryptography Extension (JCE) and installs a Sun Java runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Adobe cannot provide technical support for third-party security providers.

The default algorithm, which is the same as was used in ColdFusion 5 and ColdFusion MX, uses an XOR-based algorithm that uses a pseudo-random 32-bit key, based on a seed passed by the user as a function parameter. This algorithm is less secure than the other available algorithms.

### Example

The following example encrypts and decrypts binary data. It encrypts the binary data contained in a file and then decrypts the encrypted file. It lets you specify the encryption algorithm and encoding technique. It also has a field for a key seed to use with the CFMX\_COMPAT algorithm. For all other algorithms, it generates a secret key.

```
<h3>EncryptBinary Example</h3>
<!-- Do the following if the form has been submitted. -->
<cfif IsDefined("Form.myfile")>

<cffile file="#Form.myfile#" action="readBinary" variable="myData">
<cfscript>
/* GenerateSecretKey does not generate key for the CFMX_COMPAT algorithm,
so use the key from the form.
*/
if (Form.myAlgorithm EQ "CFMX_COMPAT")
theKey=Form.MyKey;
// For all other encryption techniques, generate a secret key.
else
theKey=generateSecretKey(Form.myAlgorithm);
//Encrypt the string
encrypted=encryptBinary(myData, theKey, Form.myAlgorithm);
//Decrypt it
decrypted=decryptBinary(encrypted, theKey, Form.myAlgorithm);
</cfscript>
<cfset encfile="#Form.myfile#" & "_enc">
<cfset decfile="#Form.myfile#" & "_dec">
<cffile file="#encfile#" action="write" output="#encrypted#">
<cffile file="#decfile#" action="write" output="#decrypted#">

<!-- Display the values used for encryption and decryption,
and the results. -->
<cfoutput>
<b>The algorithm:</b> #Form.myAlgorithm#<br>
<b>The key:</b> #theKey#<br>
<br>
<b>The InputFile:</b> #Form.myfile# <br>
<br>
<b>Encrypted:</b> #encfile#<br>
<br>
<b>Decrypted:</b> #decfile#<br>
```

```
</cfoutput>
</cfif>

<!--- The input form. --->
<form action="#CGI.SCRIPT_NAME#" method="post">
<b>Select the algorithm</b><br>
<select size="1" name="myAlgorithm">
<option selected>CFMX_COMPAT</option>
<option>AES</option>
<option>DES</option>
<option>DESEDE</option>
</select><br>
<br>
<b>Input your key</b> (used for CFMX_COMPAT encryption only)<br>
<input type = "Text" name = "myKey" value = "MyKey"><br>
<br>
<b>Enter filename to encrypt</b><br>
<input type="text" name="myfile" value="Enter the path of the file to encrypt"><br>
<input type = "Submit" value = "Encrypt file ">
</form>
```

## EntityDelete

### Description

Deletes the record from the database for the specified entity. Depending on the cascade attribute specified in the mapping, it deletes the associated objects also.

### Category

[ORM functions](#)

### Function Syntax

EntityDelete(*entity*)

### See Also

[EntityLoad](#), [EntitySave](#)

### History

ColdFusion 9: Added this function.

### Parameters

Parameter	Description
entity	Name of the entity being deleted.

### Example

```
<cfset employee = EntityLoad('employee', 100, true)>
<cfset EntityDelete(employee)>
<cfset employee = CreateObject('component', 'employee')>
<cfset employee.setEmployeeID(100)>
<cfset EntityDelete(employee)>
```

## EntityLoad

### Description

Loads and returns an array of entities for the specified entity name. You can also specify a filter criteria and sort order. All `EntityLoad` methods take the entity name as input.

### Returns

Array (if `unique=false`)

Single entity (if `unique=true`)

### Category

[ORM functions](#)

### Function syntax

```
EntityLoad (entityname)  
EntityLoad (entityname, id [, unique])  
EntityLoad (entityname, filtercriteria [,unique])  
EntityLoad(entityname, filtercriteria, sortorder [, options])
```

### See Also

[EntityLoadByExample](#), [EntityReload](#), [EntityDelete](#)

### Parameters

Parameter	Description
entity name	Name of the entity to be loaded.
ID	The primary key value of the entity that must be loaded.  If the entity has a composite key, then the <code>ID</code> has to be specified as key-value pairs (ColdFusion struct).
unique	If <code>unique</code> is set to <code>true</code> , then the entity is returned.  If you are sure that only one record exists that matches this <code>filtercriteria</code> , then you can specify <code>unique=true</code> , so that a single entity is returned instead of an array.  If you set <code>unique=true</code> and multiple records are returned, then an exception occurs.

Parameter	Description
filtercriteria	Key-value pair (ColdFusion Struct) of property names and values. If there are more than one key-value pair, then the AND operator is used. If specified, loads and returns an array of entities of the specified entity name that matches the filtercriteria.
sortorder	String used to specify the sortorder of the entities that are returned. If specified, loads and returns an array of entities that satisfy the filtercriteria sorted as specified by the sortorder.
options	<p>The following options to customize the output:</p> <ul style="list-style-type: none"><li>• ignorecase: Ignores the case of sort order when set to true. Use only if you specify the sortorder parameter.</li><li>• offset: Specifies the position from which to retrieve the objects.</li><li>• maxResults: Specifies the maximum number of objects to be retrieved.</li><li>• cacheable: Whether the result has to be cached in the secondary cache. Default is false.</li><li>• cachename: Name of the cache in secondary cache.</li><li>• timeout: Specifies the timeout value (in seconds) for the query.</li></ul>

## History

ColdFusion 9: Added this function.

## Usage

For pagination, you can use the options `offset` and `maxResults` as shown in the example:

```
EntityLoad('employee', {department='qa'} , {offset=21, maxResults=10})
```

This example retrieves the (next) 10 objects of employees whose department is qa from offset 22.

## Example

Example with only entity name specified:

```
<cfset employees = EntityLoad('employee')>
```

Example with `EntityName`, `ID`, and `unique` set to `true`. Instead of `true`, if you set `unique` as `false`, then array is returned with one entity.

```
<cfset employee = EntityLoad('employee', 100, true)>
```

Entity name, composite key.

```
<cfset orderDetail = EntityLoad('orderdetails', {OrderID=100, ProductID=1}, true)>
```

Example which describes how to retrieve objects whose country is UK, and sorted by `Department` ascending and `Age` descending:

```
<cfset employeesInUKSorted = EntityLoad('employee',  
{country="UK"}, "Department Asc, Age Desc")>
```

Example that describes how to retrieve details of all the employees who live in 'UK':

```
<cfset employeesFromUK = EntityLoad('employee', {country="UK"})>
```

Example that describes how to retrieve a unique object. If you specify `unique= "true"` and more than one object satisfies the condition, then an exception occurs.

```
<cfset employee = EntityLoad('employee', {firstname="Marcia", lastname="Em"}, "true")>
```

## EntityLoadByExample

### Description

Loads and returns an array of objects that match the `sampleentity`. The filter criteria is constructed by ANDing all the non-null properties of the `sampleentity`.

### Returns

Array of objects

### Category

[ORM functions](#)

### Function Syntax

```
entityloadbyexample(sampleentity [, unique])
```

### See Also

[EntityLoad](#), [EntityReload](#)

### History

ColdFusion 9: Added this function.

### Parameters

Parameter	Description
<code>sampleentity</code>	Name of the sample entity that is used to match and filter similar entities to load.

### Example

```
<cfset employee= CreateObject("component", "employee")>
<cfset employee.setDepartment("ColdFusion")>
<cfset employee.setCountry("USA")>
<cfset employee=EntityLoadByExample(employee)>
```

## EntityLoadByPK

### Description

Loads and returns an array of objects for the specified primary key. Use this function to avoid specifying the boolean parameter that you must specify with the `EntityLoad()` function.

### Returns

object

### Category

[ORM functions](#)

### Function Syntax

```
entityLoadByPK( entityName ,id)
```

### Parameters

Parameter	Description
entity name	Name of the entity to be loaded.
id	Primary key id

### See Also

[EntityLoad](#), [EntityReload](#), [EntityLoadByExample](#), [EntityDelete](#), ColdFusion ORM chapter in *Developing ColdFusion Applications*

### History

ColdFusion 9: Added this function.

### Example

```
<cfscript>
    art = EntityLoadByPK("Art", 1);
    writedump(art);
</cfscript>
```

## EntityMerge

### Description

Attaches the specified entity to the current ORM session. It copies the state of the given object onto the persistent object with the same identifier and returns the persistent object.

If there is no persistent instance currently associated with the session, it is loaded. The given instance is not associated with the session. User have to use the returned object from this session.

### Returns

object

### Category

[ORM functions](#)

### Function Syntax

```
entityMerge( entity)
```

### Parameters

Parameter	Description
entity	The entity that must be attached to the ORM session.

### See Also

[EntityLoad](#), [EntityLoadByExample](#), [EntityDelete](#), ColdFusion ORM chapter in *Developing ColdFusion Applications*

### History

ColdFusion 9: Added this function.

## EntityNew

**Note:** This function has been enhanced in ColdFusion 9.0.1 to support multiple data sources in the same application. Install the ColdFusion 9 update to use the feature.

### Description

Creates an instance of the persistent CFC with the entity name that you provide.

### Returns

Object

### Category

[ORM functions](#)

### Function Syntax

```
entityNew(entityName [ ,properties])
```

### Parameters

Parameter	Description
entityName	Entity name of the persistent CFC.
properties	Key-value pair (ColdFusion struct) of property names and values.

### See Also

[EntityLoad](#), [EntityLoadByExample](#), [EntityDelete](#), ColdFusion ORM chapter in *Developing ColdFusion Applications*

### History

ColdFusion 9: Added this function.

### Usage

The enhancement in ColdFusion 9.0.1 allows the application to initialize the object that is being created. `properties` takes a struct with key being the property name. When the object is created, all the properties are populated with the passed struct.

For example,

```
cfset artistObj = entityNew("Artists", {FirstName="Tom", LastName="Ron"}) >
```

### Example

```
newArtistObj = EntityNew("Artists");  
newArtistObj.setfirstname("John");  
newArtistObj.setlastname("Smith");  
newArtistObj.setaddress("5 Newport lane");  
newArtistObj.setcity("San Francisco");  
newArtistObj.setstate("CA");  
newArtistObj.setPostalCode("90012");  
newArtistObj.setphone("612-832-2343");  
newArtistObj.setfax("612-832-2344");  
newArtistObj.setemail("jsmith@company.com");  
newArtistObj.setThePassword("jsmith");  
EntitySave(newArtistObj);  
ormflush();
```

## EntityReload

### Description

Reloads data for an entity that is already loaded. This method refetches data from the database and repopulates the entity with the refreshed data.

### Category

[ORM functions](#)

### Function Syntax

```
entityreload()
```

### See Also

[EntityLoad](#), [EntityLoadByExample](#), [EntityDelete](#)

### History

ColdFusion 9: Added this function.

## EntitySave

### Description

Saves or updates data of the entity and all related entities to the database. ColdFusion automatically tries to find if a new record should be inserted or an existing record be updated for the given entity. If you set `forceinsert=true`, then ColdFusion tries to insert the entity as a new record.

### Returns

Void

### Category

[ORM functions](#)

### Function Syntax

```
EntitySave(entity, [forceinsert])
```

### See Also

[EntityLoad](#), [EntityLoadByExample](#), [EntityDelete](#)

### History

ColdFusion 9: Added this function.

### Parameters

Parameter	Description
entity	Name of the entity that must be saved in the database.
forceinsert	If true, then ColdFusion always tries to insert the entity as a new record.

### Example

To save an entity:

```
<cfset employee = createObject("Employee")>
<cfset employee.setFirstName("Marcia")>
<cfset employee.setLastName("Em")>
<cfset EntitySave(employee)>
```

To update an entity:

```
<cfset employee = EntityLoad('employee', 100, true)>
<cfset employee.setLastName("Em")>
<cfset EntitySave(employee)>
```

## EntitytoQuery

### Description

Converts the input entity object or the input array of entity objects to a query object.

### Returns

Query

### Category

[ORM functions](#)

### Function Syntax

```
EntitytoQuery (orm_object, [entity_name])
EntitytoQuery (orm_object_array, [entity_name])
```

### Parameter

Parameter	Description
orm_object	Entity object that needs to be converted to a query object.
orm_object_array	Array that needs to be converted to a query object.
entity_name	Name of the entity. Use this optional parameter to return the query of the given entity in the case of inheritance mapping.

### See Also

[EntityLoad](#), [EntityDelete](#)

### History

ColdFusion 9: Added this function.

### Usage

The following conditions apply for this function:

- In the case of array input, all objects in the array must be of the same type.
- The result query will not contain any relation data.

### Example

```
<cfset artists = EntityLoad("Artist")>  
<cfset artistQuery = EntityToQuery(artists)>
```

## Evaluate

### Description

Evaluates one or more string expressions, dynamically, from left to right. (The results of an evaluation on the left can have meaning in an expression to the right.) Returns the result of evaluating the rightmost expression.

### Returns

An object; the result of the evaluations.

### Category

[Dynamic evaluation functions](#)

### Function syntax

```
Evaluate(string_expression1 [, string_expression2 , ... ])
```

### See also

[DE](#), [IIf](#), [PrecisionEvaluate](#), Using Expressions and Number Signs in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
<i>string_expression1</i> , <i>string_expression2</i> ...	Expressions to evaluate

### Usage

String expressions can be complex. If a string expression contains a single- or double-quotation mark, the mark must be escaped.

This function is useful for forming one variable from multiple variables. For example, to reference a column of the query `qNames` with a variable, `var`, using an index value to traverse rows, you could use the following code:

```
<cfset var=Evaluate("qNames.#colname#[#index#] ")>
```

### Example

```
<!--- This example shows the use of PrecisionEvaluate and DE functions.--->
<h3>Evaluate Example</h3>
<cfif IsDefined("FORM.myExpression")>
    <cftry>
        <!--- Evaluate the expression --->
        <cfset theExpression = Evaluate(Form.myExpression)>
        <cfoutput>
            <!--- The DE function prevents the Evaluate function from evaluating
                the expression. --->
            The value of the expression #Evaluate(DE(FORM.MyExpression))#
            is #theExpression#. <br>
            <!--- The following line does not use the DE function. --->
            The value of the expression #FORM.MyExpression#
            is #theExpression#. <br>
        </cfoutput>

        <cfcatch type="application">
            <cfoutput>Could not evaluate the expression #Form.myExpression#. <br>
                Make sure you enter a valid ColdFusion Expression.
            </cfoutput>
        </cfcatch>
    </cftry>
</cfif>

<cfform preservedata="yes">
    <h3>Enter a ColdFusion expression for evaluation</h3>
    <cfinput type="text" name="myExpression" size="60"><br />
    <br />
    <cfinput type="submit" name="submit">
</cfform>
```

## Exp

### Description

Calculates the exponent whose base is *e* that represents *number*. The constant *e* equals 2.71828182845904, the base of the natural logarithm. This function is the inverse of `Log`, the natural logarithm of *number*.

### Returns

The constant *e*, raised to the power of *number*.

### Category

[Mathematical functions](#)

### Function syntax

`Exp (number)`

### See also

[Log](#), [Log10](#)

### Parameters

Parameter	Description
number	Exponent to apply to the base e

### Usage

To calculate powers of other bases, use the exponentiation operator (^).

### Example

```
<h3>Exp Example</h3>
<cfif IsDefined("FORM.Submit")>
    <cfoutput>
        <p>Your number, #FORM.number#
        <br>#FORM.number# raised to the E power: #exp(FORM.number)#
    <cfif FORM.number LTE 0>
        <br>You must enter a positive real number to see its natural logarithm
    <cfelse><br>
        The natural logarithm of #FORM.number#: #log(FORM.number)#
    </cfif>
    <cfif FORM.number LTE 0><br>
        You must enter a positive real number to see its logarithm to base 10
    <cfelse><br>
        The logarithm of #FORM.number# to base 10: #log10(FORM.number)#
    </cfif>
    </cfoutput>
</cfif>
<cfform action = "exp.cfm">
Enter a number to see its value raised to the E power, its natural logarithm,
    and the logarithm of number to base 10.
<cfinput type = "Text" name = "number" message = "You must enter a number"
    validate = "float" required = "No">
<input type = "Submit" name = "Submit">
</cfform>
```

## ExpandPath

### Description

Creates an absolute, platform-appropriate path that is equivalent to the value of *relative\_path*, appended to the base path. This function (despite its name) can accept an absolute or relative path in the *relative\_path* parameter

The base path is the currently executing page's directory path. It is stored in `pageContext.getServletContext()`.

### Returns

A string. If the relative path contains a trailing forward slash or backward slash, the return value contains the same trailing character.

### Category

[System functions](#)

### Function syntax

```
ExpandPath(relative_path)
```

### See also

[FileExists](#), [GetCurrentTemplatePath](#), [GetFileFromPath](#)

### History

ColdFusion MX: Changed behavior for the *relative\_path* parameter: this function can now accept an absolute or relative path in the *relative\_path* parameter. To resolve a path, this function uses virtual mappings that are defined in the ColdFusion Administrator. This function does not reliably use virtual mappings that are defined in IIS, Apache, or other web servers.

### Parameters

Parameter	Description
<i>relative_path</i>	Relative or absolute directory reference or filename, within the current directory, (.\ and ..\ ) to convert to an absolute path. Can include forward or backward slashes.

### Usage

If the parameter or the returned path is invalid, the function throws an error. You cannot use this function with in-memory files.

These examples show the valid constructions of *relative\_path*:

- `ExpandPath( " *.* ")`
- `ExpandPath( "/" )`
- `ExpandPath( "\" )`
- `ExpandPath( "/mycfpage.cfm" )`
- `ExpandPath( "mycfpage.cfm" )`
- `ExpandPath( "myDir/mycfpage.cfm" )`
- `ExpandPath( "/myDir/mycfpage.cfm" )`
- `ExpandPath( "../.. /mycfpage.cfm" )`

### Example

```
<h3>ExpandPath Example</h3>

<cfset thisPath=ExpandPath("*.*)">
<cfset thisDirectory=GetDirectoryFromPath(thisPath)>
<cfoutput>
The current directory is: #GetDirectoryFromPath(thisPath)#

<cfif IsDefined("form.yourFile") AND form.yourFile is not "">
    <cfset yourFile = form.yourFile>
    <cfif FileExists(ExpandPath(yourfile))>
        <p>Your file exists in this directory. You entered
the correct filename, #GetFileFromPath("#thisPath#/#yourfile#")#
    <cfelse>
        <p>Your file was not found in this directory:
        <br>Here is a list of the other files in this directory:
        <!--- use cfdirectory to give the contents of the
snippets directory, order by name and size --->
        <cfdirectory directory="#thisDirectory#"
name="myDirectory"
sort="name ASC, size DESC">
        <!--- Output the contents of the cfdirectory as a cftable --->
        <cftable query="myDirectory">
            <cfcol header="NAME:"
                text="#Name#">
            <cfcol header="SIZE:"
                text="#Size#">
        </cftable>
    </cfif>
</cfif>
</cfoutput>

<form action="expandpath.cfm" method="post">
<h3>Enter the name of a file in this directory <i>
    <font size="-1">(try expandpath.cfm)</font></i></h3>
<input type="text" name="yourFile">
<input type="submit" name="">
</form>
```

## FileClose

### Description

Closes an on-disk or in-memory file that is open. When you use the [FileOpen](#) function, ColdFusion returns a handle to a file object. When you close the file, the handle is still available; however, it lists the file as closed.

### Category

[System functions](#)

### Function syntax

```
FileClose(fileObj)
```

### See also

[FileCopy](#), [FileIsEOF](#), [FileOpen](#), [FileRead](#), [FileReadLine](#), [FileWrite](#)

## History

ColdFusion 8: Added this function.

## Parameters

Parameter	Description
fileobj	The file to close.

## Usage

Always close a file after opening it. When you use the `FileOpen` function to open a file, the file stream is opened and contents are read from or written to it. The `FileClose` function closes the stream. If you do not close a file, the stream remains open; in that case, the operating system can lock the file, which results in the file not being usable until the server is restarted.

## Example

The following example checks to see if a file is still open and closes it.

```
<cfscript>
myfile = FileOpen("c:\ColdFusion9\wwwroot\test1.txt", "read");
while(NOT FileIsEOF(myfile))
{
    x = FileReadLine(myfile);
    WriteOutput("#x# <br>");
}
</cfscript>
<!--- Additional code goes here. --->
<cfif #myfile.status# IS "open">
    <cfoutput>The file #myfile.filepath# is #myfile.status#</cfoutput><br>
    <cfscript>
        FileClose(myfile);
    </cfscript>
</cfif>
```

# FileCopy

## Description

Copies the specified on-disk or in-memory source file to the specified destination file.

## Category

[System functions](#)

## Function syntax

`FileCopy(source, destination)`

## See also

[FileClose](#), [FileIsEOF](#), [FileOpen](#), [FileRead](#), [FileReadLine](#), [FileWrite](#), [cffile](#)

## History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
source	Pathname of the on-disk or in-memory file to copy. If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <code>GetTempDirectory</code> function.
destination	Pathname of an on-disk or in-memory directory or file on the web server where the file is copied. If you specify a filename without a directory path, ColdFusion copies it relative to the source directory.

### Usage

Use the following syntax to specify an in-memory file or directory, which is not written to disk. In-memory files speed processing of transient data.

```
ram:///filepath
```

The filepath can include directories, for example `ram:///petStore/images/poodle.jpg`. Create the directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files* in the *Developing ColdFusion Applications*.

### Example

The following example copies the `test1.txt` file from the `c:\testingdir\` directory to the `c:\productiondir\` directory in Windows and names the new copy of the file `test2.txt`:

```
<h3>FileCopy Example</h3>
<cfset sourcefile="c:\testingdir\test1.txt">
<cfset destinationfile="c:\productiondir\test2.txt">

<cfif FileExists(#sourcefile#)>
  <cfif FileExists(#destinationfile#)>
    <cfoutput>A copy of #destinationfile# already exists.</cfoutput>
  <cfelse>
    <cfscript>
      FileCopy(#sourcefile#, #destinationfile#);
    </cfscript>
    <cfoutput>Copied: #sourcefile# <br>
      To: #destinationfile#</cfoutput><br>
  </cfif>
<cfelse>
  <cfoutput>The source file does not exist.</cfoutput><br>
</cfif>
```

## FileDelete

### Description

Deletes the specified on-disk or in-memory file on the server.

### Category

[System functions](#)

### Function syntax

```
FileDelete(filepath)
```

### See also

[FileClose](#), [FileIsEOF](#), [FileOpen](#), [FileRead](#), [FileReadLine](#), [FileWrite](#), [cffile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
filepath	Pathname of the on-disk or in-memory file to delete. If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <code>GetTempDirectory</code> function.

### Usage

Use this function to free the memory used by an in-memory file. For more information on using in-memory files, see *Working with in-memory files in the Developing ColdFusion Applications*.

### Example

The following example deletes the file `c:\productiondir\test1.txt` before moving `c:\testdir\test1.txt`:

```
<h3>FileDelete Example</h3>

<cfset sourcefile="c:\testdir\test1.txt">
<cfset destinationfile="c:\productiondir\test1.txt">

<cfif FileExists(#sourcefile#)>
    <cfif FileExists(#destinationfile#)>
        <cfoutput>The destination file already exists.<br>
        Deleting previous copy of #destinationfile#.<br>
        Moving: #sourcefile# <br>
        To: <br> #destinationfile#.</cfoutput><br>
        <cfscript>
            FileDelete(#destinationfile#);
            FileMove(#sourcefile#, #destinationfile#);
        </cfscript>
    <cfelse>
        <cfscript>
            FileMove(#sourcefile#, #destinationfile#);
        </cfscript>
        <cfoutput>Moved: #sourcefile# <br>
        To: <br> #destinationfile#.</cfoutput><br>
    </cfif>
<cfelse>
    <cfoutput>The source file does not exist.</cfoutput><br>
</cfif>
```

## FileExists

### Description

Determines whether an on-disk or in-memory file exists.

### Returns

Yes, if the file specified in the parameter exists; No, otherwise.

### Category

[System functions](#), [Decision functions](#)

### Function syntax

`FileExists(absolute_path)`

### See also

[DirectoryExists](#), [ExpandPath](#), [GetTemplatePath](#)

### Parameters

Parameter	Description
<code>absolute_path</code>	The absolute path of the on-disk or in-memory file.

### Usage

To access a file on a remote system, the account (for Windows) or user (for UNIX and Linux) that is running ColdFusion must have permission to access the file, directory, and remote system. For example, if you run ColdFusion in the Server Configuration as a Windows service, by default it runs under the local system account, which does not have sufficient privileges to access remote systems. You can change this, however, on the Log On page of the Services Properties dialog box.

### Example

```
<h3>FileExists Example</h3>

<cfset thisPath = ExpandPath("*.*)">
<cfset thisDirectory = GetDirectoryFromPath(thisPath)>
<cfoutput>
The current directory is: #GetDirectoryFromPath(thisPath)#
<cfif IsDefined("FORM.yourFile")>
<cfif FORM.yourFile is not "">
<cfset yourFile = FORM.yourFile>
    <cfif FileExists(ExpandPath(yourfile))>
    <p>Your file exists in this directory. You entered
the correct filename, #GetFileFromPath("#thisPath#/#yourfile#")#</p>
    <cfelse>
```

## FileIsEOF

### Description

Determines whether ColdFusion has reached the end of an on-disk or in-memory file while reading it.

### Returns

Yes, if the end of the file has been reached; No, otherwise.

### Category

[System functions](#), [Decision functions](#)

### Function syntax

`FileIsEOF(fileObj)`

### See also

[FileClose](#), [FileOpen](#), [FileRead](#), [FileReadLine](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
<code>fileObj</code>	The file object.

### Example

The following example reads a file until it reaches the end of the file:

```
<h3>FileIsEOF Example</h3>

<cfscript>
myfile = FileOpen("c:\ColdFusion9\wwwroot\test1.txt", "read");
while(NOT FileIsEOF(myfile))
{
x = FileReadLine(myfile);
WriteOutput("#x# <br>");
}
FileClose(myfile);
</cfscript>
```

## FileMove

### Description

Moves an on-disk or in-memory file from one location to another on the server.

### Category

[System functions](#)

### History

ColdFusion 8: Added this function.

### Function syntax

`FileMove(source, destination)`

### See also

[FileClose](#), [FileCopy](#), [FileOpen](#), [FileRead](#), [FileReadLine](#), [FileWrite](#), [cffile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
source	Pathname of the on-disk or in-memory file to move. If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <code>GetTempDirectory</code> function.
destination	Pathname of the destination on-disk or in-memory directory or file. If not an absolute path, it is relative to the source directory.

### Usage

Use the following syntax to specify an in-memory file, which is not written to disk. In-memory files speed processing of transient data.

```
ram:///filepath
```

The filepath can include directories, for example `ram:///petStore/images/poodle.jpg`. Create the directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files* in the *Developing ColdFusion Applications*.

### Example

The following example moves the `test1.txt` file from the `c:\testingdir\` directory to the `c:\productiondir\` directory in Windows and renames the file `test2.txt`:

```
<h3>FileMove Example</h3>
<cfset sourcefile="c:\testingdir\test1.txt">
<cfset destinationfile="c:\productiondir\test2.txt">

<cfif FileExists(#sourcefile#)>
  <cfif FileExists(#destinationfile#)>
    <cfoutput>The destination file already exists.</cfoutput>
  <cfelse>
    <cfscript>
      FileMove(#sourcefile#, #destinationfile#);
    </cfscript>
    <cfoutput>Moved: #sourcefile# <br>
      To: <br> #destinationfile#.</cfoutput><br>
  </cfif>
<cfelse>
  <cfoutput>The source file does not exist.</cfoutput><br>
</cfif>
```

## FileOpen

### Description

Opens an on-disk or in-memory file to read, write, or append. Use this function with the [FileRead](#) function to read large files.

### Returns

A file object that represents the open file.

### Category

[System functions](#)

## Function syntax

```
FileOpen(filepath, [mode, charset])
```

## See also

[FileClose](#), [FileCopy](#), [FileReadBinary](#), [FileRead](#), [FileReadLine](#), [FileWrite](#), [cffile](#)

## History

ColdFusion 8: Added this function.

## Parameters

Parameter	Description
filepath	An absolute path of an on-disk or in-memory file on the server.
mode	Action to perform on the file, including the following: <ul style="list-style-type: none"><li>• read</li><li>• readBinary</li><li>• write</li><li>• append</li></ul> If you do not specify the mode, ColdFusion opens the file in read mode.
charset	The character set of the file.

## Usage

The file does not have to exist before you open it. To write a new file, open it for writing, and then write it.

The file object is a handle to a file. You can use the object as a structure to access the following information:

- filename Name of the file you opened
- filepath Absolute path and filename
- lastmodified The time when the file was most recently modified
- mode The action for which the file was opened
- size The file size in bytes
- status Whether the file object is open or closed

The following opens a file, and then displays the absolute path and filename of that file:

```
<cfscript>
myfile = FileOpen("c:\temp\test1.txt", "read");
</cfscript>
myfile refers to:
<cfdump var="#myfile.filepath#">
```

Use the following syntax to specify an in-memory file, which is not written to disk. In-memory files speed processing of transient data.

```
ram:///filepath
```

The filepath can include directories, for example `ram:///petStore/images/poodle.jpg`. Create the directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files* in the *Developing ColdFusion Applications*.

Always close a file after opening it. When you use the `FileOpen` function to open a file, the file stream from the disk is opened and contents are read from or written to it. The `FileClose` function closes the stream. If you do not close a file, the stream remains open; in that case, the operating system can lock the file, which results in the file not being usable until the server is restarted.

### Example

The following example opens a file, reads and outputs each line of the file, then closes the file.

```
<h3>FileOpen Example</h3>

<cfscript>
myfile = FileOpen("c:\temp\test1.txt", "read");
while (NOT FileIsEOF(myfile))
{
x = FileReadLine(myfile);
WriteOutput("#x# <br>"); }
FileClose(myfile);
</cfscript>
```

## FileRead

### Description

Reads an on-disk or in-memory text file or a file object created with the [FileOpen](#) function. You use this function either as an alternative to the `cffile` tag with the `action="read"` attribute. You can also use this function to improve performance when reading a large file, because `FileRead` does not read the entire file into memory.

### Returns

If you specify a filepath, the full text content of the file.

If you specify a file object, the character or byte buffer of the specified size.

If the file was opened in read mode, `FileRead` returns the character data (a string), otherwise it returns binary data.

### Category

[System functions](#)

### Function syntax

```
FileRead(filepath [, charset])
```

OR

```
FileRead(fileobj [, buffersize])
```

### See also

[FileClose](#), [FileIsEOF](#), [FileReadBinary](#), [FileReadLine](#), [FileWrite](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
filepath	An absolute path to an on-disk or in-memory text file on the server.
charset	<p>The character encoding in which the file contents is encoded. The following list includes commonly used values:</p> <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> <p>If the file starts with a byte order mark and you set this attribute to a conflicting character encoding, ColdFusion generates an error.</p>
fileobj	The file object from which to read.
bufferSize	The number of characters to read.

### Usage

You can read a text file or a file object with the `FileRead` function. When you specify an absolute path of a text file, ColdFusion reads the entire contents of the file. When you specify a file object, which you created using the [FileOpen](#) function, ColdFusion reads the number of characters specified in `bufferSize`.

### Example

```
<h3>FileRead Example - Reading a file</h3>

<!-- This reads and outputs the entire file contents. -->
<cfscript>
myfile = FileRead("c:\temp\myfile.txt");
    WriteOutput("#myfile#");
</cfscript>

<!-- This reads and outputs the first 100 characters -->
<!-- from the same file. -->
<cfscript>
myfile = FileOpen("c:\temp\test1.txt", "read");
x = FileRead(myfile, 100);
WriteOutput("#x#");
FileClose(myfile);
</cfscript>
```

## FileReadBinary

### Description

Reads an on-disk or in-memory binary file (such as an executable or image file) on the server, into a binary object parameter that you can use in the page. To send it through a web protocol (such as HTTP or SMTP) or store it in a database, first convert it to Base64 by using the [ToBase64](#) function.

**Note:** This action reads the file into a variable in the local Variables scope. It is not intended for use with large files, such as logs, because they can bring down the server.

### Returns

The entire contents of a binary file.

### Category

[System functions](#)

### Function syntax

```
FileReadBinary(filepath)
```

### See also

[FileClose](#), [FileIsEOF](#), [FileRead](#), [FileReadLine](#), [FileWrite](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
<code>filepath</code>	An absolute path to an on-disk or in-memory binary file on the server

### Usage

You convert the binary file to Base64 to transfer it to another site. ColdFusion 8 supports reading an image file as a binary and passing the result to a `cfimage`.

### Example

The following example reads a binary file.

```
<h3>FileReadBinary Example</h3>
<cfscript>
myfile = FileReadBinary("c:\testingdir\test3.jpg");
</cfscript>
```

## FileReadLine

### Description

Reads a line from an on-disk or in-memory file.

### Returns

The line of the file.

### Category

[System functions](#)

### Function syntax

```
FileReadLine(fileObj)
```

### See also

[FileClose](#), [FileIsEOF](#), [FileRead](#), [FileWrite](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
<code>fileObj</code>	The file object

### Example

The following example opens a file, reads each line, outputs each line, and then closes the file.

```
<h3>FileReadLine Example</h3>
```

```
<cfscript>
myfile = FileOpen("c:\ColdFusion9\wwwroot\test1.txt", "read");
while(NOT FileIsEOF(myfile))
{
    x = FileReadLine(myfile); // read line
    WriteOutput("#x#");
}
FileClose(myfile);
</cfscript>
```

## FileSeek

### Description

Seeks the position for read or write operation of an on-disk or in-memory file on the server.

### Returns

Returns the file position within a stream where the next file operation occurs.

### Category

[System functions](#)

### Function syntax

```
FileSeek(fileObj, pos)
```

### See also

[FileCopy](#), [FileDelete](#), [FileExists](#), [FileMove](#), [FileSetAccessMode](#), [FileSetAttribute](#), [FileSkipBytes](#)

### History

ColdFusion 9: Added this function.

### Parameters

Parameter	Description
fileObj	The file object.
pos	The position in a file within a stream where the following read and write operation must occur.

### Example

```
<cfscript>
    NewFile = FileOpen(ExpandPath(".") & "\test.txt","write","",true);
    FileSeek(#NewFile#,0);
    FileWrite(#NewFile#,"Hello World.. This is for FileOpen, FileSeek, FileSkipBytes.");
    FileClose(#NewFile#);
    WriteOutput("<br>Opening in Read Mode.<br>");
    NewFile = FileOpen(ExpandPath(".") & "\test.txt","read","",true);
    ReadFile = FileRead(#NewFile#,100);
    WriteOutput("#ReadFile#<br>");
    FileClose(#NewFile#);
    WriteOutput("<br>Opening in Read-Write Mode.<br>");
    NewFile = FileOpen(ExpandPath(".") & "\test.txt","readwrite","",true);
    FileSeek(#NewFile#,2);
    FileSkipBytes(#NewFile#,4);
    FileWrite(#NewFile#,"Earth");
    ReadFile = FileRead(#NewFile#,100);
    WriteOutput("#ToString(ReadFile)#<br>");
    FileClose(#NewFile#);
</cfscript>
```

## FileSetAccessMode

### Description

Sets the attributes of an on-disk file on UNIX or Linux. This function does not work with in-memory files.

### Category

[System functions](#)

### Function syntax

```
FileSetAccessMode(filepath, mode)
```

### See also

[FileCopy](#), [FileDelete](#), [FileExists](#), [FileMove](#)

### History

ColdFusion 8: Added this function.

**Parameters**

Parameter	Description
filepath	An absolute path to the file on the server.
mode	<p>A three-digit value, in which each digit specifies the file access for individuals and groups:</p> <ul style="list-style-type: none"><li>• The first digit represents the owner.</li><li>• The second digit represents a group.</li><li>• The third digit represents anyone.</li></ul> <p>Each digit of this code sets permissions for the appropriate individual or group:</p> <ul style="list-style-type: none"><li>• 4 specifies read permission.</li><li>• 2 specifies write permission.</li><li>• 1 specifies execute permission.</li></ul> <p>You use the sums of these numbers to indicate combinations of the permissions:</p> <ul style="list-style-type: none"><li>• 3 specifies write and execute permission.</li><li>• 5 specifies read and execute permission.</li><li>• 6 indicates read and write permission.</li><li>• 7 indicates read, write, and execute permission.</li></ul> <p>For example, 400 specifies that only the owner can read the file; 004 specifies that anyone can read the file.</p>

**Example**

The following example sets the access mode of a file so that only the owner can read the file.

```
<h3>FileSetAccessMode Example</h3>

<cfscript>
    FileSetAccessMode("test1.txt", "004");
</cfscript>
```

**FileSetAttribute****Description**

Sets the attributes of an on-disk file in Windows. This function does not work with in-memory files.

**Category**

[System functions](#)

**Function syntax**

```
FileSetAttribute(filepath, attribute)
```

**See also**

[FileCopy](#), [FileDelete](#), [FileExists](#), [FileMove](#)

## History

ColdFusion 8: Added this function.

## Parameters

Parameter	Description
filepath	An absolute path to a file on the server.
attribute	One of the following: <ul style="list-style-type: none"><li>readOnly</li><li>hidden</li><li>normal</li></ul> Set the attribute to <code>normal</code> to make a file not read-only and not hidden.

## Example

The following example sets the access mode of a file to be read-only.

```
<h3>FileSetAttribute Example</h3>

<cfscript>
    FileSetAttribute("c:\temp\test1.txt", "readOnly");
</cfscript>
```

# FileSetLastModified

## Description

Sets the date when an on-disk or in-memory file was most recently modified.

## Category

[System functions](#)

## Function syntax

```
FileSetLastModified(filepath, date)
```

## See also

[FileCopy](#), [FileDelete](#), [FileExists](#), [FileMove](#), [FileSetAccessMode](#), [FileSetAttribute](#)

## History

ColdFusion 8: Added this function.

## Parameters

Parameter	Description
filepath	An absolute path to an on-disk or in-memory file on the server.
date	A valid ColdFusion date or datetime.

### Example

```
<cfscript>
    FileSetLastModified("c:\temp\test1.txt", "#Now()#");
    WriteOutput(#GetFileInfo("c:\temp\test1.txt").lastmodified#);
</cfscript>
```

## FileSkipBytes

### Description

Skips over the data before a read or write operation of an on-disk or in-memory file on the server.

### Category

[System functions](#)

### Function syntax

```
FileSkipBytes(fileObj, noOfBytesToSkip)
```

### See Also

[FileCopy](#), [FileDelete](#), [FileExists](#), [FileMove](#), [FileSetAccessMode](#), [FileSetAttribute](#), [FileSeek](#)

### History

ColdFusion 9: Added this function.

### Parameters

Parameter	Description
fileObj	The file object.
noOfBytesToSkip	The number of bytes that must be skipped before the next file operation.

### Usage

For noOfBytesToSkip, if you specify a value greater than the actual number of bytes, all bytes are skipped.

### Example

See the Example section for the function [FileSeek](#).

## FileUpload

### Description

Uploads file to a directory on the server.

### Returns

Struct that contains the result (or status) of file upload.

For details of what the struct contains, see the usage section of `cffile action = "upload"`.

## Function syntax

`FileUpload(destination)`  
`FileUpload(destination, filefield)`  
`FileUpload(destination, filefield, accept)`  
`FileUpload(destination, filefield, accept, nameconflict)`

## History

ColdFusion 9.0.1: Added this function.

## Parameters

Value	Description
<code>destination</code>	<p>Path of directory in which to upload the file.</p> <p>If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory returned by the function <code>GetTempDirectory</code>. If the destination you specify does not exist, ColdFusion creates a file with the specified destination name.</p> <p>For example, if you specify the destination <code>C:\XYZ</code>, ColdFusion creates a file <code>XYZ</code> in the <code>C:</code> drive.</p>
<code>accept</code>	<p>Limits the MIME types to accept. Comma-delimited list.</p> <p>For example, the following code permits JPEG and Microsoft Word file uploads:</p> <p><code>"image/jpg,application/msword"</code>.</p> <p>The browser uses the filename extension to determine file type.</p>
<code>nameConflict</code>	<p>Action to take if file has the same name of a file in the directory.</p> <ul style="list-style-type: none"> <li>• <b>Error:</b> File is not saved. ColdFusion stops processing the page and returns an error.</li> <li>• <b>Skip:</b> File is not saved. This option permits custom behavior based on file properties.</li> <li>• <b>Overwrite:</b> Replaces file.</li> <li>• <b>MakeUnique:</b> Forms a unique filename for the upload; name is stored in the file object variable <code>serverFile</code>.</li> </ul>
<code>fileField</code>	<p>Name of form field used to select the file.</p> <p>Do not use number signs (#) to specify the field name.</p>

## See also

[FileUploadAll](#)

## Usage

```
cffile action = "upload"
```

## Example

```
<cfif isdefined("form.fileData")>
    <cfscript>
        hello = FileUpload("<path>", "<mime type>", "unique");
    </cfscript>
    <cfdump var="#hello#">
</cfif>
<cfform name="myUpload" enctype="multipart/form-data">
    <cfinput type="file" name="fileData"><br>
    <cfinput type="submit" name="submit">
</cfform>
</cfif>
```

## FileUploadAll

### Description

Uploads all files sent to the page in an HTTP request to a directory on the server.

### Returns

An array of struct that provides the file upload status.

For details of what the struct contains, see the Usage Section of `cffile action = "uploadAll"`.

### Function Syntax

```
FileUploadAll(destination)
```

```
FileUploadAll(destination, accept)
```

```
FileUploadAll(destination, accept, nameConflict)
```

### History

ColdFusion 9.0.1: Added this function.

### Parameter

Value	Description
destination	<p>Path of directory in which to upload the file.</p> <p>If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, returned by the function <code>GetTempDirectory</code>.</p> <p>If the destination you specify does not exist, ColdFusion creates a file with the specified destination name. For example, if you specify the destination <code>C:\XYZ</code>, ColdFusion creates a file <code>XYZ</code> in the <code>C:</code> drive.</p>
accept	<p>Limits the MIME types to accept. Comma-delimited list.</p> <p>For example, the following code permits JPEG and Microsoft Word file uploads:</p> <pre>"image/jpeg, application/msword"</pre> <p>The browser uses the filename extension to determine file type.</p>
nameConflict	<p>Action to take if file has the same name of a file in the directory.</p> <ul style="list-style-type: none"><li>• <b>Error:</b> File is not saved. ColdFusion stops processing the page and returns an error.</li><li>• <b>Skip:</b> File is not saved. Permits custom behavior based on file properties.</li><li>• <b>Overwrite:</b> Replaces file.</li><li>• <b>MakeUnique:</b> Forms a unique filename for the upload; name is stored in the file object variable <code>serverFile</code>.</li></ul>

### See also

[FileUpload](#)

### Usage

```
cffile action = "uploadAll"
```

## FileWrite

### Description

If you specify a file path, writes the entire content to the specified on-disk or in-memory file. If you specify a file object, writes text or binary data to the file object.

### Category

[System functions](#)

### Function syntax

```
FileWrite(filepath, data [, charset])
```

OR

```
FileWrite(fileobj, data)
```

### See also

[FileCopy](#), [FileDelete](#), [FileExists](#), [FileMove](#), [cfile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
charset	<p>The character encoding in which the file contents is encoded. The following list includes commonly used values:</p> <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> <p>If the file starts with a byte order mark and you set this attribute to a conflicting character encoding, ColdFusion generates an error.</p>

Parameter	Description
data	Content of the file or file object to create.
fileobj	Name of the file object to write.
filepath	Pathname of the on-disk or in-memory file to write.  If not an absolute path (starting with a drive letter and a colon, or a forward or backward slash), it is relative to the ColdFusion temporary directory, which is returned by the <a href="#">GetTempDirectory</a> function.

### Usage

Use the following syntax to specify an in-memory file, which is not written to disk. In-memory files speed processing of transient data.

```
ram:///filepath
```

The filepath can include directories, for example `ram:///petStore/images/poodle.jpg`. Create the directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files* in the *Developing ColdFusion Applications*.

### Example

```
<h3>FileWrite Example</h3>
<!-- This example gets the email addresses of employees, --->
<!-- creates a file object that contains the e-mail addresses, --->
<!-- read the file object, and then creates a text file with a --->
<!-- list of e-mail addresses. --->

<cfquery name="getemployees" datasource="cfdocexamples">
SELECT EMAIL
FROM Employees
</cfquery>

<cfset companymail = "">

<cfloop query = "getemployees">
    <cfset companymail = companymail & #EMAIL# & ";" & " ">
</cfloop>

<cfscript>
FileWrite("mail_list", "#companymail#");
mlist = FileRead("mail_list");
FileWrite("c:\temp\mail_list.txt", "#mlist#");
</cfscript>
```

## FileWriteLine

### Description

Appends the specified text to the file object.

### Category

[System functions](#)

### Function syntax

```
FileWriteLine(fileobj, text)
```

### See also

[FileCopy](#), [FileDelete](#), [FileExists](#), [FileMove](#), [FileWrite](#), [cffile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
<i>text</i>	Content to add to the file object.
<i>fileobj</i>	The file object to which to write the line.

### Example

```
<h3>FileWriteLine Example</h3>

<cfscript>
    myfile = FileOpen("c:\temp\test1.txt", "write");
    FileWriteLine(myfile, "This line is new.");
    FileClose(myfile);
</cfscript>
```

## Find

### Description

Finds the first occurrence of a *substring* in a *string*, from a specified start position. The search is case sensitive.

### Returns

A number; the position of *substring* in *string*; or 0, if *substring* is not in *string*.

### Category

[String functions](#)

### Function syntax

```
Find(substring, string [, start ])
```

### See also

[FindNoCase](#), [Compare](#), [FindOneOf](#), [REFind](#), [Replace](#)

### Parameters

Parameter	Description
<i>substring</i>	A string or a variable that contains one. String for which to search.
<i>string</i>	A string or a variable that contains one. String in which to search.
<i>start</i>	Start position of search.

### Example

```
<cfoutput>
    <cfset stringToSearch = "The quick brown fox jumped over the lazy dog.">
    #find("the",stringToSearch)#<br>
    #find("the",stringToSearch,35)#<br>
    #find("no such substring",stringToSearch)#<br>
    <br>
    #findnocase("the",stringToSearch)#<br>
    #findnocase("the",stringToSearch,5)#<br>
    #findnocase("no such substring",stringToSearch)#<br>
    <br>
    #findoneof("aeiou",stringToSearch)#<br>
    #findoneof("aeiou",stringToSearch,4)#<br>
    #findoneof("@%*()",stringToSearch)#<br>
</cfoutput>
```

## FindNoCase

### Description

Finds the first occurrence of a *substring* in a *string*, from a specified start position. If *substring* is not in *string*, returns zero. The search is case-insensitive.

### Returns

The position of *substring* in *string*; or 0, if *substring* is not in *string*.

### Category

[String functions](#)

### Function syntax

```
FindNoCase(substring, string [, start ])
```

### See also

[Find](#), [CompareNoCase](#), [FindOneOf](#), [REFind](#), [Replace](#)

### Parameters

Parameter	Description
substring	A string or a variable that contains one. String for which to search.
string	A string or a variable that contains one. String in which to search.
start	Start position of search.

### Example

In the following example, the `Find` function returns 33 as the first position found because "the" is lowercase. The `FindNoCase` function returns 1 as the first position because the case is ignored.

```
<cfset stringToSearch = "The quick brown fox jumped over the lazy dog.">

stringToSearch = <cfoutput>#stringToSearch#</cfoutput><br>
<p>
Find Function:<br>
Find("the",stringToSearch) returns <cfoutput>#find("the",stringToSearch)#</cfoutput><br>
<p>
FindNoCase Function:<br>
FindNoCase("the",stringToSearch) returns
<cfoutput>#FindNoCase("the",stringToSearch)#</cfoutput>
```

## FindOneOf

### Description

Finds the first occurrence of *any one of a set of characters* in a *string*, from a specified start position. The search is case sensitive.

### Returns

The position of the first member of *set* found in *string*; or 0, if no member of *set* is found in *string*.

### Category

[String functions](#)

### Function syntax

```
FindOneOf(set, string [, start ])
```

### See also

[Find](#), [Compare](#), [REFind](#)

### Parameters

Parameter	Description
<i>set</i>	A string or a variable that contains one. String that contains one or more characters to search for.
<i>string</i>	A string or a variable that contains one. String in which to search.
<i>start</i>	Start position of search.

### Example

```
<cfoutput>
<cfset stringToSearch = "The quick brown fox jumped over the lazy dog.">
#find("the",stringToSearch)#<br>
#find("the",stringToSearch,35)#<br>
#find("no such substring",stringToSearch)#<br>
<br>
#findnocase("the",stringToSearch)#<br>
#findnocase("the",stringToSearch,5)#<br>
#findnocase("no such substring",stringToSearch)#<br>
<br>
#findoneof("aeiou",stringToSearch)#<br>
#findoneof("aeiou",stringToSearch,4)#<br>
#findoneof("@%^*()",stringToSearch)#<br>
</cfoutput>
```

## FirstDayOfMonth

### Description

Determines the ordinal (day number, in the year) of the first day of the month in which a given date falls.

### Returns

A number that corresponds to a day-number in a year.

### Category

[Date and time functions](#)

### Function syntax

`FirstDayOfMonth(date)`

### See also

[Day](#), [DayOfWeek](#), [DayOfWeekAsString](#), [DayOfYear](#), [DaysInMonth](#), [DaysInYear](#)

### Parameters

Parameter	Description
date	Date/time object, in the range 100 AD–9999 AD.

### Usage

When passing a date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

### Example

```
<h3>FirstDayOfMonth Example</h3>

<cfoutput>
The first day of #MonthAsString(Month(Now()))#, #Year(Now())# was
day #FirstDayOfMonth(Now())# of the year.
</cfoutput>
```

## Fix

### Description

Converts a real number to an integer.

### Returns

If *number* is greater than or equal to 0, the closest integer less than or equal to *number*.

If *number* is less than 0, the closest integer greater than or equal to *number*.

### Category

[Mathematical functions](#)

### Function syntax

`Fix(number)`

### See also

[Ceiling](#), [Int](#), [Round](#)

### Parameters

Parameter	Description
number	A number

### Example

```
<h3>Fix Example</h3>
<p>Fix returns the closest integer less than the number if the number is
    greater than or equal to 0. Fix returns the closest integer greater than
    the number if number is less than 0.</p>
<cfoutput>
<p>The fix of 3.4 is #Fix(3.4)#</p>
<p>The fix of 3 is #Fix(3)#</p>
<p>The fix of 3.8 is #Fix(3.8)#</p>
<p>The fix of -4.2 is #Fix(-4.2)#</p>
</cfoutput>
```

## FormatBaseN

### Description

Converts *number* to a string, in the base specified by *radix*.

### Returns

String that represents *number*, in the base *radix*.

### Category

[Display and formatting functions](#), [Mathematical functions](#), [String functions](#)

### Function syntax

`FormatBaseN(number, radix)`

### See also

[InputBaseN](#)

### Parameters

Parameter	Description
<code>number</code>	Number to convert
<code>radix</code>	Base of the result

### Example

```
<h3>FormatBaseN Example</h3>
<p>Converts a number to a string in the base specified by Radix.
<p>
<cfoutput>
<br>FormatBaseN(10,2): #FormatBaseN(10,2)#
<br>FormatBaseN(1024,16): #FormatBaseN(1024,16)#
<br>FormatBaseN(125,10): #FormatBaseN(125,10)#
<br>FormatBaseN(10.75,2): #FormatBaseN(10.75,2)#
</cfoutput>
<h3>InputBaseN Example</h3>
<p>InputBaseN returns the number obtained by converting a string,
    using base specified by Radix (an integer from 2 to 36).</p>

<cfoutput>
<br>InputBaseN("1010",2): #InputBaseN("1010",2)#
<br>InputBaseN("3ff",16): #InputBaseN("3ff",16)#
<br>InputBaseN("125",10): #InputBaseN("125",10)#
<br>InputBaseN(1010,2): #InputBaseN(1010,2)#
</cfoutput>
```

## GenerateSecretKey

### Description

Gets a secure key value for use in the [Encrypt](#) function.

### Returns

A string that contains the encryption key.

### Category

[Security functions](#), [String functions](#)

### Function syntax

`GenerateSecretKey(algorithm [, keysize])`

### See also

[Decrypt](#), [Encrypt](#)

### History

ColdFusion 8: Added the `keysize` attribute.

ColdFusion MX 7: Added this function.

### Parameters

Parameter	Description
<code>algorithm</code>	The encryption algorithm for which to generate the key. ColdFusion installs a cryptography library with the following algorithms: <ul style="list-style-type: none"><li>• AES: the Advanced Encryption Standard specified by the National Institute of Standards and Technology (NIST) FIPS-197.</li><li>• BLOWFISH: the Blowfish algorithm defined by Bruce Schneier.</li><li>• DES: the Data Encryption Standard algorithm defined by NIST FIPS-46-3.</li><li>• DESEDE: the "Triple DES" algorithm defined by NIST FIPS-46-3.</li></ul>
<code>keysize</code>	Number of bits requested in the key for the specified algorithm.  You can use this to request longer keys when allowed by the JDK. For example, the AES algorithm keys are limited to 128 bits unless the Java Unlimited Strength Jurisdiction Policy Files are installed. For more information, see <a href="http://java.sun.com/products/jce/index-14.html">http://java.sun.com/products/jce/index-14.html</a> .

### Usage

You cannot use the `GenerateSecretKey` function to generate a key for the ColdFusion default encryption algorithm (CFMX\_COMPAT) of the `Encrypt` and `Decrypt` functions.

ColdFusion uses the Java Cryptography Extension (JCE) and installs a Sun Java runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Adobe cannot provide technical support for third-party security providers.

### Example

The following example encrypts and decrypts a text string. It lets you specify the encryption algorithm and encoding technique. It also has a field for a key seed to use with the CFMX\_COMPAT algorithm. For all other algorithms, it uses the `GenerateSecretKey` function to generate a secret key.

```
<h3>Decrypt Example</h3>

<!-- Do the following if the form has been submitted. -->
<cfif IsDefined("Form.myString")>
    <cfscript>
        /* GenerateSecretKey does not generate keys for the CFMX_COMPAT algorithm,
        so we use a key from the form.
        */
        if (Form.myAlgorithm EQ "CFMX_COMPAT")
            theKey=Form.MyKey;
        // For all other encryption techniques, generate a secret key.
        else
            theKey=generateSecretKey(Form.myAlgorithm);
        //Encrypt the string.
        encrypted=encrypt(Form.myString, theKey, Form.myAlgorithm,
            Form.myEncoding);
        //Decrypt it.
        decrypted=decrypt(encrypted, theKey, Form.myAlgorithm, Form.myEncoding);
    </cfscript>

    <!-- Display the values used for encryption and decryption,
        and the results. -->
    <cfoutput>
        <b>The algorithm:</b> #Form.myAlgorithm#<br>
        <b>The key:</b> #theKey#<br>
        <br>
        <b>The string:</b> #Form.myString# <br>
        <br>
        <b>Encrypted:</b> #encrypted#<br>
        <br>
        <b>Decrypted:</b> #decrypted#<br>
    </cfoutput>
</cfif>

<!-- The input form. -->
<form action="#CGI.SCRIPT_NAME#" method="post">
    <b>Select the encoding</b><br>
    <select size="1" name="myEncoding" >
        <option selected>UU</option>
        <option>Base64</option>
```

```
        <option>Hex</option>
    </select><br>
    <br>
    <b>Select the algorithm</b><br>
    <select size="1" name="myAlgorithm" >
        <option selected>CFMX_COMPAT</option>
        <option>AES</option>
        <option>DES</option>
        <option>DESEDE</option>
    </select><br>
    <br>
    <b>Input your key</b> (used for CFMX_COMPAT encryption only)<br>
    <input type = "Text" name = "myKey" value = "foobar"><br>
    <br>
    <b>Enter string to encrypt</b><br>
    <textArea name = "myString" cols = "40" rows = "5" WRAP = "VIRTUAL">This string will be
    encrypted (you can replace it with more typing).
    </textArea><br>
    <input type = "Submit" value = "Encrypt my String">
</form>
```

## GetAuthUser

### Description

Gets the name of an authenticated user.

### Returns

The name of an authenticated user.

### Category

[Security functions](#)

### Function syntax

```
GetAuthUser()
```

### See also

[cflogin](#), [cfloginuser](#), [cflogout](#), [GetUserRoles](#), [IsUserInAnyRole](#), [IsUserInRole](#), [IsUserLoggedIn](#), [Securing Applications in the \*Developing ColdFusion Applications\*](#)

### History

ColdFusion MX: Added this function.

### Usage

This function works with `cflogin` authentication or web server authentication. It checks for a logged-in user as follows:

- 1 It checks for a login made with `cfloginuser`.
- 2 If no user was logged in with `cfloginuser`, it checks for a web server login (`cgi.remote_user`).

### Example

```
<H3>GetAuthUser Example</H3>

<P>Authenticated User: <cfoutput>#GetAuthUser()#</cfoutput>
```

## GetBaseTagData

### Description

Used within a custom tag. Finds calling (ancestor) tag by name and accesses its data.

### Returns

An object that contains data (variables, scopes, and so on) from an ancestor tag. If there is no ancestor by the specified name, or if the ancestor does not expose data (for example, `cfif`), an exception is thrown.

### Category

[Other functions](#)

### Function syntax

```
GetBaseTagData(tagname [, instancenumber ])
```

### See also

[GetBaseTagList](#); High-level data exchange in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
tagname	(Required) Ancestor tag name for which to return data
instancenumber	(Optional) Number of ancestor levels to jump before returning data. The default value is 1 (closest ancestor).

### Example

```
<!--- This example shows the use of GetBaseTagData
      function. Typically used in custom tags.--->
...
<cfif trim(inCustomTag) neq "">
    <cfoutput>
        Running in the context of a custom
        tag named #inCustomTag#.<p>
    </cfoutput>
    <!--- Get the tag instance data --->
    <cfset tagData = GetBaseTagData(inCustomTag)>
    <!--- Find the tag's execution mode --->
    Located inside the
    <cfif tagData.thisTag.executionMode neq 'inactive'>
        template
    <cfelse>
        BODY
    </cfif>
```

## GetBaseTagList

### Description

Gets ancestor tag names, starting with the parent tag.

### Returns

A comma-delimited list of uppercase ancestor tag names, as a string. The first list element is the current tag. If the current tag is nested, the next element is the parent tag. If the function is called for a top-level tag, it returns an empty string. If an ancestor does not expose data (see [GetBaseTagData](#)), its name might not be returned.

### Category

[Other functions](#)

### Function syntax

```
GetBaseTagList()
```

### See also

[GetBaseTagData](#); High-level data exchange in the *Developing ColdFusion Applications*

### Usage

This function does not display the following tags or end tags in the ancestor tag list:

- `cfif`, `cfelseif`, `cfelse`
- `cfswitch`, `cfcase`, `cfdefaultcase`
- `cftry`, `cfcatch`

This function displays the following tags only under the following conditions:

- `cfloop`: if it uses a `query` attribute
- `cfoutput`: if at least one of its children is a complex expression
- `cfprocessingdirective`: if it has at least one other attribute besides `pageencoding`

### Example

```
<!--- This example shows the use of GetBaseTagList function.
Typically used in custom tags. --->
<cfif thisTag.executionMode is "start">
    <!--- Get the tag context stack
    The list will look something like "CFIF,MYTAGNAME..." --->
    <cfset ancestorList = GetBaseTagList()>
<br><br>Dump of GetBaseTagList output:<br>
    <cfdump var="#ancestorList#"><br><br>
    <!--- Output current tag name --->
    <cfoutput>This is custom tag#ListGetAt(ancestorList,1)#</cfoutput><br>
    <!--- Determine whether this is nested inside a loop --->
    <cfset inLoop = ListFindNoCase(ancestorList, "cfloop")>
    <cfif inLoop>
        Running in the context of a cfloop tag.<br>
    </cfif>
</cfif>
```

## GetBaseTemplatePath

### Description

Gets the absolute path of an application's base page.

### Returns

The absolute path of the application base page, as a string.

### Category

[Other functions](#), [System functions](#)

### Function syntax

```
GetBaseTemplatePath()
```

### See also

[GetCurrentTemplatePath](#), [FileExists](#), [ExpandPath](#)

### Example

```
<h3>GetBaseTemplatePath Example</h3>
```

```
<p>The template path of the current page is:  
<cfoutput>#GetBaseTemplatePath()#</cfoutput>
```

## GetClientVariablesList

### Description

Finds the client variables to which a page has write access.

### Returns

Comma-delimited list of non-read-only client variables, as a string.

### Category

[List functions](#), [Other functions](#)

### Function syntax

```
GetClientVariablesList()
```

### See also

[DeleteClientVariable](#)

### Usage

The list of variables returned by this function is compatible with ColdFusion list functions.

### Example

```
<h3>GetClientVariablesList Example</h3>

<!--- The following line enables client variables.
      You would normally do this in Application.cfc.--->
<cfapplication clientmanagement="yes">

<p>This example creates two client variables and deletes the User_ID client variable,
if it exists in the list of client variables returned by GetClientVariablesList().</p>

<cfset client.somevar = ">
<cfset client.User_ID = ">
<p>Client variable list: <cfoutput>#GetClientVariablesList()#</cfoutput></p>

<cfif ListFindNoCase(GetClientVariablesList(), "User_ID") is not 0>
    Delete client.User_ID variable.
    <cfset temp = DeleteClientVariable("User_ID")>
    <p>Was variable "User_ID" Deleted? <cfoutput>#temp#</cfoutput>
</cfif>

<p>Amended Client variable list: <cfoutput>#GetClientVariablesList()#
</cfoutput>
```

## GetComponentMetaData

### Description

Gets metadata (such as the functions and implemented interfaces of a component) for a CFC or ColdFusion interface.

### Returns

A structure containing the metadata for the CFC or interface. For information on the structure contents, see the component entry in the table in the [GetMetaData](#) Usage section.

### Category

[Extensibility functions](#)

### Function syntax

`GetComponentMetaData(path)`

### See also

[GetMetaData](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
path	<p>The dot-delimited path of the interface or CFC definition.</p> <p>The path can be relative to the current directory or the web root. For example, if a cfm page that calls this function is in <i>web_root/my_apps/interfaces</i>, the interface file is in <i>web_root/my_apps/interfaces/definitions</i>, and you want to get the metadata for the interface defined in <i>l2.cfc</i>, specify either of the following values in this parameter:</p> <ul style="list-style-type: none"><li>• <code>definitions.l2</code></li><li>• <code>my_apps.interface.definitions.l2.cfc</code></li></ul>

### Usage

This function and the `getMetaData` function return the same data. This function, however, takes a path to the CFC or Interface definition file, and does not use or create an object instance. Also, this function can get data about CFCs and interfaces only, and you cannot specify an interface in the `getMetaData` function.

## GetContextRoot

### Description

Returns path to the J2EE server context root for the current request.

### Returns

The path from the web root to the context root for the current page. The path starts with a forward slash character (/) but does not end with a forward slash character (/). For applications in the default (root) context, returns the empty string.

### Category

[System functions](#)

### History

ColdFusion MX 7: Added this function.

### Function syntax

```
GetContextRoot()
```

### See also

[GetPageContext](#)

### Usage

This function is equivalent to calling `GetPageContext().getRequest().getContextPath()`. On J2EE configurations, it returns the path from the Web root to the J2EE context root of the ColdFusion J2EE application. On server configurations, it returns the empty string, because the context root is at the web root.

This function is useful in applications that might be installed at varying J2EE context roots.

### Example

The ColdFusion Administrator uses the following line to get the location of the administrator directory:

```
<cfset request.thisURL = "#getContextRoot()#/CFIDE/administrator/">
```

The Administrator uses the returned value in places where it uses a URL to access Administrator resources, such as images, as in the following line:

```
<a href="index.cfm"></a>
```

## GetCurrentTemplatePath

### Description

Gets the path of the page that calls this function.

### Returns

The absolute path of the page that contains the call to this function, as a string.

### Category

[System functions](#)

### Function syntax

```
GetCurrentTemplatePath()
```

### See also

[GetBaseTemplatePath](#), [FileExists](#), [ExpandPath](#)

### Usage

If the function call is made from a page included with a `cfinclude` tag, this function returns the page path of an included page. Contrast this with the `GetBaseTemplatePath` function, which returns the path of the top-level page, even if it is called from an included page.

### Example

```
<!-- This example uses GetCurrentTemplatePath to show the
    template path of the current page -->
<h3>GetCurrentTemplatePath Example</h3>

<p>The template path of the current page is:
<cfoutput>#GetCurrentTemplatePath()#</cfoutput>
```

## GetDirectoryFromPath

### Description

Extracts a directory from an absolute on-disk or in-memory path.

### Returns

Absolute path, without the filename. The last character is a forward or backward slash, depending on the operating system.

### Category

[System functions](#)

## Function syntax

GetDirectoryFromPath(*path*)

## See also

[ExpandPath](#), [GetFileFromPath](#)

## Parameters

Parameter	Description
path	Absolute on-disk or in-memory path.

## Usage

### Example

```
<h3>GetDirectoryFromPath Example</h3>
<cfset thisPath = ExpandPath("*.*)">
<cfset thisDirectory = GetDirectoryFromPath(thisPath)>
<cfoutput>
The current directory is: #GetDirectoryFromPath(thisPath)#
<cfif IsDefined("FORM.yourFile")>
    <cfif FORM.yourFile is not "">
        <cfset yourFile = FORM.yourFile>
        <cfif FileExists(ExpandPath(yourfile))>
            <p>Your file exists in this directory. You entered the correct filename,
            #GetFileFromPath("#thisPath#/#yourfile#")#
        <cfelse>
            <p>Your file was not found in this directory:
            <br>Here is a list of the other files in this directory:
            <!--- use cfdirectory show directory, order by name & size --->
            <cfdirectory directory = "#thisDirectory#"
                name = "myDirectory" SORT = "name ASC, size DESC">
            <!--- Output the contents of the cfdirectory as a CFTABLE --->
            <cftable query = "myDirectory">
                <cfcol header = "NAME:" text = "#Name#">
                <cfcol header = "SIZE:" text = "#Size#">
            </cftable>
            </cfif>
        </cfif>
    <cfelse>
        <H3>Please enter a filename</H3>
    </cfif>
</cfoutput>
<form action="getdirectoryfrompath.cfm" METHOD="post">
    <H3>Enter the name of a file in this directory <I><FONT SIZE="-1">
    (try expandpath.cfm)</FONT></I></H3>
    <input type="Text" NAME="yourFile">
    <input type="Submit" NAME="">
</form> --->
```

## GetEncoding

### Description

Returns the encoding (character set) of the Form or URL scope.

### Returns

String; the character encoding of the specified scope.

### Category

[International functions](#), [System functions](#)

### Function syntax

`GetEncoding(scope_name)`

### See also

[cfcontent](#), [cfprocessingdirective](#), [URLDecode](#), [URLEncodedFormat](#)

### History

ColdFusion MX: Added this function.

### Parameters

Parameter	Description
scope_name	<ul style="list-style-type: none"><li>Form</li><li>URL.</li></ul>

### Usage

Use this function to determine the character encoding of the URL query string or the fields of a form that was submitted to the current page. The default encoding, if none has been explicitly set, is UTF-8.

For more information, see [www.iana.org/assignments/character-sets](http://www.iana.org/assignments/character-sets).

### Example

```
<!--- This example sends the contents of two fields and interprets them as
      big5 encoded text. Note that the form fields are received as URL variables because the
form uses the GET method.--->
<cfcontent type="text/html; charset=big5">
<form action='#cgi.script_name#' method='get'>
<input name='xxx' type='text'>
<input name='yyy' type='text'>
<input type="Submit" value="Submit">
</form>

<cfif IsDefined("URL.xxx")>
<cfscript>
    SetEncoding("url", "big5");
    WriteOutput("URL.XXX is " & URL.xxx & "<br>");
    WriteOutput("URL.YYY is " & URL.yyy & "<br>");
theEncoding = GetEncoding("URL");
    WriteOutput("The URL variables were decoded using '" & theEncoding & "' encoding.");

WriteOutput("The encoding is " & theEncoding);
</cfscript>
</cfif>
```

## GetException

### Description

Used with the `cftry` and `cfcatch` tags. Retrieves a Java exception object from a Java object.

### Returns

Any Java exception object raised by a previous method call on the Java object.

### Category

[System functions](#)

### Syntax

```
GetException(object)
```

### Parameters

Parameter	Description
object	A Java object.

### Usage

ColdFusion stores a Java exception object for each method call on a Java object. Subsequent method calls reset the exception object. To get the current exception object, call `GetException` on the Java object before other methods are invoked on it.

### Example

```
<!--- Create the Java object reference --->
<cfoobject action = create type = java class = primitivetype name = myObj>
<!--- Calls the object's constructor --->
<cfset void = myObj.init()>
<cftry>
<cfset void = myObj.DoException() >
<Cfcatch type = "Any">
    <cfset exception = GetException(myObj)>
<!--- User can call any valid method on the exception object.--->
    <cfset message = exception.toString()>
    <cfoutput>
        Error<br>
        I got exception <br>
        <br> The exception message is: #message# <br>
    </cfoutput>
</cfcatch>
</cftry>
```

## GetFileFromPath

### Description

Extracts a filename from an absolute on-disk or in-memory path.

### Returns

Filename, as a string.

### Category

[System functions](#)

### Function syntax

`GetFileFromPath(path)`

### See also

[ExpandPath](#), [GetCurrentTemplatePath](#)

### Parameters

Parameter	Description
<code>path</code>	Absolute on-disk or in-memory path.

### Example

```
<h3>GetFileFromPath Example</h3>
<cfset thisPath = ExpandPath("*.*)">
<cfset thisDirectory = GetDirectoryFromPath(thisPath)>
<cfoutput>
The current directory is: #GetDirectoryFromPath(thisPath)#
<cfif IsDefined("FORM.yourFile")>
<cfif FORM.yourFile is not "">
<cfset yourFile = FORM.yourFile>
<cfif FileExists(ExpandPath(yourfile))>
    <p>Your file exists in this directory. You entered the correct file
name, #GetFileFromPath("#thisPath#/#yourfile#")#
<cfelse>
    <p>Your file was not found in this directory:
    <br>Here is a list of the other files in this directory:
    <!--- use CFDIRECTORY to give the contents of the snippets
directory, order by name and size --->
    <CFDIRECTORY
        DIRECTORY = "#thisDirectory#"
        name = "myDirectory"
        SORT = "name ASC, size DESC">
    <!--- Output the contents of the CFDIRECTORY as a CFTABLE --->
    <CFTABLE QUERY = "myDirectory">
    <CFCOL HEADER = "NAME:" TEXT = "#Name#">
    <CFCOL HEADER = "SIZE:" TEXT = "#Size#">
    ...
```

## GetFileInfo

### Description

Retrieves information about on-disk or in-memory file.

### Returns

The filename, path, parent directory, type, size, when the file was most recently modified, whether the file has read permission, write permission, and is hidden.

### Category

[System functions](#)

### Function syntax

GetFileInfo(*path*)

### See also

[FileOpen](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
path	Absolute on-disk or in-memory path.

### Usage

The function returns a structure that includes the following keys:

- Name: name of the file
- Path: absolute path of the file
- Parent: path to the file's parent directory
- Type: either "directory" or "file"
- Size: file size in bytes
- Lastmodified: datetime when it was the file was most recently modified
- canRead: whether the file can be read
- canWrite: whether the file has write permission
- isHidden: whether the file is a hidden

### Example

```
<cfscript>
    FileSetLastModified("c:\temp\test1.txt", "#Now()#");
    WriteOutput(GetFileInfo("c:\temp\test1.txt").lastmodified);
</cfscript>
```

## GetFunctionCalledName

### Description

Returns the name of the variable used to call a defined function.

### Returns

Name of the variable.

### Category

[System functions](#)

### Function syntax

```
GetFunctionCalledName()
```

### History

ColdFusion 9: Added this function

### Usage

This function can be used to return data from CFCs by simulating getters and setters. This applies only if the CFC does not use implicit getters and setters provided by ColdFusion 9.

### Example

The following example shows how you can use this function to return data without defining explicit setters and getters:

```
//callednamedemo.cfc
component
{
    variables.x1 = 1;
    variables.y1 = 2;
    function init()
    {
        return this;
    }
    function get()
    {
        var name = getFunctionCalledName();
        return variables[mid(name,4,len(name)-3)];
    }
    function set(value)
    {
        var name = getFunctionCalledName();
        variables[mid(name,4,len(name)-3)] = value;
    }
    this.getX1 = get;
    this.getY1 = get;
    this.setX1 = set;
    this.setY1 = set;
}
<!--- calledname.cfm --->
<cfscript>
    function test()
    {
        return getFunctionCalledName();
    }
    WriteOutput(test() & "<br>"); // test
    a = test;
    WriteOutput(variables.a() & "<br>"); // a
    o = new callednamedemo();
    // shows *real* methods get(), SetX1() and getY1(), etc.
    writeDump(o);
    o.setX1(10);
    o.setY1(20);
    WriteOutput(o.getX1() & "<br>"); // 10
    WriteOutput(o.getY1() & "<br>"); // 20 </cfscript>
```

## GetFunctionList

### Description

Displays a list of the functions that are available in ColdFusion.

### Returns

A structure of functions.

### Category

[System functions](#)

### Function syntax

`GetFunctionList()`

### Example

```
<!--- This example shows the use of GetFunctionList. --->
<cfset fList = GetFunctionList()>
<cfoutput>#StructCount(fList)# functions<br><br>
    </cfoutput>
<cfloop COLLECTION = "#fList#" ITEM = "key">
    <cfoutput>#key#<br>
    </cfoutput>
</cfloop>
```

## GetGatewayHelper

### Description

Gets a Java GatewayHelper object that provides methods and properties for use with a ColdFusion event gateway.

### Returns

A Java GatewayHelper object.

### Category

[Extensibility functions](#)

### Function syntax

`GetGatewayHelper(gatewayID)`

### See also

[SendGatewayMessage](#)

### History

ColdFusion MX 7: Added the function.

### Parameters

Parameter	Description
gatewayID	Identifier of the gateway that provides the GatewayHelper object. Must be the Gateway ID of one of the ColdFusion event gateway instances configured on the ColdFusion Administrator Event Gateways section's Gateways page.

### Usage

The ColdFusion `GetGatewayHelper` function returns a Java GatewayHelper object that provides event gateway-specific helper methods and properties. To use this function, the event gateway must provide access to a class that implements the GatewayHelper class. For example, an instant messaging event gateway might make buddy-list management functions available in a GatewayHelper object.

An event gateway listener CFC can get the `gatewayID` value from the `CFEvent` structure of the incoming message.

You access the GatewayHelper object's methods and properties using standard ColdFusion Java object access techniques. For more information, see *The role of the GatewayHelper object* in the *Developing ColdFusion Applications*.

**Example**

If an event gateway's helper class includes an `addBuddy` method that takes a single `String` parameter, you could use the following code to get the `GatewayHelper` object and add a buddy to the buddies list:

```
<h3>GetGatewayHelper Example</h3>
<cfscript>
    myHelper = getGatewayHelper(myGatewayID);
    status = myHelper.addBuddy("jsmith");
</cfscript>
```

## GetHttpRequestData

**Description**

Makes HTTP request headers and body available to CFML pages. Useful for capturing SOAP request data, which can be delivered in an HTTP header.

**Returns**

A ColdFusion structure.

**Category**

[System functions](#)

**Function syntax**

```
GetHttpRequestData ()
```

**Returns**

The function returns a structure that contains the following entries:

Structure element	Description
content	Raw content from form submitted by client, in string or binary format. For content to be considered string data, the FORM request header "CONTENT_TYPE" must start with "text/" or be special case "application/x-www-form-urlencoded". Other types are stored as a binary object.
headers	Structure that contains HTTP request headers as value pairs. Includes custom headers, such as SOAP requests.
method	String that contains the CGI variable <code>Request_Method</code> .
protocol	String that contains the <code>Server_Protocol</code> CGI variable.

**Usage**

To determine whether data is binary, use `IsBinary(x.content)`. To convert data to a string value, if it can be displayed as a string, use `ToString(x.content)`.

**Example**

The following example shows how this function can return HTTP header information.

```
<cfset x = GetHttpRequestData()>
<cfoutput>
<table cellpadding = "2" cellspacing = "2">
<tr>
    <td><b>HTTP Request item</b></td>
    <td><b>Value</b></td> </tr>
<cfloop collection = #x.headers# item = "http_item">
    <tr>
        <td>#http_item#</td>
        <td>#StructFind(x.headers, http_item)#</td></tr>
</cfloop>
<tr>
    <td>request_method</td>
    <td>#x.method#</td></tr>
<tr>
    <td>server_protocol</td>
    <td>#x.protocol#</td></tr>
</table>
<b>http_content --- #x.content#</b>
</cfoutput>
```

## GetHttpRequestTime

### Description

Gets the current time, in the Universal Time code (UTC).

### Returns

The time, as a string, according to the HTTP standard described in RFC 1123 and its underlying RFC, 822. This format is commonly used in Internet protocols, including HTTP.

### Category

[Date and time functions](#), [International functions](#)

### Function syntax

`GetHttpRequestTime(date_time_object)`

### See also

[GetLocale](#), [GetTimeZoneInfo](#), [SetLocale](#)

### Parameters

Parameter	Description
<code>date_time_object</code>	A ColdFusion date-time object string or Java Date object

### Usage

The time in the returned string is UTC, consistent with the HTTP standard.

### Example

```
<cfoutput>
    #GetHttpTimeString(now())#
</cfoutput>
```

## GetK2ServerDocCount

### Description

This function is deprecated.

### Returns

The number of collection metadata items stored in Verity collections.

### Category

[Full-text search functions](#), [Query functions](#)

### Function syntax

```
GetK2ServerDocCount ()
```

### See also

[GetK2ServerDocCountLimit](#)

### History

ColdFusion MX 6.1: Deprecated this function. It might not work, and it might cause an error, in later releases.

ColdFusion MX: Added this function.

### Example

```
<cfoutput>GetK2ServerDocCount =
    $*#GetK2ServerDocCount () #*$</cfoutput>
```

## GetK2ServerDocCountLimit

### Description

This function is deprecated.

### Returns

Number of collection metadata items that the K2 server permits, as an integer

### Category

[Full-text search functions](#), [Query functions](#)

### Function syntax

```
GetK2ServerDocCountLimit ()
```

### See also

[GetK2ServerDocCount](#)

### History

ColdFusion MX 6.1: Deprecated this function. It might not work, and it might cause an error, in later releases.

ColdFusion MX: Added this function.

### Usage

If a search generates a larger number of documents than the limit, ColdFusion puts a warning message in the Administrator and in the log file.

### Example

```
<cfoutput>GetK2ServerDocCountLimit =  
    $*#GetK2ServerDocCountLimit()#*$/cfoutput>
```

## GetLocale

### Description

Gets the current ColdFusion geographic/language locale value.

To set the default display format of date, time, number, and currency values in a ColdFusion application session, you use the [SetLocale](#) function.

### Returns

The current locale value, as an English string. If a locale has a Java name and a name that ColdFusion used prior to the ColdFusion MX 7 release (for example, en\_US and English (US)), ColdFusion returns the ColdFusion name (for example, English (US)).

### Category

[Display and formatting functions](#), [International functions](#), [System functions](#)

### Function syntax

```
GetLocale()
```

### See also

[GetLocaleDisplayName](#), [SetLocale](#)

### History

ColdFusion MX 7: Added support for all Java locales and locale names.

ColdFusion MX: Changed behavior to that described in usage.

### Usage

This function returns the locale name as it is represented in ColdFusion; for example, Portuguese (Brazilian), or ca\_ES. To get a locale name in the language of the locale, use the [GetLocaleDisplayName](#) function, which returns português (Brasil) and (Espanya).

This function determines whether a locale value is set for ColdFusion. (The value is set with the [SetLocale](#) function.)

- If the ColdFusion locale value is present, the function returns it.

- If the ColdFusion locale has not been explicitly set, ColdFusion now determines whether the default locale of the ColdFusion server computer operating system is among the locale values it supports. (The default locale is stored in the user environment variables `user.language` and `user.region`.)

If the default locale value is not supported, the function returns English (US). ColdFusion sets the locale in the JVM to this value; it persists until the server is restarted or it is reset with the `SetLocale` function.

This function does not access a web browser's Accept-Language HTTP header setting.

**Note:** When ColdFusion is started, it stores the supported locale values in the variable `Server.ColdFusion.SupportedLocales`. ColdFusion supports the locales supported by its Java runtime environment. The `SupportedLocales` value lists the Java names for the supported locales and the corresponding names that ColdFusion used prior to the ColdFusion MX 7 release.

For more information, see *Locales in the Developing ColdFusion Applications*.

### Example

```
<h3>Example: Using SetLocale and GetLocale</h3>
<cfoutput>
    <!--- For each new request, the locale gets reset to the JVM locale --->
    Initial locale's ColdFusion name: #GetLocale()#<br>
    <br>
    <!--- Do this only if the form was submitted. --->
    <cfif IsDefined("form.mylocale")>
        <b>Changing locale to #form.mylocale#</b><br>
        <br>
        <!--- Set the locale to the submitted value and save the old ColdFusion locale name.--->
        <cfset oldlocale=SetLocale("#form.mylocale#")>
        <!--- Get the current locale. It should have changed. --->
        New locale: #GetLocale()#<br>
    </cfif>

    <!--- Self-submitting form to select the new locale. --->
    <cfform>
        <h3>Please select the new locale:</h3>
        <cfselect name="mylocale">
            <!--- The server.coldfusion.supportedlocales variable is a
                  list of all supported locale names. Use a list cfloop tag
                  to create an HTML option tag for each name in the list. --->
            <cfloop index="i" list="#server.coldfusion.supportedlocales#">
                <option value="#i#">#i#</option>
            </cfloop>
        </cfselect><br>
        <br>
        <cfinput type="submit" name="submitit" value="Change Locale">
    </cfform>
</cfoutput>
```

## GetLocaleDisplayName

### Description

Gets a locale value and displays the name in a manner that is appropriate to a specific locale. By default, gets the current locale in the current locale's language.

### Returns

The localized display name of the locale, in the language of the specified locale.

### Category

[Display and formatting functions](#), [International functions](#), [System functions](#)

### Function syntax

```
getLocaleDisplayName([locale, inLocale])
```

### See also

[GetLocale](#), [SetLocale](#)

### History

ColdFusion MX 7: Added this function.

### Parameters

Parameter	Description
locale	The locale whose name you want. The default is the current ColdFusion locale, or if no ColdFusion locale has been set, the JVM locale.
inlocale	The locale in which to return the name. The default is the current ColdFusion locale, or if no ColdFusion locale has been set, the JVM locale.

### Example

The following example expands on the [GetLocale](#) example to show the use of the `getLocaleDisplayName` function to display locale names in the current locale and in other locales. It lets you select a locale from all supported locales, changes the ColdFusion locale to the selected locales, and displays the old and new locale names.

```
<html>
<head>
    <title>Displaying locales</title>
</head>

<body>
<h3>Example: Changing and Displaying Locales</h3>
<cfoutput>
    <!-- For each new request, the locale gets reset to the JVM locale --->
    Initial locale's ColdFusion name: #GetLocale()#<br>
    Initial locale's display name: #getLocaleDisplayName()#<br>
    <br>
    <!-- Do this only if the form was submitted. --->
    <cfif IsDefined("form.mylocale")>
        <b>Changing locale to #form.mylocale#</b><br>
        <br>
        <!-- Set the locale to the submitted value.
            SetLocale returns the old ColdFusion locale name.--->
        <cfset oldlocale=SetLocale("#form.mylocale#")>
        <!-- Get the current locale's ColdFusion name.
            It should have changed. --->
        <cfset newlocale=GetLocale()>
        New locale's ColdFusion name: #newlocale#<br>
        New locale's display name in current locale: #getLocaleDisplayName()#<br>
```

```
New locale's display name in old locale:
    #GetLocaleDisplayName(newlocale, oldlocale)#<br>
New locale's display name in en_US:
    #GetLocaleDisplayName(newlocale, "en_US")#<br>
<br>
Old locale's display name in current locale:
    #GetLocaleDisplayName(oldlocale)#<br>
Old locale's display name in en_US:
    #GetLocaleDisplayName(oldlocale, "en_US")#<br>
</cfif>

<!-- Self-submitting form to select the new locale. -->
<cfform>
    <h3>Please select the new locale:</h3>
    <cfselect name="mylocale">
        <!-- The server.coldfusion.supportedlocales variable is a
             list of all supported locale names. Use a list cfloop tag

```

## GetLocalHostIP

### Description

Returns the localhost IP address, which is 127.0.0.1 for IPv4 and ::1 for IPv6 addresses.

### Returns

The localhost IP address.

### Category

[Decision functions](#)

### Function syntax

```
GetLocalHostIP()
```

### See also

[IsLocalHost](#)

### History

ColdFusion MX 7.01: Added this function.

### Example

```
<h3>GetLocalHostIP Example</h3>

<cfoutput>The localhost IP address is #GetLocalHostIP()#.</cfoutput>
```

## GetMetaData

### Description

Gets metadata (such as the methods, properties, and parameters of a component) associated with an object that is deployed on the ColdFusion server.

### Returns

Structured metadata information: for ColdFusion components (CFCs) and user-defined functions (UDFs), a structure; for query objects, an array of structures.

### Category

[System functions](#)

### Function syntax

```
GetMetaData(object)
```

### See also

[CreateObject](#), [GetComponentMetaData](#), [QueryAddColumn](#), [QueryNew](#)

### History

ColdFusion MX 7: Added support for getting query object metadata.

ColdFusion MX: Added this function.

### Parameters

Parameter	Description
object	A ColdFusion component, user-defined function, or query object. Within a CFC, the parameter can also specify the This scope.

### Usage

This function provides information about application data, and lets applications dynamically determine the structure of an object and how to use it. This function is useful for CFCs and query objects. The metadata for a CFC includes information on the component and its functions, arguments, and properties. The `getMetaData` function also returns metadata for user-defined functions that are not part of CFCs. Use the [GetComponentMetaData](#) function to get information about ColdFusion interfaces, or about CFC definitions that you have not instantiated.

The following table lists the data returned by the function for supported object types:

Object	Field	Description
Component		A structure containing the following fields:
	displayname	Value of the <code>cfcomponent</code> tag <code>displayname</code> attribute, if any.
	extends	Metadata for the component's ancestor component. Components that do not explicitly extend another component extend the <code>WEB-INF.cftags.component</code> .
	fullname	The dot delimited path from the <code>cf_webroot</code> of the component.
	functions	Array of metadata structures for the component's functions.
	hint	Value of the <code>cfcomponent</code> tag <code>displayname</code> attribute, if any.
	implements	A structure containing the metadata of the interfaces that the component implements. The key of the structure is the interface name, and the value is a structure containing the interface metadata.
	name	Component name, including the period-delimited path from a component search root such as the web root or a directory specified in the administrator Custom Tag Paths page.
	output	Value of the <code>cfcomponent</code> tag <code>output</code> attribute, if any.
	path	Absolute path to the component.
	properties	Array of structures containing metadata specified by the component's <code>cfproperty</code> tags, if any.
	type	Always, component.
	userMetadata	User-specified attributes in the <code>cfcomponent</code> tag.
Function		A structure containing the following fields.
	access	Value of the <code>cffunction</code> tag <code>access</code> attribute, if any.
	displayname	Value of the <code>cffunction</code> tag <code>displayname</code> attribute, if any.
	hint	Value of the <code>cffunction</code> tag <code>hint</code> attribute, if any.
	name	Function name.
	output	Value of the <code>cffunction</code> tag <code>output</code> attribute, if any.
	parameters	Array of structures containing metadata for the function parameters.
	returnformat	The format in which to return values to a remote caller. This attribute has no effect on values returned to a local caller.
	returntype	Value of the <code>cffunction</code> tag <code>returntype</code> attribute, if any.
	roles	Value of the <code>cffunction</code> tag <code>output</code> attribute, if any.
	userMetadata	User-specified attributes in the <code>cffunction</code> tag.
Parameter or Property		A structure containing the following fields:

Object	Field	Description
	default	Value of the cfargument or cfproperty tag default attribute, if any.
	displayname	Value of the cfargument or cfproperty tag displayname attribute, if any.
	hint	Value of the cfargument or cfproperty tag hint attribute, if any.
	name	Function parameter or CFC property name.
	required	Value of the cfargument or cfproperty tag required attribute, if any.
	type	Value of the cfargument or cfproperty tag type attribute, if any.
	userMetadata	User-specified attributes in the argument tag.
Query		An array of structures containing the following elements:
	IsCaseSensitive	Boolean value indicating whether character data must be case correct.
	Name	The column name.
	TypeName	The SQL data type (Omitted if the query object is created with QueryNew without specifying types.)

**Note:** Use the *This* scope to access component metadata inside the CFC. The *This* scope is available at runtime in the component body and in the CFC methods. It is used to read and write variables that are present during the life of the component.

For more information, see Using introspection to get information about components in the *Developing ColdFusion Applications*.

### Example

The following example uses the `cfDump` tag to display metadata for the utilities CFC that is used by the ColdFusion component browser. It also displays the names and data types of the fields in the `cfdocexamples` database Employees table.

```
<!--- Create an instance of the Component Explorer utilities CFC.  
      and get its metadata --->  
<cfscript>  
componentutils = createObject("component", "cfide.componentutils.utils");  
utilmetadata = getMetaData(componentutils);  
</cfscript>  
  
<h4>Metadata for the CFC component utilities</h4>  
<cfdump var="#utilmetadata#">  
  
<!--- use GetMetadata to get the names and data types of the fields in the  
      cfdocexamples Employees table --->  
<cfquery name="getemployees" datasource="cfdocexamples">  
SELECT *  
FROM Employees  
</cfquery>  
<cfset employeemeta=getMetaData(getemployees)>  
  
<h4>The Employees table has the following columns</h4>  
<cfloop index="i" from="1" to="#arrayLen(employeemeta)#">  
  <cfoutput>  
    #employeemeta[i].name# #employeemeta[i].TypeName#  
    #employeemeta[i].isCaseSensitive#<br>  
  </cfoutput>  
</cfloop>
```

## GetMetricData

### Description

Gets server performance metrics.

### Returns

ColdFusion structure that contains metric data, depending on the `mode` value.

### Category

[System functions](#)

### Function syntax

`GetMetricData(mode)`

### History

ColdFusion MX: Deprecated the `cachepops` parameter. It might not work, and it might cause an error, in later releases.

### Parameters

Parameter	Option	Description
mode	perf_monitor	Returns internal data, in a structure. To receive data, enable PerfMonitor in ColdFusion Administrator before executing the function. On Windows, this data is otherwise displayed in the Windows PerfMonitor.
	simple_load	Returns an integer value that is computed from the state of the server's internal queues. Indicates the overall server load.
	prev_req_time	Returns the time, in milliseconds, that it took the server to process the previous request.
	avg_req_time	Returns the average time, in milliseconds, that it takes the server to process a request. Changing the setting to 0 prevents the server from calculating the average and removes overhead associated with gathering data. The default value is 120 seconds.

### Usage

If mode="perf\_monitor", the function returns a structure with these data fields:

Field	Description
InstanceName	The name of the ColdFusion server. The default value is cfserver.
PageHits	Number of HTTP requests received since ColdFusion was started.
ReqQueued	Number of HTTP requests in the staging queue, waiting for processing.
DBHits	Number of database requests since the server was started.
ReqRunning	Number of HTTP requests currently running. In the ColdFusion Administrator, you can set the maximum number of requests that run concurrently.
ReqTimedOut	Number of HTTP requests that timed out while in the staging queue or during processing.
BytesIn	Number of bytes in HTTP requests to ColdFusion.
BytesOut	Number of bytes in HTTP responses from ColdFusion.
AvgQueueTime	For the last two HTTP requests (current and previous), the average length of time the request waited in the staging queue.
AvgReqTime	For the last two HTTP requests (current and previous), the average length of time the server required to process the request
AvgDBTime	For the last two HTTP requests (current and previous), the average length of time the server took to process CFQueries in the request.
cachepops	This parameter is deprecated. ColdFusion automatically sets its value to -1.

### Example

```
<!--- This example gets and displays metric data from Windows NT PerfMonitor --->
<cfset pmData = GetMetricData( "PERF_MONITOR" ) >
<cfoutput>
    Current PerfMonitor data is: <p>
    InstanceName: #pmData.InstanceName# <p>
    PageHits: #pmData.PageHits# <p>
    ReqQueued: #pmData.ReqQueued# <p>
    DBHits: #pmData.DBHits# <p>
    ReqRunning: #pmData.ReqRunning# <p>
    ReqTimedOut: #pmData.ReqTimedOut# <p>
    BytesIn: #pmData.BytesIn# <p>
    BytesOut: #pmData.BytesOut# <p>
    AvgQueueTime: #pmData.AvgQueueTime# <p>
    AvgReqTime: #pmData.AvgReqTime# <p>
    AvgDBTime: #pmData.AvgDBTime# <p>
</cfoutput>
```

## GetPageContext

### Description

Gets the current ColdFusion PageContext object that provides access to page attributes and configuration, request, and response objects.

### Returns

The current ColdFusion Java PageContext Java object.

### Category

[System functions](#)

### Function syntax

```
GetPageContext()
```

### History

ColdFusion MX: Added this function.

### Usage

The ColdFusion PageContext class is a wrapper class for the Java PageContext object that can resolve scopes and perform case-insensitive variable lookups.

The PageContext object exposes fields and methods that can be useful in J2EE integration. It includes the `include` and `forward` methods that provide the equivalent of the corresponding standard JSP tags. You use these methods to call JSP pages and servlets. For example, you use the following code in CFScript to include the JSP page `hello.jsp` and pass it a `name` parameter:

```
GetPageContext().include("hello.jsp?name=Bobby"); ==
```

When you use `GetPageContext` to include a JSP page in a CFML page on WebLogic, you may need to flush the output of the CFML page with `cfflush` before calling the JSP page. Otherwise, the ColdFusion output appears after the JSP output.

The methods supported on the returned PageContext are only the ones mandated by the JSP specification. To look up scopes by name, use the StructGet function, for example:

```
<cfset myscope = "server">
<cfset myserver = StructGet(myscope)>
```

For more information, see your Java Server Pages (JSP) documentation.

On WebLogic, you may need to flush the output of the CFML page (using cfflush) before calling a JSP page. If you do not, the ColdFusion output appears after the JSP output.

On JBOSS, if you use this function and you include any JSP file, the content of the JSP file is processed prior to the processing of any CFML tags before the function.

### Example

```
<!--- This example shows using the page context to set a page
      variable and access the language of the current locale. --->
<cfset pc = GetPageContext()>

<cfset pc.setAttribute("name", "John Doe")>
<cfoutput>name: #variables.name#<br></cfoutput>

<cfoutput>Language of the current locale is
      #pc.getRequest().getLocale().getDisplayLanguage()#</cfoutput>.
```

## GetPrinterInfo

### Description

Determines which print attributes are supported by a selected printer.

### Returns

A structure that contains the attributes supported by the printer. If the printer is not specified, the structure contains attributes supported by the default printer, if one exists.

### Category

[System functions](#)

### Function syntax

```
GetPrinterInfo("printer")
```

### See also

[cfpdf](#), [cfprint](#)

### History

ColdFusion 8: Added this function.

**Parameters**

Parameter	Description
printer	<p>The name of a printer. An example in Windows is “\\s1001prn02\NTN-2W-HP_BW02”. The default is the default printer for the account where the ColdFusion server is running. Printer names are case sensitive and must be entered exactly as they appear in the System Information page of the ColdFusion Administrator.</p> <p>If you specify an empty string, for example <code>GetPrinterInfo(“”)</code>, ColdFusion generates an error. Use the following code to retrieve information on the default printer: <code>GetPrinterInfo()</code>.</p>

**Usage**

Use this function in conjunction with the `cfprint` tag when processing large print jobs. Not all printers support the complete list of print attributes allowed by the `cfprint` tag. If the selected printer does not support a print attribute, the printer ignores the attribute.

In Windows systems, the account running the ColdFusion server must have `PRINTER_ACCESS_USE` access rights for each printer it uses. Even if the printer is configured locally on the system, the printer is not available if the account in which ColdFusion is running does not have the proper permissions.

For more information on `attributeStruct`, see “[cfprint](#)” on page 517.

**Example**

```
<!--- The following code returns information on the default printer. --->
<cfdump var="#GetPrinterInfo()"#>

<!--- The following code returns information on the specified printer. --->
<cfdump var="#GetPrinterInfo('\\\\S1001prn02\NTN-2W-SHARP01')"#>
```

**GetPrinterList****Description**

Gets the list of printers that are accessible by ColdFusion server.

**Returns**

A list of accessible printers.

**Category**

[System functions](#)

**Function Syntax**

```
getPrinterList()
```

**See Also**

[cfpdf](#), [cfprint](#)

**History**

ColdFusion 8: Added this function.

**Usage**

Ensure that you run ColdFusion server using an account that has appropriate permissions to access all desired printers.

## GetProfileSections

### Description

Gets all the sections of an initialization file.

An initialization file assigns values to configuration variables, also known as entries, that are set when the system boots, the operating system comes up, or an application starts. An initialization file has the suffix INI; for example, boot.ini, Win32.ini.

### Returns

An initialization file, as a structure whose format is as follows:

- Each initialization file section name is a key in the structure
- Each list of entries in a section of an initialization file is a value in the structure

If there is no value, returns an empty string.

### Category

[System functions](#)

### Function syntax

```
GetProfileSections(iniFile)
```

### See also

[GetProfileString](#), [SetProfileString](#)

### History

ColdFusion MX: Added this function.

### Parameters

Parameter	Description
<i>iniFile</i>	Absolute path (drive, directory, filename, extension) of initialization file; for example, C:\boot.ini

## GetProfileString

### Description

Gets an initialization file entry.

An initialization file assigns values to configuration variables, also known as entries, that are set when the system boots, the operating system comes up, or an application starts. An initialization file has the suffix INI; for example, boot.ini, Win32.ini.

### Returns

An entry in an initialization file, as a string. If there is no value, returns an empty string.

### Category

[System functions](#)

**Function syntax**

```
GetProfileString(iniPath, section, entry)
```

**See also**[GetProfileSections](#), [SetProfileString](#)**Parameters**

Parameter	Description
iniPath	Absolute path (drive, directory, filename, extension) of initialization file; for example, C:\boot.ini
section	Section of initialization file from which to extract information
entry	Name of value to get

**Example**

```
<h3>GetProfileString Example</h3>
```

Uses GetProfileString to get the value of timeout in an initialization file. Enter the full path of your initialization file, and submit the form.

<!-- If the form was submitted, it gets the initialization path and timeout value specified in the form -->

```
<cfif Isdefined("Form.Submit")>
    <cfset IniPath = FORM.iniPath>
    <cfset Section = "boot loader">
    <cfset timeout = GetProfileString(IniPath, Section, "timeout")>
    <h4>Boot Loader</h4>
    <!-- If no entry in an initialization file, nothing displays -->
    <p>Timeout is set to: <cfoutput>#timeout#</cfoutput>.</p>
</cfif>
<form action = "getprofilestring.cfm">
<table cellpadding = "2" cellspacing = "2" border = "0">
    <tr>
        <td>Full Path of Init File</td>
        <td><input type = "Text" name = "IniPath" value = "C:\myboot.ini">
    </td>
</tr>
    <tr>
        <td><input type = "Submit" name = "Submit" value = "Submit"></td>
        <td></td>
    </tr></table>
</form>
```

**GetReadableImageFormats****Description**

Returns a list of image formats that ColdFusion can read on the operating system where ColdFusion is deployed.

**Returns**

A list of image file formats.

**Category**[System functions](#)

### History

ColdFusion 8: Added this function.

### Function syntax

```
GetReadableImageFormats()
```

### See also

[GetWriteableImageFormats](#), [cfimage](#) (for supported image file formats)

### Usage

Use this function to determine image file compatibility on the ColdFusion server.

### Example

```
<cfoutput>#GetReadableImageFormats()#</cfoutput>
```

## GetSOAPRequest

### Description

Returns an XML object that contains the entire SOAP request. Usually called from within a web service CFC.

### Returns

An XML object that contains the entire SOAP request.

### Category

[XML functions](#)

### History

ColdFusion MX 7: Added this function.

### Function syntax

```
GetSOAPRequest()
```

### See also

[AddSOAPRequestHeader](#), [AddSOAPResponseHeader](#), [GetSOAPRequestHeader](#), [GetSOAPResponse](#), [GetSOAPResponseHeader](#), [IsSOAPRequest](#); Basic web service concepts in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
webservice	Optional. A webservice object as returned from the <code>cfobject</code> tag or the <code>CreateObject</code> function. Required if the function is called from the client.

### Usage

Call this function to obtain a web service request object after the web service has been invoked. If you call this function from outside a web service CFC without the `webservice` parameter, it throws the following expression error:

```
Unable to use getSOAPRequest: not processing a web service request.
```

If you call this function from within a web service CFC, you can omit the `webservice` argument. The function executes against the request that it is currently processing.

You can use CFML XML functions to examine the returned XML object.

### Example

This example makes a request to execute the `echo_me` function of the `headerservice.cfc` web service. For information on implementing the `headerservice.cfc` web service and also to see the `echo_me` function and the content of the web service CFC, see the example for either the [AddSOAPResponseHeader](#) function or the [GetSOAPRequestHeader](#) function.

```
<!--- Note that you might need to modify the URL in the CreateObject function
to match your server and the location of the headerservice.cfc file if it is
different than shown here.
Note, too, that getSOAPRequest is called from the client here, whereas often it
would be called from within the web service CFC. --->
```

```
<cfscript>
    ws = CreateObject("webservice",
"http://localhost/soapheaders/headerservice.cfc?WSDL");
    ws.echo_me("hello world");
    req = getSOAPRequest(ws);
</cfscript>
<cfdump var="#req#">
```

## GetSOAPRequestHeader

### Description

Obtains a SOAP request header. Call only from within a CFC web service function that is processing a request as a SOAP web service.

### Returns

A SOAP request header.

### Category

[XML functions](#)

### History

ColdFusion MX 7: Added this function.

### Function syntax

```
GetSOAPRequestHeader(namespace, name [, asXML])
```

### See also

[AddSOAPRequestHeader](#), [AddSOAPResponseHeader](#), [GetSOAPRequest](#), [GetSOAPResponse](#), [GetSOAPResponseHeader](#), [IsSOAPRequest](#); Basic web service concepts in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
namespace	A String that is the namespace for the header.
name	A String that is the name of the header.
asXML	If true, the header is returned as a CFML XML object; if false (default), the header is returned as a Java object.

### Usage

If you specify `false` for the `asXML` parameter, ColdFusion first attempts to retrieve the header using the data type specified in the header's `xsi:type` attribute. If the `xsi:type` attribute is not available, ColdFusion attempts to retrieve the header as a string. If you specify `true` for the `asXML` parameter, ColdFusion retrieves the header as raw XML.

This function throws an error if it is invoked in a context that is not a web service request. Use the [IsSOAPRequest](#) function to determine whether the CFC is running as a web service.

### Example

This example creates a CFC web service that illustrates the operation of the `GetSOAPRequestHeader` function and also provides a web service that illustrates the operation of other ColdFusion SOAP functions.

Save the following code as `headerservice.cfc` in a folder called `soapheaders` under your web root. Test its operation, and specifically the operation of the `GetSOAPRequestHeader` function, by executing the examples that invoke this web service. For example, see the example for [AddSOAPRequestHeader](#).

```
<h3>GetSOAPRequestHeader Example</h3>
<cfcomponent displayName="tester" hint="Test for SOAP headers">

    <cffunction name="echo_me"
        access="remote"
        output="false"
        returnType="string"
        displayName="Echo Test" hint="Header test">

    <cfargument name="in_here" required="true" type="string">

    <cfset isSOAP = isSOAPRequest()>
    <cfif isSOAP>

        <!--- Get the first header as a string and as XML --->
        <cfset username = getSOAPRequestHeader("http://mynamespace/", "username")>
        <cfset return = "The service saw username: " & username>
        <cfset xmlusername = getSOAPRequestHeader("http://mynamespace/", "username", "TRUE")>
        <cfset return = return & "<br> as XML: " & xmlusername>

        <!--- Get the second header as a string and as XML --->
        <cfset password = getSOAPRequestHeader("http://mynamespace/", "password")>
        <cfset return = return & "The service saw password: " & password>
        <cfset xmlpassword = getSOAPRequestHeader("http://mynamespace/", "password", "TRUE")>
        <cfset return = return & "<br> as XML: " & xmlpassword>

        <!--- Add a header as a string --->
        <cfset addSOAPResponseHeader("http://www.tomj.org/myns", "returnheader", "AUTHORIZED VALUE",
false)>
```

```
<!--- Add a second header using a CFML XML value --->
<cfset doc = XmlNew()>
<cfset x = XmlElemNew(doc, "http://www.tomj.org/myns", "returnheader2")>
<cfset x.XmlText = "hey man, here I am in XML">
<cfsetx.XmlAttributes["xsi:type"] = "xsd:string">
<cfset tmp = addSOAPResponseHeader("ignoredNameSpace", "ignoredName", x)>

<cfelse>
  <!--- Add a header as a string - Must generate error!
<cfset addSOAPResponseHeader("http://www.tomj.org/myns", "returnheader", "AUTHORIZED VALUE",
false)>
  --->
<cfset return = "Not invoked as a web service">
</cfif>

<cfreturn return>

</cffunction>

</cfcomponent>
```

## GetSOAPResponse

### Description

Returns an XML object that contains the entire SOAP response after invoking a web service.

### Returns

An XML object that contains the entire SOAP response.

### Category

[XML functions](#)

### History

ColdFusion MX 7: Added this function.

### Function syntax

```
GetSOAPResponse(webservice)
```

### See also

[AddSOAPRequestHeader](#), [AddSOAPResponseHeader](#), [GetSOAPRequest](#), [GetSOAPRequestHeader](#),  
[GetSOAPResponseHeader](#), [IsSOAPRequest](#); Basic web service concepts in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
<code>webservice</code>	A webservice object as returned from the <code>cfobject</code> tag or the <code>CreateObject</code> function.

### Usage

Invoke the web service before attempting to get the response. You can use CFML XML functions to examine the XML response.

### Example

This example makes a request to execute the `echo_me` function of the `headerservice.cfc` web service. Following the request, the example calls the `GetSOAPResponse` function to get the SOAP response, and then calls `cfdump` to display its content.

for information on implementing the `headerservice.cfc` web service and also to see the `echo_me` function and the content of the web service CFC, see the example for either the [AddSOAPResponseHeader](#) function or the [GetSOAPRequestHeader](#) function.

```
<!--- Note that you might need to modify the URL in the CreateObject function
to match your server and the location of the headerservice.cfc file if it is
different than shown here. --->
```

```
<cfscript>
    ws = CreateObject("webservice",
"http://localhost/soapheaders/headerservice.cfc?WSDL");
    ws.echo_me("hello world");
    resp = getSOAPResponse(ws);
</cfscript>
<cfdump var="#resp#">
```

## GetSOAPResponseHeader

### Description

Returns a SOAP response header. Call this function from within code that is invoking a web service *after* making a web service request.

### Returns

A SOAP response header.

### Category

[XML functions](#)

### History

ColdFusion MX 7: Added this function.

### Function syntax

```
GetSOAPResponseHeader(webservice, namespace, name [, asXML])
```

### See also

[AddSOAPRequestHeader](#), [AddSOAPResponseHeader](#), [GetSOAPRequest](#), [GetSOAPRequestHeader](#), [GetSOAPResponse](#), [IsSOAPRequest](#); Basic web service concepts in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
<code>webservice</code>	A webservice object as returned from the <code>cfobject</code> tag or the <code>CreateObject</code> function.

Parameter	Description
namespace	A String that is the namespace for the header.
name	A String that is the name of the SOAP header.
asXML	If True, the header is returned as a CFML XML object. If False (default), the header is returned as a Java object.

### Usage

If you specify `false` for the `asXML` parameter, ColdFusion first attempts to retrieve the header using the data type specified in the header's `xsi:type` attribute. If the `xsi:type` attribute is not available, ColdFusion attempts to retrieve the header as a string. If you specify `true` for the `asXML` parameter, ColdFusion retrieves the header as raw XML.

Used within CFML code by a consumer of a web service *after* it calls the web service with `cfinvoke`.

### Example

There are two parts to this example. The first part is the web service CFC that this function (as well as the other ColdFusion SOAP functions) uses to demonstrate its interaction with a web service. To implement the web service for this function, see the example for either the [AddSOAPResponseHeader](#) function or the [GetSOAPRequestHeader](#) function.

Execute the following example to see how the `GetSOAPResponseHeader` function operates:

```
<!--- Note that you might need to modify the URL in the CreateObject function
to match your server and the location of the headerservice.cfc file if it is
different than shown here. Likewise for the cfinvoke tag at the end --->

<h3>GetSOAPResponseHeader Example</h3>
<cfscript>
    // Create the web service object
    ws = CreateObject("webservice", "http://localhost/soapheaders/headerservice.cfc?WSDL");

    // Set the username header as a string
    addSOAPRequestHeader(ws, "http://mynamespace/", "username", "tom", false);

    // Set the password header as a CFML XML object
    doc = XmlNew();
    doc.password = XmlElemNew(doc, "http://mynamespace/", "password");
    doc.password.XmlText = "My Voice is my Password";
    doc.password.XmlAttributes["xsi:type"] = "xsd:string";
    addSOAPRequestHeader(ws, "ignoredNameSpace", "ignoredName", doc);

    // Invoke the web service operation
    ret = ws.echo_me("argument");

    // Get the first header as an object (string) and as XML
    header = getSOAPResponseHeader(ws, "http://www.tomj.org/myns", "returnheader");
    XMLheader = getSOAPResponseHeader(ws, "http://www.tomj.org/myns", "returnheader", true);
```

```
// Get the second header as an object (string) and as XML
header2 =getSOAPResponseHeader(ws, "http://www.tomj.org/myns", "returnheader2");
XMLheader2 = getSOAPResponseHeader(ws, "http://www.tomj.org/myns", "returnheader2",
true);
</cfscript>
<hr>
<cfoutput>
Soap Header value: #HTMLCodeFormat(header)#<br>
Soap Header XML value: #HTMLCodeFormat(XMLheader)#<br>
Soap Header 2 value: #HTMLCodeFormat(header2)#<br>
Soap Header 2 XML value: #HTMLCodeFormat(XMLheader2)#<br>
Return value: #HTMLCodeFormat(ret)#<br>
</cfoutput>
<hr>

<cfinvoke component="soapheaders.headerservice" method="echo_me" returnvariable="ret"
in_here="hi">
</cfinvoke>
<cfoutput>Cfinvoke returned: #ret#</cfoutput>
```

## GetTempDirectory

### Description

Gets the path of the directory that ColdFusion uses for temporary files. The directory depends on the account under which ColdFusion is running and other factors. Before using this function in an application, test to determine the directory it returns under your account.

### Returns

The absolute pathname of a directory, including a trailing slash, as a string.

### Category

[System functions](#)

### Function syntax

```
GetTempDirectory()
```

### See also

[GetTempFile](#)

### History

ColdFusion MX: Changed behavior: on Windows, this function now returns the temporary directory of the embedded Java application server. On other platforms, it returns the temporary directory of the operating system.

### Example

```
<h3>GetTempDirectory Example</h3>

<p>The temporary directory for this ColdFusion server is
  <cfoutput>#GetTempDirectory()#</cfoutput>.</p>
<p>We have created a temporary file called:
  <cfoutput>#GetTempFile(GetTempDirectory(),"testFile")#</cfoutput></p>
```

## GetTempFile

### Description

Creates a temporary file in a directory whose name starts with (at most) the first three characters of *prefix*.

### Returns

Name of a temporary file, as a string.

### Category

[System functions](#)

### Function syntax

```
GetTempFile(dir, prefix)
```

### See also

[GetTempDirectory](#)

### Parameters

Parameter	Description
<code>dir</code>	Directory name
<code>prefix</code>	Prefix of a temporary file to create in the <code>dir</code> directory

### Example

```
<h3>GetTempFile Example</h3>
<p>The temporary directory for this ColdFusion Server is
    <cfoutput>#GetTempDirectory()#</cfoutput>.</p>
<p>We have created a temporary file called:
    <cfoutput>#GetTempFile(GetTempDirectory(),"testFile")#</cfoutput></p>
```

## GetTemplatePath

### Description

This function is deprecated. Use the [GetBaseTemplatePath](#) function instead.

Gets the absolute path of an application's base page.

### History

ColdFusion MX: Deprecated this function. It might not work, and it might cause an error, in later releases.

## GetTickCount

### Description

Returns the current value of an internal millisecond timer.

### Returns

A string representation of the system time, in milliseconds.

### Category

[Date and time functions](#), [System functions](#)

### Function syntax

`GetTickCount()`

### Usage

This function is useful for timing CFML code segments or other page processing elements. The value of the counter has no meaning. To generate useful timing values, take the difference between the results of two `GetTickCount` calls.

### Example

```
<!--- Setup timing test --->
<cfset iterationCount = 1000>
<!--- Time an empty loop with this many iterations --->
<cfset tickBegin = GetTickCount()>
<cfloop Index = i From = 1 To = #iterationCount#></cfloop>
<cfset tickEnd = GetTickCount()>
<cfset loopTime = tickEnd - tickBegin>

<!--- Report --->
<cfoutput>Loop time (#iterationCount# iterations) was: #loopTime#
    milliseconds</cfoutput>
```

## GetTimeZoneInfo

### Description

Gets local time zone information for the computer on which it is called, relative to Universal Time Coordinated (UTC). UTC is the mean solar time of the meridian of Greenwich, England, used as the basis for calculating standard time throughout the world.

ColdFusion stores date and time values as date-time objects: real numbers on a universal time line. It converts an object to a time zone when it formats an object; it converts a date/time value from a time zone to a real number when it parses a value.

### Returns

Structure that contains these elements and keys:

- `utcTotalOffset`: offset of local time, in seconds, from UTC
  - A plus sign indicates a time zone west of UTC (such as a zone in North America)
  - A minus sign indicates a time zone east of UTC (such as a zone in Germany)
- `utcHourOffset`: offset, in hours of local time, from UTC
- `utcMinuteOffset`: offset, in minutes, beyond the hours offset. For North America, this is 0. For countries that are not exactly on the hour offset, the number is from 0 through 60. For example, standard time in Adelaide, Australia is offset 9 hours and 30 minutes from UTC.
- `isDSTOn`: True, if Daylight Savings Time (DST) is on in the host; False, otherwise

### Category

[Date and time functions](#), [International functions](#)

### Function syntax

```
GetTimeZoneInfo()
```

### See also

[DateConvert](#), [CreateDateTime](#), [DatePart](#)

### Example

```
<h3>GetTimeZoneInfo Example</h3>
<!-- This example shows the use of GetTimeZoneInfo --->
<cfoutput>
The local date and time are #now()#.
</cfoutput>

<cfset info = GetTimeZoneInfo()>
<cfoutput>
<p>Total offset in seconds is #info.utcTotalOffset#.</p>
<p>Offset in hours is #info.utcHourOffset#.</p>
<p>Offset in minutes minus the offset in hours is
    #info.utcMinuteOffset#.</p>
<p>Is Daylight Savings Time in effect? #info.isDSTOn#.</p>
</cfoutput>
```

## GetToken

### Description

Determines whether a token of the list in the `delimiters` parameter is present in a string.

### Returns

The token found at position *index* of the string, as a string. If *index* is greater than the number of tokens in the string, returns an empty string.

### Category

[String functions](#)

### Function syntax

```
GetToken(string, index [, delimiters ])
```

### See also

[Left](#), [Right](#), [Mid](#), [SpanExcluding](#), [SpanIncluding](#)

### Parameters

Parameter	Description
string	A string or a variable that contains one. String in which to search.
index	Positive integer or a variable that contains one. The position of a token.
delimiters	A string or a variable that contains one. A delimited list of delimiters. Elements may consist of multiple characters. Default list of delimiters: space character, tab character, newline character; or their codes: "chr(32)", "chr(9)", chr(10). Default list delimiter: comma character.

## Usage

The following examples show how this function works.

### Example 1

In the following example, the function call requests element number 2 from the string, using the delimiter ":";".

```
GetToken("red,blue:;red,black,tan:;red,pink,brown:;red,three", 2, ";;")
```

The output is as follows:

```
red,black,tan
```

### Example 2

```
<cfset mystring = "four,"
    & #chr(32)# & #chr(9)# & #chr(10)#
    & ",five, nine,zero:;"
    & #chr(10)#
    & "nine,ten:, eleven:;twelve:;thirteen,"
    & #chr(32)# & #chr(9)# & #chr(10)#
    & ",four">
<cfoutput>
    #HTMLCodeFormat(mystring)#<br><br>
</cfoutput>
```

The output is as follows:

```
four,
,five, nine,zero:;
nine,ten:, eleven:;twelve:;thirteen,
,four
```

The `GetToken` function recognizes explicit spaces, tabs, or newline characters as the parameter delimiters. (To specify a space character, the code is `chr(32)`; a tab character, `chr(9)`; and a newline character, `chr(10)`.)

In the example string `mystring`, there is:

- A forced space between the substrings "four," and ",five"
- A literal space between "five," and "nine"
- A literal space between "ten:," and "eleven,"
- A forced space between "thirteen," and ",four"

In the following call against `mystring`, no spaces are specified in `delimiters` (it is omitted), so the function uses the space character as the `string` delimiter:

```
<br>
<cfoutput>
    GetToken(mystring, 3) is : #GetToken(mystring, 3)#
</cfoutput><br>
```

The output of this code is as follows:

```
GetToken(mystring, 3) is : nine,zero:;
```

The function finds the third delimiter, and returns the substring just before it that is between the second and third delimiter. This substring is "nine,zero:;".

### Example 3

```
<cfset mystring2 = "four,"
    &#chr(9)# & #chr(10)#
    & ",five,nine,zero;"
    & #chr(10)#
    & "nine,ten:,eleven:,twelve:,thirteen,"
    & #chr(9)# & #chr(10)# & ",four">
<cfoutput>
    #HTMLCodeFormat(mystring2)#<br>
</cfoutput>
```

The output is as follows:

```
four,
,five,nine,zero;
nine,ten:,eleven:,twelve:,thirteen,
,four
```

The following is a call against mystring2:

```
<cfoutput>
    GetToken(mystring2, 2) is : #GetToken(mystring2, 2)#
</cfoutput>
```

The output is as follows:

```
GetToken(mystring2, 2) is : ,five,nine,zero;;
```

The function finds the second delimiter, and returns the substring just before it that is between the first and second delimiter. This substring is ",five,nine,zero;;".

### Example

```
<h3>GetToken Example</h3>
<cfif IsDefined("FORM.yourString")>
<!--- set delimiter --->
<cfif FORM.yourDelimiter is not "">
    <cfset yourDelimiter = FORM.yourDelimiter>
<cfelse>
    <cfset yourDelimiter = " ">
</cfif>
<!--- check whether number of elements in list is greater than or
equal to the element sought to return --->
<cfif ListLen(FORM.yourString, yourDelimiter) GTE FORM.returnElement>
    <cfoutput>
        <p>Element #FORM.ReturnElement# in #FORM.yourString#,
        delimited by "#yourDelimiter#"
        <br>is:#GetToken(FORM.yourString, FORM.returnElement, yourDelimiter)#
    </cfoutput>
    ...
</cfif>
```

## GetUserRoles

### Description

Retrieves the list of roles for the current user. This function returns only ColdFusion roles, not roles set for the servlet API.

### Returns

The list of roles for the current user.

### Category

[Security functions](#)

### Function syntax

```
getUserRoles()
```

### See also

[cflogin](#), [cfloginuser](#), [cflogout](#), [GetAuthUser](#), [IsUserInAnyRole](#), [IsUserInRole](#), [IsUserLoggedIn](#), [Securing Applications in the \*Developing ColdFusion Applications\*](#)

### History

ColdFusion 8: Added this function.

### Example

```
<cfloginuser name = "#cflogin.name#" password = "#cflogin.password#"
    roles = "#getUserRoles()#" />
```

## GetVFSMetaData

### Description

Gets in-memory virtual file system metadata.

### Returns

A structure that contains information about in-memory virtual file system.

### Category

[System functions](#)

### Function syntax

```
getVFSMetaData (fileSystemType)
```

### See also

Working with in-memory files in the [Developing ColdFusion Applications](#).

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
fileSystemType	The in-memory file system type. ColdFusion 9 supports only RAM.

### Usage

The function returns a structure with the following keys:

Parameter	Description
Enabled	If support for in-memory virtual file system is enabled. This is the only key that is returned within the structure if in-memory virtual file system is disabled.
Limit	The memory limit in bytes for in-memory virtual file system.
Used	The memory out of the specified memory limit that is in use (in bytes).
Free	The free memory in bytes.

### Example

```
<cfset myroot = hash(getDirectoryFromPath(getCurrentTemplatePath())) >
<cfset name = "ram://" & myroot & "/" >
<cffile action="append" file="#name#" output="created at #now()#" >
<cfset contents = fileRead(name) >
<cfdump var="#contents#" >
<cfdump var="#getVFSMetaData("ram")#" >
```

The example works only if in-memory virtual file system is enabled.

## GetWriteableImageFormats

### Description

Returns a list of image formats that ColdFusion can write on the operating system where ColdFusion is deployed.

### Returns

A list of image file formats.

### Category

[System functions](#)

### History

ColdFusion 8: Added this function.

### Function syntax

```
GetWriteableImageFormats()
```

### See also

[GetReadableImageFormats](#), [cfimage](#) (for supported image file formats)

### Usage

Use this function to determine image file compatibility on the ColdFusion server.

### Example

```
<cfoutput>#GetWriteableImageFormats()#</cfoutput>
```

## Functions h-im

### Hash

#### Description

Converts a variable-length string to a fixed-length string that can act as a “fingerprint” or unique identifier for the original string. It is not possible to convert the hash result back to the source string.

#### Returns

A string.

#### Category

[Conversion functions](#), [Security functions](#), [String functions](#)

#### Function syntax

```
Hash(string [, algorithm [, encoding ]])
```

#### History

ColdFusion MX 7: Added the *algorithm* and *encoding* parameters.

### Parameters

Parameter	Description
string	String to hash.
algorithm	<p>(Optional) The algorithm to use to hash the string. ColdFusion installs a cryptography library with the following algorithms:</p> <ul style="list-style-type: none"><li>• CFMX_COMPAT: Generates a hash string identical to that generated by ColdFusion MX and ColdFusion MX 6.1 (default). It is only a place holder algorithm that informs ColdFusion to use an algorithm compatible with CFMX if the user does not have any option to provide algorithm.</li><li>• MD5: (default) Generates a 32-character, hexadecimal string, using the MD5 algorithm (The algorithm used in ColdFusion MX and prior releases).</li><li>• SHA: Generates a 40-character string using the Secure Hash Standard SHA-1 algorithm specified by Nation Institute of Standards and Technology (NIST) FIPS-180-2.</li><li>• SHA-256: Generates a 44-character string using the SHA-256 algorithm specified by FIPS-180-2.</li><li>• SHA-384: Generates a 64-character string using the SHA-384 algorithm specified by FIPS-180-2.</li><li>• SHA-512: Generates a 128-character string using the SHA-1 algorithm specified by FIPS-180-2.</li></ul>
	<p>The Enterprise Edition of ColdFusion installs the RSA BSafe Crypto-J library, which provides FIPS-140 Compliant Strong Cryptography. It includes the following algorithms:</p> <ul style="list-style-type: none"><li>• MD2: The MD2 hash algorithm defined by RFC 1319.</li><li>• MD5: The defined by RFC 1321.</li><li>• RIPEMD160: RACE Integrity Primitives Evaluation Message Digest 160-bit message digest algorithm and cryptographic hash function.</li><li>• SHA-1: The 160-bit secure hash algorithm defined by FIPS 180-2 and FIPS 198.</li><li>• SHA-224: The 224-bit secure hash algorithm defined by FIPS 180-2 and FIPS 198.</li><li>• SHA-256: The 256-bit secure hash algorithm defined by FIPS 180-2 and FIPS 198.</li><li>• SHA-384: The 384-bit secure hash algorithm defined by FIPS 180-2 and FIPS 198.</li><li>• SHA-512: The 512-bit secure hash algorithm defined by FIPS 180-2 and FIPS 198.</li></ul> <p>If you install a security provider with additional cryptography algorithms, you can also specify any of its hashing algorithms.</p>
encoding	<p>(Optional; to use this attribute, also specify the <i>algorithm</i> parameter) A string specifying the encoding to use when converting the string to byte data used by the hash algorithm. Must be a character encoding name recognized by the Java runtime. The default value is the value specified by the defaultCharset entry in the neo-runtime.xml file, which is normally UTF-8. Ignored when using the CFMX_COMPAT algorithm.</p>

### Usage

The result of this function is useful for comparison and validation. For example, you can store the hash of a password in a database without exposing the password. You can check the validity of the password by hashing the entered password and comparing the result with the hashed password in the database.

ColdFusion uses the Java Cryptography Extension (JCE) and installs a Sun Java runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Adobe cannot provide technical support for third-party security providers.

The `encoding` attribute is normally not required. It provides a mechanism for generating identical hash values on systems with different default encodings. ColdFusion uses a default encoding of UTF-8 unless you modify the `defaultCharset` entry in the `neo-runtime.xml` file.

### Example

The following example lets you enter a password and compares the hashed password with a hash value saved in the `SecureData` table of the `cfdocexamples` database. This table has the following entries:

User ID	Password
blaw	blaw
dknob	dknob

```
<h3>Hash Example</h3>

<!-- Do the following if the form is submitted. -->
<cfif IsDefined("Form.UserID")>

    <!-- query the data base. -->
    <cfquery name = "CheckPerson" datasource = "cfdocexamples">
        SELECT PasswordHash
        FROM SecureData
        WHERE UserID = <cfqueryparam value = "#Form.userID#"
            cfsqltype = 'CF_SQL_VARCHAR'>
    </cfquery>

    <!-- Compare query PasswordHash field and the hashed form password
        and display the results. -->
    <cfoutput>
        <cfif Hash(Form.password, "SHA") is not checkperson.passwordHash>
            User ID #Form.userID# or password is not valid. Try again.
        <cfelse>
            Password is valid for User ID #Form.userID#.
        </cfif>
    </cfoutput>
</cfif>

<!-- Form for entering ID and password. -->
<form action="#CGI.SCRIPT_NAME#" method="post">
    <b>User ID: </b>
    <input type = "text" name="UserID" ><br>
    <b>Password: </b>
    <input type = "text" name="password" ><br><br>
    <input type = "Submit" value = "Encrypt my String">
</form>
```

## HQL Methods

The Hibernate Query Language (HQL) methods return a single or multi-dimensional array of values or entities, based on what the HQL query returns. If you are sure that only one record exists that matches this filter criteria, specify `unique=true` so that a single entity is returned instead of an array.

If `unique=true` and multiple records are returned, then an exception is thrown.

**Note:** *entityname and properties used in HQL are case sensitive.*

The following HQL methods are available:

- `ORMExecuteQuery(hql, [,unique] [, queryoptions])`
- `ORMExecuteQuery(hql, params [,unique] [,queryOptions])`
- `ORMExecuteQuery(hql, namedparams [, unique] [, queryOptions])`

## **ORMExecuteQuery(hql, [,unique] [, queryoptions])**

### **Description**

Runs HQL on the default data source specified for the application. You can specify several options to control the behavior of retrieval using `queryOptions`:

- `ignorecase`: Ignores the case of sort order when you set it to true. Use this option only when you specify the `sortorder` parameter.
- `maxResults`: Specifies the maximum number of objects to be retrieved.
- `offset`: Specifies the start index of the resultset from where it has to start the retrieval.
- `cacheable`: Whether the result of this query is to be cached in the secondary cache. Default is false.
- `cachename`: Name of the cache in secondary cache.
- `timeout`: Specifies the timeout value (in seconds) for the query

**Note:** *Maxresults and timeout are used for pagination.*

### **Category**

[ORM functions](#)

### **Example**

```
<cfset employees = ORMExecuteQuery("from Employees")>
<cfset employees = ORMExecuteQuery("from Employees where age > 40")>
<cfset employeeObj = ORMExecuteQuery("from Employees where EmployeeID =1", true)>
<cfset firstNameArray = ORMExecuteQuery("select FirstName from Employees")>
<cfset numberOfEmps = ORMExecuteQuery("select count(*) from Employees")>
<cfset firstName = ORMExecuteQuery("select FirstName from Employees where EmployeeID = 1",
true)>
<cfset employees = ORMExecuteQuery("from Employees", false, {offset=5, maxresults=10,
timeout=5})>
```

## **ORMExecuteQuery(hql, params [,unique] [,queryOptions])**

### **Description**

This type of `ORMExecuteQuery` lets you pass parameters to the query. Use '?' (question mark) as the placeholder for the parameters. The values to the parameters must be passed as an array to `params`.

In addition, you can specify several options to control the behavior of retrieval using `queryOptions`:

- `ignorecase`: Ignores the case of sort order when you set it to true. Use this option only when you specify the `sortorder` parameter.
- `maxResults`: Specifies the maximum number of objects to be retrieved.
- `offset`: Specifies the start index of the resultset from where it has to start the retrieval.
- `cacheable`: Whether the result of this query is to be cached in the secondary cache. Default is false.

- **cachename:** Name of the cache in secondary cache.
- **timeout:** Specifies the timeout value (in seconds) for the query

**Note:** *Maxresults and timeout are used for pagination.*

### Category

[ORM functions](#)

### Example

```
<cfset employees = ORMExecuteQuery("from Employee where age > ?", [40])>
<cfset employeeObj = ORMExecuteQuery("from Employee where EmployeeID=?", [1], true)>
<cfset employees = ORMExecuteQuery("from Employee where age > ? and age < ?", [40, 80])>
```

## ORMExecuteQuery(hql, namedparams [, unique] [, queryOptions])

### Description

This type of ORMExecuteQuery lets you pass named parameters to the query. The placeholder for the parameter must be a name and must start with ":" as in ":age" or ":id". The values to the names must be passed as key-value pairs. In addition, you can specify several options to control the behavior of retrieval using queryOptions:

- **ignorecase:** Ignores the case of sort order when you set it to true. Use this option only when you specify the sortorder parameter.
- **maxResults:** Specifies the maximum number of objects to be retrieved.
- **offset:** Specifies the start index of the resultset from where it has to start the retrieval.
- **cacheable:** Whether the result of this query is to be cached in the secondary cache. Default is false.
- **cachename:** Name of the cache in secondary cache.
- **timeout:** Specifies the timeout value (in seconds) for the query

**Note:** *Maxresults and timeout are used for pagination.*

### Category

[ORM functions](#)

### Example

To retrieve employee details of all employees whose reside in USA and are also citizens of USA:

```
<cfset USEmployees = ORMExecuteQuery("from Employee where country=:country and
citizenship=:country", {country='USA'})>
<cfset orderDetail = ORMExecuteQuery("from Orders where OrderID=:orderid and
ProductID=:productid", {orderid=1, productid=901}, true)>
```

## Hour

### Description

Gets the current hour of the day.

### Returns

Ordinal value of the hour, in the range 0–23.

## Category

[Date and time functions](#)

## Function syntax

Hour(*date*)

## See also

[DatePart](#), [Minute](#), [Second](#)

## Parameters

Parameter	Description
<i>date</i>	Date/time object, in the range 100 AD–9999 AD.

## Usage

When passing a date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

## Example

```
<!--- This example shows the use of Hour, Minute, and Second --->
<h3>Hour Example</h3>
<cfoutput>
The time is currently #TimeFormat(Now())#.
We are in hour #Hour(Now())#, Minute #Minute(Now())#
and Second #Second(Now())# of the day.
</cfoutput>
```

# HTMLCodeFormat

## Description

Replaces special characters in a string with their HTML-escaped equivalents and inserts `<pre>` and `</pre>` tags at the beginning and end of the string.

## Returns

HTML-escaped string *string*, enclosed in `<pre>` and `</pre>` tags. Return characters are removed; line feed characters are preserved. Characters with special meanings in HTML are converted to HTML character entities such as `&gt;`.

## Category

[Display and formatting functions](#)

## Function syntax

HTMLCodeFormat(*string* [, *version* ])

## See also

[HTMLEditFormat](#)

### Parameters

Parameter	Description
string	A string or a variable that contains one.
version	HTML version to use; currently ignored. <ul style="list-style-type: none"><li>• -1: The latest implementation of HTML</li><li>• 2.0: HTML 2.0 (default)</li><li>• 3.2: HTML 3.2</li></ul>

### Usage

This function converts the following characters to HTML character entities:

Text character	Encoding
<	&lt;
>	&gt;
&	&amp;
"	&quot;

This function typically increases the length of a string. This can cause unpredictable results when performing certain string functions (`Left`, `Right`, and `Mid`, for example) against the expanded string.

The only difference between this function and `HTMLEditFormat` is that `HTMLEditFormat` does not surround the text in an `HTML pre` tag.

### Example

```
<!-- This example shows the effects of HTMLCodeFormat and
HTMLEditFormat. View it in your browser; then View it
using your browser's the View Source command. -->
<cfset testString="This is a test
& this is another
<This text is in angle brackets>
```

```
Previous line was blank!!!">
```

```
<cfoutput>
<h3>The text without processing</h3>
#testString#<br>
<h3>Using HTMLCodeFormat</h3>
#HTMLCodeFormat(testString)#
<h3>Using HTMLEditFormat</h3>
#HTMLEditFormat(testString)#
</cfoutput>
```

## HTMLEditFormat

### Description

Replaces special characters in a string with their HTML-escaped equivalents.

### Returns

HTML-escaped string *string*. Return characters are removed; line feed characters are preserved. Characters with special meanings in HTML are converted to HTML character entities such as `&gt;`.

### Category

[Display and formatting functions](#)

### Function syntax

```
HTMLEditFormat(string [, version ])
```

### See also

[HTMLCodeFormat](#), [cfapplication](#)

### Parameters

Parameter	Description
<code>string</code>	A string or a variable that contains one.
<code>version</code>	HTML version to use; currently ignored. <ul style="list-style-type: none"><li>• -1: The latest implementation of HTML</li><li>• 2.0: HTML 2.0 (default)</li><li>• 3.2: HTML 3.2</li></ul>

### Usage

This function converts the following characters to HTML character entities:

Text character	Encoding
<code>&lt;</code>	<code>&amp;lt;</code>
<code>&gt;</code>	<code>&amp;gt;</code>
<code>&amp;</code>	<code>&amp;amp;</code>
<code>"</code>	<code>&amp;quot;</code>

This function can be used to help protect ColdFusion pages that return user-provided data to the client browser from cross-site scripting attacks. However, the `scriptprotect` attribute of the [cfapplication](#) tag or the equivalent `This.scriptProtect` variable setting in `Application.cfc` can be preferable in most instances, because you only need to specify it once for an application.

This function typically increases the length of a string. This can cause unpredictable results when performing certain string functions (`Left`, `Right`, and `Mid`, for example) against the expanded string.

The only difference between this function and `HTMLCodeFormat` is that `HTMLCodeFormat` surrounds the text in an `HTML pre` tag.

### Example

```
<!--- This example shows the effects of HTMLCodeFormat and
HTMLEditFormat. View it in your browser, then View it
using your browser's the View Source command. --->
<cfset testString="This is a test
& this is another
<This text is in angle brackets>

Previous line was blank!!!">

<cfoutput>
<h3>The text without processing</h3>
#testString#<br>
<h3>Using HTMLCodeFormat</h3>
#HTMLCodeFormat(testString)#
<h3>Using HTMLEditFormat</h3>
#HTMLEditFormat(testString)#
</cfoutput>
```

## IIf

### Description

Evaluates a Boolean conditional dynamic expression. Depending on whether the expression is yes or no, dynamically evaluates one of two string expressions and returns the result. This function is convenient for incorporating a `cfif` tag in-line in HTML.

For general conditional processing, see [cfif](#). For error handling, see [cftry](#). For more information, see the *Developing ColdFusion Applications*.

### Returns

If result is yes, returns the value of `Evaluate(string_expression1)`; otherwise, returns the value of `Evaluate(string_expression2)`.

### Category

[Decision functions](#), [Dynamic evaluation functions](#)

### Function syntax

```
IIf(condition, string_expression1, string_expression2)
```

### See also

[DE](#), [Evaluate](#)

### Parameters

Parameter	Description
condition	An expression that can be evaluated as a Boolean.
string_expression1	A string or a variable that contains one. Expression to evaluate and return if condition is yes.
string_expression2	A string or a variable that contains one. Expression to evaluate and return if condition is no.

## Usage

The `IIf` function is a shortcut for the following construct:

```
<cfif condition>
    <cfset result = Evaluate(string_expression1)>
<cfelse>
    <cfset result = Evaluate(string_expression2)>
</cfif>
```

The expressions *string\_expression1* and *string\_expression2* must be string expressions, so that they are not evaluated immediately as the parameters of `IIf`. For example:

```
IIf(y is 0, DE("Error"), x/y)
```

If `y = 0`, this generates an error, because the third expression is the value of `x/0` (invalid expression).

ColdFusion evaluates *string\_expression1* and *string\_expression2*. To return the string itself, use the [DE](#) function.

**Note:** If you use number signs (#) in *string\_expression1* or *string\_expression2*, ColdFusion evaluates the part of the expression in number signs first. If you misuse the number signs, you can cause unexpected results from the `IIf` function. For example, if you use number signs around the whole expression in *string\_expression1*, and if there is an undefined variable in *string\_expression1*, the function might fail, with the error "Error Resolving Parameter."

If a variable is undefined, ColdFusion throws an error when it processes this function. The following example shows this problem:

```
#IIf(IsDefined("Form.Deliver"), DE(Form.Deliver), DE("no"))#
```

This returns "Error resolving parameter FORM.DELIVER".

To avoid this problem, use the `DE` and `Evaluate` functions in code such as the following:

```
#IIf(IsDefined("Form.Deliver"), Evaluate(DE("Form.Deliver")), DE("no"))#
```

This returns "no"; ColdFusion does not throw an error.

In the following example, `LocalVar` is undefined; however, if you omit number signs around `LocalVar`, the code works properly:

```
<cfoutput>
    #IIf(IsDefined("LocalVar"), "LocalVar",
        DE("The variable is not defined."))#
</cfoutput>
```

The output is:

```
The variable is not defined.
```

The number signs around `LocalVar` in the following code cause it to fail with the error message 'Error Resolving Parameter', because ColdFusion never evaluates the original condition `IsDefined("LocalVar")`.

Here is another example:

```
<cfoutput>
#IIf(IsDefined("LocalVar"), DE("#LocalVar#"), DE("The variable is not defined."))#
</cfoutput>
```

The error message would be as follows:

```
Error resolving parameter LOCALVAR
```

The `DE` function has no effect on the evaluation of `LocalVar`, because the number signs cause it to be evaluated immediately.

### Example

```
<h3>IIf Function Example</h3>
<p>IIf evaluates a condition, and does an Evaluate on string
    expression 1 or string expression 2 depending on the Boolean
    outcome <I>(yes: run expression 1; no: run expression 2)</I>.</p>
<p>The result of the expression
IIf( Hour(Now()) GTE 12,
    DE("It is afternoon or evening"),
    DE("It is morning"))
is:<br><b>
<cfoutput>
    #IIf( Hour(Now()) GTE 12,
    DE("It is afternoon or evening"),
    DE("It is morning"))#
</cfoutput>
</b>
```

## ImageAddBorder

### Description

Adds a rectangular border around the outside edge of a ColdFusion image.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageAddBorder(name, thickness [, color, borderType])
```

### See also

[cfimage](#), [ImageDrawRect](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.

Parameter	Description
thickness	Required. Thickness of the border in pixels. The default value is 1. The border is added to the outside edge of the image; the image area is increased accordingly.
color	Optional. Border color. The default border color is black. See Usage. Only valid if the borderType is not specified or if borderType = "constant".
borderType	Optional. The type of border: <ul style="list-style-type: none"> <li>• zero: Sets the border color to black.</li> <li>• constant: Sets the border to the specified color (default).</li> <li>• copy: Sets sample values to copies of the nearest valid pixel. For example, pixels to the left of the valid rectangle assume the value of the valid edge pixel in the same row. Pixels both above and to the left of the valid rectangle assume the value of the upper-left pixel.</li> <li>• reflect: Mirrors the edges of the source image. For example, if the left edge of the valid rectangle is located at x = 10, pixel (9, y) is a copy of pixel (10, y) and pixel (6, y) is a copy of pixel (13, y).</li> <li>• wrap: Tiles the source image in the plane.</li> </ul>

### Usage

The thickness of the border is specified in pixels by the thickness parameter. The thickness cannot be less than 0.

For the color value, specify a hexadecimal value or supported named color; see the list of valid HTML named colors in “[cfimage](#)” on page 306. For a hexadecimal value, use the form “#xxxxxx” or “xxxxxx”, where x = 0–9 or A–F; use two number signs or none.

### Example

#### Example 1

```
<!--- This example shows how to create a 10-pixel-wide red border around an image with a 5-
pixel-wide green border around the red border.--->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<!--- Draw a red border around the outside edge of the image. --->
<cfset ImageAddBorder(myImage,10,"red")>
<!--- Draw a green border around the outside edge of the red border. --->
<cfset ImageAddBorder(myImage,5,"green")>
<!--- Save the modified ColdFusion image to a file. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpeg" overwrite="yes">
<!--- Display the source image and the new image. --->

```

#### Example 2

```
<!--- This example shows how to create a border from the tiled image. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../../../cfdocs/images/artgallery/lori05.jpg" name="myImage">
<!--- Add a 50-pixel-wide border to the outside edge of the image that is a tiled version of
the image itself. --->
<cfset ImageAddBorder(myImage,50,"","wrap")>
<!--- Save the modified ColdFusion image to a file. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpeg" overwrite="yes">
<!--- Display the source image and the new image. --->

```

### Example 3

```
<!--- This example shows how to create a 100-pixel-wide border that is a mirror of the source
image. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../../../cfdocs/images/artgallery/maxwell01.jpg" name="myImage">
<!--- Create the border. --->
<cfset ImageAddBorder(myImage,100,"","reflect")>
<!--- Save the modified ColdFusion image to a file. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpeg" overwrite="yes">
<!--- Display the source image and the new image. --->

```

### Example 4

```
<!--- This example shows how to copy 100 pixels from the outer edge of the image and create a
border from it. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../../../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<cfset ImageAddBorder(myImage,100,"","copy")>
<!--- Save the modified ColdFusion image to a file. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpeg" overwrite="yes">
<!--- Display the source image and the new image. --->

```

## ImageBlur

### Description

Smooths (blurs) the ColdFusion image.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageBlur(name [, blurRadius])
```

### See also

[ImageSharpen](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
blurRadius	Optional. The size of the blur radius. Value must be greater than or equal to 3 and less than or equal to 10. The default value is 3.

### Usage

The `blurRadius` operation affects performance: as the `blurRadius` value increases, performance decreases.

### Example

```
<!--- This example shows how to blur an image by a radius of 10. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<!--- Use the maximum blur radius to blur the image. --->
<cfset ImageBlur(myImage,10)>
<!--- Save the modified ColdFusion image to a JPEG file. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpeg" overwrite="yes">
<!--- Display the source image and the new image. --->

```

## ImageClearRect

### Description

Clears the specified rectangle by filling it with the background color of the current drawing surface.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

`ImageClearRect(name, x, y, width, height)`

### See also

[ImageSetBackgroundColor](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
x	Required. The x coordinate of the rectangle to clear.
y	Required. The y coordinate of the rectangle to clear.
width	Required. The width of the rectangle to clear.
height	Required. The height of the rectangle to clear.

### Usage

Use this function in conjunction with the [ImageSetBackgroundColor](#) function.

### Example

```
<!-- This example shows how to set the background color to green and draws four rectangles
in that color on the image. -->
<!-- Create a ColdFusion image from an existing JPEG file. -->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<!-- Set the background color to green. -->
<cfset ImageSetBackgroundColor(myImage,"green")>
<!-- Draw four rectangles in the background color. -->
<cfset ImageClearRect(myImage,10,25,50,50)>
<cfset ImageClearRect(myImage,100,25,50,50)>
<cfset ImageClearRect(myImage,10,100,50,50)>
<cfset ImageClearRect(myImage,100,100,50,50)>
<!-- Save the modified ColdFusion image to a file. -->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpeg" overwrite="yes">
<!-- Display the source image and the new image. -->

```

## ImageCopy

### Description

Copies a rectangular area of an image.

### Returns

A ColdFusion image for the copied area.

### Category

[Image functions](#)

### Function syntax

```
ImageCopy(name, x, y, width, height [, dx, dy])
```

### See also

[ImageNew](#), [ImagePaste](#), [IsImageFile](#)

## History

ColdFusion 8: Added this function.

## Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
x	Required. The x coordinate of the source rectangle.
y	Required. The y coordinate of the source rectangle.
width	Required. The width of the source rectangle.
height	Required. The height of the source rectangle.
dx	Optional. The x coordinate of the destination rectangle.
dy	Optional. The y coordinate of the destination rectangle.

## Usage

The rectangle is specified by *(x,y,width,height)*. The area is copied to the rectangle with the upper-left corner specified by *(dx,dy)*.

## Example

### Example 1

```
<!--- This example shows how to copy a rectangular area of an image to a new image. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../../../cfdocs/images/artgallery/lori05.jpg" name="myImage">
<!--- Copy the rectangular area specified by the coordinates (25,25,50,50) in the image to the
rectangle beginning at (75,75), and return this copied rectangle as a new ColdFusion image. --->
<cfset dupArea = ImageCopy(myImage,25,25,50,50,75,75)>
<!--- Write the result to a PNG file. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.png" overwrite="yes">
<!--- Display the source image and the new image. --->

```

### Example 2

```
<!--- This example shows how to copy a rectangular area from one image and paste it over another
image. --->
<!--- Create a ColdFusion image named "myImage1" from an existing JPEG file.--->
<cfimage source="../../../cfdocs/images/artgallery/lori05.jpg" name="myImage1">
<!--- Create the ColdFusion image "myImage2" from a different JPEG file.
--->
<cfimage source="../../../cfdocs/images/artgallery/maxwell01.jpg" name="myImage2">
<!--- Copy a rectangular region of "myImage1" as a new image. --->
<cfset resImage = ImageCopy(myImage1,1,1,55,55)>
<!--- Paste the rectangular area on the second image. --->
<cfset ImagePaste(myImage2,resImage,50,75)>
<!--- Write the second ColdFusion image to a file. --->
<cfimage action="write" source="#myImage2#" destination="test_myImage.jpg" overwrite="yes">
<!--- Display the two source files and the new file. --->

```

## ImageCrop

### Description

Crops a ColdFusion image to a specified rectangular area.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

*ImageCrop(name, x, y, width, height)*

### See also

[ImageFlip](#), [ImageResize](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
x	Required. The x origin of the crop area.
y	Required. The y origin of the crop area.
width	Required. The width of the crop area.
height	Required. The height of the crop area.

### Usage

The rectangular area cannot be empty, and must be fully contained within the source image bounds.

### Example

```
<!--- This example shows how to crop an image. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/lori05.jpg" name="myImage">
<!--- Crop myImage to 100x100 pixels starting at the coordinates (10,10).
--->

<cfset ImageCrop(myImage,10,10,100,100)>
<!--- Write the result to a file. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpg" overwrite="yes">
<!--- Display the source image and the new image. --->

```

## ImageDrawArc

### Description

Draws a circular or elliptical arc.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageDrawArc(name, x, y, width, height, startAngle, arcAngle [, filled])
```

### See also

[ImageDrawCubicCurve](#), [ImageDrawOval](#), [ImageDrawQuadraticCurve](#), [ImageSetAntialiasing](#),  
[ImageSetDrawingColor](#), [ImageSetDrawingStroke](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
x	Required. The x coordinate of the upper-left corner of the arc.
y	Required. The y coordinate of the upper-left corner of the arc.
width	Required. The width of the arc.
height	Required. The height of the arc.
startAngle	Required. The beginning angle in degrees.
arcAngle	Required. The angular extent of the arc, relative to the start angle.
filled	Optional. Specify whether the arc is filled: <ul style="list-style-type: none"><li>yes: The arc is filled with the specified drawing color.</li><li>no: Only the outline of the arc is drawn (default).</li></ul>

### Usage

The resulting arc begins at `startAngle` and extends for `arcAngle` degrees. Degrees start at 0 in the three o'clock position. A positive value indicates a counter-clockwise rotation; a negative value indicates a clockwise rotation.

The center of the arc is the center of the rectangle whose origin is (x,y) and whose size is specified by the `width` and `height` parameters.

The angles are specified relative to the non-square extents of the bounding rectangle so that 45 degrees always falls on the line from the center of the ellipse to the upper-right corner of the bounding rectangle. As a result, if the bounding rectangle is noticeably longer on one axis than the other, the angles to the start and end of the arc segment are skewed farther along the longer axis of the bounds.

If the `filled` parameter is set to `yes`, the area inside the oval is filled with the current drawing color.

Use the [ImageSetDrawingColor](#) and [ImageSetDrawingStroke](#) functions to specify the color and line attributes of the arc. Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!-- This example shows how to use the ImageNew function to create a blank
ColdFusion image that is 250 pixels wide and 180 pixels high. -->
<cfset myImage=ImageNew("",250,320)>
<!-- Set the drawing color for the arc to orange. -->
<cfset ImageSetDrawingColor(myImage,"orange")>
<!-- Turn on antialiasing to improve image quality. -->
<cfset ImageSetAntialiasing(myImage,"on")>
<!-- Draw an enclosed orange arc starting at the coordinate (5,5). -->
<cfset ImageDrawArc(myImage,5,5,200,300,100,100,"yes")>
<!-- Display the image in a browser. -->
<cfimage action="writeToBrowser" source="#myImage#">
```

## ImageDrawBeveledRect

### Description

Draws a rectangle with beveled edges.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageDrawBeveledRect(name, x, y, width, height, raised [, filled])
```

### See also

[ImageClearRect](#), [ImageDrawLine](#), [ImageDrawLines](#), [ImageDrawRect](#), [ImageDrawRoundRect](#),  
[ImageSetAntialiasing](#), [ImageSetDrawingColor](#), [ImageSetDrawingStroke](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
x	Required. The x coordinate of the rectangle.
y	Required. The y coordinate of the rectangle.
width	Required. The width of the rectangle.
height	Required. The height of the rectangle.
raised	Required. Specify whether the rectangle appears raised above the surface or sunk into the surface: <ul style="list-style-type: none"><li>• yes: The rectangle is raised.</li><li>• no: The rectangle is sunk (default).</li></ul>
filled	Optional. Specify whether the rectangle is filled: <ul style="list-style-type: none"><li>• yes: The rectangle is filled with the specified drawing color.</li><li>• no: Only the outline of the rectangle is drawn (default).</li></ul>

### Usage

The edges of the rectangle are highlighted so that they appear beveled and lit from the upper-left corner. The colors used for the highlighting effect are determined by the current drawing color.

If the `filled` parameter is set to `yes`, the cuboid area is filled with the current drawing color.

Use the [ImageSetDrawingColor](#) and [ImageSetDrawingStroke](#) functions to specify the color and line attributes of the rectangle. Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!-- This example shows how to create a bevel-edged rectangle. -->
<!-- Use the ImageNew function to create a 200x200-pixel image. -->
<cfset myImage=ImageNew("",200,200)>
<!-- Turn on antialiasing to improve image quality. -->
<cfset ImageSetAntialiasing(myImage,"on")>
<!-- Set the drawing color for the image to light gray. -->
<cfset ImageSetDrawingColor(myImage,"lightgray")>
<!-- Draw a 3D gray, filled, raised rectangle. -->
<cfset ImageDrawBeveledRect(myImage,50,50,100,75,"yes","yes")>
<!-- Display the image in a browser. -->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageDrawCubicCurve

### Description

Draws a cubic curve.

### Returns

Nothing.

## Category

[Image functions](#)

## Function syntax

```
ImageDrawCubicCurve(name, ctrlx1, ctrly1, ctrlx2, ctrly2, x1, y1, x2, y2)
```

## See also

[ImageDrawQuadraticCurve](#), [ImageDrawRect](#), [ImageDrawRoundRect](#), [ImageSetAntialiasing](#),  
[ImageSetDrawingColor](#), [ImageSetDrawingStroke](#), [IsImageFile](#)

## History

ColdFusion 8: Added this function.

## Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
ctrlx1	Required. The xcoordinate of the first control point of the cubic curve segment.
ctrly1	Required. The y coordinate of the first control point of the cubic curve segment.
ctrlx2	Required. The x coordinate of the second control point of the cubic curve segment.
ctrly2	Required. The y coordinate of the second control point of the cubic curve segment.
x1	Required. The x coordinate of the start point of the cubic curve segment.
y1	Required. The y coordinate of the start point of the cubic curve segment.
x2	Required. The x coordinate of the end point of the cubic curve segment.
y2	Required. The y coordinate of the end point of the cubic curve segment.

## Usage

Coordinates can be integers or real numbers.

Use the [ImageSetDrawingColor](#) and [ImageSetDrawingStroke](#) functions to specify the color and line attributes of the cubic curve. Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

## Example

```
<!--- This example shows how to draw a curved line that looks like a stylized 7. --->
<!--- Use the ImageNew function to create a blank ColdFusion image that is 200 pixels wide and
380 pixels high. --->
<cfset myImage=ImageNew("",200,380)>
<!--- Set the drawing color to magenta. --->
<cfset ImageSetDrawingColor(myImage,"magenta")>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Draw a curved line that starts at (380,28) and ends at (32,56) with its first control
point at (120,380) and its second control point at (5,15). --->
<cfset ImageDrawCubicCurve(myImage,120,380,5,15,380,28,32,56)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageDrawLine

### Description

Draws a single line defined by two sets of x and y coordinates on a ColdFusion image.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageDrawLine (name, x1, y1, x2, y2)
```

### See also

[ImageDrawLines](#), [ImageSetAntialiasing](#), [ImageSetDrawingColor](#), [ImageSetDrawingStroke](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
x1	Required. The x coordinate for the start point of the line.
y1	Required. The y coordinate for the start point of a line.
x2	Required. The x coordinate for the end point of the line.
y2	Required. The y coordinate for the end point of the line.

### Usage

Each pair of coordinates, (x1,y1) and (x2,y2), defines a point. The start and end points cannot be the same.

This function is affected by the attributes defined in the [ImageSetDrawingStroke](#) and [ImageSetDrawingColor](#) functions. Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!--- This example shows how to draw a square bisected by
      a diagonal line. --->
<!--- Use the ImageNew function to create a 100x100-pixel image. --->
<cfset myImage=ImageNew("",100,100)>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Draw a diagonal line that bisects the square. --->
<cfset ImageDrawLine(myImage,0,0,100,100)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageDrawLines

### Description

Draws a sequence of connected lines defined by arrays of x and y coordinates.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageDrawLines(name, xcoords, ycoords [, isPolygon, filled])
```

### See also

[ImageDrawBeveledRect](#), [ImageDrawCubicCurve](#), [ImageDrawLine](#), [ImageDrawRect](#), [ImageDrawRoundRect](#), [ImageSetAntialiasing](#), [ImageSetDrawingColor](#), [ImageSetDrawingStroke](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
xcoords	Required. A CFML array of x coordinates.
ycoords	Required. A CFML array of y coordinates.
isPolygon	Optional. Specify whether the lines form a polygon: <ul style="list-style-type: none"><li>• yes: The lines are connected to form a polygon.</li><li>• no: The lines do not form a polygon (default).</li></ul>
filled	Optional. Specify whether the polygon is filled: <ul style="list-style-type: none"><li>• yes: The polygon is filled with the specified drawing color.</li><li>• no: Only the outline of the polygon is drawn (default).</li></ul>

### Usage

Each pair of (x,y) coordinates defines a point.

To draw a polygon, set `isPolygon` to `yes`. The start point cannot be the same value as the end point. If `isPolygon` is `yes`, a line joining start point and the end point is drawn to complete a polygon. If `isPolygon` is `no`, line completing the polygon is not drawn.

Set the `isPolygon` and `filled` parameters to `yes` to draw a polygon filled with the current drawing color.

Use the [ImageSetDrawingColor](#) and [ImageSetDrawingStroke](#) functions to control the color and line attributes. Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!--- This example shows how to draw a zigzag line. --->
<!--- Use the ImageNew function to create a 250x250-pixel image. --->
<cfset myImage=ImageNew("",250,250)>
<!--- Set the drawing color to cyan. --->
<cfset ImageSetDrawingColor(myImage,"cyan")>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Create arrays for the x and y coordinates. --->
<cfset x = ArrayNew(1)>
<cfset y = ArrayNew(1)>
<!--- Set the values for the x and y coordinates for three connected line segments: the first
segment begins at (100,50) and ends at (50,100). The second segment begins at (50, 100) and
ends at (200,100). The third segment begins at (200,100) and ends at (100,200). --->
    <cfset x[1] = "100">
    <cfset x[2] = "50">
    <cfset x[3] = "200">
    <cfset x[4] = "100">
    <cfset y[1] = "50">
    <cfset y[2] = "100">
    <cfset y[3] = "100">

<!--- Draw the lines on the image. --->
<cfset ImageDrawLines(myImage,x,y)>
<!--- Display the image in a browser. --->
<cfimage source=#myImage# action="writeToBrowser">
```

## ImageDrawOval

### Description

Draws an oval.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageDrawOval(name, x, y, width, height [, filled])
```

### See also

[ImageDrawArc](#), [ImageDrawCubicCurve](#), [ImageDrawQuadraticCurve](#), [ImageDrawRoundRect](#),  
[ImageSetAntialiasing](#), [ImageSetDrawingColor](#), [ImageSetDrawingStroke](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
x	Required. The x coordinate of the upper left corner of the oval to draw.
y	Required. The y coordinate of the upper left corner of the oval to draw.
width	Required. The width of the oval to draw.
height	Required. The height of the oval to draw.
filled	Optional. Specify whether the oval is filled: <ul style="list-style-type: none"><li>• yes: The oval is filled with the specified drawing color.</li><li>• no: Only the outline of the oval is drawn (default).</li></ul>

### Usage

The result is a circle or ellipse that fits within the rectangle specified by the x, y, width, and height arguments.

If the `filled` parameter is set to `yes`, the area inside the oval is filled with the current drawing color.

Use the [ImageSetDrawingColor](#) and [ImageSetDrawingStroke](#) functions to specify the color and line attributes of the oval. Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

#### Example 1

```
<!-- This example shows how to draw a green filled oval. -->
<!-- Use the ImageNew function to create a 200x110-pixel image. -->
<cfset myImage=ImageNew("",200,110)>
<!-- Set the drawing color to green. -->
<cfset ImageSetDrawingColor(myImage,"green")>
<!-- Turn on antialiasing to improve image quality. -->
<cfset ImageSetAntialiasing(myImage,"on")>
<!-- Draw a filled green oval on the image. -->
<cfset ImageDrawOval(myImage,5,5,190,100,"yes")>
<!-- Display the image in a browser. -->
<cfimage source="#myImage#" action="writeToBrowser">
```

#### Example 2

```
<!--- This example shows how to draw a red circle with
      a line through it. --->
<!--- Use the ImageNew function to create a 201x201-pixel image. --->
<cfset myImage=ImageNew("",201,201)>
<!--- Set the drawing color to red. --->
<cfset ImageSetDrawingColor(myImage,"red")>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Set the line width to 10 pixels. --->
<cfset attr=StructNew()>
<cfset attr.width = 10>
<cfset ImageSetDrawingStroke(myImage,attr)>
<!--- Draw a diagonal line starting at (40,40) and ending at (165,165) on myImage. --->
<cfset ImageDrawLine(myImage,40,40,165,165)>
<!--- Draw a circle starting at (5,5) and is 190 pixels high and 190 pixels wide. --->
<cfset ImageDrawOval(myImage,5,5,190,190)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageDrawPoint

### Description

Draws a point at the specified (x,y) coordinate.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageDrawPoint(name, x, y)
```

### See also

[ImageDrawLine](#), [ImageDrawLines](#), [ImageSetAntialiasing](#), [ImageSetDrawingColor](#), [ImageSetDrawingStroke](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
x	Required. The x coordinate of the point.
y	Required. The y coordinate of the point.

### Usage

Use the [ImageSetDrawingStroke](#) and [ImageSetDrawingColor](#) functions to control the appearance of the drawing point. For example, set the width attribute of the [ImageSetDrawingStroke](#) function to 10 pixels to draw a 20-pixel-square centered at (x,y). Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!--- This example shows how to draw a large square in the middle of an image. --->
<!--- Use the ImageNew function to create a 200x200-pixel image. --->
<cfset myImage=ImageNew("",200,200)>
<!---Set the drawing color to orange. --->
<cfset ImageSetDrawingColor(myImage,"orange")>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Set the drawing area to 10 pixels. --->
<cfset attr = StructNew()>
<cfset attr.width = 10>
<cfset ImageSetDrawingStroke(myImage,attr)>
<!--- Draw the point at (100,100). --->
<cfset ImageDrawPoint(myImage,100,100)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageDrawQuadraticCurve

### Description

Draws a curved line. The curve is controlled by a single point.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageDrawQuadraticCurve(name, ctrlx1, ctrly1, ctrlx2, ctrly2, x1, y1, x2, y2)
```

### See also

[ImageDrawArc](#), [ImageDrawOval](#), [ImageDrawRoundRect](#), [ImageSetAntialiasing](#), [ImageSetDrawingColor](#), [ImageSetDrawingStroke](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
ctrlx1	Required. The x coordinate of the first control point of the quadratic curve segment.
ctry1	Required. The y coordinate of the first control point of the quadratic curve segment.
ctrlx2	Required. The x coordinate of the second control point of the quadratic curve segment.
ctry2	Required. The y coordinate of the second control point of the quadratic curve segment.
x1	Required. The x coordinate of the start point of the quadratic curve segment.
y1	Required. The y coordinate of the start point of the quadratic curve segment.
x2	Required. The x coordinate of the end point of the quadratic curve segment.
y2	Required. The y coordinate of the end point of the quadratic curve segment.

### Usage

A quadratic curve is a curve controlled by a single control point. The curve is drawn from the last point in the shape to the target x and y coordinates. Coordinates can be integers or real numbers.

Use the [ImageSetDrawingColor](#) and [ImageSetDrawingStroke](#) functions to specify the color and lines of the quadratic curve. Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!--- This example shows how to draw a curved line. --->
<!--- Use the ImageNew function to create a 400x400-pixel image. --->
<cfset myImage=ImageNew("",400,400)>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Set the drawing color to green. --->
<cfset ImageSetDrawingColor(myImage,"green")>
<!--- Draw a curved line on the image. --->
<cfset ImageDrawQuadraticCurve(myImage,120,320,5,15,380,280)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageDrawRect

### Description

Draws a rectangle.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

`ImageDrawRect (name, x, y, width, height [, filled])`

### See also

[ImageDrawBeveledRect](#), [ImageDrawCubicCurve](#), [ImageDrawLine](#), [ImageDrawLines](#), [ImageDrawOval](#), [ImageDrawQuadraticCurve](#), [ImageDrawRoundRect](#), [ImageSetAntialiasing](#), [ImageSetDrawingColor](#), [ImageSetDrawingStroke](#), [ImageDrawText](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
x	Required. The x coordinate of the rectangle.
y	Required. The y coordinate of the rectangle.
width	Required. The width of the rectangle.
height	Required. The height of the rectangle.
filled	Optional. Specify whether the rectangle is filled: <ul style="list-style-type: none"><li>yes: The rectangle is filled with the specified drawing color.</li><li>no: Only the outline of the rectangle is drawn (default).</li></ul>

### Usage

The left and right edges of the rectangle are at x and x plus width, respectively. The upper and lower edges are at y and y plus height, respectively.

Set the `filled` parameter to `yes` to fill the rectangle with the current drawing color.

Use the [ImageSetDrawingColor](#) and [ImageSetDrawingStroke](#) functions to format the color and lines of the rectangle. Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!-- This example shows how to draw a rectangle. -->
<!-- Use the ImageNew function to create a ColdFusion image that is 150 pixels wide and 200
pixels high. -->
<cfset myImage=ImageNew("",150,200)>
<!-- Set the drawing color for the image to yellow. -->
<cfset ImageSetDrawingColor(myImage,"yellow")>
<!-- Turn on antialiasing to improve image quality. -->
<cfset ImageSetAntialiasing(myImage,"on")>
<!-- Draw a filled yellow rectangle on the image. -->
<cfset ImageDrawRect(myImage,25,45,100,20,"yes")>
<!-- Display the image in a browser. -->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageDrawRoundRect

### Description

Draws a rectangle with rounded corners.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageDrawRoundRect (name, x, y, width, height, arcWidth, arcHeight [, filled])
```

### See also

[ImageDrawBeveledRect](#), [ImageDrawCubicCurve](#), [ImageDrawLine](#), [ImageDrawLines](#), [ImageDrawOval](#), [ImageDrawQuadraticCurve](#), [ImageDrawRect](#), [ImageSetAntialiasing](#), [ImageSetDrawingColor](#), [ImageSetDrawingStroke](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
x	Required. The x coordinate of the rectangle.
y	Required. The y coordinate of the rectangle.
width	Required. The width of the rectangle.
height	Required. The height of the rectangle.
arcWidth	Required. The horizontal diameter of the arc at the four corners.
arcHeight	Required. The vertical diameter of the arc at the four corners.
filled	Optional. Specify whether the rectangle is filled: <ul style="list-style-type: none"><li>yes: The rectangle is filled with the specified drawing color.</li><li>no: Only the outline of the rectangle is drawn (default).</li></ul>

### Usage

The left and right edges of the rectangle are at x and x plus width, respectively. The upper and lower edges are at y and y plus height, respectively.

Set the `filled` parameter to `yes` to fill the rectangle with the current drawing color.

Use the [ImageSetDrawingColor](#) and [ImageSetDrawingStroke](#) functions to control the color and line attributes of the rectangle. Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

Example 1

```
<!--- This example shows how to draw a square with rounded corners. --->
<!--- Create a 200x200-pixel image. --->
<cfset myImage=ImageNew("",200,200)>
<!--- Set the drawing color for the image to blue. --->
<cfset ImageSetDrawingColor(myImage,"blue")>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Draw a blue filled square with round corners of arcWidth=10 and arcHeight=2. --->
<cfset ImageDrawRoundRect(myImage,5,5,190,190,"yes",10,2)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

### Example 2

```
<!--- Create an image. --->
<cfset myImage = imageNew("",100,100,"argb")>
<!--- Create a text attribute collection. --->
<cfset textStruct = structNew()>
<cfset textStruct.size=16>
<cfset textStruct.style="bold">
<cfset textStruct.font="Trebuchet MS">

<cfoutput>
<cfloop from="1" to="20" index="i">
    <!--- Turn on antialiasing to improve the quality of the rendered image. --->
    <cfset ImageSetAntialiasing(myImage,"on")>
    <!--- Set the background color. --->
    <cfset ImageSetBackgroundColor(myImage,"cyan") />
    <cfset ImageClearRect(myImage,0,0,myImage.getWidth(),myImage.getHeight())>
    <!--- Set the drawing color. --->
    <cfset ImageSetDrawingColor(myImage,"black") />
    <!--- Draw a rectangle with rounded corners. --->
    <cfset ImageDrawRoundRect(myImage,10,10,myImage.width-20, myImage.height-20,i,i,"yes")>
    <!--- Set the text arc value. --->
    <cfset ImageSetDrawingColor(myImage,"##cccccc")>
    <cfset ImageDrawText(myImage, "#i#",30,30,textStruct)>
    <!--- Write the image to a file. --->
    <cfset imageWrite(myImage,"#expandPath("#i#.png")#")>
    <!--- Display the image. --->
    
</cfloop>
</cfoutput>
```

## ImageDrawText

### Description

Draws a text string on a ColdFusion image with the baseline of the first character positioned at (x,y) in the image.

### Returns

Nothing.

### Category

[Image functions](#)

## Function syntax

```
ImageDrawText(name, str, x, y [, attributeCollection])
```

## See also

[ImageDrawArc](#), [ImageDrawBeveledRect](#), [ImageDrawCubicCurve](#), [ImageDrawLine](#), [ImageDrawLines](#),  
[ImageDrawOval](#), [ImageDrawQuadraticCurve](#), [ImageDrawRect](#), [ImageDrawRoundRect](#), [ImageSetAntialiasing](#),  
[ImageSetDrawingColor](#), [ImageTranslateDrawingAxis](#), [IsImageFile](#)

## History

ColdFusion 8: Added this function.

## Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
str	Required. The text string to draw.
x	Required. The x coordinate for the start point of the string.
y	Required. The y coordinate for the start point of the string.
attributeCollection	Optional. The structure used to specify the text characteristics. See the Usage section.

## Usage

Specify all the optional key-value pairs in an `attributeCollection` structure. To specify the text color, use the [ImageSetDrawingColor](#) function.

## attributeCollection

Element	Description
font	The name of the font used to draw the text string. If you do not specify the <code>font</code> attribute, the text is drawn in the default system font.
size	The font size for the text string. The default value is 10 points.
style	The style to apply to the font: <ul style="list-style-type: none"><li>• <code>bold</code></li><li>• <code>italic</code></li><li>• <code>boldItalic</code></li><li>• <code>plain</code> (default)</li></ul>
strikethrough	Specify whether strikethrough is applied to the text image: <ul style="list-style-type: none"><li>• <code>yes</code>: For vertical text, strikethrough is applied to each character individually.</li><li>• <code>no</code> (default)</li></ul>
underline	Specify whether underline is applied to the text image: <ul style="list-style-type: none"><li>• <code>yes</code>: For vertical text, underline is applied to each character individually.</li><li>• <code>no</code> (default)</li></ul>

## Example

### Example 1

```
<!--- This example shows how to create a text string image. --->
<!--- Use the ImageNew function to create a 200x100-pixel image. --->
<cfset myImage=ImageNew("",200,100)>
<!--- Set the drawing color to green. --->
<cfset ImageSetDrawingColor(myImage,"green")>
<!--- Specify the text string and the start point for the text. --->
<cfset ImageDrawText(myImage,"It's not easy being green.",10,50)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

### Example 2

```
<!--- This example shows how to draw three text strings with different text attributes. --->
<!--- Use the ImageNew function to create a 400x400-pixel image. --->
<cfset myImage=ImageNew("",400,400)>
<!--- Set the text attributes. --->
<cfset attr = StructNew()>
<cfset attr.underline = "yes">
<cfset attr.size = 25>
<cfset attr.style = "bold">
<cfset ImageSetDrawingColor(myImage,"yellow")>
<!--- Draw the text string "ColdFusion Rocks!" starting at (100,150). --->
<cfset ImageDrawText(myImage,"ColdFusion Rocks!",100,150,attr)>
<!--- Set new text attributes. --->
<cfset attr=StructNew()>
<cfset attr.size = 18>
<cfset attr.strikethrough = "yes">
<cfset attr.style = "bolditalic">
<cfset ImageSetDrawingColor(myImage,"red")>
<!--- Draw the text string "Powered by ColdFusion" starting at (100,200). --->
<cfset ImageDrawText(myImage,"Powered by ColdFusion",110,200,attr)>
<!--- Set new text attributes. --->
<cfset attr = StructNew()>
<cfset attr.font="Arial">
<cfset attr.style="italic">
<cfset attr.size=15>
<cfset ImageSetDrawingColor(myImage,"white")>
<!--- Draw the text string "Coming in 2007" starting at (150,250). --->
<cfset ImageDrawText(myImage,"We've arrived",150,250,attr)>
<!--- Display the text image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageFlip

### Description

Flips an image across an axis.

### Returns

Nothing.

## Category

[Image functions](#)

## Function syntax

```
ImageFlip(name [, transpose])
```

## See also

[ImageBlur](#), [ImageClearRect](#), [ImageCrop](#), [ImageNegative](#), [ImageNew](#), [ImageOverlay](#), [ImagePaste](#), [ImageResize](#), [ImageRotate](#), [ImageScaleToFit](#), [ImageSetAntialiasing](#), [ImageSharpen](#), [ImageShear](#), [ImageTranslate](#), [IsImageFile](#)

## History

ColdFusion 8: Added this function.

## Parameters

Parameter	Description
<code>name</code>	Required. The ColdFusion image on which this operation is performed.
<code>transpose</code>	Optional. Transpose the image: <ul style="list-style-type: none"><li><code>vertical</code>: Flip an image across an imaginary horizontal line that runs through the center of the image (default).</li><li><code>horizontal</code>: Flip an image across an imaginary vertical line that runs through the center of the image.</li><li><code>diagonal</code>: Flip an image across its main diagonal that runs from the upper-left to the lower-right corner.</li><li><code>antidiagonal</code>: Flip an image across its main diagonal that runs from the upper-right to the lower-left corner.</li><li><code>("90 180 270")</code> : Rotate an image clockwise by 90, 180, or 270 degrees.</li></ul>

## Usage

If you do not specify the `transpose` parameter for the `ImageFlip` function, the image is transposed on a vertical axis, creating an image that is an upside-down version of the source. Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

## Example

### Example 1

```
<!--- This example shows how to rotate an image by 270 degrees. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/paul03.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Rotate the image by 270 degrees. --->
<cfset ImageFlip(myImage,"270")>
<!--- Display the modified image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

### Example 2

```
<!--- This example shows how to flip an image on a vertical axis. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../../../cfdocs/images/artgallery/paul03.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Flip the image so that it is upside down. --->
<cfset ImageFlip(myImage,"vertical")>
<!--- Display the modified image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

#### Example 3

```
<!--- This example shows how to flip an image on a horizontal axis. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../../../cfdocs/images/artgallery/paul03.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Flip the image so that it is a mirror image of the source. --->
<cfset ImageFlip(myImage,"horizontal")>
<!--- Display the modified image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

#### Example 4

```
<!--- This example shows how to flip an image on a diagonal axis. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../../../cfdocs/images/artgallery/paul03.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Flip the image on a diagonal axis. --->
<cfset ImageFlip(myImage,"diagonal")>
<!--- Display the modified image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

#### Example 5

```
<!--- This example shows how to flip an image on an antidiagonal axis. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../../../cfdocs/images/artgallery/paul03.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Flip the image on an antidiagonal axis. --->
<cfset ImageFlip(myImage,"antidiagonal")>
<!--- Display the modified image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageGetBlob

### Description

Retrieves the bytes of the underlying image. The bytes are in the same image format as the source image.

### Returns

The bytes of the underlying image of a BLOB.

### Category

[Image functions](#)

## Function syntax

`ImageGetBlob(source)`

## See also

[cfimage](#), [ImageGetBufferedImage](#), [ImageGetEXIFTag](#), [ImageGetHeight](#), [ImageGetIPTCTag](#), [ImageGetWidth](#), [ImageInfo](#), [IsImage](#)

## History

ColdFusion 8: Added this function.

## Parameters

Parameter	Description
source	Required. The ColdFusion image on which this operation is performed.

## Usage

Use this function to insert ColdFusion images into BLOB columns of databases.

**Note:** If you do not specify a source image, you get a parameter validation error.

## Example

### Example 1

```
<!--- This example shows how to add a ColdFusion image to a database. --->
<!--- Create ColdFusion image from a an existing JPEG file. --->
<cfimage source="aiden01.jpg" name="myImage">
<!--- Use the cfquery tag to insert the ColdFusion image as a BLOB in the database. --->
<cfquery name="InsertBlobImage" datasource="myBlobData" >
INSERT into EMPLOYEES (FirstName,LastName,Photo)
VALUES ('Aiden','Quinn',<cfqueryparam value="#ImageGetBlob(myImage)#"
cfsqltype='cf_sql_blob'>)
</cfquery>
```

### Example 2

The following example shows how to use the `ImageNew` function to generate thumbnail images in JPEG format from BLOB data retrieved from a database:

```
<!--- Use the cfquery tag to retrieve all employee photos and employee IDs from a database. --->
<cfquery name= "GetBLOBs" datasource= "myBlobData">
SELECT EMLPOYEEID, PHOTO FROM Employees
</cfquery>
<!--- Use the ImageNew function to create a ColdFusion image from the BLOB data that was
retrieved from the database. --->
<cfset myImage = ImageNew(#GetBLOBs.PHOTO#)>
<!--- Create thumbnail versions of the images by resizing them to a 100x100-pixel image, while
maintaining the aspect ratio of the
source image. --->
<cfset ImageScaleToFit(myImage,100,"")>
<!--- Convert the images to JPEG format and save them to files in the thumbnails subdirectory,
using the employee ID as the filename. --->
<cfimage source="#myImage#" action="write"
destination="images/thumbnails/#GetBLOBs.EMPLOYEEID#.jpg">
```

## ImageGetBufferedImage

### Description

Returns the `java.awt.BufferedImage` object underlying the current ColdFusion image.

### Returns

The `java.awt.BufferedImage` object.

### Category

[Image functions](#)

### Function syntax

`ImageGetBufferedImage (name)`

### See also

[cfimage](#), [ImageGetBlob](#), [ImageGetEXIFTag](#), [ImageGetHeight](#), [ImageGetIPTCTag](#), [ImageGetWidth](#), [ImageInfo](#), [IsImage](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.

### Usage

Use this function to return an image object that can be used with other Java Abstract Windowing Toolkit (AWT) objects embedded in the page.

### Example

```
<!-- This example shows how to create a ColdFusion image, modify it, and retrieve the width
of the buffered image. -->
<!-- Create a ColdFusion image from an existing JPEG file. -->
<cfimage source="../cfdocs/images/artgallery/paul05.jpg" name="myImage">
<!-- Blur the image by an order of 10. -->
<cfset ImageBlur(myImage,10)>
<!-- Get the blurred image from the buffer and set it to variable x. -->
<cfset x = ImageGetBufferedImage(myImage)>
<!-- Return the width of the buffered image. -->
<cfoutput>#x.getWidth()#
</cfoutput>
```

## ImageGetEXIFMetadata

### Description

Retrieves the Exchangeable Image File Format (EXIF) headers in an image as a CFML structure.

### Returns

A structure with the EXIF header values.

### Category

[Image functions](#)

### Function syntax

`ImageGetEXIFMetadata (name)`

### See also

[cfimage](#), [ImageGetEXIFTag](#), [ImageGetBlob](#), [ImageGetBufferedImage](#), [ImageGetHeight](#), [ImageGetIPTCTag](#), [ImageGetWidth](#), [ImageInfo](#), [IsImage](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.

### Usage

The EXIF is a standard for storing interchange information in image files, especially those using JPEG compression. Most digital cameras use the EXIF format.

EXIF metadata includes information pertaining to the creation of the image, such as the creation date, the software used to create the image, the aperture, the make and model, and the resolution of the image.

The result of the `ImageGetEXIFMetadata` function is cached in the ColdFusion image to optimize performance.

The `ImageGetEXIFMetadata` function applies only to JPEG images. If you try to retrieve metadata for Base64, BLOB, or other types of images, ColdFusion generates errors.

### Example

```
<!--- This example shows how to retrieve the EXIF header information from a
JPEG file. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="images\paul05.jpg" name="myImage">
<!--- Retrieve the metadata associated with the image. --->
<cfset data =ImageGetEXIFMetadata(myImage)>
<!--- Display the ColdFusion image parameters. --->
<cfdump var="#myImage#">
<!--- Display the EXIF header information associated with the image
(creation date, software, and so on). --->
<cfdump var="#data#">
```

## ImageGetEXIFTag

### Description

Retrieves the specified EXIF tag in an image.

### Returns

The value of the specified EXIF tag.

### Category

[Image functions](#)

### Function syntax

```
ImageGetEXIFTag(name, tagName)
```

### See also

[cfimage](#), [ImageGetBlob](#), [ImageGetBufferedImage](#), [ImageGetHeight](#), [ImageGetIPTCTag](#), [ImageGetWidth](#), [ImageInfo](#), [IsImage](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
<code>name</code>	Required. The ColdFusion image on which this operation is performed.
<code>tagName</code>	Required. The EXIF tag name to be returned.

### Usage

The `ImageGetEXIFTag` function applies only to JPEG images. If you try to retrieve metadata for Base64, BLOB, or other types of images, ColdFusion generates errors.

### Example

```
<!--- This example shows how to retrieve one element from the EXIF information associated with
an image. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../../../cfdocs/images/artgallery/paul05.jpg" name="myImage">
<!--- Retrieve the name of the software application used to create the original image. --->
<cfset data = ImageGetEXIFTag(myImage,"software")>
<!--- Display the name of the software. --->
<cfdump var="#data#">
```

## ImageGetHeight

### Description

Retrieves the height of the ColdFusion image in pixels.

### Returns

The height of the specified ColdFusion image in pixels.

### Category

[Image functions](#)

### Function syntax

`ImageGetHeight (name)`

### See also

[cfimage](#), [ImageGetBlob](#), [ImageGetBufferedImage](#), [ImageGetEXIFTag](#), [ImageGetIPTCTag](#), [ImageGetWidth](#), [ImageInfo](#), [IsImage](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.

### Usage

Use this function to retrieve the height of a ColdFusion image.

### Example

```
<!--- This example shows how to retrieve the height of an image. --->
<!--- Create a ColdFusion image from a JPEG file. --->
<cfimage source="../../../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<!--- Retrieve the height of the image. --->
<cfset height=#ImageGetHeight(myImage)#>
<!--- Display the height of the image. --->
<cdump var="#height#">
```

## ImageGetIPTCMetadata

### Description

Retrieves the International Press Telecommunications Council (IPTC) headers in a ColdFusion image as a structure. The IPTC metadata contains text that describes the image that is stored with it. IPTC metadata includes, but is not limited to, caption, keywords, credit, copyright, object name, created date, byline, headline, and source.

### Returns

A structure containing IPTC header values.

### Category

[Image functions](#)

### Function syntax

`ImageGetIPTCMetadata (name)`

### See also

[cfimage](#), [ImageGetBlob](#), [ImageGetBufferedImage](#), [ImageGetEXIFMetadata](#), [ImageGetEXIFTag](#), [ImageGetHeight](#), [z](#), [ImageGetWidth](#), [ImageInfo](#), [IsImage](#), [IsImageFile](#)

## History

ColdFusion 8: Added this function.

## Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.

## Usage

The IPTC metadata contains text that describes the image that is stored with it. IPTC metadata includes, but is not limited to, caption, keywords, credit, copyright, object name, created date, byline, headline, and source.

The result of the `ImageGetIPTCMetadata` function is cached in the ColdFusion image to optimize performance.

The `ImageGetIPTCMetadata` function applies only to JPEG images. If you try to retrieve metadata for Base64, BLOB, or other types of images, ColdFusion generates errors.

## Example

```
<!--- This example shows how to retrieve the IPTC header information for a
JPEG file. --->
<!--- Create a ColdFusion image from a JPEG file. --->
<cfimage source="images\aiden01.jpg" name="myImage">
<!--- Retrieve the IPTC header information saved with the image, such as
copyright, caption, and headline. --->
<cfset data = ImageGetIPTCMetadata(myImage)>
<!--- Display the parameter values for the ColdFusion image. --->
<cfdump var="#myImage#">
<!--- Display the IPTC header information. --->
<cfdump var="#data#">
```

## ImageGetIPTCTag

### Description

Retrieves the value of the IPTC tag for a ColdFusion image.

### Returns

The value of the IPTC tag.

### Category

[Image functions](#)

### Function syntax

```
ImageGetIPTCTag (name, tagName)
```

### See also

[cfimage](#), [ImageGetBlob](#), [ImageGetBufferedImage](#), [ImageGetEXIFMetadata](#), [ImageGetEXIFTag](#),  
[ImageGetHeight](#), [ImageGetIPTCMetadata](#), [ImageGetWidth](#), [ImageInfo](#), [IsImage](#), [IsImageFile](#)

## History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
tagName	Required. The IPTC tag name whose value is returned.

### Usage

The `ImageGetIPTCTag` function applies only to JPEG images. If you try to retrieve metadata for Base64, BLOB, or other image types, ColdFusion generates errors.

### Example

```
<!--- This example shows how to retrieve the caption for a JPEG file. --->
<!--- Create a ColdFusion image from a JPEG file. --->
<cfimage source="../../../cfdocs/images/artgallery/paul05.jpg" name="myImage" action="read">
<!--- Retrieve the camera make used to take the original picture. --->
<cfset cameraMake=ImageGetIPTCTag(myImage, "make")>
<cdump var="#cameraMake#">
```

## ImageGetWidth

### Description

Retrieves the width of the specified ColdFusion image.

### Returns

An integer that represents the width of the ColdFusion image in pixels.

### Category

[Image functions](#)

### Function syntax

```
ImageGetWidth(name)
```

### See also

[cfimage](#), [ImageGetBlob](#), [ImageGetBufferedImage](#), [ImageGetEXIFTag](#), [ImageGetHeight](#), [ImageGetIPTCTag](#), [ImageInfo](#), [IsImage](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.

### Example

```
<!--- This example shows how to retrieve the width of an image. --->
<!--- Create a ColdFusion image from an existing JPEG file.--->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<!--- Get the width of the image. --->
<cfset width=#ImageGetWidth(myImage)#>
<!--- Display the width of the image in pixels. --->
<cfdump var=#width#>
```

## ImageGrayscale

### Description

Converts a ColdFusion image to grayscale.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

`ImageGrayscale (name)`

### See also

[ImageBlur](#), [ImageNegative](#), [ImageSetAntialiasing](#), [ImageSharpen](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.

### Usage

Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!--- This example shows how to change a color image to grayscale. --->
<!--- Create a ColdFusion image from an existing color image. --->
<cfimage source="../cfdocs/images/artgallery/jeff04.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Change the image to grayscale. --->
<cfset ImageGrayscale(myImage)>
<!--- Save the grayscale image to a JPEG file. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpg" overwrite="yes">
<!--- Display the source image and the grayscale image. --->

```

## ImageInfo

### Description

Returns a structure that contains information about the image, such as height, width, color model, size, and filename.

### Returns

A structure that contains information for image parameters.

### Category

[Image functions](#)

### Function syntax

`ImageInfo (name)`

### See also

[cfimage](#), [ImageGetHeight](#), [ImageGetWidth](#), [IsImage](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.

### Usage

Use this function to determine whether images are compatible. For example, to use the `ImageOverlay` function to overlay two images, both images must have the same color model.

### Example

```
<!--- This example shows how to retrieve information associated with the image. --->
<!--- Create a ColdFusion image from a JPEG file.--->
<cfimage source="../../../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<!--- Retrieve the information associated with the image. --->
<cfset info=ImageInfo(myImage)>
<cfdump var="#info#"></cfdump>
<p>height = <cfoutput>#info.height#</cfoutput>
<p>width = <cfoutput>#info.width#</cfoutput>
<p>source = <cfoutput>#info.source#"</cfoutput>
<p>pixel size = <cfoutput>#info.colormodel.pixel_size#</cfoutput>
<p>transparency = <cfoutput>#info.colormodel.transparency#</cfoutput>
```

## ImageNegative

### Description

Inverts the pixel values of a ColdFusion image.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

`ImageNegative (name)`

### See also

[ImageBlur](#), [ImageGrayscale](#), [ImageSetAntialiasing](#), [ImageSharpen](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.

### Usage

The resulting image has the same dimensions of the source image, but not necessarily the same number bytes. Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!--- This example shows how to create a negative version of an image. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Create a negative version of the image. --->
<cfset ImageNegative(myImage)>
<!--- Save the modified image to a file. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpg" overwrite="yes">
<!--- Display the source image and the negative image. --->

```

## ImageNew

### Description

Creates a ColdFusion image.

### Returns

A ColdFusion image.

### Category

[Image functions](#)

## Function syntax

```
ImageNew([source, width, height, imageType, canvasColor])
```

## See also

[cfimage](#), [ImageCopy](#), [ImageRead](#), [ImageReadBase64](#), [ImageSetDrawingColor](#), [IsImageFile](#)

## History

ColdFusion 8: Added this function.

## Parameters

Parameter	Description
source	Optional. The source image on-disk or in-memory pathname, URL, a ColdFusion variable that is read into the new ColdFusion image, or a Java buffered image.
width	Optional. The width of the new ColdFusion image. Valid when the height is specified and the source is not.
height	Optional. The height of the new ColdFusion image. Valid when the width is specified and the source is not.
imageType	Optional. The type of the ColdFusion image to create: <ul style="list-style-type: none"><li>• rgb</li><li>• argb</li><li>• grayscale</li></ul> Valid only when width and height are specified.
canvasColor	Optional. Color of the image canvas: <ul style="list-style-type: none"><li>• Hexadecimal value of RGB color. For example, specify the color white as #FFFFFF or FFFFFFFF.</li><li>• String value of color (for example, "black", "red", "green"). The default value of the drawing color is "black".</li><li>• List of three numbers for (R,G,B) values. Each value must be in the range 0–255.</li></ul>

## Usage

You can pass the `ImageNew` function any of the following parameters:

- Absolute or relative pathname: The image file located at the specified pathname on a disk is read and returned as a ColdFusion image.
- URL: The image from the specified URL is read and returned as a ColdFusion image.
- Width and height (`imageType` is optional): A blank ColdFusion image with the specified attributes is returned.
- ColdFusion image variable: An image variable in memory; for example, `#myImage#`.
- A BLOB from a database that contains image data.
- A byte array that contains Base64 image data.
- A Java buffered image.

ColdFusion generates an error when the passed attributes cannot create a valid ColdFusion image.

The `ImageNew` function and the `cfimage` read action support the SQL Server Image Column data type.

To read Base64 images, use the [ImageReadBase64](#) function.

If the color value is a string, specify a supported named color; see the valid HTML named colors in “[cfimage](#)” on page 306. For a hexadecimal value, use the form “#xxxxxx” or “xxxxxx”, where x = 0–9 or A–F; use two number signs or none.

**Note:** If you specify the ARGB image type, the image is white; however, if you specify RGB or grayscale, the image is black. To create blank images consistently, use the `canvasColor` parameter.

### Example

#### Example 1

```
<!-- Use the ImageNew function to create a 200x200-pixel image in ARGB format. --->
<cfset myImage = ImageNew("",200,200,"argb")>
<cfimage action="writeTobrowser" source="#myImage#">
```

#### Example 2

```
<!-- This example shows how to create a ColdFusion image from a BLOB in a database. --->
<cfquery
name="GetBLOBS" datasource="myblobdata">
SELECT LastName,Photo
FROM Employees
</cfquery>
<cfset i = 0>
<table border=1>
  <cfoutput query="GetBLOBS">
    <tr>
      <td>
        #LastName#
      </td>
      <td>
        <cfset i = i+1>
        <cfset myImage=ImageNew("#GetBLOBS.Photo#")>
        <cfset ImageWrite(myImage,"photo#i#.png")>
      </td>
    </tr>
  </cfoutput>
</table>
```

#### Example 3

```
<!-- This example shows how to create a ColdFusion image from a URL. --->
<cfset myImage = ImageNew("http://www.google.com/images/logo_sm.gif")>
<cfset ImageWrite(myImage,"google_via_imagenew.png")>

```

#### Example 4

```
<!-- This example shows how to use the cffile tag to convert an image file to binary format
and pass it as a variable to the ImageNew function. --->
<!--Use the cffile tag to read an image file, convert it to binary format, and write the
result to a variable. --->
<cffile action = "readBinary" file = apple.jpg"
  variable = "aBinaryObj">
<!-- Use the ImageNew function to create a ColdFusion image from the variable. --->
<cfset myImage = ImageNew(aBinaryObj)>
```

#### Example 5

```
<!--- This example shows how to use the cffile tag to write a ColdFusion image to a file. --->
<!--- Use the ImageNew function to create a ColdFusion image from a JPEG file. --->
<cfset myImage = ImageNew("../cfdocs/images/artgallery/aiden01.jpg")>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Resize the image. --->
<cfset ImageResize(myImage,"50%","")>
<!--- Pass the image object to the cffile tag and write the result to a file on the local
drive. --->
<cffile file="#myImage#" action="write" output="c:\test_myImage.jpg">
<cfimage action="writeToBrowser" source="#myImage#">
```

#### Example 6

```
<!--- This example uses cfscript to pass a Java buffered image to the ImageNew function. --->
<cfscript>
    bufferedImage = createObject("java", "java.awt.image.BufferedImage");
    bufferedImage.init(JavaCast("int", 100), JavaCast("int", 100),
BufferedImage.TYPE_4BYTE_ABGR);
    myImage = imageNew(bufferedImage);
</cfscript>
```

## ImageOverlay

### Description

Reads two source ColdFusion images and overlays the second source image on the first source image.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

`ImageOverlay(source1, source2)`

### See also

[ImageCopy](#), [ImagePaste](#), [ImageSetAntialiasing](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
<i>source1</i>	Required. The ColdFusion image that is the bottom layer in the ColdFusion image.
<i>source2</i>	Required. The ColdFusion image that is the top layer (overlaid on the <i>source1</i> image) in the ColdFusion image.

### Usage

The destination image always has the same bounding rectangle as the first source image and the same image type as the two sources. If the two source images do not intersect, the destination image is the same as the first source image.

The two source images must have the same color models. For example, you can overlay an RGB image over another RGB image, but you cannot overlay an RGB image on a grayscale image. To verify the color model of an image, use the [ImageInfo](#) function.

Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!-- This example shows how to overlay a smaller image on a
larger image. -->
<!-- Create a ColdFusion image from an existing JPEG file and enlarge it by 150%. This image
is displayed in the background. -->
<cfimage source="../cfdocs/images/artgallery/maxwell01.jpg" name="myImage" action="resize"
width="150%" height="150%">
<!-- Turn on antialiasing to improve image quality. -->
<cfset ImageSetAntialiasing(myImage,"on")>
<!-- Create a ColdFusion image from an existing JPEG file. This image is overlaid on the
background image. -->
<cfimage source="../cfdocs/images/artgallery/viata05.jpg" name="topImage">
<!-- Overlay the top image on the background image. -->
<cfset ImageOverlay(myImage,topImage)>
<!-- Display the combined image in a browser. -->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImagePaste

### Description

Takes two images and an (x,y) coordinate and draws the second image over the first image with the upper-left corner at coordinate (x,y).

### Returns

A ColdFusion image.

### Category

[Image functions](#)

### Function syntax

```
ImagePaste(image1, image2, x, y)
```

### See also

[ImageCopy](#), [ImageOverlay](#), [ImageSetAntialiasing](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
image1	Required. The bottom ColdFusion image.
Image2	Required. The ColdFusion image that is pasted on top of image1.
x	Required. The x coordinate where the upper-left corner of image2 is pasted.
y	Required. The y coordinate where the upper-left corner of image2 is pasted.

### Usage

Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!--- This example shows how to copy a small rectangular area of one image and paste it over
a larger image. --->
<!--- Create a ColdFusion image from an existing JPEG file and name it "myImage1". --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage1">
<!--- Create a ColdFusion image from an existing JPEG file and name it "myImage2". --->
<cfimage source="../cfdocs/images/artgallery/maxwell01.jpg" name="myImage2">
<!--- Copy a rectangular region of myImage1. --->
<cfset resImage = ImageCopy(myImage1,1,1,50,50)>
<!--- Paste the rectangular area over myImage2. --->
<cfset ImagePaste(myImage2,resImage,100,100)>
<!--- Write the second ColdFusion image to result.jpg. --->
<cfimage source="#myImage2#" action="write" destination="test_myImage.jpg" overwrite="yes">
<!--- Display the two source images and the new image. --->

```

## ImageRead

### Description

Reads the on-disk or in-memory source pathname or URL and creates a ColdFusion image.

### Returns

A ColdFusion image.

### Category

[Image functions](#)

### Function syntax

`ImageRead(path)`

### History

ColdFusion 8: Added this function.

### See also

[cfimage](#), [ImageNew](#), [ImageReadBase64](#), [ImageWrite](#), [IsImageFile](#)

### Parameters

Parameter	Description
path	Required. On-disk or in-memory pathname or URL of the source image.

### Usage

The `ImageRead` function performs the same operation as the `cfimageread` action. However, you cannot use the `cfimage` tag to read and create a ColdFusion image variable in the `cfscript` tag. Use the `ImageRead` function within the `cfscript` tag to read ColdFusion images.

The following example reads the image file `aiden01.jpg` into a variable called `myImage` and displays the image in the browser:

```
<cfset myImage=ImageRead("../cfdocs/images/artgallery/aiden01.jpg")>
<cfimage action="writeToBrowser" source="#myImage#">
```

For a list of valid image formats, see the supported image file formats listed in “[cfimage](#)” on page 306. To retrieve a list of readable formats on the server where the ColdFusion application is deployed, use the [GetReadableImageFormats](#) function.

### Example

```
<!--- This example shows how to create a script that reads an image from a URL. --->
<cfscript>
    myImage=ImageRead("http://www.google.com/images/logo.gif");
    ImageWrite(myImage, "google-logo.gif");
</cfscript>
<p>This image has been downloaded by ColdFusion:</p>

<p>This is the original image:</p>

```

## ImageReadBase64

### Description

Creates a ColdFusion image from a Base64 string.

### Returns

A ColdFusion image.

### Category

[Image functions](#)

### Function syntax

```
ImageReadBase64 (string)
```

### See also

[ImageNew](#), [ImageRead](#), [ImageWrite](#), [ImageWriteBase64](#), [BinaryDecode](#), [BinaryEncode](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
string	Required. The ColdFusion variable or Base64 string.

### Usage

Base64 is a way to describe binary data as a printable string of characters. The `ImageReadBase64` function takes Base64 strings as input and creates images from the strings.

The strings can be with or without the headers used to pass Base64 images to an HTML `<img src>` tag.

Use this function to convert any Base64 string to a ColdFusion image. Some databases store images as Base64 strings instead of BLOB data. You can query the database and use the `ImageReadBase64` function to convert the string into a ColdFusion image. This eliminates the intermediary step of converting images with the [BinaryEncode](#) and [BinaryDecode](#) functions.

Really Simple Syndication (RSS) feeds transfer images in the form of embedded Base64 strings in the XML file. Use the `ImageReadBase64` function to read these images in ColdFusion.

### Example

#### Example 1

```
<!-- This example shows how to read a Base64 string with headers. -->

<cfset myImage = ImageReadBase64(".....")>
<cfimage source="#myImage#" destination="test_my64.jpeg" action="write">
```

#### Example 2

```
<!-- This example shows how to read a Base64 string without headers. -->

<cfset myImage = ImageReadBase64("/9j/4AAQSkZJRgABAQA.....")>
<cfimage source="#myImage#" destination="test_my64.jpeg" action="write">
```

## ImageResize

### Description

Resizes a ColdFusion image.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageResize(name, width, height [, interpolation, blurFactor])
```

### See also

[cfimage](#), [ImageSetAntialiasing](#), [ImageScaleToFit](#), [IsImageFile](#)

## History

ColdFusion 8: Added this function.

## Parameters

Parameter	Description
<code>name</code>	Required. The ColdFusion image on which this operation is performed.
<code>width</code>	Required. New width of the ColdFusion image. If this value is blank, the width is calculated proportionately to the height.
<code>height</code>	Required. New height of the ColdFusion image. If this value is blank, the height is calculated proportionately to the width.
<code>interpolation</code>	Optional. The interpolation method for resampling. You can specify a specific interpolation algorithm by name (for example, <code>hamming</code> ), by image quality (for example, <code>mediumQuality</code> ), or by performance (for example, <code>highestPerformance</code> ). Valid values are: <ul style="list-style-type: none"> <li><code>highestQuality</code> (default)</li> <li><code>highQuality</code></li> <li><code>mediumQuality</code></li> <li><code>highestPerformance</code></li> <li><code>highPerformance</code></li> <li><code>mediumPerformance</code></li> <li><code>nearest</code></li> <li><code>bilinear</code></li> <li><code>bicubic</code></li> <li><code>bessel</code></li> <li><code>blackman</code></li> <li><code>hamming</code></li> <li><code>hanning</code></li> <li><code>hermite</code></li> <li><code>lanczos</code></li> <li><code>mitchell</code></li> <li><code>quadratic</code></li> </ul> See Interpolation algorithms in the Usage section for more information.
<code>blurFactor</code>	Optional. The blur factor used for resampling. The higher the blur factor, the more blurred the image (also, the longer it takes to resize the image). This value must be from 1 through 10.

## Usage

You can use this function to enlarge an image or create a thumbnail image.

To specify the height or width in pixels, enter the integer, for example, 100. To specify the height or width as a percentage, enter the percentage followed by the percent symbol, for example, 50%.

To resize an image by one dimension (for example, height), specify the height and leave width value blank ("" ). ColdFusion calculates the width proportionally to the height.

Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Interpolation algorithms

Interpolation algorithms let you fine-tune how images are resampled. Each algorithm balances image quality against performance: in general, the higher the image quality, the slower the performance. Quality and performance differ based on image type and the size of the source file. The following table describes the algorithms and their named equivalents based on average test results:

Value	Named equivalents	Description
highestQuality (default)	lanczos	Highest image quality with low performance
highQuality, mediumPerformance	mittchell, quadratic	Good image quality with slightly higher performance
mediumQuality, highPerformance	hamming, hanning, hermite	Medium quality image with medium performance
	blackman, bessel	Slightly distorted image quality with high performance
highestPerformance	nearest, bicubic, bilinear	Poor image quality with highest performance

### Example

```
<!--- This example shows how to resize an image to 50% of original size and resize it
proportionately to the new width. Notice that the height is blank.--->
<cfset myImage=ImageNew("http://www.google.com/images/logo_sm.gif")>
<cfset ImageResize(myImage,"50%", "", "blackman",2)>
<!--- Save the modified image to a file called "test_myImage.jpeg" and display the image in a
browser. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpeg" overwrite="yes">
<!--- Display the source image and the thumbnail image. --->

```

## ImageRotate

### Description

Rotates a ColdFusion image at a specified point by a specified angle.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageRotate(name, angle [, x, y, interpolation])
```

### See also

[cfimage](#), [ImageFlip](#), [ImageSetAntialiasing](#), [IsImageFile](#)

## History

ColdFusion 8: Added this function.

## Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
angle	Required. The rotation angle in degrees.
x	Optional. The x coordinate for the point of rotation. The default value is 2.
y	Optional. The y coordinate for the point of rotation. The default value is 2.
interpolation	Optional. Type of interpolation: <ul style="list-style-type: none"><li>• <b>nearest</b>: Applies the nearest neighbor method of interpolation. Image quality is lower than the other interpolation methods, but processing is fastest (default).</li><li>• <b>bilinear</b>: Applies the bilinear method of interpolation. The quality of the image is less pixelated than the default, but processing is slower.</li><li>• <b>bicubic</b>: Applies the bicubic method of interpolation. Generally, the quality of image is highest with this method and processing is slowest.</li></ul>

## Usage

Specify both the x and the y coordinates or neither. If you do not specify the x and y coordinates, the point of rotation is the center of the image, which is the default position. Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

## Example

### Example 1

```
<!--- This example shows how to rotate an image by 10 degrees. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfset myImage=ImageNew("../cfdocs/images/artgallery/jeff05.jpg")>
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Rotate the image by 10 degrees. --->
<cfset ImageRotate(myImage,10)>
<cfimage source="#myImage#" action="writeToBrowser">
```

### Example 2

```
<!--- This example shows how to rotate an image by 10 degrees and change the interpolation to
bicubic for higher resolution. The image is rotated at the (10,90) coordinates. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<cfset ImageRotate(myImage,10,10,90,"bicubic")>
<cfimage source="#myImage#" destination="testMyImage.jpeg" action="write" overwrite="yes">

```

## ImageRotateDrawingAxis

### Description

Rotates all subsequent drawing on a ColdFusion image at a specified point by a specified angle.

### Returns

A ColdFusion image.

### Category

[Image functions](#)

### Function syntax

```
ImageRotateDrawingAxis(name, angle [, x, y])
```

### See also

[ImageRotate](#), [ImageSetAntialiasing](#), [ImageSetBackgroundColor](#), [ImageSetDrawingColor](#),  
[ImageSetDrawingStroke](#), [ImageSetDrawingTransparency](#), [ImageShearDrawingAxis](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
<i>name</i>	Required. The ColdFusion image on which this operation is performed.
<i>angle</i>	Required. The rotation angle in degrees.
<i>x</i>	Optional. The x coordinate for the point of rotation. The default value is 0.
<i>y</i>	Optional. The y coordinate for the point of rotation. The default value is 0.

### Usage

The default position of the origin is 0,0. To revert to the original drawing axis, call the same (x,y) parameters with the negative of the original angle. Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!--- This example shows how to create an image with three shapes drawn on the same axis. --->
<!--- Use ImageNew to create a 300x300-pixel image. --->
<cfset myImage=ImageNew("",300,300)>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Set the drawing axis to 30 degrees and the point of rotation at (10,10). --->
<cfset ImageRotateDrawingAxis(myImage,30,10,10)>
<!--- Set the drawing color to blue. --->
<cfset ImageSetDrawingColor(myImage,"blue")>
<!--- Draw three shapes with the same color and drawing axis. --->
<cfset ImageDrawRect(myImage,150,10,10,150,"yes")>
<cfset ImageDrawOval(myImage,200,40,45,65,"yes")>
<cfset ImageDrawRect(myImage,275,10,10,150,"yes")>
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageScaleToFit

### Description

Creates a resized image with the aspect ratio maintained.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageScaleToFit(name, fitWidth, fitHeight [, interpolation , blurFactor])
```

### See also

[cfimage](#), [ImageResize](#), [ImageSetAntialiasing](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
<i>name</i>	Required. The ColdFusion image on which this operation is performed.
<i>fitWidth</i>	Required. The width of the bounding box in pixels. You can specify an integer, or an empty string ("" ) if the <i>fitHeight</i> is specified. See the Usage section for more information.

Parameter	Description
<code>fitHeight</code>	Required. The height of the bounding box in pixels. You can specify an integer, or an empty string ("" ) if the <code>fitWidth</code> is specified. See the Usage section for more information.
<code>interpolation</code>	<p>Optional. The interpolation method for resampling. You can specify a specific interpolation algorithm by name (for example, <code>hamming</code>), by image quality (for example, <code>mediumQuality</code>), or by performance (for example, <code>highestPerformance</code>). Valid values are:</p> <ul style="list-style-type: none"><li>• <code>highestQuality</code> (default)</li><li>• <code>highQuality</code></li><li>• <code>mediumQuality</code></li><li>• <code>highestPerformance</code></li><li>• <code>highPerformance</code></li><li>• <code>mediumPerformance</code></li><li>• <code>nearest</code></li><li>• <code>bilinear</code></li><li>• <code>bicubic</code></li><li>• <code>bessel</code></li><li>• <code>blackman</code></li><li>• <code>hamming</code></li><li>• <code>hanning</code></li><li>• <code>hermite</code></li><li>• <code>lanczos</code></li><li>• <code>mitchell</code></li><li>• <code>quadratic</code></li></ul> <p>See <i>Interpolation algorithms</i> in the Usage section for more information.</p>
<code>blurFactor</code>	Optional. The blur factor used for resampling. The higher the blur factor, the more blurred the image (also, the longer it takes to resize the image). Valid values are 1–10.

### Usage

Use this operation to resize images or create thumbnail images while maintaining the aspect ratio. Specify the `fitWidth` and `FitHeight` parameters; either the `fitWidth` or the `fitHeight` can be an empty string:

```
<cfset ImageScaleToFit(myImage,100,"")>
```

In this example, the `ImageScaleToFit` function resizes the image so that it fits in a 100x100-pixel square; the width of the resulting image is 100 pixels and the height is less than or equal to 100 pixels. For example, if the source image is 400x200 pixels, the resulting image is 100x50 pixels.

Likewise, if you specify the `fitHeight` parameter and an empty string for the `fitWidth` parameter, the `ImageScaleToFit` function resizes the image so that the height equals the `fitHeight` parameter and the width of the image is scaled proportionately:

```
<cfset ImageScaleToFit(myImage,"",100)>
```

In this example, a 400x200-pixel source image is resized to 200x100 pixels, and a 200x400-pixel image is resized to 50x100 pixels.

If you set both the `fitWidth` and the `fitHeight` parameters, the `ImageScaleToFit` function resizes the image proportionately so that both conditions are true: the width of the resulting image is less than or equal to the `fitWidth`, and the height is less than or equal to the `fitHeight`:

```
<cfset ImageScaleToFit(myImage,100,200)>
```

In this example, a 400x200-pixel source image is resized to 100x50 pixels, and a 200x400-pixel source image is resized to 100x200 pixels.

Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!--- This example shows how to resize an image to fit a 100x100-pixel square while maintaining
the aspect ratio. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/jeff05.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<cfset ImageScaleToFit(myImage,100,"","lanczos")>
<!--- Display the modified image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageSetAntialiasing

### Description

Switches antialiasing on or off in rendered graphics.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageSetAntialiasing(name [, antialias])
```

### See also

[ImageRotateDrawingAxis](#), [ImageSetBackgroundColor](#), [ImageSetDrawingColor](#), [ImageSetDrawingStroke](#), [ImageSetDrawingTransparency](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
antialias	Optional. Antialiasing switch: <ul style="list-style-type: none"><li>• on (default)</li><li>• off</li></ul>

### Usage

The `ImageSetAntialiasing` function is used to turn antialiasing on and off when drawing shapes and text in an image. Antialiasing is a technique used to soften jagged edges. Turn on antialiasing when using other image functions, such as `ImageDrawRoundRect` and `ImageRotate`, to improve the quality of the rendered image. Notice that antialiasing decreases performance.

### Example

#### Example 1

```
<!--- This example shows how to turn off antialiasing for a ColdFusion image. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfset myImage=ImageNew("../cfdocs/images/artgallery/electa02.jpg")>
<!--- Turn off antialiasing.--->
<cfset ImageSetAntialiasing(myImage,"off")>
<!--- Display the modified image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

#### Example 2

```
<!--- This example shows how to turn on antialiasing to improve the output of the
ImageDrawRoundRect function. --->
<!--- Create a 200x200-pixel image. --->
<cfset myImage=ImageNew("",200,200)>
<!--- Set the drawing color for the image to blue. --->
<cfset ImageSetDrawingColor(myImage,"blue")>
<!--- Turn on antialiasing. --->
<cfset ImageSetAntialiasing(myImage)>
<!--- Draw a blue filled square with round corners of arcWidth=10 and arcHeight=2. --->
<cfset ImageDrawRoundRect(myImage,5,5,190,190,"yes",10,2)>
<!--- Rotate the image 30 degrees. --->
<cfset ImageRotate(myImage,30)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageSetBackgroundColor

### Description

Sets the background color for the ColdFusion image. The background color is used for clearing a region. Setting the background color only affects the subsequent `ImageClearRect` calls.

### Returns

Nothing.

## Category

[Image functions](#)

## Function syntax

`ImageSetBackgroundColor (name, color)`

## See also

[ImageClearRect](#), [ImageSetAntialiasing](#), [IsImageFile](#)

## History

ColdFusion 8: Added this function.

## Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
color	Required. Background color: <ul style="list-style-type: none"><li>Hexadecimal value of RGB color. For example, specify the color white as <code>##FFFFFF</code> or <code>FFFFFF</code>.</li><li>String value of color (for example, "black", "red", "green"). The default value of the drawing color is "black".</li><li>List of three numbers for (R,G,B) values. Each value must be in the range 0–255.</li></ul>

## Usage

If the color value is a string, specify a supported named color; see the list of valid HTML named colors in “[cfimage](#)” on page 306. For a hexadecimal value, use the form “`##xxxxxx`” or “`xxxxxx`”, where x = 0–9 or A–F; use two number signs or none.

Use this function in conjunction with the [ImageClearRect](#) function to clear a rectangular area of an image and set it to a specified color.

## Example

```
<!--- This example shows how to set the background color, and then draw a rectangle on an image
filled with that color. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage name="myImage" source="../cfdocs/images/artgallery/maxwell101.jpg">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage)>
<!--- Set the background color to magenta. --->
<cfset ImageSetBackgroundColor(myImage,"magenta")>
<!--- Clear the rectangle specified on myImage with the background color specified for the
image. --->
<cfset ImageClearRect(myImage,36,45,100,100)>
<!--- Display the modified image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageSetDrawingColor

### Description

Sets the current drawing color for ColdFusion images. All subsequent graphics operations use the specified color.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageSetDrawingColor(name, color)
```

### See also

[ImageSetAntialiasing](#), [ImageSetBackgroundColor](#), [ImageSetDrawingStroke](#),  
[ImageSetDrawingTransparency](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
<code>name</code>	Required. The ColdFusion image on which this operation is performed.
<code>color</code>	Required. Drawing color: <ul style="list-style-type: none"><li>Hexadecimal value of RGB color. For example, specify the color white as <code>"#FFFFFF"</code> or <code>"FFFFFF"</code>.</li><li>String value of color (for example, <code>"black"</code>, <code>"red"</code>, <code>"green"</code>). The default value of the drawing color is <code>"black"</code>.</li><li>List of three numbers for (R,G,B) values. Each value must be in the range 0–255.</li></ul>

### Usage

Use the `ImageSetDrawingColor` function to control the color of all subsequent drawing objects in ColdFusion images. For example, you can use this function to set the drawing color to red once, and then draw a circle, a square, and 10 lines in that color.

If the color value is a string, specify a supported named color; see the list of valid HTML named colors in [“cfimage”](#) on page 306. For a hexadecimal value, use the form `"#xxxxxx"` or `"xxxxxx"`, where x = 0-9 or A-F; use two number signs or none.

### Example

```
<!--- This example shows how to set the drawing color and draw several objects in that color.
--->
<!--- Use the ImageNew function to create a ColdFusion image. --->
<cfset myImage=ImageNew("",200,300)>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage)>
<!--- Set the drawing color to pink. --->
<cfset ImageSetDrawingColor(myImage,"pink")>
<!--- Draw a pink line. --->
<cfset ImageDrawLine(myImage,1,1,200,300)>
<!--- Draw a pink oval. --->
<cfset ImageDrawOval(myImage,40,50,80,40)>
<!--- Draw another pink oval. --->
<cfset ImageDrawOval(myImage,15,180,80,40)>
<!--- Draw a pink rectangle. --->
<cfset ImageDrawRect(myImage,100,100,45,65)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageSetDrawingStroke

### Description

Sets the drawing stroke for points and lines in subsequent ColdFusion images.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageSetDrawingStroke(name [, attributeCollection])
```

### See also

[ImageDrawText](#), [ImageSetAntialiasing](#), [ImageSetBackgroundColor](#), [ImageSetDrawingColor](#),  
[ImageSetDrawingTransparency](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
attributeCollection	Optional. The structure used to specify the line attributes. See the Usage section.

## Usage

Use the `ImageSetDrawingStroke` function to control the line attributes of all subsequent drawing objects in a ColdFusion image. For example, you can use this function to set the drawing stroke to a dash pattern once, and then create a rectangle, two ovals, and five lines with that pattern.

If a blank or no attribute structure is passed, the drawing stroke is reset to the default values.

## attributeCollection

Element	Description
<code>width</code>	Pen width, which is measured perpendicularly to the pen trajectory.
<code>endcaps</code>	Decoration applied to the ends of unclosed subpaths and dash segments. Subpaths that start and end on the same point are considered unclosed if they do not have a close segment: <ul style="list-style-type: none"><li>• <code>butt</code></li><li>• <code>round</code></li><li>• <code>square</code></li></ul>
<code>lineJoins</code>	Type of line joins: <ul style="list-style-type: none"><li>• <code>bevel</code></li><li>• <code>miter</code></li><li>• <code>join</code></li></ul>
<code>miterLimit</code>	The limit to trim a line join that has a mitered join decoration. (Use only when <code>lineJoins = "miter"</code> .) A line join is trimmed when the ratio of miter length to stroke width is greater than the <code>miterLimit</code> value. The miter length is the diagonal length of the miter, which is the distance between the inside corner and the outside corner of the intersection. The smaller the angle formed by two line segments, the longer the miter length and the sharper the angle of intersection. The default value is 10.0, which trims all angles less than 11 degrees. Trimming miters converts the decoration of the line join to bevel.
<code>dashArray</code>	An array of numbers that indicates the dash pattern. For example, if <code>dashArray</code> is (8,4), the dash pattern is 8 pixels solid, 4 pixels blank, 8 pixels solid, 4 pixels blank, and so on.
<code>dash_phases</code>	An offset into the dash pattern. For example, a <code>dash_phase</code> of 2, and a <code>dashArray</code> of (8,4) produces the dash pattern of 6 pixels solid, 4 pixels blank, 8 pixels solid, 4 pixels blank, and so on.

## Example

### Example 1

```
<!--- This example shows how to create an attribute collection for the ImageSetDrawingStroke
function and draws a line with those attributes.
--->
<!--- Use the ImageNew function to create a ColdFusion image. --->
<cfset myImage=ImageNew("",200,200)>
<!--- Create an attribute collection to pass to the ImageSetDrawingStroke function. Create a
stroke that is 10-pixels wide, has round endcaps, and has a dash pattern of (8,4). --->
<cfset attr = StructNew()>
<cfset attr.width = 2>
<cfset attr.endcaps = "round">
<cfset dashPattern = ArrayNew(1)>
<cfset dashPattern[1] = 8>
<cfset dashPattern[2] = 4>
<cfset attr.dashArray = dashPattern>
<!--- Apply the attribute collection to the ImageSetDrawingStroke function for the image. --->
<cfset ImageSetDrawingStroke(myImage,attr)>
<!--- Draw a line on the ColdFusion image with the drawing stroke attributes. --->
<cfset ImageDrawLine(myImage,20,20,40,150)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

#### Example 2

```
<!--- Use the ImageNew function to create a ColdFusion image. --->
<cfset myImage=ImageNew("",500,500)>
<!-- Set the drawing color of the image to cyan. --->
<cfset ImageSetDrawingColor(myImage,"cyan")>
<!--- Draw a line from (30,40) to (200,190). --->
<cfset ImageDrawLine(myImage,30,30,200,200)>
<!--- Create the attribute collection for the drawing stroke. --->
<cfset attr = StructNew()>
<cfset attr.width = 1>
<cfset attr.endcaps = "round">
<cfset dashPattern = ArrayNew(1)>
<cfset dashPattern[1] = 3>
<cfset dashPattern[2] = 4>
<cfset dashPattern[3] = 8>
<cfset attr.dashArray = dashPattern>
<!--- Pass the attribute collection as an argument to the set drawing stroke
function. --->
<cfset ImageSetDrawingStroke(myImage,attr)>
<!-- Set the drawing color of the image to yellow. --->
<cfset ImageSetDrawingColor(myImage,"yellow")>
<!--- Draw a rectangle with the drawing stroke specified. --->
<cfset ImageDrawRect(myImage,200,50,210,200)>
<!-- Reset the drawing stroke. -->
<cfset ImageSetDrawingStroke(myImage)>
<!--- Draw a green quadratic curve. --->
<cfset ImageSetDrawingColor(myImage,"green")>
<cfset ImageDrawQuadraticCurve(myImage,120,320,5,15,380,280)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageSetDrawingTransparency

### Description

Specifies the degree of transparency of drawing functions.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageSetDrawingTransparency(name, percent)
```

### See also

[ImageSetAntialiasing](#), [ImageSetBackgroundColor](#), [ImageSetDrawingColor](#), [ImageSetDrawingStroke](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
<code>name</code>	Required. The ColdFusion image on which this operation is performed.
<code>percent</code>	Required. Percent of transparency: <ul style="list-style-type: none"><li>• 0 = opaque</li><li>• 100 = transparent</li></ul> Decimal values are valid.

### Usage

By default drawing images are opaque. Use this function to create watermarks or other translucent images. Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

Example 1

```
<!--- This example shows how to draw semitransparent text over an image.
--->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../../../cfdocs/images/artgallery/austin01.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage)>
<!--- Set the drawing transparency to 40%. --->
<cfset ImageSetDrawingTransparency(myImage,40)>
<!--- Set the text drawing attributes. --->
<cfset attr = StructNew()>
<cfset attr.size = 40>
<cfset attr.style = "bold">
<!--- Specify the text string and the location of the text on the image.
--->
<cfset ImageDrawText(myImage,"SOLD!",40,100,attr)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

### Example 2

```
<!--- This example shows how to create a watermark from the a JPEG file.
--->
<!--- Create a ColdFusion image from a JPEG file. --->
<cfimage source="../../../cfdocs/getting_started/photos/somewhere.jpg" name="myImage"
action="read">
<!--- Set the drawing transparency to 75%. --->
<cfset ImageSetDrawingTransparency(myImage,75)>
<!--- Create a ColdFusion image from a picture in the cfartgallery. --->
<cfimage source="../../../cfdocs/images/artgallery/raquel05.jpg" name="myImage2" action="read">
<!--- Set the drawing transparency to 30%. --->
<cfset ImagesetDrawingTransparency(myImage,30)>
<!--- Paste the ColdFusion log over the picture at coordinates (0,0).--->
<cfset ImagePaste(myImage,myImage2,0,0)>
<!--- Display the two source images and the result. --->
<cfimage source="#myImage#" destination="watermark.jpg" action="write" overwrite="yes">

```

### Example 3

```
<!--- This code creates a ColdFusion image to be used as a watermark. --->
<cfimage action="read" name="logo" source="../../../cfdocs/getting_started/photos/somewhere.jpg">
<cfset imageGrayscale(logo)>
<cfset imageRotate(logo,45)>
<!--- This code creates the ColdFusion image to be used as the base image.
--->
<cfimage action="read" source="../../../cfdocs/images/artgallery/raquel05.jpg" name="baseImage">
<!--- This code sets the drawing transparency for the base image to 80%.
--->
<cfset ImageSetDrawingTransparency(baseImage,80)>
<!--- This code pastes the watermark image onto the base image at the coordinates (0,0). --->
<cfset ImagePaste(baseImage,logo,0,0)>
<!--- This code writes the result to a file. --->
<cfimage action="write" source="#baseImage#" destination="abc_watermark.jpg" overwrite="yes">
<!--- This code displays the image used as a watermark and the result. --->

```

## ImageSharpen

### Description

Sharpens a ColdFusion image by using the unsharp mask filter.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageSharpen(name [, gain])
```

### See also

[ImageBlur](#), [ImageSetAntialiasing](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
gain	Optional. -1 <= gain <= 2.  Gain values can be integers or real numbers. The default value is 1.0.  The value determines whether the image is blurred or sharpened: <ul style="list-style-type: none"><li>• If &gt; 0, the image is sharpened.</li><li>• If = 0, no effect</li><li>• If &lt; 0, the image is blurred.</li></ul>

### Usage

Use this function to sharpen outlines in photographs. Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/paul01.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Sharpen myImage by 2. --->
<cfset ImageSharpen(myImage,2)>
<!--- Write the sharpened image to a file. --->
<cfimage source="#myImage#" action="write" destination="test_myImage.jpg" overwrite="yes">
<!--- Display the original and the sharpened images. --->

```

## ImageShear

### Description

Shears an image either horizontally or vertically. For each pixel (x, y) of the destination, the source value at the fractional subpixel position (x', y') is constructed with an Interpolation object and written to the destination.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageShear(name, shear [, direction, interpolation])
```

### See also

[ImageSetAntialiasing](#), [ImageShearDrawingAxis](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
<code>name</code>	Required. The ColdFusion image on which this operation is performed.
<code>shear</code>	Required. Shear value. Coordinates can be integers or real numbers.
<code>direction</code>	Optional. Shear direction: <ul style="list-style-type: none"><li>horizontal (default)</li><li>vertical</li></ul>
<code>interpolation</code>	Optional. Type of interpolation: <ul style="list-style-type: none"><li>nearest: Applies the nearest neighbor method of interpolation. Image quality is lower than the other interpolation methods, but processing is fastest (default).</li><li>bilinear: Applies the bilinear method of interpolation. The quality of the image is less pixelated than the default, but processing is slower.</li><li>bicubic: Applies the bicubic method of interpolation. Generally, the quality of image is highest with this method and processing is slowest.</li></ul>

### Usage

Use this function to distort an image.

If the `direction` parameter is set to `horizontal`,  $x' = (x - y * \text{shear})$  and  $y' = y$ .

If the `direction` parameter is set to `vertical`,  $x' = x$  and  $y' = (y - x * \text{shear})$ .

Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!--- This example shows how to shear an image. --->
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../../../cfdocs/images/artgallery/paul03.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Shear the image by a factor of 1 on a horizontal axis. --->
<cfset ImageShear(myImage,1,"horizontal")>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageShearDrawingAxis

### Description

Shears the drawing canvas.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

`ImageShearDrawingAxis(name, shx, shy)`

### See also

[ImageRotateDrawingAxis](#), [ImageSetAntialiasing](#), [ImageShear](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
shx	Required. The multiplier by which coordinates are shifted in the positive x axis direction as a function of the y coordinate.
shy	Required. the multiplier by which coordinates are shifted in the positive y axis direction as a function of the x coordinate.

### Usage

For each pixel (x,y) of the destination, the source value at the fractional subpixel position (x',y') is constructed with an interpolation object and written to the destination.

If the direction parameter is equal to horizontal,  $x' = (x - y * \text{shear})$  and  $y' = y$ .

If the direction parameter is equal to vertical,  $x' = x$  and  $y' = (y - x * \text{shear})$ .

Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../cfdocs/images/artgallery/paul03.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Set the shear drawing axis. --->
<cfset ImageShearDrawingAxis(myImage,0.5,0.5)>
<!--- Draw a rectangle on the image with the shear settings. --->
<cfset ImageDrawRect(myImage,50,50,50,50)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageTranslate

### Description

Copies an image to a new location on the plane.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageTranslate(name, xTrans, yTrans [, interpolation])
```

### See also

[ImageSetAntialiasing](#), [ImageShear](#), [ImageTranslateDrawingAxis](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
xTrans	Required. Displacement in the x direction.
yTrans	Required. Displacement in the y direction.
interpolation	Optional. Type of interpolation used for resampling: <ul style="list-style-type: none"><li>• <b>nearest</b>: Applies the nearest neighbor method of interpolation. Image quality is lower than the other interpolation methods, but processing is fastest (default).</li><li>• <b>bilinear</b>: Applies the bilinear method of interpolation. The quality of the image is less pixelated than the default, but processing is slower.</li><li>• <b>bicubic</b>: Applies the bicubic method of interpolation. Generally, the quality of image is highest with this method and processing is slowest.</li></ul>

### Usage

For each pixel (x,y) of the destination, the source value at the fractional subpixel position (x - xTrans, y - yTrans) is constructed with an interpolation object and written to the destination. If both xTrans and yTrans are integral, the operation wraps the source image to change the image's position in the coordinate plane.

Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!--- Create a ColdFusion image from an existing JPEG file. --->
<cfimage source="../../../cfdocs/images/artgallery/aiden01.jpg" name="myImage">
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage,"on")>
<!--- Offset the image's position to (20,10). --->
<cfset ImageTranslate(myImage,20,10)>
<!--- Display the offset image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageTranslateDrawingAxis

### Description

Translates the origin of the image context to the point (x,y) in the current coordinate system. Modifies the image context so that its new origin corresponds to the point (x,y) in the image's original coordinate system.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

`ImageTranslateDrawingAxis(name, x, y)`

### See also

[ImageSetAntialiasing](#), [ImageSetDrawingColor](#), [ImageSetDrawingStroke](#), [ImageSetDrawingTransparency](#), [ImageShearDrawingAxis](#), [ImageTranslate](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
x	x coordinate
y	y coordinate

### Usage

All coordinates used in subsequent rendering operations on this image context are relative to the new origin. Use the [ImageSetAntialiasing](#) function to improve the quality of the rendered image.

### Example

```
<!--- Create a 200x200-pixel image. --->
<cfset myImage=ImageNew("",200,200)>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage)>
<!--- Translate the origin to (100,20). --->
<cfset ImageTranslateDrawingAxis(myImage,100,20)>
<!--- Draw a rectangle at the offset location. --->
<cfset ImageDrawRect(myImage,50,60,40,50)>
<!--- Display the image in a browser. --->
<cfimage source="#myImage#" action="writeToBrowser">
```

## ImageWrite

### Description

Writes a ColdFusion image to the specified on-disk or in-memory destination.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

```
ImageWrite(name [, destination, quality, optional])
```

### See also

[cfimage](#), [GetWriteableImageFormats](#), [ImageNew](#), [ImageRead](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
<code>name</code>	Required. The ColdFusion image on which this operation is performed.

Parameter	Description
destination	Optional. The absolute or relative on-disk or in-memory pathname where you write the file.  If you create the image with the <code>ImageNew</code> function or another operation where you do not specify the filename, specify the <code>destination</code> parameter.  The file format is derived from the extension of the filename. The default value for this parameter is the filename of the original image source.
overwrite	Optional. If set to <code>true</code> , overwrites the destination file.
quality	Optional. Defines the JPEG quality used to encode the image. This parameter applies only to destination files with an extension of JPG or JPEG. Valid values are fractions that range from 0 through 1 (the lower the number, the lower the quality). The default value is 0.75.

### Usage

Use the following syntax to specify an in-memory file, which is not written to disk. In-memory files speed processing of transient data.

```
ram:///filepath
```

The filepath can include directories, for example `ram:///petStore/images/poodle.jpg`. Create the directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files* in the *Developing ColdFusion Applications*.

The file format is derived from the file extension, therefore, use this function to convert images.

For a list of valid formats to write, see the supported image file formats listed in “[cfimage](#)” on page 306. To retrieve a list of writable formats on the server where the ColdFusion application is deployed, use the [GetWriteableImageFormats](#) function.

**Note:** Converting images between one file format to another is time-consuming. Also, image quality can degrade; for example, PNG images support 24-bit color, but GIF images support only 256 colors. Converting transparent images (images with alpha) can degrade image quality.

### Example

```
<!--- This example shows how to convert a GIF image to a PNG image. --->
<!--- Use the ImageNew function to create a ColdFusion image. --->
<cfset myImage = ImageNew("http://www.google.com/images/logo_sm.gif")>
<!--- Convert the image to a PNG format. --->
<cfset ImageWrite(myImage,"google.png")>
<!--- Display the PNG image. --->

```

## ImageWriteBase64

### Description

Writes Base64 images to the specified on-disk or in-memory destination.

### Returns

Base64 string.

### Category

[Image functions](#)

**Function syntax**

```
ImageWriteBase64(name, destination, format [, inHTMLFormat, optional])
```

**See also**

[cfimage](#), [ImageReadBase64](#), [IsImageFile](#)

**History**

ColdFusion 8: Added this function.

**Parameters**

Parameter	Description
name	Required. The ColdFusion image on which this operation is performed.
destination	Required. The absolute or relative on-disk or in-memory pathname where you write the file.
format	Required. The format
inHTMLFormat	Optional. Specify whether Base64 output includes the headers used by the Base64 images in the HTML <img> tag ("data:image/<format>;base64,..."): <ul style="list-style-type: none"><li>• yes</li><li>• no (default)</li></ul>
overwrite	Optional. If set to true, overwrites the destination file.

**Usage**

You use the `ImageWriteBase64` function to encode image data as a string of printable characters. This is useful for several applications, including sending images by e-mail and storing images in database text fields.

Use the following syntax to specify an in-memory file, which is not written to disk. In-memory files speed processing of transient data.

```
ram:///filepath
```

The filepath can include directories, for example `ram:///petStore/images/poodle.jpg`. Create the directories in the path before you specify the file. For more information on using in-memory files, see *Working with in-memory files* in the *Developing ColdFusion Applications*.

If you do not specify a file format, ColdFusion cannot recognize the format required to encode the image before converting to Base64, and generates errors.

You can verify whether ColdFusion reads a Base64 string properly in the following ways:

- Use the `cfdump` tag. For example: `<cfdump var="#myImage#">`
- Use the `ImageInfo` function. For example: `<cfset ImageInfo(myImage)>`
- Use the `ImageWrite` function and save the image as a JPEG file. Then open the JPEG file in a browser or imaging application.

### Example

```
<!--- This example shows how to convert a JPEG image to Base64 format and save it to a file.
--->
<!--- Create a new ColdFusion image. --->
<cfset myImage=ImageNew("../cfdocs/images/artgallery/jeff01.jpg")>
<!--- Convert the image to Base64 format and write it to a file.--->
<cfset ImageWriteBase64(myImage,"jeffBase64.txt","jpg","yes")>
```

## ImageXORDrawingMode

### Description

Sets the paint mode of the image to alternate between the image's current color and the new specified color.

### Returns

Nothing.

### Category

[Image functions](#)

### Function syntax

`ImageXORDrawingMode(name, c1)`

### See also

[ImageSetDrawingColor](#), [IsImageFile](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
<code>name</code>	Required. The ColdFusion image on which this operation is performed.
<code>c1</code>	Required. XOR alternation color: <ul style="list-style-type: none"><li>Hexadecimal value of the RGB color. For example, specify the color white as "<code>##FFFFFF</code>" or "<code>FFFFFF</code>".</li><li>String value of color (for example, "<code>black</code>", "<code>red</code>", "<code>green</code>").</li></ul>

### Usage

This function alternates pixels between the current color and a new specified XOR (exclusive Or) color.

When drawing operations are performed, pixels that are the current color are changed to the specified color, and vice versa.

Pixels that are of colors other than current color or the new specified color are changed in an unpredictable but reversible manner. If the same figure is drawn twice, all pixels are restored to their original values.

If the color value is a string, specify a supported named color; see the list of valid HTML named colors in "[cfimage](#)" on page 306. For a hexadecimal value, use the form "`##xxxxxx`" or "`xxxxxx`", where x = 0–9 or A–F; use two number signs or none.

### Example

```
<!--- This example shows how to draw rectangles with alternating colors where they overlap. -
-->
<!--- Use the ImageNew function to create a 300x200-pixel image in RGB format. --->
<cfset myImage = ImageNew("",300,200,"rgb")>
<!--- Turn on antialiasing to improve image quality. --->
<cfset ImageSetAntialiasing(myImage)>
<!--- Set the drawing color to white. --->
<cfset ImageSetDrawingColor(myImage,"white")>
<!--- Draw a white filled rectangle that is the size of the original image. --->
<cfset ImageDrawRect(myImage,0,0,300,200,"yes")>
<!--- Set the XOR drawing mode to white. --->
<cfset ImageXORDrawingMode(myImage,"white")>
<!--- Set the drawing color to red. --->
<cfset ImageSetDrawingColor(myImage,"red")>
<!--- Draw a filled red rectangle. --->
<cfset ImageDrawRect(myImage,50,50,150,100,"yes")>
<!--- Translate the drawing axis to (25,25). --->
<cfset ImageTranslateDrawingAxis(myImage,25,25)>
<!--- Set the drawing color to blue. --->
<cfset ImageSetDrawingColor(myImage,"blue")>
<!--- Draw a blue filled rectangle at the offset location. --->
<cfset ImageDrawRect(myImage,50,50,150,100,"yes")>
<!--- Save the ColdFusion image as a PNG file. --->
<cfset ImageWrite(myImage,"xortest.png")>
<!--- Display the PNG file.--->

```

## Functions in-k

### IncrementValue

#### Description

Adds one to an integer.

#### Returns

The integer part of *number*, incremented by one.

#### Category

[Mathematical functions](#)

#### Function syntax

IncrementValue(*number*)

#### See also

[DecrementValue](#)

### Parameters

Parameter	Description
number	Number to increment

### Example

```
<h3>IncrementValue Example</h3>
<p>Returns the integer part of a number incremented by one.
<p>IncrementValue(0): <cfoutput>#IncrementValue(0)#</cfoutput>
<p>IncrementValue("1"): <cfoutput>#IncrementValue("1")#</cfoutput>
<p>IncrementValue(123.35): <cfoutput>#IncrementValue(123.35)#</cfoutput>
```

## InputBaseN

### Description

Converts *string*, using the base specified by *radix*, to an integer.

### Returns

A number in the range 2-36, as a string.

### Category

[Mathematical functions](#)

### Function syntax

```
InputBaseN(string, radix)
```

### See also

[FormatBaseN](#)

### Parameters

Parameter	Description
string	A string or a variable that contains one. String that represents a number, in the base specified by <i>radix</i> .
radix	Base of the number represented by <i>string</i> , in the range 2—36.

## Example

```
<h3>InputBaseN Example</h3>

<p>FormatBaseN converts a number to a string in the base specified by Radix.
<p>
<cfoutput>
<br>FormatBaseN(10,2): #FormatBaseN(10,2)#
<br>FormatBaseN(1024,16): #FormatBaseN(1024,16)#
<br>FormatBaseN(125,10): #FormatBaseN(125,10)#
<br>FormatBaseN(10.75,2): #FormatBaseN(10.75,2)#
</cfoutput>
<h3>InputBaseN Example</h3>
<p>InputBaseN returns the number obtained by converting a string,
    using the base specified by Radix,.
<cfoutput>
<br>InputBaseN("1010",2): #InputBaseN("1010",2)#
<br>InputBaseN("3ff",16): #InputBaseN("3ff",16)#
<br>InputBaseN("125",10): #InputBaseN("125",10)#
<br>InputBaseN(1010,2): #InputBaseN(1010,2)#
</cfoutput>
```

## Insert

### Description

Inserts a substring in a string after a specified character position. If `position=0`, prefixes the substring to the string.

### Returns

A string.

### Category

[String functions](#)

### Function syntax

```
Insert(substring, string, position)
```

### See also

[RemoveChars](#), [Len](#)

### Parameters

Parameter	Description
substring	A string or a variable that contains one. String to insert.
string	A string or a variable that contains one. String into which to insert substring.
position	Integer or variable; position in string after which to insert substring.

### Example

```
<h3>Insert Example</h3>

<cfif IsDefined("FORM.myString")>
    <!--- if the position is longer than the length of the string, err --->
    <cfif FORM.insertPosition GT Len(MyString)>
        <cfoutput>
            <p>This string only has #Len(MyString)# characters; therefore,
            you cannot insert the substring #FORM.mySubString# at position
            #FORM.insertPosition#.
        </cfoutput>
    </cfif>
<cfelse>
    <cfoutput>
        <p>You inserted the substring #FORM.MySubString# into the string
        #FORM.MyString#, resulting in the following string:
        <br>#Insert(FORM.MySubString, FORM.myString,
        FORM.insertposition)#
    </cfoutput>
</cfif>
```

## Int

### Description

Calculates the closest integer that is smaller than *number*. For example, it returns 3 for `Int (3.3)` and for `Int (3.7)`; it returns -4 for `Int (-3.3)` and for `Int (-3.7)`

### Returns

An integer, as a string.

### Category

[Mathematical functions](#)

### Function syntax

`Int (number)`

### See also

[Ceiling](#), [Fix](#), [Round](#)

### Parameters

Parameter	Description
number	Real number to round down to an integer.

### Example

```
<h3>Int Example</h3>
<p>Int returns the closest integer smaller than a number.

<p>Int (11.7) : <cfoutput>#Int (11.7)#</cfoutput>
<p>Int (-11.7) : <cfoutput>#Int (-11.7)#</cfoutput>
<p>Int (0) : <cfoutput>#Int (0)#</cfoutput>
```

## IsArray

### Description

Determines whether a value is an array.

### Returns

True, if *value* is an array, or a query column object.

### Category

[Array functions](#), [Decision functions](#)

### Function syntax

```
IsArray(value [, number ])
```

### See also

[Array functions](#); Modifying a ColdFusion XML object in the *Developing ColdFusion Applications*

### History

ColdFusion MX:

- Changed behavior: if the *value* parameter contains a reference to a query result column, this function now returns True. For example: `isArray(MyQuery['Column1'])` returns True. (In earlier releases, it returns False.)
- Changed behavior: this function can be used on XML objects.

### Parameters

Parameter	Description
value	Variable or array name
number	Dimension; function tests whether the array has exactly this dimension

### Usage

Use this function to determine whether a value is an array or query column. This function evaluates a Java array object, such as a vector object, as having one dimension.

### Example

```
<h3>IsArray Example</h3>

<!-- Make an array -->
<cfset MyNewArray = ArrayNew(1)>
<!-- set some elements -->
<cfset MyNewArray[1] = "element one">
<cfset MyNewArray[2] = "element two">
<cfset MyNewArray[3] = "element three">
<!-- is it an array? -->
<cfoutput>
    <p>Is this an array? #IsArray(MyNewArray)#
    <p>It has #ArrayLen(MyNewArray)# elements.
    <p>Contents: #ArrayToList(MyNewArray)#
</cfoutput>
```

## IsAuthenticated

### Description

This function is obsolete. Use the newer security tools; see “[Conversion functions](#)” on page 689 and Securing Applications in the *Developing ColdFusion Applications*.

### History

ColdFusion MX: This function is obsolete. It does not work in ColdFusion MX and later ColdFusion releases.

## IsAuthorized

### Description

This function is obsolete. Use the newer security tools; see “[Conversion functions](#)” on page 689 and Securing Applications in the *Developing ColdFusion Applications*.

### History

ColdFusion MX: This function is obsolete. It does not work in ColdFusion MX and later releases.

## IsBinary

### Description

Determines whether a value is stored as binary data.

### Returns

True, if the value is binary; False, otherwise.

### Category

[Decision functions](#)

### Function syntax

`IsBinary(value)`

### See also

[ToBinary](#), [ToBase64](#), [IsNumeric](#), [YesNoFormat](#)

### Parameters

Parameter	Description
value	Number or string

### Example

```
<!--- Create a string of all ASCII characters (32-255)
      and concatenate them together. --->
<cfset charData = "">
<cfloop index="data" from="32" to="255">
    <cfset ch=chr(data)>
    <cfset charData=charData & ch>
</cfloop>

<b>The following string is the concatenation of all characters (32 to 255) from the ASCII
table.</b><br><br>
<cfoutput>#htmleditformat(charData)#</cfoutput>
<br><br>
<!--- Create a Base 64 representation of this string. --->
<cfset data64=toBase64(charData)>
<!--- Convert string to binary. --->
<cfset binaryData=toBinary(data64)>
<!--- Check to see if it really is a binary value. --->
<cfif IsBinary(binaryData)>
The binaryData variable is binary!<br>
</cfif>
<!--- Convert binary data back to Base 64. --->
<cfset another64=toBase64(binaryData)>
<cfif Not IsBinary(another64)>
The another64 variable is NOT binary!<br>
</cfif>
<!--- Compare another64 with data64 to ensure that they are equal. --->
<cfif another64 eq data64>
    Base 64 representation of binary data is identical to the Base 64
    representation of string data.
<cfelse>
    <h3>Conversion error.</h3>
</cfif>
```

## IsBoolean

### Description

Determines whether a value can be converted to Boolean

### Returns

True, if the parameter can be converted to Boolean; False, otherwise.

### Category

[Decision functions](#)

### Function syntax

IsBoolean(*value*)

### See also

[IsNumeric](#), [IsValid](#), [YesNoFormat](#)

### Parameters

Parameter	Description
value	Number or string

### Example

```
<h3>IsBoolean Example</h3>

<cfif IsDefined("FORM.theTestValue")>
    <cfif IsBoolean(FORM.theTestValue)>
        <h3>The expression <cfoutput>#DE(FORM.theTestValue)#</cfoutput> is
        Boolean</h3>
    <cfelse>
        <h3>The expression <cfoutput>#DE(FORM.theTestValue)#</cfoutput> is not Boolean</h3>
    </cfif>
</cfif>

<form action = "isBoolean.cfm">
<p>Enter an expression, and discover whether it can be evaluated to a
    Boolean value.

<input type = "Text" name = "TheTestValue" value = "1">
<input type = "Submit" value = "Is it Boolean?" name = "">
</form>
```

## IsCustomFunction

### Description

Determines whether a name represents a custom function.

### Returns

True, if *name* can be called as a custom function; False, otherwise.

### Category

[Decision functions](#)

### Function syntax

IsCustomFunction(*name*)

### Parameters

Parameter	Description
name	Name of a custom function. Must not be in quotation marks. If not a defined variable or function name, ColdFusion generates an error.

### Usage

The IsCustomFunction function returns True for any function that can be called as a custom function, including functions defined using CFScript function declarations and cffunction tags, and functions that are ColdFusion component methods. For CFC methods, first instantiate the component.

**Note:** To prevent undefined variable exceptions, always precede `IsCustomFunction` with an [IsDefined](#) test, as shown in the example.

### Example

```
<h3>IsCustomFunction Example</h3>
<cfscript>
function realUDF() {
    return 1;
}
</cfscript>
<cfset X = 1>

<!--- Example that fails existence test --->
<cfif IsDefined("Foo") AND IsCustomFunction(Foo)>
    Foo is a UDF.<br>
</cfif>

<!--- Example that passes existence test but fails IsCustomFunction --->
<cfif IsDefined("X") AND IsCustomFunction(X)>
    X is a UDF.<br>
</cfif>

<!--- Example that passes both tests--->
<cfif IsDefined("realUDF") AND IsCustomFunction(realUDF)>
    realUDF is a function.<br>
</cfif>

<!--- Example using a CFC, defined in TestCFC.cfc--->
<cfobject component="TestCFC" name="myTestCFCObject">
<CFIF IsDefined("myTestCFCObject.testFunc") AND
    IsCustomFunction(myTestCFCObject.testFunc)>
    myTestCFCObject.testFunc is a function.
</CFIF>
```

## IsDate

### Description

Determines whether a string or Java object can be converted to a date/time value.

### Returns

True, if *string* can be converted to a date/time value; False, otherwise. ColdFusion converts the Boolean return value to its string equivalent, "Yes" or "No."

### Category

[Date and time functions](#), [Decision functions](#)

### Function syntax

`IsDate(string)`

### See also

[CreateDateTime](#), [IsNumericDate](#), [IsValid](#), [LSDateFormat](#), [LSIsDate](#), [ParseDateTime](#)

### Parameters

Parameter	Description
string	A string or a variable that contains one.

### Usage

This function checks against U.S. date formats only. For other date support, see [LSDateFormat](#).

A date/time object falls in the range 100 AD–9999 AD.

### Example

```
<h3>IsDate Example</h3>
<cfif IsDefined("FORM.theTestValue")>
    <cfif IsDate(FORM.theTestValue)>
        <h3>The string <cfoutput>#DE(FORM.theTestValue) #</cfoutput>
        is a valid date</h3>
    <cfelse>
        <h3>The string <cfoutput>#DE(FORM.theTestValue) #</cfoutput>
        is not a valid date</h3>
    </cfif>
</cfif>
<form action = "isDate.cfm" method="post">
<p>Enter a string, find whether it can be evaluated to a date value.
<p><input type = "Text" name = "TheTestValue" value = "<cfoutput>#Now()#
    </cfoutput>">
<input type = "Submit" value = "Is it a Date?" name = "">
</form>
```

## IsDDX

### Description

Determines whether a DDX file exists and is valid, or if a string contains valid DDX instructions.

### Returns

True, if the value represents a valid DDX file or string. False, otherwise.

### Category

[Decision functions](#)

### Function syntax

```
IsDDX("path or string")
```

### See also

[IsPDFObject](#), [IsPDFFile](#), [cfpdf](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
path or string	Pathname to the DDX file or a string of DDX instructions. The pathname can be absolute or relative to the CFM page that calls it and must be enclosed in quotation marks.

### Usage

This function returns False if the pathname to the DDX file is invalid, the pathname to the DDX file is null, the DDX file does not conform to the schema supported by ColdFusion, or the DDX instructions are invalid.

### Example

```
<cfif IsDDX("TOCformat.ddx")>

    <cfset inputStruct=StructNew()>
    <cfset inputStruct.Doc0="title.pdf">
    <cfset inputStruct.Doc1="Chap1.pdf">
    <cfset inputStruct.Doc2="Chap2.pdf">
    <cfset inputStruct.Doc3="Chap3.pdf">
    <cfset inputStruct.Doc4="Chap4.pdf">

    <cfset outputStruct=StructNew()>
    <cfset outputStruct.Out1="myBook.pdf">

    <cfpdf action="processddx" ddxfile="TOCformat.ddx" inputfiles="#inputStruct#"
outputfiles="#outputStruct#" name="ddxVar">

    <cfoutput>#ddxVar.Out1#</cfoutput>

<cfelse>
    <p>This is not a valid DDX file.</p>
</cfif>
```

## IsDebugMode

### Description

Determines whether debugging output is enabled.

### Returns

True, if debugging mode is set in the ColdFusion Administrator; False if debugging mode is disabled.

### Category

[Decision functions](#)

### Function syntax

```
IsDebugMode()
```

### See also

[cfsetting](#)

### Description

If debugging output is enabled in ColdFusion Administrator and has not been overridden by setting the `cfsetting` tag `showDebugOutput` attribute to No, the `IsDebugMode` function returns Yes; No, otherwise.

### Example

```
<h3>IsDebugMode Example</h3>
<cfif IsDebugMode()>
    <h3>Debugging is set in the ColdFusion Administrator</h3>
<cfelse>
    <h3>Debugging is disabled</h3>
</cfif>
```

## IsDefined

### Description

Evaluates a string value to determine whether the variable named in it exists.

This function is an alternative to the [ParameterExists](#) function, which is deprecated.

### Returns

True, if the variable is found; False, otherwise.

### Category

[Decision functions](#)

### Function syntax

```
IsDefined("variable_name")
```

### See also

[Evaluate](#)

### History

ColdFusion MX: Changed behavior: this function can process only the following constructs:

- A simple variable
- A named variable with dot notation
- A named structure with dot notation (for example: `mystruct.key`)

### Parameters

Parameter	Description
<code>variable_name</code>	String, enclosed in quotation marks. Name of variable to test for.

### Usage

Passing an array entry, such as `myArray[3]` to this function causes an error. To check whether a specific entry exists in an array, use the `ArrayIsDefined` function.

You can test whether a specific key exists in a structure by using this function or the `StructKeyExists` function. For example, when working with scopes that ColdFusion exposes as structures, the `StructKeyExists` function can sometimes replace this function. The following lines are equivalent:

```
if (isDefined("form.myVariable"))  
if (structKeyExists(form, "myVariable"))
```

### Example

```
<cfif IsDefined("form.myString")>  
    <p>The variable form.myString has been defined, so show its contents.  
    This construction allows us to place a form and its resulting action code  
    on the same page and use IsDefined to control the flow of execution.</p>  
    <p>The value of "form.myString" is <b><i>  
    <cfoutput>#form.myString#</cfoutput></i></b>  
<cfelse>  
    <p>During the first time through this template, the variable "form.myString"  
    has not yet been defined, so we do not try to evaluate it.  
</cfif>  
  
<form action="#CGI.Script_Name" method="POST">  
<input type="Text" name="MyString" value="My sample value">  
<input type="Submit" name="">  
</form>
```

## IsImage

### Description

Determines whether a variable returns a ColdFusion image.

### Returns

True, if the value is a ColdFusion image; False, otherwise.

### Category

[Image functions](#)

### Function syntax

`IsImage (name)`

### See also

[cfimage](#), [ImageGetBlob](#), [ImageInfo](#), [ImageNew](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
name	Required. The ColdFusion variable that is checked.

### Usage

Use this function to determine whether a variable returns a ColdFusion image.

### Example

```
<cfif IsImageFile("images/#form.art#")>
<cfset myImage=ImageNew("images/#form.art#")>
...
<cfset IsImage("#myImage#")>
<cfimage action="writeToBrowser" source="#myImage#">
</cfif>
```

## IsImageFile

### Description

Verifies whether an image file is valid.

### Returns

True, if the value is a valid image file; False, otherwise.

### Category

[Image functions](#)

### Function syntax

```
IsImageFile("path")
```

### See also

[cfimage](#), [ImageGetBlob](#), [ImageInfo](#), [ImageNew](#), [IsImage](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
path	Required. The pathname of the on-disk or in-memory file, or URL, to be checked. The pathname can be absolute or relative to the CFM page and must be enclosed in quotation marks.

### Usage

Use this function to determine whether an image file is valid. This function returns a False value if the image file format is not supported by the server where ColdFusion is deployed, or if the pathname to the image file is null or invalid.

For a list of standard image file formats supported by ColdFusion, see the supported image file formats provided in [“cfimage”](#) on page 306. To determine which image file formats are supported on the server where ColdFusion is deployed, use the [“GetReadableImageFormats”](#) on page 908 and [“GetWriteableImageFormats”](#) on page 922.

### Example

```
<!--- Use the IsImageFile function to determine whether an image retrieved from the artwork
table in the cfartgallery database is a valid image file. --->
<cfif IsImageFile("images/#artwork.largeImage#")>
    <cfset myImage=ImageNew("images/#artwork.largeImage#")>
    <cfset ImageResize(myImage,50,"")>
    <cfimage action="writeToBrowser" source="#myImage#">
<cfelse>
    <p>I'm sorry, there is no image associated with the title you selected. Please click the
Back button and try again.</p>
</p>
</cfif>
```

## IsInstanceOf

### Description

Determines whether an object is an instance of a ColdFusion interface or component, or of a Java class.

### Returns

Returns true if any of the following is true:

- The object specified by the first parameter is an instance of the interface or component specified by the second parameter.
- The Java object specified by the first parameter was created by using the `cfobject` tag or `CreateObject` method and is an instance of the Java class specified by the second parameter.
- The object specified by the first parameter is an instance of a component that extends the component specified in the second parameter.
- The object specified by the first parameter is an instance of a component that extends a component that implements the interface specified in the second parameter.
- The Java object specified by the first parameter was created by using the `cfobject` tag or `CreateObject` method and is an instance of a Java class that extends the class specified by the second parameter.

Returns false otherwise.

**Note:** The `isInstanceOf` function returns *false* if the CFC specified by the `object` parameter does not define any functions.

### Category

[Decision functions](#), [Extensibility functions](#)

### Function syntax

`IsInstanceOf(object, typeName)`

### See also

[cfcomponent](#), [cfinterface](#), [cfobject](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
object	The CFC instance or Java object that you are testing
typeName	The name of the interface, component, or Java class of which the object might be an instance

### Usage

For Java objects, the comparison is valid only if you created the object specified in the first parameter by using a `cfoobject` tag or `CreateObject` method.

### Example

```
<!--- to use this example, create an I1.cfc interface, as follows: --->

<cfinterface>
    <cffunction name = "method1">
    </cffunction>
</cfinterface>

<!--- Create a C1.cfc component that implements the I1.cfc interface, as
follows: --->
<cfcomponent implements=I1>
    <cffunction name = "method1">
        <cfoutput>C1.method1 called</cfoutput>
    </cffunction>
</cfcomponent>

<!--- Create a test.cfm file as follows and display the page. --->
<!--- Create an instance of the C1 CFC, which implements the I1 interface.
--->
<cfset clobj = CreateObject("Component", "C1")>
<!--- Create a Java object --->
<cfset javaObj = createobject("java", "java.lang.System")>

<cfoutput>
    IsInstanceOf(clobj,"C1") = #IsInstanceOf(clobj,"C1")#
    (Expected = YES)<br><br>
    IsInstanceOf(clobj,"I1") = #IsInstanceOf(clobj,"I1")#
    (Expected = YES)<br><br>
    IsInstanceOf(clobj,"C2") = #IsInstanceOf(clobj,"C2")#
    (Expected = NO)<br><br>
    IsInstanceOf(javaObj,"java.lang.System") =
        #IsInstanceOf(javaObj,"java.lang.System")# (Expected = YES)<br><br>
    IsInstanceOf(javaObj,"java.lang.String") =
        #IsInstanceOf(javaObj,"java.lang.String")# (Expected = NO)<br><br>
</cfoutput>
```

## IsIPv6

### Description

Determines whether the host supports IPv6.

### Returns

True if the host supports IPv6.

### Category

[Decision functions](#)

### Syntax

```
IsIPv6 ()  
IsIPv6 (hostname)
```

### See also

[GetLocalHostIP](#), [IsLocalHost](#)

### History

ColdFusion 9: Added this function

### Usage

When you use this function to verify if the remote host supports IPv6, pass the hostname and not the IP address.

This function applies only if the server that places the request is IPv6-enabled.

### Example

The following example checks whether the localhost supports IPv6:

```
<cfset hostname="localhost">  
<cfset test=IsIPv6 () >  
<cfif test>  
<cfoutput>localhost supports IPv6</cfoutput>  
</cfif>
```

The following example checks whether the remote host supports IPv6:

```
<cfset hostname="remote hostname">  
<cfset test=IsIPv6 (hostname) >  
<cfif test>  
<cfoutput>#hostname# supports IPv6</cfoutput>  
</cfif>
```

## IsJSON

### Description

Evaluates whether a string is in valid JSON (JavaScript Object Notation) data interchange format.

### Returns

True if the parameter is a valid JSON value.

False if the parameter is not a valid JSON data representation.

### Category

[Conversion functions](#)

## Syntax

IsJSON (var)

## See also

[DeserializeJSON](#), [SerializeJSON](#), [cfajaxproxy](#), Using Ajax Data and Development Features in the *Developing ColdFusion Applications*, <http://www.json.org>

## History

ColdFusion 8: Added function

## Parameters

Parameter	Description
var	A string or variable that represents one.

## Example

This example checks whether the data feed that is generated by the example for the [SerializeJSON](#) function contains valid JSON data.

The feed is in the form of a JavaScript function call where the parameter is a JSON string that contains the feed data. The example does the following operations:

- 1 Uses a `cfhttp` tag to get the feed (in the `cfhttp.fileContent` variable).
- 2 Strips the function call wrapper from the text.
- 3 Uses the `IsJSON` function to check whether the result of the previous step is a valid JSON format string.
- 4 Displays a message that indicates whether the text is valid JSON data, followed by the feed text string.

To run this example, put this file and the example for the [SerializeJSON](#) function in an appropriate location under your ColdFusion web root, replace the URL with the correct URL for the serialization example, and run this page.

```
<!--- Get the JSON Feed --->
<cfhttp url="http://localhost:8500/My_Stuff/Ajax/Books/CreateJSON_NEW.cfm">

<!--- JSON data is often distributed as a JavaScript function.
      The following REReplace functions strip the function wrapper. --->
<cfset theData=REReplace(cfhttp.FileContent,
    "^\\s*[[[:word:]]*\\s*\\(\\s*", "")>
<cfset theData=REReplace(theData, "\\s*\\)\\s*$", "")>

<!--- Test to make sure you have JSON data. --->
<cfif isJSON(theData)>
    <h3>The URL you requested provides valid JSON</h3>
<cfelse>
    <h3>The URL you requested does not provide valid JSON</h3>
</cfif>
<!--- Display the data. --->
<cfoutput>#theData#</cfoutput>
```

For a more complex example that then converts the JSON data, see [DeserializeJSON](#).

## IsK2ServerABroker

### Description

This function is deprecated.

### Returns

True, if K2Broker is in configured with ColdFusion; False, otherwise.

### Category

[Decision functions](#), [Full-text search functions](#), [Query functions](#)

### Function syntax

```
IsK2ServerABroker()
```

### See also

[GetK2ServerDocCountLimit](#), [IsK2ServerDocCountExceeded](#), [IsK2ServerOnline](#)

### History

ColdFusion MX 6.1: Deprecated this function. It might not work, and it might cause an error, in later releases.

ColdFusion MX: Added this function.

### Example

```
<cfoutput>IsK2ServerABroker =  
    $*#IsK2ServerABroker()*#$</cfoutput>
```

## IsK2ServerDocCountExceeded

### Description

This function is deprecated.

### Returns

True, if the document count limit is exceeded; False, otherwise.

### Category

[Decision functions](#), [Full-text search functions](#), [Query functions](#)

### Function syntax

```
IsK2ServerDocCountExceeded()
```

### See also

[GetK2ServerDocCountLimit](#), [IsK2ServerABroker](#)

### History

ColdFusion MX 6.1: Deprecated this function. It might not work, and it might cause an error, in later releases.

ColdFusion 5: Added this function.

### Example

```
<cfoutput>IsK2ServerDocCountExceeded =  
    $*#IsK2ServerDocCountExceeded()*$</cfoutput>
```

## IsK2ServerOnline

### Description

This function is deprecated because the K2Server is always running when ColdFusion is running.

### Returns

True, if the K2Server is available to perform a search; False, otherwise.

### Category

[Decision functions](#), [Full-text search functions](#), [Query functions](#)

### Function syntax

```
IsK2ServerOnline()
```

### See also

[IsK2ServerABroker](#)

### History

ColdFusion MX 6.1: Deprecated this function. It might not work, and it might cause an error, in later releases.

ColdFusion MX: Added this function.

### Example

```
<cfoutput>IsK2ServerOnline =  
    $*#IsK2ServerOnline()*$</cfoutput>
```

## IsLeapYear

### Description

Determines whether a year is a leap year.

### Returns

True, if *year* is a leap year; False, otherwise.

### Category

[Date and time functions](#), [Decision functions](#)

### Function syntax

```
IsLeapYear(year)
```

### See also

[DaysInYear](#)

### Parameters

Parameter	Description
year	Number representing a year

### Example

```
<h3>IsLeapYear Example</h3>

<cfif IsDefined("FORM.theTestValue")>
    <cfif IsLeapYear(FORM.theTestValue)>
        <h3>The year value <cfoutput>#DE(FORM.theTestValue)#</cfoutput> is a Leap Year</h3>
    <cfelse>
        <h3>The year value <cfoutput>#DE(FORM.theTestValue)#</cfoutput> is not a Leap
Year</h3>
    </cfif>
</cfif>

<form action = "isLeapYear.cfm" method="POST">
<p>Enter a year value, and find out whether it is a Leap Year.
<p><input type = "Text" name = "TheTestValue" value = "
    <cfoutput>#Year(Now())#</cfoutput>">
<input type = "Submit" value = "Is it a Leap Year?" name = "">
</form>
```

## IsLocalHost

### Description

Determines whether the specified IP address is the localhost. This supports both IPv4 and IPv6 addresses.

### Returns

True, if the IP address is the localhost; False, otherwise.

### Category

[Decision functions](#)

### Function syntax

```
IsLocalHost(ipaddress)
```

### See also

[GetLocalHostIP](#)

### History

ColdFusion MX 7.01: Added this function.

### Parameters

Parameter	Description
ipaddress	Valid IP address.

### Example

```
<h3>IsLocalHost Example</h3>

<cfif IsDefined("FORM.theTestIPAddress")>
    <cfif IsLocalHost(FORM.theTestIPAddress)>
        <h3>The IP address <cfoutput>#FORM.theTestIPAddress)</cfoutput> is the localhost</h3>
    <cfelse>
        <h3>The IP address <cfoutput>#DE(FORM.theTestIPAddress)</cfoutput> is not the
localhost.</h3>
    </cfif>
</cfif>

<form action = "isIPAddressLocalHost.cfm">
<p>Enter an IP address to find out if it is the localhost.
<p><input type = "Text" name = "TheTestIPAddress" value = "127.0.0.1"
<input type = "Submit" value = "Is this the localhost?" name = "">
</form>
```

## IsNull

### Description

Used to check if the given object or expression evaluates to null.

### Returns

True, if the given object is null or if the given expression evaluates to null; False, otherwise.

### Category

[Decision functions](#)

### Function syntax

`IsNull(obj)`

### Parameters

Parameter	Description
<code>obj</code>	Object for which you perform the null check.

## IsNumeric

### Description

Determines whether a string can be converted to a numeric value. Supports numbers in U.S. number format. For other number support, use [LSIsNumeric](#).

### Returns

True, if *string* can be converted to a number; False, otherwise.

### Category

[Decision functions](#)

### Function syntax

`IsNumeric(string)`

### See also

[IsBinary](#), [IsValid](#)

### Parameters

Parameter	Description
<code>string</code>	A string or a variable that contains one.

### Example

```
<h3>IsNumeric Example</h3>
<cfif IsDefined("FORM.theTestValue")>
    <cfif IsNumeric(FORM.theTestValue)>
        <h3>The string <cfoutput>#DE(FORM.theTestValue)#</cfoutput> can be
        converted to a number</h3>
    <cfelse>
        <h3>The string <cfoutput>#DE(FORM.theTestValue)#</cfoutput> cannot be
        converted to a number</h3>
    </cfif>
</cfif>

<form action = "isNumeric.cfm">
<p>Enter a string, and find out whether it can be evaluated to a numeric value.

<p><input type = "Text" name = "TheTestValue" value = "123">
<input type = "Submit" value = "Is it a Number?" name = "">
</form>
```

## IsNumericDate

### Description

Evaluates whether a real number is a valid representation of a date (date/time object).

### Returns

True, if the parameter represents a valid date/time object; False, otherwise.

### Category

[Date and time functions](#), [Decision functions](#)

### Function syntax

`IsNumericDate(number)`

### See also

[IsDate](#), [ParseDateTime](#)

### Parameters

Parameter	Description
number	A real number

### Usage

ColdFusion, by default, evaluates any input parameter and attempts to convert it to a real number before it passes the parameter to the `IsNumericDate` function. As a result, parameter values such as 12/12/03 and {ts '2003-01-14 10:04:13'} return True, because ColdFusion converts valid date string formats to date/time objects, which are real numbers.

### Example

```
<h3>IsNumericDate Example</h3>
<cfif IsDefined("form.theTestValue")>
<!--- test if the value represents a number or a pre-formatted Date value --->

    <cfif IsNumeric(form.theTestValue) or IsDate(form.theTestValue)>
<!--- if this value is a numericDate value, then pass --->
        <cfif IsNumericDate(form.theTestValue)>
            <h3>The string <cfoutput>#DE(form.theTestValue)</cfoutput> can be converted to a
valid numeric date</h3>
        <cfelse>
            <h3>The string <cfoutput>#DE(form.theTestValue)</cfoutput> can not be converted
to a valid numeric date</h3>
        </cfif>
    <cfelse>
        <h3>The string <cfoutput>#DE(form.theTestValue)</cfoutput> is not a valid numeric
date</h3>
    </cfif>

</cfif>

<form action="#cgi.script_name#" method="POST">
<p>Enter a value, and discover if it can be evaluated to a date value.
<p>
<input type="Text" name="TheTestValue" value="<CFOUTPUT>#Now()</CFOUTPUT>">
<input type="Submit" value="Is it a Date?" name="">
</form>
```

## IsObject

### Description

Determines whether a value is an object.

### Returns

True, if the value represents a ColdFusion object. False if the value is any other type of data, such as an integer, string, date, or struct.

### Category

[Decision functions](#)

## Function syntax

`IsObject (value)`

## See also

[IsDate](#), [IsImage](#), [IsNumeric](#), [IsNumericDate](#), [IsQuery](#), [IsSimpleValue](#), [IsStruct](#), [IsWDDX](#), [IsXmlDoc](#), [IsXmlElem](#), [IsXmlRoot](#)

## History

ColdFusion MX: Added this function.

## Parameters

Parameter	Description
value	A value, typically the name of a variable.

## Usage

This function returns False for query and XML objects.

## Example

```
<!--- to use this example, create a color.cfc component as follows: --->
<!---
<cfcomponent>
<cffunction name="myFunction" access="public" returntype="string">
<!--- Create a structure object --->
    <cfset myColor = "Blue">
    <cfreturn myColor>
</cffunction>
</cfcomponent>
--->

<!--- Create an instance of the color.cfc component --->
<cfobject name="getColor" component="color">

<cfif IsObject(getColor)>
    <!--- Invoke the myFunction method --->
    <cfinvoke
        component="#getColor#"
        method="myFunction"
        returnVariable="myColor">
    </cfinvoke>

    <cfif IsDefined("myColor")>
        <!--- Output the returned variable --->
        The value of myColor = <cfoutput>#myColor#</cfoutput><p>
    </cfif>
</cfif>
```

## IsPDFFile

### Description

Verifies whether a PDF file is valid.

### Returns

True, if the value returns a valid PDF file. False, otherwise.

### Category

[Decision functions](#)

### Function syntax

```
IsPDFFile("path")
```

### See also

[IsDate](#), [IsImage](#), [IsImageFile](#), [IsNumeric](#), [IsNumericDate](#), [IsObject](#), [IsPDFObject](#), [IsQuery](#), [IsSimpleValue](#), [IsStruct](#), [IsWDDX](#), [IsXmlDoc](#), [IsXmlElem](#), [IsXmlRoot](#), [cfpdf](#), [cfpdfform](#), [cfprint](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
path	Pathname to an on-disk or in-memory PDF file. The pathname can be absolute or relative to the CFM page and must be enclosed in quotation marks.

### Usage

This function returns False if the value is not a valid pathname to a PDF file, the pathname is null, the PDF file is not valid, or the PDF file is corrupted.

### Example

```
<!--- The following code shows the action page for a form where a user chooses a PDF document
to print. --->

<cfif IsPDFFile("#form.printMe#")>
    <cfprint type="PDF" source="#myPDF#">
<cfelse>
    <p>This is not a valid PDF file or the PDF document you have chosen is not available.</p>
</cfif>
```

## IsPDFObject

### Description

Determines whether a value is a PDF object.

### Returns

True, if the value represents a PDF object. False if the value is any other type of data, such as an integer, string, date, or structure.

### Category

[Decision functions](#)

### Function syntax

`IsPDFObject (value)`

### See also

[IsDate](#), [IsImage](#), [IsNumeric](#), [IsNumericDate](#), [IsObject](#), [IsPDFFile](#), [IsQuery](#), [IsSimpleValue](#), [IsStruct](#), [IsWDDX](#), [IsXmlDoc](#), [IsXmlElem](#), [IsXmlRoot](#), [cfpdf](#), [cfpdfform](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
value	A value, typically the PDF object stored as a variable name.

### Usage

This function returns False for query and XML objects.

### Example

```
<cfpdf source="c:\forms\'noteform.pdf" action="read" name="myPDFform"/>
<cfif IsPDFObject(myPDFform)>
    <cfpdf source=#myPDFform# action="write" destination = "c:\forms\newPDFForm.pdf">
<cfelse>
    <p>This is not a PDF.</p>
</cfif>
```

## IsProtected

### Description

This function is obsolete. Use the newer security tools; see “[Conversion functions](#)” on page 689 and *Securing Applications in the Developing ColdFusion Applications*

### History

ColdFusion MX: This function is obsolete. It does not work in ColdFusion MX and later releases.

## IsQuery

### Description

Determines whether *value* is a query.

### Returns

True, if *value* is a query.

### Category

[Decision functions](#), [Query functions](#)

### Function syntax

`IsQuery(value)`

### See also

[QueryAddRow](#)

### Parameters

Parameter	Description
value	Query variable

### Example

```
<!--- Shows an example of IsQuery and IsSimpleValue --->
<h3>IsQuery Example</h3>
<!--- define a variable called "GetEmployees" --->
<CFPARAM name = "GetEmployees" DEFAULT = "#Now()#">

<p>Before the query is run, the value of GetEmployees is
  <cfoutput>#GetEmployees#</cfoutput>

<cfif IsSimpleValue(GetEmployees)>
  <p>GetEmployees is currently a simple value
</cfif>
<!--- make a query on the snippets datasource --->
<cfquery name = "GetEmployees" datasource = "cfdocexamples">
SELECT *
FROM employees
</cfquery>

<p>After the query is run, GetEmployees contains a number of rows
  that look like this (display limited to three rows):
<cfoutput QUERY = "GetEmployees" MaxRows = "3">
<pre>#Emp_ID# #FirstName# #LastName#</pre>
</cfoutput>
<cfif IsQuery(GetEmployees)>
  GetEmployees is no longer a simple value, but the name of a query
</cfif>
```

## IsSimpleValue

### Description

Determines the type of a value.

### Returns

True, if value is a string, number, Boolean, or date/time value; False, otherwise.

### Category

[Decision functions](#)

### Function syntax

`IsSimpleValue(value)`

## See also

[IsValid](#)

## Parameters

Parameter	Description
value	Variable or expression

## Example

```
<!--- Shows an example of IsQuery and IsSimpleValue --->
<h3>IsSimpleValue Example</h3>
<!--- define a variable called "GetEmployees" --->
<cfparam name = "GetEmployees" default = "#Now()#">

<p>Before the query is run, the value of GetEmployees is
  <cfoutput>#GetEmployees#</cfoutput>

<cfif IsSimpleValue(GetEmployees)>
  <p>GetEmployees is currently a simple value
</cfif>
<!--- make a query on the snippets datasource --->
<cfquery name = "GetEmployees" datasource = "cfdocexamples">
  SELECT *
  FROM employees
</cfquery>
<p>After the query is run, GetEmployees contains a number of rows
  that look like this (display limited to three rows):
<cfoutput QUERY = "GetEmployees" MaxRows = "3">
<pre>#Emp_ID# #FirstName# #LastName#</pre>
</cfoutput>

<cfif IsQuery(GetEmployees)>
  GetEmployees is no longer a simple value, but the name of a query
</cfif>
```

## IsSOAPRequest

### Description

Determines whether a CFC is being called as a web service.

### Returns

True if CFC is being called as a web service; False, otherwise.

### Category

[XML functions](#)

### History

ColdFusion MX 7: Added this function.

### Function syntax

IsSOAPRequest ()

**See also**

[AddSOAPRequestHeader](#), [AddSOAPResponseHeader](#), [GetSOAPRequest](#), [GetSOAPRequestHeader](#), [GetSOAPResponse](#), [GetSOAPResponseHeader](#); Basic web service concepts in the *Developing ColdFusion Applications*

**Usage**

Call this function within a CFC to determine if it is running as a web service.

**Example**

This example creates a CFC web service that illustrates the operation of the `IsSOAPRequest` function and also provides a web service that illustrates the operation of other ColdFusion SOAP functions.

Save the following code as `headerservice.cfc` in a folder called `soapheaders` under your web root. Test its operation, and specifically the operation of the `IsSOAPRequest` function, by executing the examples that invoke this web service. For example, see the example for [AddSOAPRequestHeader](#).

```
<h3>IsSOAPRequest Example</h3>
<cfcomponent displayName="tester" hint="Test for SOAP headers">

    <cffunction name="echo_me"
        access="remote"
        output="false"
        returntype="string"
        displayName="Echo Test" hint="Header test">

    <cfargument name="in_here" required="true" type="string">

    <cfset isSOAP = isSOAPRequest()>
    <cfif isSOAP>

        <!--- Get the first header as a string and as XML --->
        <cfset username = getSOAPRequestHeader("http://mynamespace/", "username")>
        <cfset return = "The service saw username: " & username>

```

## IsSpreadsheetFile

### Description

Returns a value that determines if the input is a spreadsheet file.

### Returns

A Boolean value. True if the input is a spreadsheet file; False if it is a spreadsheet object.

### Category

Microsoft Office Integration

### Function syntax

```
IsSpreadsheetFile(spreadsheetfile)
```

### See also

### History

ColdFusion 9: Added.

### Parameters

Parameter	Description
spreadsheefile	Specifies the spreadsheet file.

### Example

```
<cfset filepath = "C:/Documents/SingleSheet.xls">
<cfoutput># isSpreadSheetObject(filepath)# NOT an Object<br></cfoutput>
<cfoutput># isSpreadSheetFile(filepath)# a File<br></cfoutput>
```

## IsSpreadsheetObject

### Description

Returns a value that determines if the input is a spreadsheet object.

### Returns

A Boolean value. True if the input is a spreadsheet object; False if it is a spreadsheet file.

### Category

Microsoft Office Integration

### Function syntax

```
IsSpreadsheetObject (spreadsheetobject)
```

### See also

[IsSpreadsheetFile](#)

### History

ColdFusion 9: Added.

### Parameters

Parameter	Description
spreadsheeobject	Specifies the spreadsheet object.

### Example

```
<cfspreadsheet action="read" src="C:/documents/SingleSheet.xls" name="SpreadsheetObj" >
<cfoutput># isSpreadSheetObject(SpreadsheetObj)# an Object<br></cfoutput>
<cfoutput># isSpreadSheetFile(SpreadsheetObj)# NOT a File<br></cfoutput>
```

## IsStruct

### Description

Determines whether a variable is a structure.

### Returns

True, if *variable* is a ColdFusion structure or is a Java object that implements the java.lang.Map interface. The return value is False if the object in *variable* is a user-defined function (UDF).

### Category

[Decision functions](#), [Structure functions](#)

### Function syntax

```
IsStruct (variable)
```

### See also

[Structure functions](#); Modifying a ColdFusion XML object in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

### Parameters

Parameter	Description
variable	Variable name

### Example

```
<!--- This view-only example shows the use of IsStruct. --->
<p>This file is similar to addemployee.cfm, which is called by StructNew,
    StructClear, and StructDelete. It is an example of a custom tag used to
    add employees. Employee information is passed through the employee
    structure (the EMPINFO attribute). In UNIX, you must also add the Emp_ID.
<!---
<cfswitch expression = "#ThisTag.ExecutionMode#">
<cfcase value = "start">
    <cfif IsStruct(attributes.EMPINFO)>
        <cfoutput>Error. Invalid data.</cfoutput>
        <cfexit method = "ExitTag">
    <cfelse>
        <cfquery name = "AddEmployee" datasource = "cfdocexamples">
            INSERT INTO Employees
            (FirstName, LastName, Email, Phone, Department)
            VALUES
        <cfoutput>
            (
                '#StructFind(attributes.EMPINFO, "firstname")#' ,
                '#StructFind(attributes.EMPINFO, "lastname")#' ,
                '#StructFind(attributes.EMPINFO, "email")#' ,
                '#StructFind(attributes.EMPINFO, "phone")#' ,
                '#StructFind(attributes.EMPINFO, "department")#'
            )
        </cfoutput>
        </cfquery>
    </cfif>
    <cfoutput><hr>Employee Add Complete</cfoutput>
</cfcase>
</cfswitch> --->
```

## IsUserInAnyRole

### Description

Determines whether an authenticated user belongs to any role in a list of roles.

### Returns

True, if the authenticated user, belongs to any Role in the list; False, otherwise.

### Category

[Security functions](#), [Decision functions](#)

### Function syntax

```
IsUserInAnyRole(role_list)
```

### See also

[cflogin](#), [cfloginuser](#), [cflogout](#), [GetAuthUser](#), [GetUserRoles](#), [IsUserInRole](#), [IsUserLoggedIn](#), [Securing Applications in the \*Developing ColdFusion Applications\*](#)

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
role_list	A comma-delimited list of one or more roles to be tested.

### Example

```
<cfif IsUserInAnyRole(allRoles) >
    <cfoutput>Authenticated user is in these roles: #GetUserRoles()#</cfoutput>
<cfelseif >
    <cfoutput>Authenticated user is in no roles</cfoutput>
</cfif>
```

## IsUserInRole

### Description

Determines whether an authenticated user belongs to the specified Role.

### Returns

True, if the authenticated user, belongs to the specified Role; False, otherwise.

### Category

[Security functions](#), [Decision functions](#)

### Function syntax

```
IsUserInRole("role_name")
```

### See also

[cflogin](#), [cfloginuser](#), [GetAuthUser](#), [GetUserRoles](#), [IsUserInAnyRole](#), [IsUserLoggedIn](#), [Securing Applications in the \*Developing ColdFusion Applications\*](#)

### History

ColdFusion MX: Added this function.

### Parameters

Parameter	Description
role_name	Name of a security role

### Usage

Role names are not case-sensitive.

To check if a user is in multiple roles, specify them in a comma-delimited list, such as "Admin,HR". Lists with multiple roles cannot contain spaces as separators; for example, do not use "Admin, HR".

### Example

```
<cfif IsUserInRole("Admin") >
    <cfoutput>Authenticated user is an administrator</cfoutput>
<cfelse IsUserInRole("User") >
    <cfoutput>Authenticated user is a user</cfoutput>
</cfif>
```

## IsUserLoggedIn

### Description

Determines whether a user is logged in.

### Returns

True, if the user, is logged in; False, otherwise.

### Category

[Security functions](#), [Decision functions](#)

### Function syntax

```
IsUserLoggedIn()
```

### See also

[cflogin](#), [cfloginuser](#), [GetAuthUser](#), [GetUserRoles](#), [IsUserInAnyRole](#), [IsUserInRole](#), [Securing Applications in the Developing ColdFusion Applications](#)

### History

ColdFusion 8: Added this function.

### Example

```
<cfif IsUserLoggedIn() >
    <cfinclude template="welcome.cfm">
<cfelse>
    <cfinclude template="loginform.cfm">
    <cfabort>
</cfif>
```

## IsValid

### Description

Tests whether a value meets a validation or data type rule.

### Returns

True, if the value conforms to the rule; False, otherwise.

### Category

[Decision functions](#)

### Function syntax

```
IsValid(type, value)  
isValid("range", value, min, max)  
isValid("regex" or "regular_expression", value, pattern)
```

### See also

[cfparam](#), [cfform](#), [IsBoolean](#), [IsDate](#), [IsNumeric](#), [IsSimpleValue](#); Validating data with the IsValid function and the cfparam tag in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added the component value for to the type attribute.

ColdFusion MX 7: Added this function.

## Parameters

Parameter	Description
type	<p>The valid format for the data; one of the following. For detailed information on validation algorithms, see <i>Validating form data using hidden fields</i> in the <i>Developing ColdFusion Applications</i>.</p> <ul style="list-style-type: none"> <li>any: any simple value. Returns false for complex values, such as query objects;; equivalent to the <a href="#">IsSimpleValue</a> function.</li> <li>array: an ColdFusion array; equivalent to the <a href="#">IsArray</a> function.</li> <li>binary: a binary value;; equivalent to the <a href="#">IsBinary</a> function.</li> <li>boolean: a Boolean value: yes, no, true, false, or a number; equivalent to the <a href="#">IsBoolean</a> function.</li> <li>component: a ColdFusion component (CFC).</li> <li>creditcard: a 13-16 digit number conforming to the mod10 algorithm.</li> <li>date or time: any date-time value, including dates or times; equivalent to the <a href="#">IsDate</a> function.</li> <li>email: a valid email address.</li> <li>eurodate: any date-time value, including US date formats and time values,</li> <li>float or numeric: a numeric value; equivalent to the <a href="#">IsNumeric</a> function.</li> <li>guid: a Universally Unique Identifier of the form "XXXXXXXX-XXXX-XXXX-XXXX-XXXXXXXXXXXX" where 'x' is a hexadecimal number.</li> <li>integer: an integer.</li> <li>query: a query object; equivalent to the <a href="#">IsQuery</a> function.</li> <li>range: a numeric range, specified by the <code>min</code> and <code>max</code> attributes.</li> <li>regex or regular_expression: matches input against <code>pattern</code> attribute.</li> <li>ssn or social_security_number: A U.S. social security number.</li> <li>string: a string value, including single characters and numbers</li> <li>struct: a structure; equivalent to the <a href="#">IsStruct</a> function.</li> <li>telephone: a standard US telephone number.</li> <li>URL: an http, https, ftp, file, mailto, or news URL,</li> <li>UUID: a ColdFusion Universally Unique Identifier, formatted 'XXXXXXXX-XXXX-XXXX-XXXXXXXXXXXX', where 'x' is a hexadecimal number. See <a href="#">CreateUUID</a>.</li> <li>USdate: a U.S. date of the format mm/dd/yy, with 1-2 digit days and months, 1-4 digit years.</li> <li>variableName: a string formatted according to ColdFusion variable naming conventions.</li> <li>zipcode: U.S., 5- or 9-digit format ZIP codes.</li> <li>maxlength: Specifies a maximum number of characters</li> </ul>
value	The value to test
min	The minimum valid value; used only for <code>range</code> validation
max	The maximum valid value; used only for <code>range</code> validation
pattern	A JavaScript regular expression that the parameter must match; used only for <code>regex</code> or <code>regular_expression</code> validation.

### Usage

The `isValid` function lets you assure that validation is performed on the server. You can use the `cfparam` tag to perform equivalent validation.

### Example

The following example checks whether a user has submitted a numeric ID and a valid e-mail address and phone number. If any of the submitted values does not meet the validation test, it displays an error message.

```
<cfif isDefined("form.saveSubmit")>
    <cfif isValid("integer", form.UserID) and isValid("email", form.emailAddr)
        and isValid("telephone", form.phoneNo)>
        <cfoutput>
            <!-- Application code to update the database goes here -->
            <h3>The email address and phone number for user #Form.UserID#
                have been added</h3>
        </cfoutput>
    <cfelse>
        <H3>You must supply a valid User ID, phone number, and email address.</H2>
    </cfif>
</cfif>

<cfform action="#CGI.SCRIPT_NAME#">
    User ID:<cfinput type="Text" name="UserID"><br>
    Phone: <cfinput type="Text" name="phoneNo"><br>
    email: <cfinput type="Text" name="emailAddr"><br>
    <cfinput type="submit" name="saveSubmit" value="Save Data"><br>
</cfform>
```

## IsWDDX

### Description

Determines whether a value is a well-formed WDDX packet.

### Returns

True, if the value is a well-formed WDDX packet; False, otherwise.

### Category

[Decision functions](#), [XML functions](#)

### Syntax

```
IsWDDX (value)
```

### See also

Using WDDX in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed behavior: if the `value` parameter is not a WDDX packet, ColdFusion returns False. (In earlier releases, ColdFusion threw an error.)

### Parameters

Parameter	Description
value	A WDDX packet

### Usage

This function processes a WDDX packet with a validating XML parser, which uses the WDDX Document Type Definition (DTD).

To prevent CFWDDX deserialization errors, you can use this function to validate WDDX packets from unknown sources.

### Example

```
<cfset packet="
  <wddxPacket version='1.0'>
    <header></header>
    <data>
      <struct>
        <var name='ARRAY'>
          <array length='3'>
            <string>one</string>
            <string>two</string>
          </array>
        </var>
        <var name='NUMBER'>
          <string>5</string>
        </var>
        <var name='STRING'>
          <string>hello</string>
        </var>
      </struct>
    </data>
  </wddxPacket>"
>
<hr>
<xmp>
<cfoutput>#packet#
</xmp>
IsWDDX() returns #IsWDDX(packet)#<br>
</cfoutput>
```

## IsXML

### Description

Determines whether a string is well-formed XML text.

### Returns

True, if the function parameter is a string that contains well-formed XML text; False, otherwise.

### Category

[Decision functions](#), [XML functions](#)

### Function syntax

`IsXML (value)`

### See also

[IsXmlAttribute](#), [IsXmlDoc](#), [IsXmlElem](#), [IsXmlNode](#), [IsXmlRoot](#), [XmlParse](#), [XmlValidate](#); Using XML and WDDX in the *Developing ColdFusion Applications*

### History

ColdFusion MX 7: Added this function.

### Parameters

Parameter	Description
value	A string containing the XML document text

### Usage

This function determines whether text is well-formed XML, that is, it conforms to all XML syntax and structuring rules. The string does not have to be a complete XML document. The function does not validate against a Document Type Definition (DTD) or XML Schema.

### Example

The following example creates two strings, and tests whether they are well-formed XML text:

```
<!--- A well formed XML string --->
<cfset xmlString1='<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
  </items>
</order>'
>

<!--- An invalid XML string, missing the </item> close tag --->
<cfset xmlString2='<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </items>
  </order>'
>

<!--- Test the strings to see if they are well formed XML --->
<cfoutput>
xmlString1 contains the following text:<br><br>
#HTMLCodeFormat(xmlString1)#
Is it well formed XML text? #IsXML(xmlString1)#<br><br>
<hr>
xmlString2 contains the following text:<br><br>
#HTMLCodeFormat(xmlString2)#
Is it well formed XML text? #IsXML(xmlString2)#
</cfoutput>
```

## IsXmlAttribute

### Description

Determines whether the function parameter is an XML Document Object Model (DOM) attribute node.

### Returns

True, if the function argument is an XML attribute node; False, otherwise.

### Category

[Decision functions](#), [XML functions](#)

### Function syntax

IsXmlAttribute(*value*)

### See also

[IsXML](#), [IsXmlDoc](#), [IsXmlElem](#), [IsXmlNode](#), [IsXmlRoot](#), [XmlGetNodeType](#), [XmlValidate](#), [Using XML and WDDX in the Developing ColdFusion Applications](#)

## History

ColdFusion MX 7: Added this function.

## Parameters

Parameter	Description
value	Name of an XML attribute

## Usage

This function determines whether the parameter is an XML DOM attribute node, a node with an `XMLType` value of `ATTRIBUTE`. It is useful for determining whether a value returned by the `XmlSearch` function is an XML attribute.

The DOM, and therefore ColdFusion, treats XML attributes as properties of an element and does not directly expose them as DOM nodes. For this reason, the `XmlAttributes` entries in ColdFusion XML document objects do not represent DOM attribute nodes, and tests such as the following always return `False`:

```
IsXmlAttribute(myxmlelement.XmlAttributes);  
IsXmlAttribute(myxmlelement.XmlAttributes.myattribute);
```

The `XmlSearch` function does return attributes as XML DOM attribute nodes. For example, the following line returns an array of attribute nodes containing the quantity attributes in the `xmlobject` document object:

```
quantities = XmlSearch(xmlobject, '@quantity');
```

## Example

The following example creates an XML document object and gets parts of it. It then tests whether these parts are attribute nodes.

```
<!--- Create an XML document object --->
<cfxml variable="xmlobject">
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
  </items>
</order>
</cfxml>

<!--- Get an array with all lastname quantity DOM attribute nodes
(In this example there is only one entry) --->
<cfset lastnames = XmlSearch(xmlobject, '//@lastname')>

<!--- Test objects to see if they are attributes --->
<cfoutput>
<h3>Are the following XML Attribute nodes?</h3>
<!--- The order element id attribute.
      This a simple variable, not a DOM attribute node.--->
node.xmlobject.order.XmlAttributes.id:
  #IsXmlAttribute(xmlobject.order.XmlAttributes.id)#<br>
<!--- The items element --->
xmlobject.order.items: #IsXmlAttribute(xmlobject.order.items)#<br>
lastnames[1] returned by XmlSearch:
  #IsXmlAttribute(lastnames[1])#<br>
</cfoutput>
```

## IsXmlDoc

### Description

Determines whether the function parameter is a ColdFusion XML document object.

### Returns

True, if the function argument is an XML document object; False, otherwise.

### Category

[Decision functions](#), [XML functions](#)

### Function syntax

IsXmlDoc(*value*)

### See also

[IsXML](#), [IsXmlAttribute](#), [IsXmlElem](#), [IsXmlNode](#), [IsXmlRoot](#), [XmlValidate](#); *Using XML and WDDX in the Developing ColdFusion Applications*

### History

ColdFusion MX: Added this function.

### Parameters

Parameter	Description
value	Name of an XML document object

### Example

The following example creates an XML Document object and a Java object and tests whether they are XML document objects:

```
<!-- Create an XML document object -->
<cfxml variable="xmlobject">
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
  </items>
</order>
</cfxml>

<!-- Create a Java object -->
<cfobject type="JAVA" action="create" class="java.lang.Error" name="javaobject" >

<!-- Test the objects -->
<cfoutput>
Is xmlobject an XML document object? #IsXmlDoc(xmlobject)#<br>
Is javaobject an XML document object? #IsXmlDoc(javaobject)#<br>
</cfoutput>
```

## IsXmlElem

### Description

Determines whether the function parameter is an XML document object element.

### Returns

True, if the function argument is an XML document object element; False, otherwise.

### Category

[Decision functions](#), [XML functions](#)

### Function syntax

IsXmlElem(*value*)

### See also

[IsXML](#), [IsXmlAttribute](#), [IsXmlDoc](#), [IsXmlNode](#), [IsXmlRoot](#), [XmlGetNodeType](#), [XmlValidate](#); Using XML and WDDX in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Added this function.

### Parameters

Parameter	Description
value	Name of an XML document object element

### Example

The following example tests whether an XML document object, the document root, and an element are elements:

```
<!--- Create an XML document object --->
<cfxml variable="xmlobject">
<order id="4323251">
    <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
    <items>
        <item id="43">
            <quantity>1</quantity>
            <unitprice>15.95</unitprice>
        </item>
    </items>
</order>
</cfxml>

<!--- Test parts of the document object to see if they are elements --->
<cfoutput>
    <h3>Are the following XML document object elements?</h3>
    xmlobject: #IsXmlElem(xmlobject) #<br>
    xmlobject.XMLRoot: #IsXmlElem(xmlobject.XMLRoot) #<br>
    xmlobject.order.items: #IsXmlElem(xmlobject.order.items) #<br>
</cfoutput>
```

## IsXmlNode

### Description

Determines whether the function parameter is an XML document object node.

### Returns

True, if the function argument is an XML document object node, including an element; False, otherwise.

### Category

[Decision functions, XML functions](#)

### Function syntax

IsXmlNode(*value*)

### See also

[IsXML](#), [IsXmlAttribute](#), [IsXmlDoc](#), [IsXmlElem](#), [IsXmlRoot](#), [XmlGetNodeType](#), [XmlSearch](#), [XmlValidate](#); Using XML and WDDX in the *Developing ColdFusion Applications*

### History

ColdFusion MX 7: Added this function.

### Parameters

Parameter	Description
value	Name of an XML document object node.

### Usage

This function returns True for the following components of an XML document object:

- The document object
- Elements in the object
- XmlNode objects in an element's XmlNodes array

It also returns True for XML node objects returned by the [XmlSearch](#) function. It does not return True for most entries in an element, including XmlText, XmlComment, XmlCdata, or the XmlAttributes array (or individual XML attributes).

### Example

The following example tests whether an XML document object, an element, an attribute in the object, and an attribute returned by an `XmlSearch` function are nodes:

```
<!-- Create an XML document object -->
<cfxml variable="xmlobject">
  <?xml version="1.0" encoding="UTF-8"?>
  <order id="4323251">
    <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
    <items>
      <item id="43">
        <quantity>1</quantity>
        <unitprice>15.95</unitprice>
      </item>
    </items>
  </order>
</cfxml>

<!-- use XmlSearch to get an attribute node. -->
<cfset lastnames = XmlSearch(xmlobject, '//@lastname')>

<!-- Test the objects to see if they are XML nodes-->
<cfoutput>
<h3>Are the following XML nodes?</h3>
xmlobject: #IsXmlNode(xmlobject)#<br>
<!-- The items element -->
xmlobject.order.items: #IsXmlNode(xmlobject.order.items)#<br>
<!-- The order element id attribute; a simple variable, not a DOM node.-->
xmlobject.order.XmlAttributes.id:
  #IsXmlNode(xmlobject.order.XmlAttributes.id)#<br>
lastnames[1] returned by XmlSearch:
#isXmlNode(lastnames[1])#
</cfoutput>
```

## IsXmlRoot

### Description

Determines whether the function parameter is the root element of an XML document object.

### Returns

True, if the function argument is the root object of an XML document object; False, otherwise.

### Category

[Decision functions](#), [XML functions](#)

### Function syntax

```
IsXmlRoot ( value )
```

### See also

[IsXML](#), [IsXmlAttribute](#), [IsXmlDoc](#), [IsXmlElem](#), [IsXmlNode](#), [XmlGetNodeType](#), [XmlValidate](#); Using XML and WDDX in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Added this function.

### Parameters

Parameter	Description
value	Name of an XML document object

### Example

The following example tests whether an XML document object, its root element, and a child element are XML root elements:

```
<!--- Create an XML document object --->
<cfxml variable="xmlobject">
<?xml version="1.0" encoding="UTF-8"?>
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
  </items>
</order>
</cfxml>

<!--- Test objects to see if they are XML root elements --->
<cfoutput>
<h3>Are the following the XML Root?</h3>
xmlobject: #IsXmlRoot(xmlobject)#<br>
xmlobject.order: #IsXmlRoot(xmlobject.order)#<br>
<!--- The order element id attribute --->
xmlobject.order.XmlAttributes.id:
  #IsXmlRoot(xmlobject.order.XmlAttributes.id)#<br>
</cfoutput>
```

## JavaCast

### Description

Converts the data type of a ColdFusion variable to a specified Java type to pass as an argument to Java or .NET object. Use only for scalar, string, and array arguments.

### Returns

The variable, as type *type*.

### Category

[String functions](#)

### Function syntax

`JavaCast(type, variable)`

### History

ColdFusion MX 8: Added support for bigdecimal, byte, char, and short data types and for casting Arrays.

ColdFusion MX 7: Added support for nulls.

### See also

[CreateObject](#), [cfobject](#), [Converting between .NET and ColdFusion data types](#) in and [Java and ColdFusion data type conversions in the \*Developing ColdFusion Applications\*](#)

### Parameters

Parameter	Description
type	Data type to which to convert variable: <ul style="list-style-type: none"><li>• bigdecimal (converts to java.math.BigDecimal)</li><li>• boolean</li><li>• byte</li><li>• char</li><li>• int</li><li>• long</li><li>• float</li><li>• double</li><li>• short</li><li>• string</li><li>• null</li><li>• xxx[] where xxx is one of the following:</li><li>• any of the preceding types, except for null</li><li>• a Java class name</li></ul>
variable	A ColdFusion variable that holds a scalar or string type. Must be "" if type is null.

### Usage

Use this method to specify the Java type to use for a variable that you use when calling a Java or .NET method when the conversion between types is ambiguous; for example, if a method is overloaded and differs only in parameter type or a .NET method is declared as taking a System.Object class parameter.

Use after creating a Java object with the `cfobject` tag, before calling one of its methods. If the method takes more than one overloaded argument, call `JavaCast` for each one. Use `JavaCast` only when a method is overloaded (because its arguments can take more than one data type, not because the method can take a variable number of arguments).

`JavaCast` cannot be used to cast between complex objects, nor to cast to a super-class.

Because there is not a one-to-one correspondence between internally stored ColdFusion types and Java scalar types, some conversions cannot be performed.

Use the result of this function only on calls to Java or .NET objects. The following example shows the use when calling a Java method.

```
<cfscript>
    x = CreateObject("java", "test.Hello");
    x.init();
    ret = x.sayHello(JavaCast("null", ""));
</cfscript>
```

**Note:** Do not assign the results of `JavaCast("null", "")` to a ColdFusion variable. Unexpected results will occur.

The format `JavaCast(type[], variable)` casts a ColdFusion Array variable to a single dimensional Array of the specified type. It cannot convert multi-dimensional arrays. You can specify a primitive type or the name of a Class as the type to cast to. For example, you can use the following format to cast a ColdFusion Array to an Array of `vom.x.y.MyClass` objects.

```
javacast("vom.x.y.MyClass[]", myCFArr)
```

Use an array in the first `JavaCast` parameter in any of the following circumstances:

- You have two functions with signatures with the same number of parameters, and a parameter takes different types of Arrays in different signatures; for example, if you have both of the following functions: `foo(int[] x)` and `foo(String[] str)`.
- The method parameter requires a class array in its signature; for example, `foo(com.x.y.MyClass[])`.
- The method parameter requires an Object in its signature and you must pass an array of any particular type.

The following example shows the use of the `JavaCast` function to cast arrays:

You might have a `fooClass` class that defines the following two methods, each with two arguments where the first argument differs in the type of the array:

```
public class fooClass {  
    public fooClass () {  
    }  
    public String foo(long[] arg) {  
return "Argument was a long array";  
    }  
    public String foo(int[] arg) {  
return "Argument was an Integer array";  
    }  
}
```

To be able to use these functions in your CFML, use the `JavaCast` function to convert the ColdFusion Array to the array type required by one of the functions, as shown in the following code snippet:

```
<cfset arr = [1,2,4,20,10]>  
<cfset fooObj = createObject("java", "fooClass")>  
  
<cfset fooObj.foo(javacast("int[]", arr))>  
<cfset fooObj.foo(javacast("long[]", arr))>
```

### Example

The method `fooMethod` in the class `fooClass` takes one overloaded argument. The `fooClass` class is defined as follows:

```
public class fooClass {  
    public fooClass () {  
    }  
    public String fooMethod(String arg) {  
        return "Argument was a String";  
    }  
    public String fooMethod(int arg) {  
        return "Argument was an Integer";  
    }  
}
```

Within ColdFusion, you use the following code:

```
<cfobject  
action="create"  
type = "java"  
class = "fooClass"  
name = obj>  
  
<!--- ColdFusion can treat this as a string or a real number --->  
<cfset x = 33>  
  
Perform an explicit cast to an int and call fooMethod:<br>  
<cfset myInt = JavaCast("int", x)>  
<cfoutput>#obj.fooMethod(myInt)#</cfoutput>  
<br><br>  
Perform an explicit cast to a string and call fooMethod:<br>  
<cfset myString = javaCast("String", x)>  
<cfoutput>#obj.fooMethod(myString)#</cfoutput>
```

## JSStringFormat

### Description

Escapes special JavaScript characters, such as single-quotation mark, double-quotation mark, and newline.

### Returns

A string that is safe to use with JavaScript.

### Category

[String functions](#)

### Function syntax

`JSStringFormat(string)`

### Parameters

Parameter	Description
<code>string</code>	A string or a variable that contains one.

### Usage

Escapes special JavaScript characters, so you can put arbitrary strings safely into JavaScript.

### Example

```
<!--- This example shows the use of the JSStringFormat function. ---->
<h3>JSStringFormat</h3>
<cfset stringValue = "An example string value with a tab chr(8),
    a newline (chr10) and some "quoted" 'text'">

<p>This is the string we have created:<br>
<cfoutput>#stringValue#</cfoutput>
</p>
<cfset jsStringValue = JSStringFormat(#stringValue#)>
<!--- Generate an alert from the JavaScript string jsStringValue. ---->
<SCRIPT>
s = "<cfoutput>#jsStringValue#</cfoutput>";
alert(s);
</SCRIPT>
```

## Functions I

### LCase

#### Description

Converts the alphabetic characters in a string to lowercase.

#### Returns

A string, converted to lowercase.

#### Category

[String functions](#)

#### Function syntax

`LCase(string)`

#### See also

[UCase](#)

#### Parameters

Parameter	Description
string	A string or a variable that contains one

### Example

```
<h3>LCase Example</h3>

<cfif IsDefined("FORM.sampleText")>
    <cfif FORM.sampleText is not "">
        <cfoutput>
            <p>Your text, <b>#FORM.sampleText#</b>, returned in lowercase is
            <b>#LCase(FORM.sampleText)#</b>.</p>
        </cfoutput>
    <cfelse>
        <p><b><i>Please enter some text.</i></b></p>
    </cfif>
</cfif>

<p>Enter your text. Press "submit" to see it returned in lowercase: </p>

<form method="post" action = "<cfoutput>#cgi.script_name#</cfoutput>" name="lcaseForm">
<input type = "Text" name = "SampleText" value = "SAMPLE">
<input type = "Submit" name = "" value = "submit">
</form>
```

## Left

### Description

Returns up to the leftmost *count* characters in a string.

### Returns

String; up to the first *count* characters in the *string* parameter.

### Category

[String functions](#)

### Function syntax

`Left(string, count)`

### See also

[Right](#), [Mid](#), [Len](#)

### Parameters

Parameter	Description
string	A string or a variable that contains one.
count	A positive integer or a variable that contains one. Maximum number of characters to return.

### Example

```
<h3>Left Example</h3>

<cfif IsDefined("Form.myText")>
<!-- If len returns 0 (zero), then show error message. --->
  <cfif Len(Form.myText)>
    <cfif Len(Form.myText) LTE Form.RemoveChars>
      <cfoutput><p style="color: red; font-weight: bold">Your string #Form.myText# only
has #Len(Form.myText)# characters. You cannot output
the #Form.removeChars# leftmost characters of this string because it is
not long enough.</p></cfoutput>
    <cfelse>
      <cfoutput><p>Your original string: <strong>#Form.myText#</strong></p>
      <p>Your changed string, showing only the <strong>#Form.removeChars#
      </strong> leftmost characters:
      <strong>#Left(Form.myText, Form.removeChars)#</strong></p>
    </cfoutput>
  </cfif>
<cfelse>
  <p style="color: red; font-weight: bold">Please enter a string of more than 0 (zero)
characters.</p>
</cfif>
</cfif>

<form action="#<cfoutput>#CGI.ScriptName#</cfoutput>" method="POST">
<p>Type in some text<br />
<input type="Text" name="myText"></p>
<p>How many characters from the left do you want to show?
<select name="RemoveChars">
<option value="1">1
<option value="3" selected>3
<option value="5">5
<option value="7">7
<option value="9">9</select>
<input type="Submit" name="Submit" value="Remove characters"></p>
</form>
```

## Len

### Description

Determines the length of a string or binary object.

### Returns

Number; length of a string or a binary object.

### Category

[String functions](#)

### Function syntax

`Len(string or binary object)`

### See also

[ToBinary](#), [Left](#), [Right](#), [Mid](#)

### History

ColdFusion MX: Changed Unicode support: ColdFusion supports the Java UCS-2 representation of Unicode character values 0–65535. (ColdFusion 5 and earlier releases supported ASCII values 1–255. When calculating a length, some string-processing functions processed the ASCII 0 (NUL) character, but did not process subsequent characters of the string.)

### Parameters

Parameter	Description
string	A string, the name of a string, or a binary object

### Example

```
<h3>Len Example</h3>

<cfif IsDefined("Form.MyText")>
    <!-- If len returns 0 (zero), then show error message. -->
    <cfif Len(FORM.myText)>
        <cfoutput><p>Your string, <strong>"#FORM.myText#"</strong>,
            has <strong>#Len(FORM.myText)#</strong> characters.</cfoutput>
    <cfelse>
        <p style="color: red; font-weight: bold">Please enter a string of more
            than 0 characters.</p>
    </cfif>
</cfif>

<form action = "<cfoutput>#CGI.SCRIPT_NAME#</cfoutput>" method="POST">
<p>Type in some text to see the length of your string.</p>

<input type = "Text" name = "MyText"><br />
<input type = "Submit" name="Submit" value = "Count characters"><br>
</form>
```

## ListAppend

### Description

Concatenates a list or element to a list.

### Returns

A copy of the list, with *value* appended. If *value* = "", returns a copy of the list, unchanged.

### Category

[List functions](#)

### Function syntax

```
ListAppend(list, value [, delimiters ])
```

### See also

[ListPrepend](#), [ListInsertAt](#), [ListGetAt](#), [ListLast](#), [ListSetAt](#); Lists in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
list	A list or a variable that contains one.
value	An element or a list of elements.
delimiters	A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion uses only the first character.

### Usage

ColdFusion inserts a delimiter character before *value*.

The following table shows examples of `ListAppend` processing:

Statement	Output	Comment
<code>ListAppend('elem1,elem2', ' ' )</code>	elem1,elem2,	Appended element is empty; delimiter is last character in list; list length is 2.
<code>ListAppend('', 'elem1,elem2' )</code>	elem1,elem2	List length is 2.
<code>ListAppend("one__two", "three", "__")</code>	"one__two_three"	Inserted the first character of <code>delimiters</code> before "three."

### Example

```
<h3>ListAppend Example</h3>
<!-- First, query to get some values for our list elements-->
<cfquery name = "GetParkInfo" datasource = "cfdocexamples">
    SELECT PARKNAME,CITY,STATE
    FROM PARKS WHERE PARKNAME LIKE 'AL%'
</cfquery>
<cfset temp = ValueList(GetParkInfo.ParkName)>
<cfoutput>
<p>The original list: #temp#
</cfoutput>
<!-- now, append a park name to the list -->
<cfset temp2 = ListAppend(Temp, "ANOTHER PARK")>
```

## ListChangeDelims

### Description

Changes a list delimiter.

### Returns

A copy of the list, with each delimiter character replaced by *new\_delimiter*.

### Category

[List functions](#)

### Function syntax

```
ListChangeDelims(list, new_delimiter [, delimiters, includeEmptyValues ])
```

### See also

[ListFirst](#), [ListQualify](#); Lists in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
includeEmptyValues	Optional. Set to yes to include empty values.
list	A list or a variable that contains one.
new_delimiter	Delimiter string or a variable that contains one. Can be an empty string. ColdFusion processes the string as one delimiter.
delimiters	A string or a variable that contains one. Characters that separate list elements. The default value is comma.  If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.

### Example

```
<h3>ListChangeDelims Example</h3>
<p>ListChangeDelims lets you change the delimiters of a list.
<!-- First, query to get some values for our list elements-->
<CFQUERY NAME="GetParkInfo" DATASOURCE="cfdocexamples">
    SELECT PARKNAME,CITY,STATE
    FROM Parks
    WHERE PARKNAME LIKE 'BA%'
</CFQUERY>
<CFSET temp = ValueList(GetParkInfo.ParkName)>
<cfoutput>
<p>The original list: <p>#temp#
</cfoutput>
<!-- Change the delimiters in the list -->
<CFSET temp2 = ListChangeDelims(Temp, " :P |", ",")>
<cfoutput>
<p>After executing the statement
    <strong>ListChangeDelims(Temp, " :P |", ",")</strong>,
    the updated list: <p>#temp2#
</cfoutput>
```

## ListContains

### Description

Determines the index of the first list element that contains a specified substring.

### Returns

Index of the first list element that contains *substring*. If not found, returns zero.

### Category

[List functions](#)

## Function syntax

```
ListContains(list, substring [, delimiters, includeEmptyValues ])
```

## See also

`ListContainsNoCase`, `ListFind`; Lists in the *Developing ColdFusion Applications*

## Parameters

Parameter	Description
includeEmptyValues	Optional. Set to <code>yes</code> to include empty values.
list	A list or a variable that contains one.
substring	A string or a variable that contains one. The search is case sensitive.
delimiters	<p>A string or a variable that contains one. Characters that separate list elements. The default value is comma.</p> <p>If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.</p>

## Usage

ColdFusion ignores empty list elements; thus, the list "a,b,c,,,d" has four elements.

### Example

[illegible]

## ListContainsNoCase

### Description

Determines the index of the first list element that contains a specified substring.

### Returns

Index of the first list element that contains *substring*, regardless of case. If not found, returns zero.

### Category

[List functions](#)

### Function syntax

```
ListContainsNoCase(list, substring [, delimiters, includeEmptyValues ])
```

### See also

[ListContains](#), [ListFindNoCase](#); Lists in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
includeEmptyValues	Optional. Set to <code>yes</code> to include empty values.
list	A list or a variable that contains one.
substring	A string or a variable that contains one. The search is case-insensitive.
delimiters	A string or a variable that contains one. Characters that separate list elements. The default value is comma.  If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.

### Usage

ColdFusion ignores empty list elements; thus, the list "a,b,c,,,d" has four elements.

### Example

```
<h3>ListContainsNoCase Example</h3>
<cfif IsDefined("form.letter")>
    <!-- First, query to get some values for our list -->
    <cfquery name="GetParkInfo" datasource="cfdocexamples">
        SELECT PARKNAME,CITY,STATE
        FROM Parks
        WHERE PARKNAME LIKE '#form.letter#%'
    </cfquery>
    <cfset tempList = #ValueList(GetParkInfo.City)#>
    <cfif ListContainsNoCase(tempList, form.yourCity) is not 0>
        There are parks in your city!
    <cfelse>
        <p>Sorry, there were no parks found for your city.
        Try searching under a different letter.
    </cfif>
</cfif>
```

## ListDeleteAt

### Description

Deletes an element from a list.

### Returns

A copy of the list, without the specified element.

### Category

[List functions](#)

### Function syntax

```
ListDeleteAt(list, position [, delimiters ])
```

### See also

[ListGetAt](#), [ListSetAt](#), [ListLen](#); Lists in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
list	A list or a variable that contains one.
position	A positive integer or a variable that contains one. Position at which to delete element. The first list position is 1.
delimiters	A string or a variable that contains one. Characters that separate list elements. The default value is comma.  If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.

### Usage

To use this and other functions with the default delimiter (comma), you can code as follows:

```
<cfset temp2 = ListDeleteAt(temp, "3")>
```

To specify another delimiter, you code as follows:

```
<cfset temp2 = ListDeleteAt(temp, "3", ";")>
```

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

### Example

```
<!--- First, query to get some values for our list elements. --->
<CFQUERY NAME="GetParkInfo" DATASOURCE="cfdocexamples">
    SELECT PARKNAME,CITY,STATE
    FROM Parks
    WHERE PARKNAME LIKE 'CHI%'
</CFQUERY>
<CFSET temp = ValueList(GetParkInfo.ParkName)>
<CFSET deleted_element = ListGetAt(temp, "3", ",")>
<cfoutput><p>The original list: #temp#</p></cfoutput>
<!--- Delete the third element from the list. --->
<CFSET temp2 = ListDeleteAt(Temp, "3")>
<cfoutput>
<p>The changed list: #temp2#
<p><I>This list element:<br>#deleted_element#<br> is no longer present
    at position three of the list.</I> </cfoutput>
```

## ListFind

### Description

Determines the index of the first list element in which a specified value occurs. Case sensitive.

### Returns

Index of the first list element that contains *value*, with matching case. If not found, returns zero. The search is case sensitive.

### Category

[List functions](#)

### Function syntax

```
ListFind(list, value [, delimiters, includeEmptyValues ])
```

### See also

[ListContains](#), [ListFindNoCase](#); Lists in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
includeEmptyValues	Optional. Set to yes to include empty values.
list	A list or a variable that contains one
value	A string, a number, or a variable that contains one. Item for which to search. The search is case sensitive.
delimiters	A string or a variable that contains one. Characters that separate list elements. The default value is comma.  If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.

### Usage

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

### Example

```
<!--- Uses ListFind and ListFindNoCase to see if a substring exists
in a list --->
<form action="/listfind.cfm" method="POST">
    <p>Try changing the case in Leary's last name:
    <br><input type="Text" size="25" name="myString" value="Leary">
    <p>Pick a search type:
        <select name="type">
            <option value="ListFind" selected>Case-Sensitive
            <option value="ListFindNoCase">Case-Insensitive
        </select>
        <input type="Submit" name="" value="Search Employee List">
    </form>

<!--- wait to have a string for searching defined --->
<cfif IsDefined("form.myString") and IsDefined("form.type")>

<cfquery name="SearchEmpLastName" datasource="cfdocexamples">
    SELECT FirstName, RTrim(LastName) AS LName, Phone, Department
    FROM Employees
</cfquery>

<cfset myList = ValueList(SearchEmpLastName.LName)>
<!--- Is this case-sensitive or case-insensitive searching --->
<cfif form.type is "ListFind">
    <cfset temp = ListFind(myList, form.myString)>
    <cfif temp is 0>
        <h3>An employee with that exact last name was not found</h3>
    <cfelse>
        <cfoutput>
            <p>Employee #ListGetAt(ValueList(SearchEmpLastName.FirstName), temp)#
            #ListGetAt(ValueList(SearchEmpLastName.LName), temp)#, of the
            #ListGetAt(ValueList(SearchEmpLastName.Department), temp)# Department,
            can be reached at #ListGetAt(ValueList(SearchEmpLastName.Phone),
            temp)#.
            <p>This was the first employee found under this case-sensitive last name
            search.
        </cfoutput>
    </cfif>
<cfelse>
    <cfset temp = ListFindNoCase(myList, form.myString)>
    <cfif temp is 0>
        <h3>An employee with that exact last name was not found</h3>
    <cfelse>
        <cfoutput>
            <p>Employee #ListGetAt(ValueList(SearchEmpLastName.FirstName), temp)#
            #ListGetAt(ValueList(SearchEmpLastName.LName), temp)#, of the
            #ListGetAt(ValueList(SearchEmpLastName.Department), temp)#
            Department, can be reached at
            #ListGetAt(ValueList(SearchEmpLastName.Phone), temp)#.
            <p>This was the first employee found under this case-insensitive last
            name search.
        </cfoutput>
    </cfif>
</cfif>
</cfif>
```

## ListFindNoCase

### Description

Determines the index of the first list element in which a specified value occurs.

### Returns

Index of the first list element that contains *value*. If not found, returns zero. The search is case-insensitive.

### Category

[List functions](#)

### Function syntax

```
ListFindNoCase(list, value [, delimiters, includeEmptyValues ])
```

### See also

[ListContains](#), [ListFind](#); Lists in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
includeEmptyValues	Optional. Set to <code>yes</code> to include empty values.
list	A list or a variable that contains one.
value	Number or string for which to search. The search is case-insensitive.
delimiters	A string or a variable that contains one. Characters that separate list elements. The default value is comma.  If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.

### Usage

ColdFusion ignores empty list elements; thus, the list "a,b,c,,,d" has four elements.

### Example

```
<!--- Uses ListFind and ListFindNoCase to see if a substring exists
in a list --->
<form action="/listfind.cfm" method="POST">
    <p>Try changing the case in Leary's last name:
    <br><input type="Text" size="25" name="myString" value="Leary">
    <p>Pick a search type:
        <select name="type">
            <option value="ListFind" selected>Case-Sensitive
            <option value="ListFindNoCase">Case-Insensitive
        </select>
    <input type="Submit" name="" value="Search Employee List">
</form>

<!--- wait to have a string for searching defined --->
<cfif IsDefined("form.myString") and IsDefined("form.type")>

<cfquery name="SearchEmpLastName" datasource="cfdocexamples">
    SELECT FirstName, RTrim(LastName) AS LName, Phone, Department
    FROM Employees
</cfquery>

<cfset myList = ValueList(SearchEmpLastName.LName)>
<!--- Is this case-sensitive or case-insensitive searching --->
<cfif form.type is "ListFind">
    <cfset temp = ListFind(myList, form.myString)>
    <cfif temp is 0>
        <h3>An employee with that exact last name was not found</h3>
    <cfelse>
        <cfoutput>
            <p>Employee #ListGetAt(ValueList(SearchEmpLastName.FirstName), temp)#
            #ListGetAt(ValueList(SearchEmpLastName.LName), temp)#, of the
            #ListGetAt(ValueList(SearchEmpLastName.Department), temp)# Department,
            can be reached at #ListGetAt(ValueList(SearchEmpLastName.Phone),
            temp)#.
            <p>This was the first employee found under this case-sensitive last name
            search.
        </cfoutput>
    </cfif>
<cfelse>
    <cfset temp = ListFindNoCase(myList, form.myString)>
    <cfif temp is 0>
        <h3>An employee with that exact last name was not found</h3>
    <cfelse>
        <cfoutput>
            <p>Employee #ListGetAt(ValueList(SearchEmpLastName.FirstName), temp)#
            #ListGetAt(ValueList(SearchEmpLastName.LName), temp)#, of the
            #ListGetAt(ValueList(SearchEmpLastName.Department), temp)#
            Department, can be reached at
            #ListGetAt(ValueList(SearchEmpLastName.Phone), temp)#.
            <p>This was the first employee found under this case-insensitive last
            name search.
        </cfoutput>
    </cfif>
</cfif>
</cfif>
```

## ListFirst

### Description

Gets the first element of a list.

### Returns

The first element of a list. If the list is empty, returns an empty string.

### Category

[List functions](#)

### Function syntax

```
ListFirst(list [, delimiters, includeEmptyValues ])
```

### See also

[ListGetAt](#), [ListLast](#), [ListQualify](#); Lists in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
includeEmptyValues	Optional. Set to yes to include empty values.
list	A list or a variable that contains a list.
delimiters	A string or a variable that contains one. Characters that separate list elements. The default value is comma.  If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.

### Usage

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

### Example

```
<h3>ListFirst Example</h3>
<!--- Find a list of users who wrote messages --->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
    SELECT Username, Subject, Posted
    FROM Messages
</cfquery>

<cfset temp = ValueList(GetMessageUser.Username)>
<p>Before editing the list, it is:&nbsp;  </p>
<cfoutput>#ValueList(GetMessageUser.Username)#</cfoutput>.
<p>(Users who posted more than once are listed more than once.)
<!--- Show the first user in the list --->
<p>The first user in the list is:
<cfoutput>#ListFirst(temp)#</cfoutput>
<p>The rest of the list is:&nbsp;  <cfoutput>#ListRest(temp)#</cfoutput>.
<p>(Users who posted more than once are listed more than once.)
<p>The last user in the list is: <cfoutput>#ListLast(temp)#</cfoutput>
```

## ListGetAt

### Description

Gets a list element at a specified position.

### Returns

Value of the list element at position *position*.

### Category

[List functions](#)

### Function syntax

```
ListGetAt(list, position [, delimiters, includeEmptyValues ])
```

### See also

[ListFirst](#), [ListLast](#), [ListQualify](#), [ListSetAt](#); Lists in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
list	A list or a variable that contains one.
position	A positive integer or a variable that contains one. Position at which to get element. The first list position is 1.
delimiters	A string or a variable that contains one. Characters that separate list elements. The default value is comma.  If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.
includeEmptyValues	Optional. Set to <code>yes</code> to include empty values.

### Usage

If you use list functions on strings that are delimited by a delimiter character and a space, a returned list element might contain a leading space; you use the `trim` function to remove such spaces from a returned element. For example, consider this list:

```
<cfset myList = "one hundred, two hundred, three hundred">
```

To get a value from this list, use the `trim` function to remove the space before the returned value:

```
<cfset MyValue = #trim(listGetAt(myList, 2))#>
```

With this usage, `MyValue` = "two hundred", not " two hundred", and spaces within a list element are preserved.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

### Example

```
<h3>ListGetAt Example</h3>
<!-- Find a list of users who wrote messages -->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
    SELECT Username, Subject, Posted
    FROM Messages
</cfquery>
<cfset temp = ValueList(GetMessageUser.Username)>
<!-- loop through the list and show it with ListGetAt -->
<h3>This list of usernames who have posted messages numbers
<cfoutput>#ListLen(temp)#</cfoutput> users.</h3>
<ul>
<cfloop From = "1" To = "#ListLen(temp)#" index = "Counter">
    <cfoutput><li>Username #Counter#: #ListGetAt(temp, Counter)# </cfoutput>
</cfloop>
</ul>
```

## ListInsertAt

### Description

Inserts an element in a list.

### Returns

A copy of the list, with *value* inserted at the specified position.

### Category

[List functions](#)

### Function syntax

```
ListInsertAt(list, position, value [, delimiters, includeEmptyValues ])
```

### See also

[ListDeleteAt](#), [ListAppend](#), [ListPrepend](#), [ListSetAt](#); Lists in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
includeEmptyValues	Optional. Set to <i>yes</i> to include empty values.
list	A list or a variable that contains one.
position	A positive integer or a variable that contains one. Position at which to insert element. The first list position is 1.
value	An element or a list of elements.
delimiters	A string or a variable that contains one. Characters that separate list elements. The default value is comma.  If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.

### Usage

When inserting an element, ColdFusion inserts a delimiter. If `delimiters` contains more than one delimiter, ColdFusion uses the first delimiter in the string; if `delimiters` is omitted, ColdFusion uses a comma.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

### Example

```
<!--- This example shows ListInsertAt --->
<cfquery name = "GetParkInfo" datasource = "cfdocexamples">
SELECT PARKNAME,CITY,STATE
FROM PARKS
WHERE PARKNAME LIKE 'DE%'
</cfquery>
<cfset temp = ValueList(GetParkInfo.ParkName)>
<cfset insert_at_this_element = ListGetAt(temp, "3", ",")>
<cfoutput>
<p>The original list: #temp#
</cfoutput>
<cfset temp2 = ListInsertAt(Temp, "3", "my Inserted Value")>
```

## ListLast

### Description

Gets the last element of a list.

### Returns

The last element of the list.

### Category

[List functions](#)

### Function syntax

```
ListLast(list [, delimiters, includeEmptyValues ])
```

### See also

[ListGetAt](#), [ListFirst](#); Lists in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
<code>includeEmptyValues</code>	Optional. Set to <code>yes</code> to include empty values.
<code>list</code>	A list or a variable that contains a list.
<code>delimiters</code>	A string or a variable that contains one. Characters that separate list elements. The default value is comma.  If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter; you cannot specify a multicharacter delimiter.

### Usage

If you use list functions on strings that separated by a delimiter character and a space, a returned list element might contain a leading space; use the `trim` function to remove leading and trailing spaces from a returned element. For example, consider this list:

```
<cfset myList = "one hundred, two hundred, three hundred">
```

To get a value from this list, use the `trim` function to remove the space before the returned value:

```
<cfset MyValue = #trim(ListLast(myList))#>
```

With this usage, the `MyValue` variable gets the value "three hundred", not " three hundred", and spaces within a list element are preserved.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

### Example

```
<h3>ListFirst, ListLast, and ListRest Example</h3>
<!-- Find a list of users who wrote messages -->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
    SELECT Username, Subject, Posted
    FROM Messages
</cfquery>
<cfset temp = ValueList(GetMessageUser.Username)>
<p>Before editing the list, it is:&nbsp;</p>
<cfoutput>#ValueList(GetMessageUser.Username)#</cfoutput>.
<p>(Users who posted more than once are listed more than once.)
<!-- Show the first user in the list -->
<p>The first user in the list is: <cfoutput>#ListFirst(temp)#</cfoutput>
<p>The rest of the list is:&nbsp;<cfoutput>#ListRest(temp)#</cfoutput>.
<p>(Users who posted more than once are listed more than once.)
<p>The last user in the list is: <cfoutput>#ListLast(temp)#</cfoutput>
```

## ListLen

### Description

Determines the number of elements in a list.

Integer; the number of elements in a list.

### Category

[List functions](#)

### Function syntax

```
ListLen(list [, delimiters ])
```

### See also

[ListAppend](#), [ListDeleteAt](#), [ListInsertAt](#), [ListPrepend](#); Lists in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
list	A list or a variable that contains one.
delimiters	A string or a variable that contains one. Characters that separate list elements. The default value is comma.  If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.

### Usage

ColdFusion ignores empty list elements; thus, the list "a,b,c,,,d" has four elements.

Here are some examples of ListLen processing:

Statement	Output	Comment
ListLen('a,b, c,,,d')	4	Third element is " c"
ListLen('a,b, c,,,d','')	4	Fourth element is "d"
ListLen('elem_1__elem_2__elem_3')	1	
ListLen('elem*1***elem*2***elem*3')	1	
ListLen('elem_1__elem_2__elem_3','_')	6	

### Example

```
<h3>ListLen Example</h3>
<!--- Find a list of users who wrote messages --->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
    SELECT Username, Subject, Posted
    FROM Messages
</cfquery>
<cfset temp = ValueList(GetMessageUser.Username)>
<!--- loop through the list and show it with ListGetAt --->
<h3>This is a list of usernames who have posted messages
<cfoutput>#ListLen(temp)#</cfoutput> users.</h3>
<ul>
<cfloop From = "1" TO = "#ListLen(temp)#" INDEX = "Counter">
    <cfoutput><li>Username #Counter#:
        #ListGetAt(temp, Counter)#</cfoutput>
</cfloop>
</ul>
```

## ListPrepend

### Description

Inserts an element at the beginning of a list.

### Returns

A copy of the list, with *value* inserted at the first position.

### Category

[List functions](#)

### Function syntax

```
ListPrepend(list, value [, delimiters ])
```

### See also

[ListAppend](#), [ListInsertAt](#), [ListSetAt](#); Lists in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
list	A list or a variable that contains one.
value	An element or a list of elements.
delimiters	A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion only uses the first character and ignores the others.

### Usage

When prepending an element to a list, ColdFusion inserts a delimiter. If *delimiters* *contains more* than one delimiter character, ColdFusion uses the first delimiter in the string; if *delimiters* is omitted, ColdFusion uses a comma.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,,d" has four elements.

If the *delimiters* parameter is the empty string (""), ColdFusion returns the contents of the *value* parameter.

### Example

```
<!--- This example shows ListPrepend --->
<cfquery name = "GetParkInfo" datasource = "cfdocexamples">
    SELECT PARKNAME,CITY,STATE
    FROM PARKS
    WHERE PARKNAME LIKE 'DE%'
</cfquery>
<cfset temp = ValueList(GetParkInfo.ParkName)>
<cfset first_element = ListFirst(temp)>
<cfoutput><p>The original list: #temp#</cfoutput>
<!--- now, insert an element at position 1--->
<cfset temp2 = ListPrepend(Temp, "my Inserted Value")>
```

## ListQualify

### Description

Inserts a string at the beginning and end of list elements.

### Returns

A copy of the list, with *qualifier* before and after the specified elements.

### Category

[List functions](#)

### Function syntax

```
ListQualify(list, qualifier [, delimiters, elements, includeEmptyValues ])
```

### See also

Lists in Using ColdFusion Variables in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed behavior: as the `elements` parameter value, you must specify `"all"` or `"char"`; otherwise, ColdFusion throws an exception. (In earlier releases, the function ignored an invalid value, and used `"all"`; this was inconsistent with other functions.)

### Parameters

Parameter	Description
<code>includeEmptyValues</code>	Optional. Set to <code>yes</code> to include empty values.
<code>list</code>	A list or a variable that contains one.
<code>qualifier</code>	A string or a variable that contains one. Character or string to insert before and after the list elements specified in the <code>elements</code> parameter.
<code>delimiters</code>	A string or a variable that contains one. Characters that separate list elements. The default value is comma. If this parameter contains more than one character, ColdFusion uses the first character as the delimiter and ignores the remaining characters.
<code>elements</code>	<ul style="list-style-type: none"><li>• <code>all</code>: all elements</li><li>• <code>char</code>: elements that are composed of alphabetic characters</li></ul>

### Usage

The new list might not preserve all of the delimiters in the list.

ColdFusion ignores empty list elements; thus, the list `"a,b,c,,d"` has four elements.

### Example

```
<cfquery name = "GetEmployeeNames" datasource = "cfdocexamples">
SELECT FirstName, LastName
FROM Employees
</cfquery>

<h3>ListQualify Example</h3>
<p>This example uses ListQualify to put the full names of the
employees in the query within quotation marks.</p>
<cfset myArray = ArrayNew(1)>

<!-- loop through query; append these names successively
to the last element -->
<cfloop query = "GetEmployeeNames">
    <cfset temp = ArrayAppend(myArray, "#FirstName# #LastName#")>
</cfloop>

<!-- sort that array descending alphabetically -->
<cfset myAlphaArray = ArraySort(myArray, "textnocase")>

<!-- show the resulting array as a list -->
<cfset myList = ArrayToList(myAlphaArray, ",")>
```

```
<cfoutput>
    <p>The contents of the unqualified list are as follows:</p>
    #myList#
</cfoutput>

<!--- show the resulting alphabetized array as a qualified list with
      single quotation marks around each full name.--->
<cfset qualifiedList1 = ListQualify(myList,"'",",",",", "CHAR")>

<!--- output the array as a list --->
<cfoutput>
    <p>The contents of the qualified list are as follows:</p>
    <p>#qualifiedList1#</p>
</cfoutput>

<!--- show the resulting alphabetized array as a qualified list with quotation
      marks around each full name. We use &quot; to denote quotation marks
      because the quotation mark character is a control character. --->
<cfset qualifiedList2 = ListQualify(myList,"&quot;","&quot;","&quot;","CHAR")>

<!--- output the array as a list --->
<cfoutput>
    <p>The contents of the second qualified list are:</p>
    <p>#qualifiedList2#</p>
</cfoutput>
```

## ListRest

### Description

Gets a list, without its first element.

### Returns

A copy of *list*, without the first element. If *list* has one element, returns an empty list.

### Category

[List functions](#)

### Function syntax

```
ListRest(list [, delimiters, includeEmptyValues ])
```

### See also

[ListFirst](#), [ListGetAt](#), [ListLast](#); Lists in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
includeEmptyValues	Optional. Set to yes to include empty values.
list	A list or a variable that contains one.
delimiters	A string or a variable that contains one. Characters that separate list elements. The default value is comma.  If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.

### Usage

If the list begins with one or more empty entries, this function drops them, as well as the first element.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

### Example

```
<h3>ListFirst, ListLast, and ListRest Example</h3>
<!-- Find a list of users who wrote messages -->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
    SELECT Username, Subject, Posted
    FROM Messages
</cfquery>

<cfset temp = ValueList(GetMessageUser.Username)>
<p>Before editing the list, it is:&nbsp;  </p>
<cfoutput>#ValueList(GetMessageUser.Username)#</cfoutput>.
<p>(Users who posted more than once are listed more than once.)
<p>The first user in the list is:
<cfoutput>#ListFirst(temp)# </cfoutput>
<p>The rest of the list is:&nbsp;  <cfoutput>#ListRest(temp)#</cfoutput>.
<p>(Users who posted more than once are listed more than once.)
<p>The last user in the list is: <cfoutput>#ListLast(temp)#</cfoutput>
```

## ListSetAt

### Description

Replaces the contents of a list element.

### Returns

A copy of a list, with a new value assigned to the element at a specified position.

### Category

[List functions](#)

### Function syntax

```
ListSetAt(list, position, value [, delimiters, includeEmptyValues ])
```

### See also

[ListDeleteAt](#), [ListGetAt](#), [ListInsertAt](#); Lists in the *Developing ColdFusion Applications*

## History

ColdFusion MX: Changed delimiter modification: ColdFusion MX does not modify delimiters in the list. (In earlier releases, in some cases, replaced delimiters with the first character in the `delimiters` parameter.)

## Parameters

Parameter	Description
<code>includeEmptyValues</code>	Optional. Set to <code>yes</code> to include empty values.
<code>list</code>	A list or a variable that contains one.
<code>position</code>	A positive integer or a variable that contains one. Position at which to set a value. The first list position is 1.
<code>value</code>	An element or a list of elements.
<code>delimiters</code>	A string or a variable that contains one. Characters that separate list elements. The default value is comma.  If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.

## Usage

When assigning an element to a list, ColdFusion inserts a delimiter. If `delimiters` contains more than one delimiter, ColdFusion uses the first delimiter in the string, or, if `delimiters` was omitted, a comma.

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

## Example

```
<h3>ListSetAt Example</h3>
<!-- Find a list of users who wrote messages -->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
SELECT Username, Subject, Posted
FROMMessages
</cfquery>

<cfset temp = ValueList(GetMessageUser.Subject)>

<!-- loop through the list and show it with ListGetAt -->
<h3>This is a list of <cfoutput>#ListLen(temp)#</cfoutput>
subjects posted in messages.</h3>

<cfset ChangedElement = ListGetAt(temp, 2)>
<cfset TempToo = ListSetAt(temp, 2, "I changed this subject", ",")>
<ul>
<cfloop From = "1" To = "#ListLen(temptoo)#" INDEX = "Counter">
    <cfoutput><li>(#Counter#) SUBJECT: #ListGetAt(temptoo, Counter)#
    </cfoutput>
</cfloop>
</ul>
<p>Note that element 2, "<cfoutput>#changedElement#</cfoutput>",
has been altered to "I changed this subject" using ListSetAt.
```

## ListSort

### Description

Sorts list elements according to a sort type and sort order.

### Returns

A copy of a list, sorted.

### Category

[List functions](#)

### Function syntax

```
ListSort(list, sort_type [, sort_order, delimiters, includeEmptyValues ])
```

### See also

Lists in Using ColdFusion Variables in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed the order in which sorted elements are returned: in a `textnocase`, descending sort, this function might return elements in a different sort order than in earlier releases. If `sort_type="textnocase"` and `sort_order="desc"`, ColdFusion MX processes elements that *differ only in case* differently from earlier releases. ColdFusion MX outputs the elements in the reverse of the ascending order. Earlier releases do not change order of elements that differ only in case. Both operations are correct. The new operation ensures that an ascending and descending sort output elements in exactly reverse order.

For example, in a `textnocase, desc` sort of `d, a, a, b, A`, the following occurs:

- ColdFusion MX returns `d, b, A, a, a`
  - Earlier ColdFusion releases return `d, b, a, a, A`
- (In a `textnocase, asc` sort, all ColdFusion releases return `a, a, A, b, d`.)

### Parameters

Parameter	Description
<code>includeEmptyValues</code>	Optional. Set to <code>yes</code> to include empty values.
<code>list</code>	A list or a variable that contains one.

Parameter	Description
sort_type	<ul style="list-style-type: none"> <li>• numeric: sorts numbers</li> <li>• text: sorts text alphabetically, taking case into account (also known as case sensitive). All letters of one case precede the first letter of the other case: <ul style="list-style-type: none"> <li>- aabzABZ, if sort_order = "asc" (ascending sort)</li> <li>- ZBAzbaa, if sort_order = "desc" (descending sort)</li> </ul> </li> <li>• textnocase: sorts text alphabetically, without regard to case (also known as case-insensitive). A letter in varying cases precedes the next letter: <ul style="list-style-type: none"> <li>- aAaBbBzzZ, in an ascending sort; preserves original intra-letter order</li> <li>- ZzzBbBaAa, in a descending sort; reverses original intra-letter order</li> </ul> </li> </ul>
sort_order	<ul style="list-style-type: none"> <li>• asc - ascending sort order. Default. <ul style="list-style-type: none"> <li>- aabzABZ or aAaBbBzzZ, depending on value of sort_type, for letters</li> <li>- from smaller to larger, for numbers</li> </ul> </li> <li>• desc - descending sort order. <ul style="list-style-type: none"> <li>- ZBAzbaa or ZzzBbBaAa, depending on value of sort_type, for letters</li> <li>- from larger to smaller, for numbers</li> </ul> </li> </ul>
delimiters	<p>A string or a variable that contains one. Characters that separate list elements. The default value is comma.</p> <p>If this parameter contains more than one character, ColdFusion uses the first character in the string as the delimiter, and ignores the rest.</p>

### Usage

ColdFusion ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

### Example

```
<h3>ListSort Example</h3>

<!-- Find a list of users who wrote messages -->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
SELECT  Username, Subject, Posted
FROM    Messages
</cfquery>

<cfset myList = ValueList(GetMessageUser.UserName)>
<p>Here is the unsorted list. </p>
<cfoutput>#myList#
</cfoutput>

<p>Here is the list sorted alphabetically:</p>
<cfset sortedList = ListSort(myList, "Text")>
<cfoutput>#sortedList#
</cfoutput>

<p>Here is a numeric list that is to be sorted in descending order.</p>
<cfset sortedNums = ListSort("12,23,107,19,1,65","Numeric", "Desc")>
<cfoutput>#sortedNums# </cfoutput>

<p>Here is a list that must be sorted numerically, since it contains
negative and positive numbers, and decimal numbers. </p>
<cfset sortedNums2 = ListSort("23.75;-34,471:100,-9745","Numeric", "ASC", ";,:")>
<cfoutput>#sortedNums2# </cfoutput>

<p>Here is a list to be sorted alphabetically without consideration of case.</p>
<cfset sortedMix =
    ListSort("hello;123,HELLO:jeans,-345,887;ColdFusion:coldfusion",
        "TextNoCase", "ASC", ";,:")>
<cfoutput>#sortedMix# </cfoutput>
```

## ListToArray

### Description

Copies the elements of a list to an array.

### Returns

An array

### Category

[Array functions](#), [Conversion functions](#), [List functions](#)

### Function syntax

```
ListToArray(list [, delimiters[, includeEmptyFields[, multiCharacterDelimiter]])
```

### See also

[ArrayToList](#); Using Arrays and Structures in the *Developing ColdFusion Applications*

### History

ColdFusion 9: Added the multiCharacterDelimiter parameter.

### Parameters

Parameter	Description
list	A list or a variable that contains one. You define a list variable with a <code>cfset</code> statement.
delimiters	A string or a variable that contains one. ColdFusion treats each character in the string as a delimiter. The default value is comma.
includeEmptyFields	A Boolean value specifying whether to create empty array entries if there are two delimiters in a row. <ul style="list-style-type: none"><li>• <code>false</code> (Default) ignore empty elements in a list; for example, convert <code>a, , c</code> into an array with only two elements.</li><li>• <code>true</code> Convert empty elements in a list to empty array entries; for example, convert <code>a, , c</code> into an array with three elements, the second of which is empty.</li></ul>
multiCharacterDelimiter	A Boolean value specifying whether the <code>delimiters</code> parameter specifies a multi-character delimiter. The default is <code>false</code> . If this parameter is <code>true</code> , the <code>delimiters</code> parameter must specify a single delimiter consisting of multiple characters. This parameter enables the <code>ListToArray</code> function to convert a list such as the following to an array of color names: <code>red;orange;yellow;green;blue;indigo;violet</code> .

### Usage

ColdFusion, by default, ignores empty list elements; thus, the list "a,b,c,,d" has four elements.

ColdFusion treats each character in the `delimiters` parameter as a separate delimiter. Therefore, if the parameter is "+," ColdFusion will break the list at *either* a comma or a plus sign.

If you specify a `multiCharacterDelimiter` parameter, all list elements must be separated by exactly the specified characters. For example, the following code creates an array with three entries, "red, orange", "yellow, green" and "blue, violet".

```
<cfset list = "red,orange,&yellow,green,&blue,violet">
<cfset arr = listToArray (list, "&",&false,true)>
```

### Example

```
<h3>ListToArray Example</h3>
<!--- Find a list of users who wrote messages --->
<cfquery name = "GetMessageUser" datasource = "cfdocexamples">
SELECT Username, Subject, Posted
FROMMessages
</cfquery>
<cfset myList = ValueList(GetMessageUser.UserName)>
<p>My list is a list with <cfoutput>#ListLen(myList)#</cfoutput>
elements.
<cfset myArrayList = ListToArray(myList)>
<p>My array list is an array with <cfoutput>#ArrayLen(myArrayList)#
</cfoutput> elements.
```

## ListValueCount

### Description

Counts instances of a specified value in a list. The search is case sensitive.

### Returns

The number of instances of *value* in the list.

### Category

[List functions](#), [String functions](#)

### Function syntax

```
ListValueCount(list, value [, delimiters ])
```

### See also

[ListValueCountNoCase](#); Lists in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
list	A list or a variable that contains one.
value	String or number, or a variable that contains one. Item for which to search. The search is case sensitive.
delimiters	A string or a variable that contains one. Characters that separate list elements. The default value is comma.  If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.

### Example

```
<cfquery name = "SearchByDepartment" datasource = "cfdocexamples">
SELECT Department
FROM Employees
</cfquery>
<h3>ListValueCount Example</h3>
<p>This example uses ListValueCount to count employees in a department.

<form action = "listvaluecount.cfm">
<p>Select a department:</p>
  <select name = "departmentName">
    <option value = "Accounting">
      Accounting
    </OPTION>
    <option value = "Administration">
      Administration
    </OPTION>
    <option value = "Engineering">
      Engineering
    </OPTION>
    <option value = "Sales">
      Sales
```

```
        </OPTION>
    </select>
    <input type = "Submit" name = "Submit" value = "Search Employee List">
</form>

<!-- wait to have a string for searching defined -->
<cfif IsDefined("FORM.Submit") and IsDefined("FORM.departmentName")>
    <cfset myList = ValueList(SearchByDepartment.Department)>
    <cfset numberInDepartment = ListValueCount(myList, FORM.departmentName)>

    <cfif numberInDepartment is 0>
        <h3>There are no employees in <cfoutput>#FORM.departmentName#</cfoutput></h3>
    <cfelseif numberInDepartment is 1>
        <cfoutput><p>There is only one person in #FORM.departmentName#.
    </cfoutput>
    <cfelse>
        <cfoutput><p>There are #numberInDepartment# people in #FORM.departmentName#.
    </cfoutput>
    </cfif>
</cfif>
```

## ListValueCountNoCase

### Description

Counts instances of a specified value in a list. The search is case-insensitive.

### Returns

The number of instances of *value* in the list.

### Category

[List functions](#)

### Function syntax

```
ListValueCountNoCase(list, value [, delimiters ])
```

### See also

[ListValueCount](#); Lists in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
list	A list or a variable that contains one.
value	String or number, or a variable that contains one. Item for which to search. The search is case-insensitive.
delimiters	A string or a variable that contains one. Characters that separate list elements. The default value is comma.  If this parameter contains more than one character, ColdFusion processes each occurrence of each character as a delimiter.

### Example

```
<cfquery name = "SearchByDepartment" datasource = "cfdocexamples">
SELECT Department
FROM Employees
</cfquery>

<h3>ListValueCountNoCase Example</h3>
<p>This example uses ListValueCountNoCase to count employees in a department.

<form action = "listvaluecountnocase.cfm">
<p>Select a department:</p>
  <select name = "departmentName">
    <option value = "Accounting">
      Accounting
    </OPTION>
    <option value = "Administration">
      Administration
    </OPTION>
    <option value = "Engineering">
      Engineering
    </OPTION>
    <option value = "Sales">
      Sales
    </OPTION>
  </select>
</select>
<input type = "Submit" name = "Submit" value = "Search Employee List">
</form>
<!-- wait to have a string for searching defined -->
<cfif IsDefined("FORM.Submit") and IsDefined("FORM.departmentName")>
  <cfset myList = ValueList(SearchByDepartment.Department)>
  <cfset numberInDepartment = ListValueCountNoCase(myList,
    FORM.departmentName)>

  <cfif numberInDepartment is 0>
    <h3>There are no employees in <cfoutput>#FORM.departmentName#</cfoutput></h3>
  <cfelseif numberInDepartment is 1>
    <cfoutput><p>There is only one person in #FORM.departmentName#.
  </cfoutput>
  <cfelse>
    <cfoutput><p>There are #numberInDepartment# people in #FORM.departmentName#.
  </cfoutput>
  </cfif>
</cfif>
```

## Justify

### Description

Left justifies characters in a string of a specified length.

### Returns

A copy of a string, left-justified.

## Category

[Display and formatting functions](#), [String functions](#)

## Function syntax

LJustify(*string*, *length*)

## See also

[CJustify](#), [RJustify](#)

## Parameters

Parameter	Description
string	A string or a variable that contains one
length	Length of field in which to justify string

## Example

```
<!--- This example shows how to use LJustify --->
<cfparam name = "jstring" default = "">

<cfif IsDefined("FORM.justifyString")>
    <cfset jstring = LJustify(FORM.justifyString, 35)>
</cfif>
<html>
<head>
    <title>LJustify Example</title>
</head>
<body>

<h3>LJustify Function</h3>
<p>Enter a string, and it will be left justified within the sample field

<form action = "ljustify.cfm">
<p><input type = "Text" value = "<cfoutput>#jString#</cfoutput>"
    size = 35 name = "justifyString">

<p><input type = "Submit" name = ""> <input type = "RESET">
</form>
```

## Location

### Description

A function equivalent of the `cflocation` tag and is used in the `<cfscript>` mode.

### Parameters

Same as the `<cflocation>` tag.

## Category

[Data output functions](#)

### Function syntax

```
location("url", addtoken, statusCode);
```

For positional notations, the sequence must be followed exactly in the same manner as provided in the syntax. If you do not provide one of the parameters, use an empty string instead. This does not apply to Boolean values for which you must provide proper values even if you have to skip them.

### See also

[cfscript](#), [cflocation](#)

### Usage

You can call this function as name=value pair or as positional argument.

### Example

```
<cfscript>  
    location(url="http://localhost:8500/administrator")  
</cfscript>
```

## Log

### Description

Calculates the natural logarithm of a number. Natural logarithms are based on the constant e (2.71828182845904).

### Returns

The natural logarithm of a number.

### Category

[Mathematical functions](#)

### Function syntax

```
Log(number)
```

### See also

[Exp](#), [Log10](#)

### Parameters

Parameter	Description
number	Positive real number for which to calculate the natural logarithm

### Example

```
<h3>Log Example</h3>

<cfif IsDefined("FORM.number")>
    <cfoutput>
        <p>Your number, #FORM.number#
        <br>#FORM.number# raised to the E power: #exp(FORM.number)#
        <cfif FORM.number LTE 0><br>Enter a positive real number to get its
        natural logarithm
            <cfelse><br>The natural logarithm of #FORM.number#: #log(FORM.number)#
        </cfif>
        <cfif FORM.number LTE 0><br>Enter a positive real number to get its
        logarithm to base 10
            <cfelse><br>The logarithm of #FORM.number# to base 10: #log10(FORM.number)#
        </cfif>
    </cfoutput>
</cfif>
<cfform action = "log.cfm">
Enter a number to see its value raised to the E power, its natural logarithm,
and the logarithm of number to base 10.

    validate = "float" required = "No">
<input type = "Submit" name = ">
</cfform>
```

## Log10

### Description

Calculates the logarithm of *number*, to base 10.

### Returns

Number; the logarithm of *number*, to base 10.

### Category

[Mathematical functions](#)

### Function syntax

Log10 (*number*)

### See also

[Exp](#), [Log](#)

### Parameters

Parameter	Description
number	Positive real number for which to calculate the logarithm

### Example

```
<h3>Log10 Example</h3>
<cfif IsDefined("FORM.number")>
    <cfoutput>
        <p>Your number, #FORM.number#
        <br>#FORM.number# raised to the E power: #exp(FORM.number)#
        <cfif FORM.number LTE 0><br>You must enter a positive real number to

<input type = "Submit" name = "">
</cfform>
```

## LSCurrencyFormat

### Description

Formats a number in a locale-specific currency format. For countries that use the euro, the result depends on the JVM.

### Returns

A formatted currency value.

### Category

[Display and formatting functions](#), [International functions](#)

### Function syntax

```
LSCurrencyFormat(number [, type, locale])
```

### See also

[LSEuroCurrencyFormat](#), [LSIsCurrency](#), [LSParseCurrency](#), [LSParseEuroCurrency](#), [SetLocale](#); Handling data in ColdFusion in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added the `locale` parameter.

ColdFusion MX: Changed formatting behavior: this function might return different formatting than in earlier releases. If a negative number is passed to it, it returns a negative number. If `type = "local"`, it returns the value in the current locale's standard format. If `type = "international"`, it returns the value in the current locale's international standard format. This function uses Java standard locale formatting rules on all platforms.

### Parameters

Parameter	Description
number	Currency value
type	<ul style="list-style-type: none"><li>• local: the currency format and currency symbol used in the locale.<ul style="list-style-type: none"><li>- With JDK 1.3, the default for Euro Zone countries is their local currency.</li><li>- With JDK 1.4, the default for Euro Zone countries is the euro.</li></ul></li><li>• international: the international standard currency format and currency symbol of the locale.</li><li>• none: the currency format used in the locale; no currency symbol</li></ul>
locale	Locale to use instead of the locale of the page when processing the function

### Usage

This function uses Java standard locale formatting rules on all platforms.

**Note:** With a Sun 1.3.1-compliant JVM, use the [LSEuroCurrencyFormat](#) function to format euro currency values.

### Currency output

The following table shows sample currency output. For locales that use Euro, the Local and International columns contains two entries. The first is entry is the result with a Sun the 1.4.1 or later compliant JVM, the second entry is the result with a 1.3.1-compliant JVM.

Locale	Type = Local	Type = International	Type = None

Swedish	100.000,00 kr	SEK100.000,00	100.000,00

**Note:** ColdFusion maps Spanish (Modern) to the Spanish (Standard) format.

To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

### Example

```
<h3>LSCurrencyFormat Example</h3>
<p>LSCurrencyFormat returns a currency value using the locale
convention. Default value is "local."
<!-- loop through list of locales; show currency values for 100,000 units -->
<cfloop LIST = "#Server.Coldfusion.SupportedLocales#"
index = "locale" delimiters = ",">
    <cfset oldlocale = SetLocale(locale)>
    <cfoutput><p><b><i>#locale#</i></b><br>
        Local: #LSCurrencyFormat(100000, "local")#<br>
        International: #LSCurrencyFormat(100000, "international")#<br>
        None: #LSCurrencyFormat(100000, "none")#<br>
    <hr noshade>
</cfoutput>
</cfloop>
```

## LSDateFormat

### Description

Formats the date part of a date/time value in a locale-specific format.

### Returns

A formatted date/time value. If no mask is specified, the value is formatted according to the locale setting of the client computer.

### Category

[Date and time functions](#), [Display and formatting functions](#), [International functions](#)

### Function syntax

```
LSDateFormat(date [, mask, locale])
```

### See also

[LSParseDateTime](#), [LSTimeFormat](#), [DateFormat](#), [SetLocale](#); *Handling data in ColdFusion in the Developing ColdFusion Applications*

### History

ColdFusion 8: Added the `locale` parameter.

ColdFusion MX:

- Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java standard locale formatting rules on all platforms.
- Added support for the following *mask* parameter options: `short`, `medium`, `long`, and `full`.

### Parameters

Parameter	Description
date	A date/time object, in the range 100 AD–9999 AD.
mask	<p>Characters that show how ColdFusion displays the date:</p> <ul style="list-style-type: none"><li>• d: Day of month. Digits; no leading zero for single-digit days</li><li>• dd: Day of month. Digits; leading zero for single-digit days</li><li>• ddd: Day of week, abbreviation</li><li>• dddd: Day of week, Full name</li><li>• m: Month. Digits; no leading zero for single-digit months</li><li>• mm: Month. Digits; leading zero for single-digit months</li><li>• mmm: Month, abbreviation (if appropriate)</li><li>• mmmm: Month, Full name</li><li>• y: Year. Last two digits; no leading zero for years less than 10</li><li>• yy: Year. Last two digits; leading zero for years less than 10</li><li>• yyyy: Year. Four digits</li><li>• gg: Period/era string. Not processed. Reserved for future use</li></ul> <p>The following conform to Java locale-specific time encoding standards. Their exact formats depend on the locale:</p> <ul style="list-style-type: none"><li>• short: dd, mm, and yy separated by / marks</li><li>• medium: text format using mmm, d, and yyyy</li><li>• long: text format using mmmm, d, and yyyy</li><li>• full: text format using dddd, mmmm, d, and yyyy</li></ul> <p>The default value is medium</p> <p>For more information on formats, see <a href="#">LSParseDateTime</a>.</p>
locale	Locale to use instead of the locale of the page when processing the function

### Usage

This function uses Java standard locale formatting rules on all platforms.

When passing date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

To calculate a difference between time zones, use the [GetTimeZoneInfo](#) function.

### Example

```
<h3>LSDateFormat Example</h3>
<p>LSDateFormat formats the date part of a date/time value using the
    locale convention.
<!-- loop through a list of locales; show date values for Now() -->
<cfloop list = "#Server.Coldfusion.SupportedLocales#"
    index = "locale" delimiters = ",">
    <cfset oldlocale = SetLocale(locale)>

    <cfoutput><p><B><I>#locale#</I></B><br>
        #LSDateFormat(Now(), "mmm-dd-yyyy")#<br>
        #LSDateFormat(Now(), "mmm d, yyyy")#<br>
        #LSDateFormat(Now(), "mm/dd/yyyy")#<br>
        #LSDateFormat(Now(), "d-mmm-yyyy")#<br>
        #LSDateFormat(Now(), "ddd, mmmm dd, yyyy")#<br>
        #LSDateFormat(Now(), "d/m/yy")#<br>
        #LSDateFormat(Now())#<br>
    <hr noshade>
    </cfoutput>
</cfloop>
```

## LSEuroCurrencyFormat

### Description

Formats a number in a locale-specific currency format.

### Returns

A formatted currency value. For countries in the Euro currency zone, the function uses the locale's rule's for formatting currency in euros.

### Category

[Display and formatting functions](#), [International functions](#)

### Function syntax

```
LSEuroCurrencyFormat(currency-number [, type, locale])
```

### See also

[LSParseEuroCurrency](#), [LSCurrencyFormat](#), [SetLocale](#); Locale-specific content in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added the `locale` parameter.

ColdFusion MX: Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java locale formatting rules on all platforms, except that it uses the rule detailed in the Usage section for countries in the Euro currency zone. As a result, it format currencies for non-Euro zone locales using the country's currency, not euros.

### Parameters

Parameter	Description
currency-number	Currency value.
locale	Locale to use instead of the locale of the page when processing the function
type	<ul style="list-style-type: none"><li>local: the currency format used in the locale. (Default.)</li><li>international: the international standard currency format of the locale. For example, EUR10.00</li><li>none: the currency format used in the locale; no currency symbol</li></ul>

### Usage

This function uses euro currency formatting rules for all JVM versions, as follows:

- If the country of the current locale belongs to the Euro Zone (whose members have converted to the euro) the formatted output for the local type includes the Euro currency sign (€); for the international type, the output includes the euro currency symbol (EUR). If the value is negative, the format includes a negative sign before the value or parentheses around the value, according to the formatting rules of the current locale.
- If the country of the current locale is not in the Euro Zone, the currency sign or symbol of the current locale displays. If the value is negative, the format includes a negative sign before the value or parentheses around the value, according to the formatting rules of the current locale.

For a list of the locale options that ColdFusion supports, and information on setting the default display format of date, time, number, and currency values, see “[SetLocale](#)” on page 1174.

### Currency output

The following table shows examples of currency output:

Locale	Type = Local	Type = International	Type = None
Chinese (China)	¥100,000.00	CNY100,000.00	100,000.00
Chinese (Hong Kong)	HK\$100,000.00	HKD100,000.00	100,000.00
Chinese (Taiwan)	NT\$100,000.00	TWD100,000.00	100,000.00

French (Swiss)	SFr. 100'000.00	CHF100'000.00	100'000.00
German (Austrian)	€ 100.000,00	EUR100.000,00	100.000,00

Locale	Type = Local	Type = International	Type = None
German (Standard)	100.000,00 €	EUR100.000,00	100.000,00
German (Swiss)	SFr. 100'000.00	CHF100'000.00	100'000.00
Italian (Standard)	€ 100.000,00	EUR10.000.000	10.000.000
Italian (Swiss)	SFr. 100'000.00	CHF100'000.00	100'000.00
Japanese	¥100,000	JPY100,000	JPY100,000
Korean	₩100,000	KRW100,000	100,000
Norwegian (Bokmal)	kr 100 000,00	NOK100 000,00	100 000,00
Norwegian (Nynorsk)	kr 100 000,00	NOK100 000,00	100 000,00
Portuguese (Brazilian)	R\$100.000,00	BRC100.000,00	100.000,00
Portuguese (Standard)	100.000,00 €	EUR100.000,00	100.000,00
Spanish (Mexican)	\$100,000.00	MXN100,000.00	100,000.00
Spanish (Modern)	100.000,00 €	EUR10.000.000	10.000.000
Spanish (Standard)	100.000,00 €	ESP10.000.000	10.000.000
Swedish	100.000,00 kr	SEK100.000,00	100.000,00

**Note:** ColdFusion uses the Spanish (Standard) formats for Spanish (Modern) and Spanish (Standard).

The following example shows how the function formats negative values. The format includes a negative sign before the value, or parentheses around the value, according to the formatting rules of the current locale.

Input value	Output if locale = French (Standard)	Output if locale = English (US)
-1234.56	-1 234,56 €	(\$1,234.56)

### Example

```
<h3>LSEuroCurrencyFormat Example</h3>
<p>LSEuroCurrencyFormat returns a currency value using the locale
convention. Default value is "local."
<!-- Loop through list of locales, show currency values for 100,000 units -->
<cfloop list = "#Server.Coldfusion.SupportedLocales#"
index = "locale" delimiters = ",">
  <cfset oldlocale = SetLocale(locale)>
  <cfoutput><p><B><I>#locale#</I></B><br>
    Local: #LSEuroCurrencyFormat(100000, "local")#<br>
    International: #LSEuroCurrencyFormat(100000, "international")#<br>
    None: #LSEuroCurrencyFormat(100000, "none")#<br>
  <Hr noshade>
</cfoutput>
</cfloop>
```

## LSIsCurrency

### Description

Determines whether a string is a valid representation of a currency amount in the current locale.

### Returns

True, if the parameter is formatted as a valid currency amount, including the appropriate currency indicator. The return value is True for amounts in the local, international, or none currency formats.

### Category

[Display and formatting functions](#), [Decision functions](#), [International functions](#)

### Function syntax

```
LSIsCurrency(string [, locale])
```

### See also

[GetLocale](#), [SetLocale](#), [LSCurrencyFormat](#)

### History

ColdFusion 8: Added the `locale` parameter.

ColdFusion MX: Changed formatting behavior: this function might return a different result than in earlier releases. This function uses Java standard locale formatting rules on all platforms; the results might vary depending upon the JVM; for example, Sun JVM 1.4.1 requires euro format the local currency if the current locale's country belongs to the Euro Zone.

### Parameters

Parameter	Description
<code>string</code>	A currency string or a variable that contains one.
<code>locale</code>	Locale to use instead of the locale of the page when processing the function

### Usage

For examples of ColdFusion code and output that shows differences between earlier ColdFusion releases and ColdFusion MX in accepting input formats and displaying output, see [LSCurrencyFormat](#).

**Note:** If the locale belongs to a Euro zone country and the currency is a correctly formatted euro value for the locale, this function returns True for all JVMs, including Sun 1.3.1. As a result, with 1.3.1-compliant JVMs, the `LSIsCurrency` function does not ensure that [LSParseCurrency](#) returns a value. If a currency uses the older country-specific format for Euro Zone locales, the `LSIsCurrency` function returns False for newer JVMs, such as Sun 1.4.1 and 1.6, and True for older JVMs, such as Sun 1.3.1.

**Note:** To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

### Example

```
<h3>LSIsCurrency Example</h3>

<cfif IsDefined("FORM.locale")>
<!-- if locale is defined, set locale to that entry -->
<cfset NewLocale = SetLocale(FORM.locale)>

<p>Is the value "<cfoutput>#FORM.myValue#</cfoutput>"
    a proper currency value for <cfoutput>#GetLocale()#</cfoutput>?
<p>Answer: <cfoutput>#LSIsCurrency(FORM.myValue)#</cfoutput>
</cfif>

<p><form action = "LSIsCurrency.cfm">
<p>Select a locale for which you would like to check a currency value:
<!-- check the current locale for server -->
<cfset serverLocale = GetLocale()>
```

## LSIsDate

### Description

Determines whether a string is a valid representation of a date/time value in the current locale.

### Returns

True, if the string can be formatted as a date/time value in the current locale; False, otherwise.

### Category

[Date and time functions](#), [Display and formatting functions](#), [International functions](#)

### Function syntax

```
LSIsDate(string [, locale])
```

### See also

[CreateDateTime](#), [GetLocale](#), [IsNumericDate](#), [LSDateFormat](#), [ParseDateTime](#), [SetLocale](#); Handling data in ColdFusion in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added the `locale` parameter.

ColdFusion MX:

- Changed formatting behavior: this function might return a different result than in earlier releases. This function uses Java standard locale formatting rules on all platforms.
- Changed behavior: this function accepts a dash or hyphen character only in the Dutch(Standard) and Portuguese(Standard) locales. If called this way (for example, `LSIsDate("3-1-2002")`) in any other locale, this function returns False. (Earlier releases returned True.)
- Changed behavior: when using the SUN JRE 1.3.1 on an English(UK) locale, this function returns False for a date that has a one-digit month or day (for example, 1/1/01). To work around this, insert a zero in a one-digit month or day (for example, 01/01/01).

### Parameters

Parameter	Description
string	A string or a variable that contains one
locale	Locale to use instead of the locale of the page when processing the function

### Usage

A date/time object is in the range 100 AD–9999 AD.

To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

### Example

```
<h3>LSIsDate Example</h3>
<cfif IsDefined("FORM.locale")>
    <!-- if locale is defined, set locale to that entry -->
    <cfset NewLocale = SetLocale(FORM.locale)>
    <p>Is the value "<cfoutput>#FORM.myValue#</cfoutput>" a proper date
    value for <cfoutput>#GetLocale()#</cfoutput>?
    <p>Answer: <cfoutput>#LSIsDate(FORM.myValue)#</cfoutput>
</cfif>
<p><form action = "LSIsDate.cfm">
<p>Select a locale for which you would like to check a date value:
<!-- check the current locale for server -->
<cfset serverLocale = GetLocale()>
```

## LSIsNumeric

### Description

Determines whether a string is a valid representation of a number in the current locale.

### Returns

True, if the string represents a number the current locale; False, otherwise.

### Category

[Decision functions](#), [International functions](#), [String functions](#)

### Function syntax

```
LSIsNumeric(string [, locale])
```

### See also

[GetLocale](#), [SetLocale](#); Handling data in ColdFusion in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added the `locale` parameter.

ColdFusion MX: Changed formatting behavior: this function might return a different result than in earlier releases. This function uses Java standard locale formatting rules on all platforms.

### Parameters

Parameter	Description
string	A string or a variable that contains one
locale	Locale to use instead of the locale of the page when processing the function

### Usage

To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

### Example

```
<h3>LSIsNumeric Example</h3>

<cfif IsDefined("FORM.locale")>
<!-- if locale is defined, set locale to that entry -->
<cfset NewLocale = SetLocale(FORM.locale)>

<p>Is the value "<cfoutput>#FORM.myValue#</cfoutput>"
a proper numeric value for <cfoutput>#GetLocale()#</cfoutput>?

<p>Answer: <cfoutput>#LSIsNumeric(FORM.myValue)#</cfoutput>
</cfif>

<p><form action = "LSIsNumeric.cfm">

<p>Select a locale for which to check a numeric value:
...
```

## LSNumberFormat

### Description

Formats a number in a locale-specific format.

### Returns

A formatted number.

- If no mask is specified, it returns the number formatted as an integer
- If no mask is specified, truncates the decimal part; for example, it truncates 34.57 to 35
- If the specified mask cannot correctly mask a number, it returns the number unchanged
- If the parameter value is "" (an empty string), it returns 0.

### Category

[Display and formatting functions](#), [International functions](#)

### Function syntax

```
LSNumberFormat(number [, mask, locale])
```

### See also

[GetLocale](#), [SetLocale](#); Handling data in ColdFusion in the *Developing ColdFusion Applications*

## History

ColdFusion 8: Added the `locale` parameter.

ColdFusion MX:

- Changed behavior: if the specified mask format cannot correctly mask a number, this function returns the number unchanged. (In earlier releases, it truncated the number or threw an error.) (If no mask is specified, ColdFusion MX truncates the decimal part as ColdFusion 5 does. For example, it truncates 1234.567 to 1235.)
- Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java standard locale formatting rules on all platforms.

## Parameters

Parameter	Description
<code>number</code>	Number to format
<code>mask</code>	<code>LSNumberFormat</code> mask characters apply, except: dollar sign, comma, and dot are mapped to their locale-specific equivalents.
<code>locale</code>	Locale to use instead of the locale of the page when processing the function

The following table lists the `LSNumberFormat` mask characters:

Character	Meaning
<code>_</code>	(Underscore.) Digit placeholder.
<code>9</code>	Digit placeholder. (Shows decimal places more clearly than <code>_</code> .)
<code>.</code>	Location of a mandatory decimal point (or locale-appropriate symbol).
<code>0</code>	Located to the left or right of a mandatory decimal point. Pads with zeros.
<code>()</code>	If number is less than zero, puts parentheses around the mask.
<code>+</code>	Puts plus sign before positive number; minus sign before negative number.
<code>-</code>	Puts space before positive number; minus sign before negative number.
<code>,</code>	Separates every third decimal place with a comma (or locale-appropriate symbol).
<code>L,C</code>	Left-justifies or center-justifies number within width of mask column. First character of mask must be L or C. The default value is right-justified.
<code>\$</code>	Puts a dollar sign (or locale-appropriate symbol) before formatted number. First character of mask must be the dollar sign (\$).
<code>^</code>	Separates left and right formatting.

**Note:** If you do not specify a sign for the mask, positive and negative numbers do not align in columns. To put a plus sign or space before positive numbers and a minus sign before negative numbers, use the plus or hyphen mask character, respectively.

## Usage

This function uses Java standard locale formatting rules on all platforms.

These examples show how symbols determine formats:

Number	Mask	Result
4.37	\$____.____	"\$ 4.37"
4.37	_\$____.____	" \$4.37"

Number	Mask	Result
-4.37	-____.____	"- 4.37"
-4.37	__-____.____	" -4.37"

An underscore determines whether the code is placed in the far or near position. Most code characters' effect is determined by the field in which they are located. This example shows how to specify where to put parentheses to display negative numbers:

Number	Mask	Result
3.21	C(_^_)	"( 3.21 )"
3.21	C_(^_)	" (3.21 )"
3.21	C(_^)_	"( 3.21) "
3.21	C_(^)_	" (3.21) "

[illegible]

### Example

```
<h3>LSNumberFormat Example</h3>
<p>LSNumberFormat returns a number value using the locale convention.
<!-- loop through a list of locales and show number values -->
<cfloop LIST = "#Server.Coldfusion.SupportedLocales#"
index = "locale" delimiters = ",">
    <cfset oldlocale = SetLocale(locale)>
    <cfoutput><p><b><i>#locale#</i></b><br>
        #LSNumberFormat (-1234.5678, "_____")#<br>
        #LSNumberFormat (-1234.5678, "_____.____")#<br>
        #LSNumberFormat (1234.5678, "_____")#<br>
        #LSNumberFormat (1234.5678, "_____.____")#<br>
        #LSNumberFormat (1234.5678, "$_(_____.____)")#<br>
        #LSNumberFormat (-1234.5678, "$_(_____.____)")#<br>
        #LSNumberFormat (1234.5678, "+_____.____")#<br>
        #LSNumberFormat (1234.5678, "-_____.____")#<br>
    </cfoutput>
</cfloop>
```

## LSParseCurrency

### Description

Converts a locale-specific currency string into a formatted number. Attempts conversion by comparing the string with each the three supported currency formats (none, local, international) and using the first that matches.

### Returns

A formatted number (string representation of a number) that matches the value of the parameter.

### Category

[International functions](#), [String functions](#)

### Function syntax

```
LSParseCurrency(string [, locale])
```

### See also

[LSParseEuroCurrency](#), [LSCurrencyFormat](#), [LSEuroCurrencyFormat](#), [LSIsCurrency](#); Locale-specific content in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added the `locale` parameter.

ColdFusion MX: Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java standard locale formatting rules on all platforms.

### Parameters

Parameter	Description
<code>string</code>	A locale-specific string a variable that contains one
<code>locale</code>	Locale to use instead of the locale of the page when processing the function

### Usage

This function uses the locale formatting rules of the JVM (specified in the ColdFusion Administrator Java and JVM page) on all platforms. These rules changed between Sun JVM 1.3.1 and JVM 1.4.1:

- JVM 1.3.1 requires that the local and international versions of currencies of countries in the Euro zone be formatted using the older, country-specific designations, such as 100.000,00 DM or DEM100.000,00 for the German (Standard) locale. Use the [LSParseEuroCurrency](#) function to parse euro currencies in these locales with JVM 1.3.1.
- JVM 1.4.1 requires that currencies for Euro zone countries be expressed as euros; for example 100.000,00 BADCHAR or EUR100.000,00.

**Note:** The [LSIsCurrency](#) function always returns *True* if the locale is in the Euro currency zone and the currency is expressed in euros, including when using JVM 1.3.1. As a result, with older JVMs, [LSIsCurrency](#) does not ensure that [LSParseCurrency](#) returns a value.

To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

For a list of the locale-specific formats used to parse the currency, see [LSCurrencyFormat](#).

### Example

```
<h3>LSParseCurrency Example</h3>
<p>LSParseCurrency converts a locale-specific currency string to a number.
  Attempts conversion through each of the three default currency formats.
<!-- loop through a list of locales; show currency values for 123,456 units -->
<cfloop LIST = "#Server.Coldfusion.SupportedLocales#"
index = "locale" delimiters = ",">
  <cfset oldlocale = SetLocale(locale)>
  <cfoutput><p><B><I>#locale#</I></B><br>
    Local: #LSCurrencyFormat(123456.78, "local")#<br>
    Parsed local Currency:
    #LSParseCurrency(LSCurrencyFormat(123456, "local"))#<br>
    International: #LSCurrencyFormat(123456.78999, "international")#<br>
    Parsed International Currency:
    #LSParseCurrency(LSCurrencyFormat(123456.78999, "international"))#<br>
    None: #LSCurrencyFormat(123456.78999, "none")#<br>
    Parsed None formatted currency:
    #LSParseCurrency(LSCurrencyFormat(123456.78999, "none"))#<br>
  <hr noshade>
</cfoutput>
</cfloop>
```

## LSParseDateTime

### Description

Converts a string that is a valid date/time representation in the current locale into a date/time object.

### Returns

A date/time object.

### Category

[Date and time functions](#), [Display and formatting functions](#), [International functions](#), [String functions](#)

### Function syntax

```
LSParseDateTime(date/time-string [, locale])
```

### See also

[LSDateFormat](#), [ParseDateTime](#), [SetLocale](#), [GetLocale](#); *Locales in the Developing ColdFusion Applications*

### History

ColdFusion 8: Added the `locale` parameter.

ColdFusion MX:

- Changed formatting behavior: this function might not parse string formats that worked with earlier releases. This function uses Java standard locale formatting rules on all platforms.
- Changed how the `date/time-string` parameter value is processed: ColdFusion processes the `date/time-string` parameter value time zone information differently than in earlier releases, as described in the Usage section.

### Parameters

Parameter	Description
<code>date/time-string</code>	A string a variable that contains one, in a format that is readable in the current locale.
<code>locale</code>	Locale to use instead of the locale of the page when processing the function

### Usage

This function can parse any date, time, or date/time combination that conforms to Java standard locale formatting rules for the current locale.

The following table lists some of the date/time values you can pass to this function in the English (US) locale. You can also pass only the date or the time parts of these formats:

Format	Example
<code>m/dd/yy h:mm:ss</code>	1/30/02 7:02:33
<code>m/dd/yy h:mm tt</code>	1/30/02 7:02 AM
<code>m/dd/yyyy h:mm</code>	1/30/2002 7:02 AM
<code>mmm dd, yyyy h:mm:ss tt</code>	Jan 30, 2002 7:02:12 AM
<code>mmmm dd, yyyy h:mm:ss tt zzz</code>	January 30, 2002 7:02:23 AM PST
<code>ddd, mmm dd, yyyy hh:mm:ss</code>	Wed, Jan 30, 2002 07:02:12
<code>dddd, mmmm dd, yyyy h:mm:ss tt zzz</code>	Wednesday, January 30, 2002 7:02:12 AM PST

Valid dates are in the range 100 AD–9999 AD. Two-digit years in the range 00–29 are interpreted as being 2000–2029. Two-digit years in the range 30–99 are interpreted as being 1930–1999

This function corrects for differences between the current time zone and any time zone specified in the input parameter.

- If a time zone specified in the `date/time-string` parameter is different from the time zone setting of the computer, ColdFusion adjusts the time value to its equivalent in the computer time zone.
- If a time zone is not specified in the `date/time-string` parameter, ColdFusion does not adjust the time value.

**Note:** This function does not accept POP dates, which include a time zone offset value.

### Example

```
<h3>LSParseDateTime Example - returns a locale-specific date/time object</h3>
<!-- loop through a list of locales and show date values for Now() -->
<cfloop LIST = "#Server.Coldfusion.SupportedLocales#"
index = "locale" delimiters = ",">
    <cfset oldlocale = SetLocale(locale)>
    <cfoutput><p><B><I>#locale#</I></B><br>
        <p>Locale-specific formats:
        <br>#LSDateFormat(Now(), "mmm-dd-yyyy")# #LSTimeFormat(Now())#<br>
        #LSDateFormat(Now(), "mmm d, yyyy")# #LSTimeFormat(Now())#<br>
        #LSDateFormat(Now(), "mm/dd/yyyy")# #LSTimeFormat(Now())#<br>
        #LSDateFormat(Now(), "d-mmm-yyyy")# #LSTimeFormat(Now())#<br>
        #LSDateFormat(Now(), "ddd, mmm dd, yyyy")# #LSTimeFormat(Now())#<br>
        #LSDateFormat(Now(), "d/m/yy")# #LSTimeFormat(Now())#<br>
        #LSDateFormat(Now())# #LSTimeFormat(Now())#<br>
        <p>Standard Date/Time:
        #LSParseDateTime("#LSDateFormat(Now())# #LSTimeFormat(Now())#")#<br>
    </cfoutput>
</cfloop>
```

## LSParseEuroCurrency

### Description

Formats a locale-specific currency string as a number. Attempts conversion through each of the default currency formats (none, local, international). Ensures correct handling of euro currency for Euro zone countries.

### Returns

A formatted number that matches the value of the string.

### Category

[International functions](#), [String functions](#)

### Function syntax

```
LSParseEuroCurrency(currency-string [, locale])
```

### See also

[LSParseCurrency](#), [LSEuroCurrencyFormat](#), [SetLocale](#); Locale-specific content in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added the `locale` parameter.

ColdFusion MX: Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java locale formatting rules on all platforms, except that it uses the rule detailed in the Usage section for countries in the Euro currency zone.

### Parameters

Parameter	Description
currency-string	Locale-specific string or a variable that contains one.
locale	Locale to use instead of the locale of the page when processing the function

### Usage

This function determines whether the current locale's country belongs to the Euro Zone, whose members have converted to the euro; if so, the `currency-string` parameter must be formatted in euros on all JVMs, including Sun JVM 1.3.1. If the country is not in the Euro zone, the string must follow the locale formatting rules of the JVM. For examples of valid currency formats in all supported locales, see "[LSEuroCurrencyFormat](#)" on page 1089.

For a list of the locale options that ColdFusion supports, and information on setting the default display format of date, time, number, and currency values, see [SetLocale](#).

### Example

```
<h3>LSParseEuroCurrency Example</h3>
<p>Loop through all available locales. Create string representations of the value
123,456 in the three supported currency formats,
and parse the results back to numbers.<p>
<cfloop list="#Server.Coldfusion.SupportedLocales#" index="locale" delimiters=",">
  <cfset oldlocale = SetLocale(locale)>
  <cfoutput><p>Current Locale: <b><i>#locale#</i></b><br>
  <cfset localCurrency = LSEuroCurrencyFormat(123456, "local")>
    Value in local currency: #localCurrency#<br>
    Parsed using LSParseEuroCurrency:
    #LSParseEuroCurrency(localCurrency)#<br>
  <cfset IntlCurrency = LSEuroCurrencyFormat(123456, "international")>
    Value with International currency formatting: #IntlCurrency#<br>
    Parsed using LSParseEuroCurrency:
    #LSParseEuroCurrency(IntlCurrency)#<br>
  <cfset Currency = LSEuroCurrencyFormat(123456, "none")>
    Value with no currency formatting: #currency#<br>
    Parsed using LSParseEuroCurrency:
    #LSParseEuroCurrency(Currency)#<br>
  <hr noshade>
</cfoutput>
</cfloop>
```

## LSParseNumber

### Description

Converts a string that is a valid numeric representation in the current locale into a formatted number.

### Returns

A formatted number that matches the value of the string.

### Category

[International functions](#), [String functions](#)

### Function syntax

`LSParseNumber(string [, locale])`

### See also

[LSParseDateTime](#), [SetLocale](#); Locales in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added the `locale` parameter.

ColdFusion MX: Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java standard locale formatting rules on all platforms.

### Parameters

Parameter	Description
<code>string</code>	A string or a variable that contains one
<code>locale</code>	Locale to use instead of the locale of the page when processing the function

### Usage

This function uses Java standard locale formatting rules on all platforms.

To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

### Example

```
<h3>LSParseNumber Example</h3>
<p>LSParseNumber converts a locale-specific string to a number.
    Returns the number matching the value of string.
<!-- loop through a list of locales and show number values -->
<cfloop LIST = "#Server.Coldfusion.SupportedLocales#"
index = "locale" delimiters = ",">
    <cfset oldlocale = SetLocale(locale)>

    <cfoutput><p><B><I>#locale#</I></B><br>
        #LSNumberFormat(-1234.5678, "_____")#<br>
        #LSNumberFormat(-1234.5678, "_____.____")#<br>
        #LSNumberFormat(1234.5678, "_____")#<br>
        #LSNumberFormat(1234.5678, "_____.____")#<br>
        #LSNumberFormat(1234.5678, "$_(_____.____)")#<br>
        #LSNumberFormat(-1234.5678, "$_(_____.____)")#<br>
        #LSNumberFormat(1234.5678, "+_____.____")#<br>
        #LSNumberFormat(1234.5678, "-_____.____")#<br>
        The actual number:
        #LSParseNumber(LSNumberFormat(1234.5678, "_____"))#<br>
    </cfoutput>
</cfloop>
```

## LSTimeFormat

### Description

Formats the time part of a date/time string into a string in a locale-specific format.

### Returns

A string representing the time value.

### Category

[Date and time functions](#), [Display and formatting functions](#), [International functions](#)

### Function syntax

```
LSTimeFormat(time [, mask ])
```

### See also

[LSParseDateTime](#), [LSDateFormat](#), [TimeFormat](#); *Locales in the Developing ColdFusion Applications*

### History

ColdFusion MX 6.1: Added the mask character L or l to represent milliseconds.

ColdFusion MX:

- Changed formatting behavior: this function might return different formatting than in earlier releases. This function uses Java standard locale formatting rules on all platforms.
- Added support for the following *mask* parameter options: `short`, `medium`, `long`, and `full`.

**Parameters**

Parameter	Description
string	<ul style="list-style-type: none"><li>• A date/time value</li><li>• A string that is convertible to a time value</li></ul> A date/time object is in the range 100 AD–9999 AD.
mask	<p>Masking characters that determine the format:</p> <ul style="list-style-type: none"><li>• h: Hours; no leading zero for single-digit hours (12-hour clock)</li><li>• hh: Hours; leading zero for single-digit hours. (12-hour clock)</li><li>• H: Hours; no leading zero for single-digit hours (24-hour clock)</li><li>• HH: Hours; leading zero for single-digit hours (24-hour clock)</li><li>• m: Minutes; no leading zero for single-digit minutes</li><li>• mm: Minutes; leading zero for single-digit minutes</li><li>• s: Seconds; no leading zero for single-digit seconds</li><li>• ss: Seconds; leading zero for single-digit seconds</li><li>• l: Milliseconds</li><li>• t: One-character time marker string, such as A or P.</li><li>• tt: Multiple-character time marker string, such as AM or PM</li></ul> <p>The following conform to Java locale-specific time encoding standards. Their exact formats depend on the locale:</p> <ul style="list-style-type: none"><li>• short: includes hours, minutes; may include AM or PM</li><li>• medium: includes hours, minutes; may include AM or PM</li><li>• long: medium plus time zone</li><li>• full: long, may also include an hour designator</li></ul> <p>The default value is short.</p>

**Usage**

This function uses Java standard locale formatting rules on all platforms.

When passing date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

To calculate a difference between time zones, use the [GetTimeZoneInfo](#) function.

To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

If no seconds value is passed to this function, and the mask value is `s`, the default output seconds format is one zero; for example, `ltimeformat(6:39, "h:m:s")` returns `6:39:0`. If the mask value is `ss`, it returns `6:39:00`.

### Example

```
<h3>LSTimeFormat Example</h3>

<p>LSTimeFormat returns a time value using the locale convention.

<!-- loop through a list of locales and show time values -->
<cfloop LIST = "#Server.Coldfusion.SupportedLocales#"
index = "locale" delimiters = ",">
    <cfset oldlocale = SetLocale(locale)>

    <cfoutput><p><B><I>#locale#</I></B><br>
#LSTimeFormat(Now())#<br>
#LSTimeFormat(Now(), 'hh:mm:ss')#<br>
#LSTimeFormat(Now(), 'hh:mm:ssT')#<br>
#LSTimeFormat(Now(), 'hh:mm:ssTT')#<br>
#LSTimeFormat(Now(), 'HH:mm:ss')#<br>
    <hr noshade>
</cfoutput>

</cfloop>
```

## LTrim

### Description

Removes leading spaces from a string.

### Returns

A copy of the string, without leading spaces.

### Category

[Display and formatting functions](#), [String functions](#)

### Function syntax

```
LTrim(string)
```

### See also

[RTrim](#), [ToBase64](#)

### Parameters

Parameter	Description
string	A string or a variable that contains one

### Example

```
<h3>LTrim Example</h3>

<cfif IsDefined("FORM.myText")>
<cfoutput>
<pre>
Your string:"#FORM.myText#"
Your string:"#LTrim(FORM.myText)#"
(left trimmed)
</pre>
</cfoutput>
</cfif>

<form action = "ltrim.cfm">
<p>Type in some text, and it will be modified by LTrim to remove
    leading spaces from the left
<p><input type = "Text" name = "myText" value = " TEST">

<p><input type = "Submit" name = "">
</form>
```

## Functions m-r

### Max

#### Description

Determines the greater of two numbers.

#### Returns

The greater of two numbers.

#### Category

[Mathematical functions](#)

#### Function syntax

*Max(number1, number2)*

#### See also

[Min](#)

#### Parameters

Parameter	Description
number1, number2	Numbers

### Example

```
<h3>Max Example</h3>
<cfif IsDefined("FORM.myNum1")>
    <cfif IsNumeric(FORM.myNum1) and IsNumeric(FORM.myNum2)>
        <p>The maximum of the two numbers is <cfoutput>#Max(FORM.myNum1,
            FORM.myNum2)#</cfoutput>
        <p>The minimum of the two numbers is <cfoutput>#Min(FORM.myNum1,
            FORM.myNum2)#</cfoutput>
    <cfelse>
        <p>Please enter two numbers
    </cfif>
</cfif>

<form action = "max.cfm">
<h3>Enter two numbers, see the maximum and minimum of them</h3>

Number 1 <input type = "Text" name = "MyNum1">
<br>Number 2 <input type = "Text" name = "MyNum2">

<br><input type = "Submit" name = "" value = "See results">
</form>
```

## Mid

### Description

Extracts a substring from a string.

### Returns

A string; the set of characters from *string*, beginning at *start*, of length *count*.

### Category

[String functions](#)

### Function syntax

`Mid(string, start, count)`

### See also

[Left](#), [Len](#), [Right](#)

### Parameters

Parameter	Description
string	A string or a variable that contains one. Must be single-quotation mark or double-quotation mark delimited.
start	A positive integer or a variable that contains one. Position at which to start count. Positions start with 1, not 0.
count	A positive integer or a variable that contains one. Number of characters to return. (Zero is not valid, but it does not throw an error.)

## Example

```
<h3>Mid Example</h3>

<cfif IsDefined("Form.myText")>
    <!--- If len returns 0 (zero), then show error message. --->
    <cfif Len(Form.myText)>
        <cfif Len(Form.myText) LTE Form.RemoveChars>
            <cfoutput><p style="color: red; font-weight: bold">Your string
                #Form.myText# only has #Len(Form.myText)# characters. You cannot output
                the #Form.removeChars# middle characters of this string because it is
                not long enough.</p></cfoutput>
        <cfelseif Form.startPos GTE Len(Form.myText)>
            <cfoutput><p style="color: red; font-weight: bold">Your string
                #Form.myText# only has #Len(Form.myText)# characters. You cannot start
                at position #Form.startPos#.</p></cfoutput>
        <cfelse>
            <cfoutput><p>Your original string: <strong>#Form.myText#</strong></p>
            <p>Your changed string, showing only the <strong>#Form.removeChars#
            </strong> middle characters: <strong>#Mid(Form.myText,
                Form.startPos, Form.removeChars)#</strong></p></cfoutput>
        </cfif>
    <cfelse>
        <p style="color: red; font-weight: bold">Please enter a string of more
            than 0 (zero) characters.</p>
    </cfif>
</cfif>

<form action="#<cfoutput>#CGI.ScriptName#</cfoutput>" method="POST">
    <p>Type in some text<br />
    <input type="Text" name="myText"></p>
    <p>Enter a starting position (from the beginning of the entered text)<br />
    <input name="startPos" type="text" size="1"></p>
    <p>How many characters do you want to show?
    <select name="RemoveChars">
        <option value="1">1
        <option value="3" selected>3
        <option value="5">5
        <option value="7">7
        <option value="9">9</select>
    <input type="Submit" name="Submit" value="Remove characters"></p>
</form>
```

## Min

### Description

Determines the lesser of two numbers.

### Returns

The lesser of two numbers.

### Category

[Mathematical functions](#)

### Function syntax

`Min(number1, number2)`

### See also

[Max](#)

### Parameters

Parameter	Description
number1, number2	Numbers

### Example

```
<h3>Min Example</h3>
<cfif IsDefined("FORM.myNum1")>
    <cfif IsNumeric(FORM.myNum1) and IsNumeric(FORM.myNum2)>
        <p>The maximum of the two numbers is <cfoutput>#Max(FORM.myNum1,
            FORM.myNum2)#</cfoutput>
        <p>The minimum of the two numbers is <cfoutput>#Min(FORM.myNum1,
            FORM.myNum2)#</cfoutput>
        <cfelse>
            <p>Please enter two numbers
        </cfif>
    </cfif>

<form action = "min.cfm">
<h3>Enter two numbers, and see the maximum and minimum of the two numbers</h3>

Number 1 <input type = "Text" name = "MyNum1">
<br>Number 2 <input type = "Text" name = "MyNum2">

<br><input type = "Submit" name = "" value = "See results">
</form>
```

## Minute

### Description

Extracts the minute value from a date/time object.

### Returns

The ordinal value of the minute, in the range 0–59.

### Category

[Date and time functions](#)

### Function syntax

`Minute(date)`

### See also

[DatePart](#), [Hash](#), [Second](#)

### Parameters

Parameter	Description
date	A date/time object, in the range 100 AD–9999 AD.

### Usage

When passing a date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

### Example

```
<h3>Minute Example</h3>
```

```
<cfoutput>
The time is currently #TimeFormat(Now())#.
We are in hour #Hour(Now())#, Minute #Minute(Now())#
and Second #Second(Now())# of the day.
</cfoutput>
```

## Month

### Description

Extracts the month value from a date/time object.

### Returns

The ordinal value of the month, in the range 1 (January) – 12 (December).

### Category

[Date and time functions](#)

### Function syntax

```
Month(date)
```

### See also

[DatePart](#), [MonthAsString](#), [Quarter](#)

### Parameters

Parameter	Description
date	Date/time object, in the range 100 AD–9999 AD.

### Usage

When passing a date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

**Note:** You can pass the [CreateDate](#) function or the [Now](#) function as the date parameter of this function; for example:  
`#Month(CreateDate(2001, 3, 3))#`.

### Example

```
<h3>Month Example</h3>
<cfif IsDefined("FORM.year")>
More information about your date:
<cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
<cfoutput>
  <p>Your date, #DateFormat(yourDate)#.
  <br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day
    #DayOfWeek(yourDate)# in the week.
  <br>This is day #Day(yourDate)# in the month of
    #MonthAsString(Month(yourDate))#, which has
    #DaysInMonth(yourDate)# days.
  <br>We are in week #Week(yourDate)# of #Year(yourDate)#
    (day #DayOfYear(yourDate)# of #DaysInYear(yourDate)#). <br>
  <cfif IsLeapYear(Year(yourDate))>This is a leap year
    <cfelse>This is not a leap year
  </cfif>
</cfoutput>
</cfif>
```

## MonthAsString

### Description

Determines the name of the month that corresponds to *month\_number*.

### Returns

A string; the name of the specified month, in the current locale.

### Category

[Date and time functions](#), [String functions](#)

### Function syntax

MonthAsString(*month\_number* [, *locale*])

### See also

[DatePart](#), [Month](#), [Quarter](#)

### History

ColdFusion 8: Added the *locale* parameter.

### Parameters

Parameter	Description
month_number	An integer in the range 1 – 12.
locale	Locale to use instead of the locale of the page when processing the function

### Example

```
<h3>MonthAsString Example</h3>

<cfif IsDefined("FORM.year")>
<p>More information about your date:
<cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>

<cfoutput>
<p>Your date, #DateFormat(yourDate)#.
<br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day
      #DayOfWeek(yourDate)# in the week.
<br>This is day #Day(YourDate)# in the month of
      #MonthAsString(Month(yourDate))#, which has
      #DaysInMonth(yourDate)# days.
<br>We are in week #Week(yourDate)# of #Year(yourDate)#
      (day #DayOfYear(yourDate)# of #DaysInYear(yourDate)#). <br>
      <cfif IsLeapYear(Year(yourDate))>This is a leap year
      <cfelse>This is not a leap year
      </cfif>
</cfoutput>
</cfif>
```

## Now

### Description

Gets the current date and time of the computer running the ColdFusion server. The return value can be passed as a parameter to date functions such as [DaysInYear](#) or [FirstDayOfMonth](#).

### Returns

A date/time object; the current date and time of the computer running the ColdFusion server.

### Category

[Date and time functions](#)

### Function syntax

```
Now()
```

### See also

[CreateDateTime](#), [DatePart](#)

### Example

```
<h3>Now Example</h3>
<p>Now returns the current date and time as a valid date/time object.

<p>The current date/time value is <cfoutput>#Now()#</cfoutput>
<p>You can also represent this as <cfoutput>#DateFormat(Now())#,
      #TimeFormat(Now())#</cfoutput>
```

## NumberFormat

### Description

Creates a custom-formatted number value. Supports the numeric formatting used in the U.S. For international number formatting, see [LSNumberFormat](#).

### Returns

A formatted number value:

- If no mask is specified, returns the value as an integer with a thousands separator.
- If the parameter value is "" (an empty string), returns 0.

### Category

[Display and formatting functions](#)

### Function syntax

```
NumberFormat ( number [, mask ] )
```

### See also

[DecimalFormat](#), [DollarFormat](#), [IsNumeric](#), [LSNumberFormat](#)

### History

ColdFusion MX: Changed behavior: if the mask format cannot correctly mask a number, this function returns the number unchanged. (It does not truncate the number nor throw an error.) (If no mask is selected, ColdFusion MX rounds the decimal part as ColdFusion 5 does. For example, it rounds 34.567 to 35.)

### Parameters

Parameter	Description
number	A number.
mask	A string or a variable that contains one. Set of characters that determine how ColdFusion displays the number

The following table explains mask characters:

Mask character	Meaning
_ (underscore)	Optional. Digit placeholder.
9	Optional. Digit placeholder. (Shows decimal places more clearly than _)
.	Location of a mandatory decimal point.
0	Located to the left or right of a mandatory decimal point. Pads with zeros.
()	If number is less than zero, puts parentheses around the mask.
+	Puts plus sign before positive number; minus sign before negative number.
-	Puts a space before positive number; minus sign before negative number.
,	Separates every third decimal place with a comma.

Mask character	Meaning
L,C	Left-justifies or center-justifies number within width of mask column. First character of mask must be L or C. The default value is right-justified.
\$	Puts a dollar sign before formatted number. First character of mask must be the dollar sign (\$).
^	Separates left and right formatting.

**Note:** If you do not specify a sign for the mask, positive and negative numbers do not align in columns. To put a plus sign or space before positive numbers and a minus sign before negative numbers, use the plus or minus sign, respectively.

### Usage

This function uses Java standard locale formatting rules on all platforms.

The position of symbols in format masks determines where the codes take effect. For example, if you put a dollar sign at the far left of a format mask, ColdFusion displays a dollar sign at the left edge of the formatted number. If you separate the dollar sign on the left edge of the format mask by at least one underscore, ColdFusion displays the dollar sign just to the left of the digits in the formatted number.

These examples show how symbols determine formats:

Number	Mask	Result
4.37	\$____.	"\$ 4.37"
4.37	_\$____.	" \$4.37"

The positioning can also show where to place the minus sign for negative numbers:

Number	Mask	Result
-4.37	-____.	"- 4.37"
-4.37	_ -____.	" -4.37"

The positions for a symbol are: far left, near left, near right, and far right. The left and right positions are determined by the side of the decimal point on which the code character is shown. For formats that do not have a fixed number of decimal places, you can use a caret (^) to separate the left fields from the right.

An underscore determines whether the code is placed in the far or near position. Most code characters' effect is determined by the field in which they are located. This example shows how to specify where to put parentheses to display negative numbers:

Number	Mask	Result
3.21	C(_ ^ _)	"( 3.21 )"
3.21	C_(^ _)	" (3.21 )"
3.21	C(_ ^) _	"( 3.21 ) "
3.21	C_(^ ) _	" (3.21) "

When converting from string to double, to prevent rounding errors, this function adds a rounding factor of 1.5543122344752E-014 to the converted number. For example, without adding the rounding factor, converting the string value 1.275 to double with two digits of precision results in a value of 1.2749999999999999, which would be rounded up to 1.27. By adding the rounding factor, the conversion correctly results in a value of 1.28.

To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

Parameter	Description
param 1	New instance of the CFC on the client.
param 2	Original instance of the CFC.

### Example

```
<cfset isNotConflict = ObjectEquals(originalobject, serverobject)>
<cfif isNotConflict>
<cfif operation eq "UPDATE">
<cfset obj = ORMGetSession().merge(clientobject)>
<cfset EntitySave(obj)>
<cfelseif operation eq "DELETE">
<cfset obj = ORMGetSession().merge(originalobject)>
<cfset EntityDelete(obj)>
</cfif>
<cfelse><!---Conflict--->
<cflog text = "is a conflict">
<cfset conflict = CreateObject("component", "CFIDE.AIR.conflict")>
<cfset conflict.serverobject = serverobject>
<cfset conflict.clientobject = clientobject>
<cfset conflict.originalobject = originalobject>
<cfset conflict.operation = operation>
<cfset conflicts[conflictcnt++] = conflict>
<cfcontinue>
```

## ObjectLoad

### Description

Loads a serialized ColdFusion array, CFC, DateTime object, Java object, query, or structure into memory as the corresponding object.

### Returns

The deserialized ColdFusion object, such as a CFC or a query object.

### Category

[Other functions](#)

### Function syntax

```
ObjectLoad(binaryObject)
ObjectLoad(filepath)
```

### See also

[ObjectSave](#)

### Parameters

Parameter	Description
binaryObject	A binary object returned by <code>ObjectSave</code> function.
filepath	A string specifying the path to a file containing a serialized complexobject, such as a query or CFC, or a variable that is a serializable binary representation of a complex object.  This parameter must be the name of a file or an object returned by the <code>SaveCFObject</code> function.

### Usage

This function is useful for handling dynamic data that has a relatively long period of usefulness and takes substantial time or resources to obtain. It lets you save the data in a file and use it in multiple application instances.

For example, you can create a CFC that stores a query that takes long time to run and retrieves infrequently updated data. If you use the `ObjectSave` function to initially save the CFC as a file, you can then deserialize the CFC file on future application starts and improve application performance.

### Example

```
<h3>Loading and saving an object.</h3>

<!-- Create the component object. -->
<cfoject component="tellTime" name="tellTimeObj">
<!-- Save the component object to a file. -->
<cfset ObjectSave(tellTimeObj, "data.out")/>
<!-- Load the component object again. -->
<cfset ObjLoaded = ObjectLoad("data.out") >
<!-- Invoke the methods from loaded objects. -->
<cfinvoke component="#ObjLoaded#" method="getLocalTime" returnvariable="localTime">
<cfinvoke component="#ObjLoaded#" method="getUTCtime" returnvariable="UTCtime">
<!-- Display the results. -->
<h3>Time Display Page</h3>
<cfoutput>
Server's Local Time: #localTime#<br>
Calculated UTC Time: #UTCtime#
</cfoutput>
```

## ObjectSave

### Description

Converts a ColdFusion array, CFC, `DateTime` object, Java object, query, or structure into a serializable binary object and optionally saves the object in a file.

### Returns

A serializable binary representation of the object.

### Category

[Other functions](#)

### Function syntax

```
ObjectSave(object[, filePath])
```

### See also

[ObjectLoad](#)

### Parameters

Parameter	Description
object	The complex object, such as a query or CFC, that will be serialized.
filePath	The path of the file in which to save the serialized data.

### Usage

This function is useful for handling dynamic data that has a relatively long period of usefulness and takes substantial time or resources to obtain. It lets you save the data in a file and use it in multiple application instances.

For example, you can create a CFC that stores a query that takes long time to run and retrieves infrequently updated data. If you use the `ObjectSave` function to initially save the CFC as a file, and deserialize the CFC file on future application starts, you can improve application performance.

### Example

```
<h3>Saving and loading an object</h3>

<!--- Create the component object. --->
<cfoobject component="tellTime" name="tellTimeObj">
<!--- Save the component object to a file. --->
<cfset ObjectSave(tellTimeObj, "data.out")/>

<!--- Load the component object again. --->
<cfset ObjLoaded = ObjectLoad("data.out") >

<!--- Invoke the methods from loaded objects. --->
<cfinvoke component="#ObjLoaded#" method="getLocalTime" returnvariable="localTime">
<cfinvoke component="#ObjLoaded#" method="getUTCtime" returnvariable="UTCtime">
<!--- Display the results. --->
<h3>Time Display Page</h3>
<cfoutput>
Server's Local Time: #localTime#<br>
Calculated UTC Time: #UTCtime#
</cfoutput>
```

## ORMClearSession

**Note:** This function has been enhanced in ColdFusion 9.0.1 to support multiple data sources in the same application. Install the ColdFusion 9 update to use the feature.

### Description

Clears the Hibernate session associated with the given data source.

The function clears the first level cache and removes the objects that are not yet saved to the database.

If you do not specify the data source, the Hibernate session associated with the default data source is cleared.

### Category

[ORM functions](#)

### Function Syntax

```
Ormclearsession([datasource])
```

### See Also

[ORMCloseSession](#), [ORMGetSession](#), [ORMFlush](#), [ORMGetSessionFactory](#), [ORMClearSession\(\)](#) in *Developing ColdFusion Applications*.

## ORMCloseSession

**Note:** This function has been enhanced in ColdFusion 9.0.1 to support multiple data sources in the same application. Install the ColdFusion 9 update to use the feature.

### Description

Closes the Hibernate session associated with the data source in the request. If you do not specify a data source, the Hibernate session associated with the default data source is closed.

### Category

[ORM functions](#)

### Function Syntax

```
ormcloseSession([datasource])
```

### See Also

[ORMGetSession](#), [ORMClearSession](#), [ORMFlush](#), [ORMGetSessionFactory](#), [ORMCloseSession\(\)](#) in *Developing ColdFusion Applications*.

## ORMCloseAllSessions

**Note:** This function has been added in ColdFusion 9.0.1 to support multiple data sources in the same application. Install the ColdFusion 9 update to use the feature.

### Description

Closes all Hibernate sessions in the request.

### Function Syntax

```
ormcloseallSessions()
```

### See Also

[ORMGetSession](#), [ORMClearSession](#), [ORMFlush](#), [ORMGetSessionFactory](#), [ORMCloseSession\(\)](#) in *Developing ColdFusion Applications*.

## ORMEvictCollection

### Description

This method is used to evict all the collection or association data for the given entity name and collection name, from the secondary cache. If the primary key is specified, then, the collection or association data of the entity with the primary key is evicted.

### Category

[ORM functions](#)

### See Also

[ORMEvictEntity](#), [ORMEvictQueries](#), Evict content from secondary cache in *Developing ColdFusion Applications*

### Function Syntax

```
ormevictcollection("<entity_name>", "<collection_name>", [primarykey])
```

### Parameters

Parameter	Description
entity name	Entity name of the persistent CFC.
collection name	Name of the collection in the component
primary key	Primary key of the collection or association data of the entity

### Example

To evict all the association or collection data of collection arts belonging to the component CARTists:

```
<cfset ORMEvictCollection("CARTists", "arts")>
```

## ORMEvictEntity

### Description

This method is used to evict items for the given entity name, from the secondary cache. If the primary key is specified, then the data of the entity with that primary key is evicted. Primary key should be a value in case of simple primary key or should be a struct in case of composite primary key.

### Category

[ORM functions](#)

### See Also

[ORMEvictCollection](#), [ORMEvictQueries](#), Evict content from secondary cache in *Developing ColdFusion Applications*

### Function Syntax

```
ORMEvictEntity("<entity_name>", [primarykey])
```

### Parameters

Parameter	Description
component name	Entity name of the persistent CFC
primary key	Primary key value of the component

### Example

To evict all the cache data of CARTist entity:

```
<cfset ORMEvictEntity("CARTists")>
```

To evict the cache data of CARTists entity whose primary key is 1:

```
<cfset ORMEvictEntity("CARTists", 1)>
```

## ORMEvictQueries

**Note:** This function has been enhanced in ColdFusion 9.0.1 to support multiple data sources in the same application. Install the ColdFusion 9 update to use the feature.

### Description

This method is used to evict the data of all the queries from the default query cache of the specified data source. If cache name is specified, then the data of all queries belonging to the cache region with the given cache name are evicted.

If no data source is specified, the default query cache of the default data source is evicted.

### Category

[ORM functions](#)

### See Also

[ORMEvictEntity](#), [ORMEvictCollection](#), Evict content from secondary cache in *Developing ColdFusion Applications*

### Syntax

```
ORMEvictQueries([cachename])  
ORMEvictQueries([cachename], datasource)
```

### Parameters

Parameter	Description
<code>cachename</code>	Name of the cache region that you want to evict.
<code>datasource</code>	Name of the data source whose cache you want to evict. If you do not specify the cache, the default query cache is evicted.

### Example

Evicts the data of all the queries from the default query cache.

```
<cfset ORMEvictQueries()>
```

Evicts the data of all the queries from the cache region with the name `availableArtsCache`.

```
<cfset ORMEvictQueries("availableArtsCache")>
```

## ORMExecuteQuery

**Note:** This function has been enhanced in ColdFusion 9.0.1 to support multiple data sources in the same application. Install the ColdFusion 9 update to use the feature.

### Description

Executes a Hibernate Query Language (HQL) query.

By default, this function works on ORM's default data source. To use this function for another data source, specify the data source key-value pair within the `queryoptions`.

### Syntax

```
ORMExecuteQuery(hql, [params] [,unique])  
ORMExecuteQuery(hql, [,unique] [, queryoptions])  
ORMExecuteQuery(hql, params [,unique] [,queryOptions])
```

### Parameters

Parameter	Description
Hql	The HQL query that has to be executed.
Params	Object parameter for the entity.
Unique	Specifies if the object parameter is unique.
Queryoptions	Key-value pair of options for the query.

### Example

```
<cfset artistArr = ORMExecuteQuery("from Artists where artistid=1", true,  
{datasource="cfartgallery"})>  
<cfset countArray = ORMExecuteQuery("select count(*) from Authors", [], false,  
{datasource="cfbookclub"})>
```

## ORMFlush

**Note:** This function has been enhanced in ColdFusion 9.0.1 to support multiple data sources in the same application. Install the ColdFusion 9 update to use the feature.

### Description

Flushes the Hibernate session associated with the data source in the request. ORMFlush flushes all pending CRUD operations in the request. Any changes made in the objects, in the current ORM session, are saved to the database.

If you do not specify the data source, the Hibernate session associated with the default data source is flushed.

### Category

[ORM functions](#)

### Function Syntax

```
ormflush([datasource])
```

### See Also

[ORMCloseSession](#), [ORMClearSession](#), [ORMGetSession](#), [ORMGetSessionFactory](#), [ORMFlush\(\)](#) in *Developing ColdFusion Applications*.

## ORMFlushall

**Note:** This function has been added in ColdFusion 9.0.1 to support multiple data sources in the same application. Install the ColdFusion 9 update to use the feature.

### Description

Flushes all the current Hibernate sessions in the request.

### Function syntax

```
ormflushall()
```

### See Also

[ORMCloseSession](#), [ORMClearSession](#), [ORMGetSession](#), [ORMGetSessionFactory](#), [ORMFlush\(\)](#) in *Developing ColdFusion Applications*.

## ORMGetSession

**Note:** This function has been enhanced in ColdFusion 9.0.1 to support multiple data sources in the same application. Install the ColdFusion 9 update to use the feature.

### Description

Returns the Hibernate session associated with the data source in the request. If ORM is not configured for this data source, it results in an exception. If data source is not specified, the Hibernate session of the default data source is returned.

Use this session object to call the APIs, which, otherwise, ColdFusion does not expose.

For information on session APIs, see:

<http://docs.jboss.org/hibernate/core/3.3/api/org/hibernate/Session.html>

### Category

[ORM functions](#)

### Function Syntax

```
ormgetsession([datasource])
```

### See Also

[ORMCloseSession](#), [ORMClearSession](#), [ORMFlush](#), [ORMGetSessionFactory](#), [ORMGetSession\(\)](#) in *Developing ColdFusion Applications*.

## ORMGetSessionFactory

**Note:** This function has been enhanced in ColdFusion 9.0.1 to support multiple data sources in the same application. Install the ColdFusion 9 update to use the feature.

### Description

Returns the Hibernate Session Factory object associated with the data source. Results in an error if ORM is not configured for this data source. If you do not specify the data source, the Hibernate session factory object associated with the default data source is returned.

For information on Session API, go to the following URL:

<http://docs.jboss.org/hibernate/core/3.3/api/org/hibernate/SessionFactory.html>

### Category

[ORM functions](#)

### Function Syntax

```
OrmgetSessionfactory([datasource])
```

### See Also

[ORMCloseSession](#), [ORMClearSession](#), [ORMFlush](#), [ORMGetSession](#) in *Developing ColdFusion Applications*.

## ORMReload

### Description

Reinitializes ORM for the application.

If you make any change to the persistent metadata of the CFCs, then you might want to reload the ORM.

### Returns

Returns ORM session factory instance.

### Category

“[ORM functions](#)” on page 693

### Function Syntax

```
ORMReload()
```

### Usage

Adobe recommends that you use this function only during the time of development.

### See Also

ColdFusion ORM

### Example

```
component
{
    this.name = Hash( GetCurrentTemplatePath() );
    /* define the application wide datasource */
    this.datasource = "cfartgallery";
    /* enable hibernate support for this application */
    this.ormenabled = true;
    /* create a struct of ORM settings */
    this.ormsettings = {};
    /* turn on event handling */
    this.ormsettings.eventhandling = true;
    /**
     * @output true
     */
    public boolean function onRequestStart( targetPage )
    {
        /* this is to ensure that ORM is up-to-date for demo */
        ORMReload();
        return true;
    }
}
```

## ParagraphFormat

### Description

Replaces characters in a string:

- Single newline characters (CR/LF sequences) with spaces
- Double newline characters with HTML paragraph tags (<p>)

### Returns

A copy of the string, with characters converted.

### Category

[Display and formatting functions](#), [String functions](#)

### Function syntax

ParagraphFormat(*string*)

### See also

[StripCR](#)

### Parameters

Parameter	Description
string	A string or a variable that contains one

### Usage

This function is useful for displaying data entered in textarea fields.

### Example

```
<h3>ParagraphFormat Example</h3>
<p>Enter text into this textarea, and see it returned as HTML.
<cfif IsDefined("FORM.myTextArea")>
    <p>Your text area, formatted
    <p><cfoutput>#ParagraphFormat(FORM.myTextArea)#</cfoutput>
</cfif>
<!-- use #Chr(10)##Chr(13)# to simulate a line feed/carriage
return combination; i.e, a return -->
<form action = "paragraphformat.cfm">
<textarea name = "MyTextArea" cols = "35" ROWS = 8>
This is sample text and you see how it scrolls
    <cfoutput>#Chr(10)##Chr(13)#</cfoutput>
    From one line
    <cfoutput>#Chr(10)##Chr(13)##Chr(10)##Chr(13)#</cfoutput>
    to the next

<input type = "Submit" name = "Show me the HTML version">
</form>
```

## ParameterExists

### Description

This function is deprecated. Use the `IsDefined` function.

Determines whether a parameter exists. ColdFusion does not evaluate the argument.

### History

ColdFusion MX: Deprecated this function. It might not work, and might cause an error, in later releases.

## ParseDateTime

### Description

Parses a date/time string according to the English (U.S.) locale conventions. (To format a date/time string for other locales, use the [LSParseDateTime](#) function.)

### Returns

A date/time object

### Category

[Date and time functions](#), [Display and formatting functions](#)

### Function syntax

```
ParseDateTime (date/time-string [, pop-conversion ])
```

### See also

[IsDate](#), [IsNumericDate](#), [SetLocale](#)

### Parameters

Parameter	Description
date/time string	A string containing a date/time value formatted according to U.S. locale conventions. Can represent a date/time in the range 100 AD–9999 AD. Years 0-29 are interpreted as 2000-2029; years 30-99 are interpreted as 1930-1999.
pop-conversion	<ul style="list-style-type: none"><li>pop: specifies that the date/time string is in POP format, which includes the local time of the sender and a time-zone offset from UTC. ColdFusion applies the offset and returns a value with the UTC time.</li><li>standard: (the default) function does no conversion.</li></ul>

### Usage

This function is similar to `CreateDateTime`, but it takes a string instead of enumerated date/time values. These functions are provided primarily to increase the readability of code in compound expressions.

To calculate a difference between time zones, use the [GetTimeZoneInfo](#) function.

To set the default display format of date, time, number, and currency values, use the [SetLocale](#) function.

### Example

```
<h3>ParseDateTime Example</h3>
<cfif IsDefined("form.theTestValue")>
    <cfif IsDate(form.theTestValue)>
        <h3>The expression <cfoutput>#DE(form.theTestValue)#</cfoutput> is a valid date</h3>
        <p>The parsed date/time is:
        <cfoutput>#ParseDateTime(form.theTestValue)#</cfoutput>
        <cfelse>
        <h3>The expression <cfoutput>#DE(form.theTestValue)#</cfoutput> is not a valid date</h3>
        </cfif>
    </cfif>

<form action="#CGI.ScriptName#" method="POST">
<p>Enter an expression, and discover if it can be evaluated to a date value.
<input type="Text" name="TheTestValue" value="<CFOUTPUT>#DateFormat(Now())#
    #TimeFormat(Now())#</CFOUTPUT>">
<input type="Submit" value="Parse the Date" name="">
</form>
```

## Pi

### Description

Gets the mathematical constant p, accurate to 15 digits.

### Returns

The number 3.14159265358979.

### Category

[Mathematical functions](#)

### Function syntax

Pi()

### See also

[ASin](#), [Cos](#), [Sin](#), [Tan](#)

### Example

```
<h3>Pi Example</h3>
<!-- By default, ColdFusion displays only 11 significant digits.
    Use NumberFormat to display all 15. -->
The Pi function Returns the number
<cfoutput>
#NumberFormat(Pi(), "_." <cfoutput> the mathematical constant pi, accurate to 15 digits.
```

## PrecisionEvaluate

### Description

Evaluates one or more string expressions, dynamically, from left to right, using BigDecimal precision arithmetic to calculate the values of arbitrary precision arithmetic expressions.

### Returns

An object; the result of the evaluations.

### Category

[Mathematical functions](#), [Dynamic evaluation functions](#)

### Function syntax

```
PrecisionEvaluate(string_expression1 [, string_expression2 , ... ])
```

### See also

[Evaluate](#), Using Expressions and Number Signs in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
string_expression1, string_expression2...	Expressions to evaluate

### Usage

The `PrecisionEvaluate` function lets you calculate arbitrarily long decimal (BigDecimal precision) values. BigDecimal precision arithmetic accepts and generates decimal numbers of any length, and does not use exponential notation.

The `PrecisionEvaluate` function calculates arbitrary precision results only for addition, subtraction, multiplication, and division. If you use any of the following operations, ColdFusion performs normal integer or floating point arithmetic and does not return BigDecimal values.

- exponentiation (^)
- modulus (MOD or %)
- integer division (/)

This function differs from the `Evaluate` function only in its use of BigDecimal precision arithmetic to calculate numeric values; otherwise the two functions are identical. The results of an evaluation on the left can have meaning in an expression to the right, and the function returns the result of evaluating the rightmost expression. If a string expression contains a single- or double-quotation mark, the mark must be escaped.

If an expression, such as 1/3, results in an infinitely repeating decimal value, ColdFusion limits the decimal part to 20 digits.

**Note:** To increase processing efficiency, do not put the arithmetic expressions to evaluate in quotation marks (""). ColdFusion compiles `PrecisionEvaluate(a*b)` more efficiently than it compiles `PrecisionEvaluate("a*b")`, although both formats produce the same results.

### Example

```
<h3>PrecisionEvaluate Example</h3>
<cfif IsDefined("FORM.myExpression")>
    <cftry>
        <!--- Evaluate the expression and display the result. --->
        <cfset theExpression = PrecisionEvaluate(FORM.myExpression)>
        <cfoutput>
            The value of the expression #FORM.MyExpression#
            is #theExpression#.<br>
        </cfoutput>

        <cfcatch type="any">
            <cfoutput>Could not evaluate the expression #Form.myExpression#.
            </cfoutput>
        </cfcatch>
    </cftry>
</cfif>

<cfform preservedata="yes">
    <h3>Enter a ColdFusion expression for evaluation.</h3>
    <p>Try using some really big decimal numbers.</p>
    <cfinput type="text" name="myExpression" size="60"><br>
    <br>
    <cfinput type="submit" name="submit">
</cfform>
```

## PreserveSingleQuotes

### Description

Prevents ColdFusion from automatically escaping single-quotation mark characters that are contained in a variable. ColdFusion does not evaluate the argument.

### Returns

(None)

### Category

[Other functions](#)

### Function syntax

`PreserveSingleQuotes(variable)`

### History

ColdFusion MX: Changed behavior: ColdFusion automatically escapes simple-variable, array-variable, and structure-variable references within a `cfquery` tag body or block. (Earlier releases did not automatically escape array-variable references.)

### Parameters

Parameter	Description
variable	Variable that contains a string in which to preserve single-quotation marks.

**Usage**

This function is useful in SQL statements to defer evaluation of a variable reference until runtime. This prevents errors that result from the evaluation of a single-quote or apostrophe data character (for example, "Joe's Diner") as a delimiter.

**Example A:** Consider this code:

```
<cfset mystring = "'Newton's Law', 'Fermat's Theorem'">
PreserveSingleQuotes(#mystring#) is
<cfoutput>
    #PreserveSingleQuotes(mystring)#
</cfoutput>
```

The output is as follows:

```
PreserveSingleQuotes(#mystring#) is 'Newton's Law', 'Fermat's Theorem'
```

**Example B:** Consider this code:

```
<cfset list0 = " '1','2', '3' ">
<cfquery sql = "select * from foo where bar in (#list0#)">
```

ColdFusion escapes the single-quote characters in the list as follows:

```
"'1'", "'2'", "'3'"
```

The `cfquery` tag throws an error.

You code this function correctly as follows:

```
<cfquery sql = "select * from foo where bar in (#preserveSingleQuotes(list0#))"> **tharwood
11/16
```

This function ensures that ColdFusion evaluates the code as follows:

```
'1', '2', '3'
```

**Example**

`<h3>PreserveSingleQuotes Example</h3>`  
This is a useful function for creating lists of information to return from a query. In this example, we pick the list of Centers in Suisun, San Francisco, and San Diego, using the SQL grammar IN to modify a WHERE clause, rather than looping through the result set after the query is run.

```
<cfset List = "'Suisun', 'San Francisco', 'San Diego'">
<cfquery name = "GetCenters" datasource = "cfdocexamples">
    SELECT Name, Address1, Address2, City, Phone
    FROM Centers
    WHERE City IN (#PreserveSingleQuotes(List)#)
</cfquery>
<p>We found <cfoutput>#GetCenters.RecordCount#</cfoutput> records.
<cfoutput query = "GetCenters">
    <p>#Name#<br>
    #Address1#<br>
    <cfif Address2 is not "">#Address2#
        </cfif>
    #City#<br>
    #Phone#<br>
</cfoutput>
```

## Quarter

### Description

Calculates the quarter of the year in which a date falls.

### Returns

An integer, 1–4.

### Category

[Date and time functions](#)

### Function syntax

```
Quarter(date)
```

### See also

[DatePart](#), [Month](#)

### Parameters

Parameter	Description
<code>date</code>	A date/time object in the range 100 AD–9999 AD.

### Usage

When passing a date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

### Example

```
<h3>Quarter Example</h3>
```

```
Today, <cfoutput>#DateFormat(Now())#</cfoutput>,  
is in Quarter <cfoutput>#Quarter(Now())#</cfoutput>.
```

## QueryAddColumn

### Description

Adds a column to a query and populates its rows with the contents of a one-dimensional array. Pads query columns, if necessary, to ensure that all columns have the same number of rows.

### Returns

The number of the column that was added.

### Category

[Query functions](#)

### Function syntax

```
QueryAddColumn(query, column-name [, datatype], array-name)
```

### See also

[QueryNew](#), [QueryAddRow](#), [QuerySetCell](#); Managing data types for columns in the *Developing ColdFusion Applications*

### History

ColdFusion MX 7: Added the `datatype` parameter.

ColdFusion MX: Changed behavior: if a user attempts to add a column whose name is invalid, ColdFusion throws an error. (In earlier releases, ColdFusion permitted the add operation, but the user could not reference the column after adding it.)

### Parameters

Parameter	Description
<code>query</code>	Name of a query object.
<code>column-name</code>	Name of the new column.
<code>datatype</code>	(Optional) Column data type. ColdFusion generates an error if data you add to the column is not of this type, or if it cannot convert the data to this type. The following data types are valid: <ul style="list-style-type: none"><li>• Integer: 32-bit integer</li><li>• BigInt: 64-bit integer</li><li>• Double: 64-bit decimal number</li><li>• Decimal: Variable length decimal, as specified by <code>java.math.BigDecimal</code></li><li>• VarChar: String</li><li>• Binary: Byte array</li><li>• Bit: Boolean (1=True, 0=False)</li><li>• Time: Time</li><li>• Date: Date (can include time information)</li></ul>
<code>array-name</code>	Name of an array whose elements populate the new column.

### Usage

You can add columns to query objects, such as queries retrieved with the `cfquery` tag or queries created with the `QueryNew` function. You cannot use the `QueryAddColumn` function on a cached query. This function is useful for generating a query object from the arrays of output parameters that Oracle stored procedures can generate.

Adobe recommends that you use the optional `datatype` parameter. Without this parameter, ColdFusion must try to determine the column's data type when it uses the query object in a query of queries. Determining the data type requires additional processing, and can result in errors if ColdFusion does not guess the type correctly.

### Example

The following example creates a query object, uses the `QueryAddColumn` function to add three columns to the object, and displays the results. Because two of the arrays that provide the data are shorter than the third, `QueryAddColumn` adds padding to the corresponding columns in the query.

```
<!--- Make a query. --->
<cfset myQuery = QueryNew("")>

<!--- Create an array. --->
<cfset FastFoodArray = ArrayNew(1)>
<cfset FastFoodArray[1] = "French Fries">
<cfset FastFoodArray[2] = "Hot Dogs">
<cfset FastFoodArray[3] = "Fried Clams">
<cfset FastFoodArray[4] = "Thick Shakes">
<!--- Use the array to add a column to the query. --->
<cfset nColumnNumber = QueryAddColumn(myQuery, "FastFood", "VarChar",
    FastFoodArray)>

<!--- Create a second array. --->
<cfset FineCuisineArray = ArrayNew(1)>
<cfset FineCuisineArray[1] = "Lobster">
<cfset FineCuisineArray[2] = "Flambe">
<!--- Use the array to add a second column to the query. --->
<cfset nColumnNumber2 = QueryAddColumn(myQuery, "FineCuisine", "VarChar",
    FineCuisineArray)>

<!--- Create a third array. --->
<cfset HealthFoodArray = ArrayNew(1)>
<cfset HealthFoodArray[1] = "Bean Curd">
<cfset HealthFoodArray[2] = "Yogurt">
<cfset HealthFoodArray[3] = "Tofu">
<!--- Use the array to add a third column to the query. --->
<cfset nColumnNumber3 = QueryAddColumn(myQuery, "HealthFood", "VarChar",
    HealthFoodArray)>

<!--- Display the results. --->
<table cellpadding = "2" cellspacing = "2" border = "0">
<tr>
<th align = "left">Fast Food</th>
<th align = "left">Fine Cuisine</th>
<th align = "left">Health Food</th>
</tr>
<cfoutput query = "myQuery">
<tr>
<td>#FastFood#</td>
<td>#FineCuisine#</td>
<td>#HealthFood#</td>
</tr>
</cfoutput>
</table>
```

## QueryAddRow

### Description

Adds a specified number of empty rows to a query.

### Returns

The number of rows in the query

## Category

[Query functions](#)

## Function syntax

```
QueryAddRow(query [, number])
```

## See also

[QueryAddColumn](#), [QuerySetCell](#), [QueryNew](#); Creating a recordset with the `QueryNew()` function in the *Developing ColdFusion Applications*

## Parameters

Parameter	Description
query	Name of an executed query.
number	Number of rows to add to the query. The default value is 1.

## Example

```
<h3>QueryAddRow Example</h3>

<!-- start by making a query -->
<cfquery name = "GetCourses" datasource = "cfdocexamples">
    SELECT Course_ID, Number, Descript
    FROM Courses
</cfquery>

<p>The Query "GetCourses" has <cfoutput>#GetCourses.RecordCount#</cfoutput> rows.

<cfset CountVar = 0>
<cfloop CONDITION = "CountVar LT 15">
    <cfset temp = QueryAddRow(GetCourses)>
    <cfset CountVar = CountVar + 1>
    <cfset Temp = QuerySetCell(GetCourses, "Number", 100*CountVar)>
    <cfset Temp = QuerySetCell(GetCourses, "Descript",
        "Description of variable #Countvar#")>
</cfloop>

<p>After the QueryAddRow action, the query has <CFOUTPUT>#GetCourses.RecordCount#</CFOUTPUT>
records.
<CFOUTPUT query="GetCourses">
<PRE>#Course_ID# #Number# #Descript#</pre>
</cfoutput>
```

## QueryConvertForGrid

### Description

Converts query data to a structure that contains a paged subset of the query. Used in CFC functions that return data to Ajax format `cfgrid` controls in response to a bind expression.

### Returns

A structure that contains one page of data from the query.

## Category

[Query functions](#)

## Function syntax

```
QueryConvertForGrid(query, page, pageSize)
```

## See also

[cfgrid](#), Dynamically filling form data in the *Developing ColdFusion Applications*

## History

ColdFusion 8: Added this function.

## Parameters

Parameter	Description
query	Name of the query whose data is returned.
page	The specific page of query data to be returned. Pages are numbered starting with 1.
pageSize	Number of rows of query data on a page.

## Usage

You can also create the return value for a `cfgrid` bind CFC without using this function if your query returns only a single grid page of data at a time. For more information see *Using Ajax User Interface Components and Features* in the *Developing ColdFusion Applications*.

## Example

The following example shows how a CFC function that is called by an Ajax format `cfgrid` tag `bind` attribute, uses the `QueryConvertForGrid` function to prepare query data to return to the grid. The CFML page with the `cfgrid` tag has the following code:

```
<cfform>
  <cfgrid format="html" name="grid01" pagesize=5 sort=true
    bind="cfc:places.getData({cfgridpage},{cfgridpagesize},
      {cfgridsortcolumn},{cfgridsortdirection})" selectMode="row">
    <cfgridcolumn name="Emp_ID" display=true header="Employee ID"/>
    <cfgridcolumn name="FirstName" display=true header="Name"/>
    <cfgridcolumn name="Email" display=true header="Email"/>
  </cfgrid>
</cfform>
```

The `getData` function in the `places.cfc` page has the following code:

```
<cffunction name="getData" access="remote" output="false">
    <cfargument name="page">
    <cfargument name="pageSize">
    <cfargument name="gridsortcolumn">
    <cfargument name="gridstartdirection">
    <cfset query = "SELECT Emp_ID, FirstName, EMail
        FROM Employees" >
    <cfif gridsortcolumn neq "" or gridstartdirection neq "">
        <cfset query=query & " order by #gridsortcolumn#
            #gridstartdirection#">
    </cfif>
    <cfquery name="team" datasource="cfdocexamples">
        <cfoutput>#query#</cfoutput>
    </cfquery>
    <cfreturn QueryConvertForGrid(team, page, pageSize)>
</cffunction>
```

## QueryNew

### Description

Creates an empty query (query object).

### Returns

An empty query with a set of named columns, or an empty query.

### Category

[Query functions](#)

### Function syntax

```
QueryNew(columnlist [, columntypelist])
```

### History

ColdFusion MX 7: Added `columntypelist` parameter.

### See also

[QueryAddColumn](#), [QueryAddRow](#), [QuerySetCell](#); Managing data types for columns in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
<code>columnlist</code>	Comma-delimited list of column names, or an empty string.
<code>columntypelist</code>	<p>(Optional) Comma-delimited list specifying column data types. ColdFusion generates an error if the data you add to the column is not of this type, or if it cannot convert the data to this type. The following data types are valid:</p> <ul style="list-style-type: none"> <li>Integer: 32-bit integer</li> <li>BigInt: 64-bit integer</li> <li>Double: 64-bit decimal number</li> <li>Decimal: Variable length decimal, as specified by <code>java.math.BigDecimal</code></li> <li>VarChar: String</li> <li>Binary: Byte array</li> <li>Bit: Boolean (1=True, 0=False)</li> <li>Time: Time</li> <li>Date: Date (can include time information)</li> </ul>

### Usage

If you specify an empty string in the `columnlist` parameter, use the `QueryAddColumn` function to add columns to the query.

Adobe recommends that you use the optional `columntypelist` parameter. Without this parameter, ColdFusion must try to determine data types when it uses the query object in a query of queries. Determining data types requires additional processing, and can result in errors if ColdFusion does not guess a type correctly.

### Example

The following example uses the `QueryNew` function to create an empty query with three columns. It populates two rows of the query and displays the contents of the query object and its metadata.

```

<!--- Create a new three-column query, specifying the column data types --->
<cfset myQuery = QueryNew("Name, Time, Advanced", "VarChar, Time, Bit")>

<!--- Make two rows in the query --->
<cfset newRow = QueryAddRow(MyQuery, 2)>

<!--- Set the values of the cells in the query --->
<cfset temp = QuerySetCell(myQuery, "Name", "The Wonderful World of CMFL", 1)>
<cfset temp = QuerySetCell(myQuery, "Time", "9:15 AM", 1)>
<cfset temp = QuerySetCell(myQuery, "Advanced", False, 1)>
<cfset temp = QuerySetCell(myQuery, "Name", "CFCs for Enterprise
    Applications", 2)>
<cfset temp = QuerySetCell(myQuery, "Time", "12:15 PM", 2)>
<cfset temp = QuerySetCell(myQuery, "Advanced", True, 2)>

<h4>The query object contents</h4>
<cfoutput query = "myQuery">
    #Name# #Time# #Advanced#<br>
</cfoutput><br>
<br>
<h4>Using individual query data values</h4>
<cfoutput>
    #MyQuery.name[2]# is at #MyQuery.Time[2]#<br>
</cfoutput><br>
<br>
<h4>The query metadata</h4>
<cfset querymetadata=getMetaData(myQuery)>
<cfdump var="#querymetadata#">

```

## QuerySetCell

### Description

Sets a cell to a value. If no row number is specified, the cell on the last row is set.

Starting with ColdFusion MX 7, you cannot add a string literal (for example, "All") to a column that is of type numeric, although this was allowed in previous versions of ColdFusion.

### Returns

True, if successful; False, otherwise.

### Category

[Query functions](#)

### Function syntax

```
QuerySetCell(query, column_name, value [, row_number ])
```

### See also

[QueryAddColumn](#), [QueryAddRow](#), [QueryNew](#); Creating a recordset with the `QueryNew()` function in the *Developing ColdFusion Applications*

### History

ColdFusion MX 7: Changed the behavior of the function so that it does type validation.

### Parameters

Parameter	Description
query	Name of an executed query.
column_name	Name of a column in the query.
value	Value to set in the cell.
row_number	Row number. The default value is last row.

### Example

```
<!--- This example shows the use of QueryAddRow and QuerySetCell --->

<!--- start by making a query --->
<cfquery name = "GetCourses" datasource = "cfdocexamples">
    SELECT Course_ID, Descript
    FROM Courses
</cfquery>
<p>The Query "GetCourses" has <cfoutput>#GetCourses.RecordCount#</cfoutput> rows.

<cfset CountVar = 0>
<cfloop CONDITION = "CountVar LT 15">
    <cfset temp = QueryAddRow(GetCourses)>
    <cfset CountVar = CountVar + 1>
    <cfset Temp = QuerySetCell(GetCourses, "Number", 100*CountVar)>
    <cfset CountVar = CountVar + 1>
    <cfset Temp = QuerySetCell(GetCourses, "Descript",
        "Description of variable #Countvar#")>
</cfloop>

<P>After the QueryAddRow action, the query has
    <CFOUTPUT>#GetCourses.RecordCount#</CFOUTPUT>
    records.
    <CFOUTPUT query="GetCourses">
    <PRE>#Course_ID# #Course_Number# #Descript#</pre> </cfoutput>
```

## QuotedValueList

### Description

Gets the values of each record returned from an executed query. ColdFusion does not evaluate the arguments.

### Returns

A delimited list of the values of each record returned from an executed query. Each value is enclosed in single-quotation marks.

### Category

[Query functions](#), [List functions](#)

### Function syntax

```
QuotedValueList(query.column [, delimiter ])
```

### See also

[ValueList](#)

### Parameters

Parameter	Description
query.column	Name of an executed query and column. Separate query name and column name with a period.
delimiter	A string or a variable that contains one. Character(s) that separate column data.

### Example

```
<!--- use the contents of one query to create another dynamically --->
<cfset List = "'BIOL', 'CHEM'">
<!--- first, get the department IDs in our list --->
<cfquery name = "GetDepartments" datasource = "cfdocexamples">
    SELECT Dept_ID FROM Departments
    WHERE Dept_ID IN (#PreserveSingleQuotes(List)#)
</cfquery>

<!--- now, select the courses for that department based on the
quotedValueList produced from our previous query --->
<cfquery name = "GetCourseList" datasource = "cfdocexamples">
    SELECT *
    FROM CourseList
    WHERE Dept_ID IN ('#GetDepartments.Dept_ID#')
</cfquery>

<!--- now, output the results --->

List the course numbers that are in BIOL and CHEM (uses semicolon (;) as the delimiter):<br>
<cfoutput>
#QuotedValueList(GetCourseList.CorNumber, ";")#<br>
</cfoutput>
```

## Rand

### Description

Generates a pseudo-random number.

### Returns

A pseudo-random decimal number, in the range 0 – 1.

### Category

[Mathematical functions](#), [Security functions](#)

### Function syntax

```
Rand([algorithm])
```

### History

ColdFusion MX 7: Added the *algorithm* parameter.

**See also**[Randomize](#), [RandRange](#)**Parameters**

Parameter	Description
algorithm	(Optional) The algorithm to use to generate the random number. ColdFusion installs a cryptography library with the following algorithms: <ul style="list-style-type: none"><li>CFMX_COMPAT: the algorithm used in ColdFusion (default).</li><li>SHA1PRNG: generates a number using the Sun Java SHA1PRNG algorithm. This algorithm provides greater randomness than the default algorithm</li><li>IBMSecureRandom: for IBM WebSphere (IBM JVM does not support the SHA1PRNG algorithm).</li></ul>

**Usage**

Call the [Randomize](#) function before calling this function to seed the random number generator. Seeding the generator ensures that the `Rand` function always generates the same sequence of pseudo-random numbers. This behavior is useful if you must reproduce a pattern consistently.

ColdFusion MX uses the Java Cryptography Extension (JCE) and installs a Sun Java 1.4.2 runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section (except the default algorithm). The JCE framework includes facilities for using other provider implementations; however, cannot provide technical support for third-party security providers.

**Example**

The following example uses the SHA1PRNG algorithm to generate a single random number:

```
<h3>Rand Example</h3>
<cfoutput>
  <p>Rand("SHA1PRNG") returned: #Rand("SHA1PRNG")#</p>
  <p><A HREF = "#CGI.SCRIPT_NAME#">Try again</A>
</cfoutput>
```

## Randomize

**Description**

Seeds the pseudo-random number generator with an integer number, ensuring repeatable number patterns.

**Returns**

A pseudo-random decimal number, in the range 0–1.

**Category**

[Mathematical functions](#), [Security functions](#)

**Function syntax**

```
Randomize(number [, algorithm])
```

**History**

ColdFusion MX 7: Added the *algorithm* parameter.

### See also

[Rand](#), [RandRange](#)

### Parameters

Parameter	Description
number	Integer number. If the number is not in the range -2,147,483,648 – 2,147,483,647, ColdFusion generates an error.
algorithm	(Optional) The algorithm to use to generate the seed number. ColdFusion installs a cryptography library with the following algorithms: <ul style="list-style-type: none"><li>• CFMX_COMPAT: the algorithm used in ColdFusion (default).</li><li>• SHA1PRNG: generates a number using the Sun Java SHA1PRNG algorithm. This algorithm provides greater randomness than the default algorithm.</li><li>• IBMSecureRandom: for IBM WebSphere (IBM JVM does not support the SHA1PRNG algorithm).</li></ul>

### Usage

Call this function before calling [Rand](#) to seed the random number generator. Seeding the generator ensures that the `Rand` function always generates the same sequence of pseudo-random numbers. This behavior is useful if you must reproduce a pattern consistently.

In Standard Edition, for all algorithms except the default algorithm, ColdFusion uses the Java Cryptography Extension (JCE) and installs a Sun Java runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section. The JCE framework includes facilities for using other provider implementations; however, Adobe cannot provide technical support for third-party security providers.

In Enterprise Edition, ColdFusion also installs the RSA BSafe Crypto-J library. This provider adds the following algorithms: FIPS186PRNG, MD5PRNG, DummyPRNG, OBFPRNG. DummyPRNG always returns 0.

### Example

The following example calls the `Randomize` function to seed the random number generator and generates 10 random numbers. To show the effect of the seed, submit the form with the same value multiple times.

```
<h3>Randomize Example</h3>

<!-- Do the following only if the form has been submitted. -->
<cfif IsDefined("Form.myRandomInt")>

    <!-- Make sure submitted value is a number and display its value. -->
    <cfif IsNumeric(FORM.myRandomInt)>
        <cfoutput>
            <b>Seed value is #FORM.myRandomInt#</b><br>
        </cfoutput><br>

        <!-- Call Randomize to seed the random number generator. -->
        <cfset r = Randomize(FORM.myRandomInt, "SHA1PRNG")>

        <cfoutput>
            <b>Random number returned by Randomize(#Form.myRandomInt#,
                "SHA1PRNG") :</b><br>
            #r#<br>
            <br>
            <b>10 random numbers generated using the SHA1PRNG algorithm:</b><br>
            <cfloop index = "i" from = "1" to = "10" step = "1">
                #Rand("SHA1PRNG")#<br>
            </cfloop><br>
        </cfoutput>

    <cfelse>
        <p>Please enter a number.
    </cfif>
</cfif>

<!-- Form to specify the seed value. -->
<form action="#CGI.SCRIPT_NAME#" method="post">
<p>Enter a number to seed the randomizer:
<input type = "Text" name = "MyRandomInt" value="12345">
<p><input type = "Submit" name = "">
</form>
```

## RandRange

### Description

Generates a pseudo-random integer in the range between two specified numbers.

### Returns

A pseudo-random integer.

### Category

[Mathematical functions](#), [Security functions](#)

### Function syntax

```
RandRange(number1, number2[, algorithm])
```

## History

ColdFusion MX 7: Added the *algorithm* parameter.

## See also

[Rand](#), [Randomize](#)

## Parameters

Parameter	Description
number1, number2	Integer numbers. If the numbers are not in the range -2,147,483,648 – 2,147,483,647, ColdFusion generates an error.
algorithm	(Optional) The algorithm to use to generate the random number. ColdFusion installs a cryptography library with the following algorithms: <ul style="list-style-type: none"><li>CFMX_COMPAT: the algorithm used in ColdFusion (default).</li><li>SHA1PRNG: generates a number using the Sun Java SHA1PRNG algorithm. This algorithm provides greater randomness than the default algorithm</li><li>IBMSecureRandom: for IBM WebSphere (IBM JVM does not support the SHA1PRNG algorithm.)</li></ul>

## Usage

Very large positive or negative values for the *number1* and *number2* parameters might result in poor randomness in the results. To prevent this problem, do not specify numbers outside the range -1,000,000,000 – 1,000,000,000.

ColdFusion uses the Java Cryptography Extension (JCE) and installs a Sun Java 1.4.2 runtime that includes the Sun JCE default security provider. This provider includes the algorithms listed in the Parameters section (except the default algorithm). The JCE framework includes facilities for using other provider implementations; however, cannot provide technical support for third-party security providers.

## Example

The following example contains a form that requires random number range values, and lets you optionally specify a random number seed value. It uses `cfform` controls and attributes to specify a default range, ensure that the range fields have values, and validate that the field values are in a specified integer range. When you submit the form, it checks whether the seed field has an empty string; if the field has a value, the code uses the number to seed the random number generator. It then generates and displays the random number.

```
<h3>RandRange Example</h3>

<!-- Do the following only if the form has been submitted. -->
<cfif IsDefined("Form.mySeed")>

    <!-- Do the following only if the seed field has a non-empty string. -->
    <cfif Form.mySeed NEQ "">
        <cfoutput>
            <b>Seed value is #FORM.mySeed#</b><br>
        </cfoutput>
        <br>

        <!-- Call Randomize to seed the random number generator. -->
        <cfset r = Randomize(FORM.mySeed, "SHA1PRNG")>
    <cfelse>
        <b>No Seed value submitted</b><br>
    </cfif>

    <!-- Generate and display the random number. -->
    <cfoutput><p><b>
        RandRange returned: #RandRange(FORM.myInt, FORM.myInt2, "SHA1PRNG")#
    </b></p>
</cfoutput></b></p>
</cfif>

<!-- This form uses cfform input validation to check the input range. -->
<cfform action = "#CGI.SCRIPT_NAME#">
<p>Enter the random number Range: From
<cfinput type = "Text" name = "MyInt" value = "1"
    RANGE = "-1000000000,1000000000"
    message = "Please enter a value between -1,000,000,000 and 1,000,000,000"
    validate = "integer" required = "Yes">
To
<cfinput type = "Text" name = "MyInt2" value = "9999"
    RANGE = "-1000000000,1000000000"
    message = "Please enter a value between --1,000,000,000and 1,000,000,000"
    validate = "integer" required = "Yes"></p>
<p>Enter a number to seed the randomizer:
<cfinput type = "Text" name = "mySeed" RANGE = "-1000000000,1000000000"
    message = "Please enter a value between -1,000,000,000 and 1,000,000,000"
    validate = "integer" required = "No"></p>
<p><input type = "Submit" name = "">
</cfform>
```

## REFind

### Description

Uses a regular expression (RE) to search a string for a pattern. The search is case sensitive.

For more information on regular expressions, including escape sequences, anchors, and modifiers, see Using Regular Expressions in Functions in the *Developing ColdFusion Applications*.

## Returns

Depends on the value of the `returnsubexpressions` parameter:

- If `returnsubexpressions= "False"`:
  - The position in the string where the match begins
  - 0, if the regular expression is not matched in the string
- If `returnsubexpressions = "True"`: a structure that contains two arrays, `len` and `pos`. The array elements are as follows:
  - If the regular expression is found in the string, the first element of the `len` and `pos` arrays contains the length and position, respectively, of the first match of the entire regular expression.
  - If the regular expression contains parentheses that group subexpressions, each subsequent array element contains the length and position, respectively, of the first occurrence of each group.
  - If the regular expression is not found in the string, the first element of the `len` and `pos` arrays contains 0.

## Category

[String functions](#)

## Function syntax

```
REFind(reg_expression, string [, start, returnsubexpressions ] )
```

## See also

[Find](#), [FindNoCase](#), [REFindNoCase](#), [REReplace](#), [REReplaceNoCase](#)

## Parameters

Parameter	Description
<code>reg_expression</code>	Regular expression for which to search. Case sensitive.
<code>string</code>	A string, or a variable that contains one, in which to search.
<code>start</code>	Optional. A positive integer, or a variable that contains one. Position in the string at which to start search. The default value is 1.
<code>returnsubexpressions</code>	Optional. Boolean. Whether to return substrings of <code>reg_expression</code> , in arrays named <code>len</code> and <code>pos</code> : <ul style="list-style-type: none"><li>• True: if the regular expression is found, the first array element contains the length and position, respectively, of the first match. If the regular expression contains parentheses that group subexpressions, each subsequent array element contains the length and position, respectively, of the first occurrence of each group. If the regular expression is not found, the arrays each contain one element with the value 0.</li><li>• False: the function returns the position in the string where the match begins. Default.</li></ul>

## Usage

This function finds the first occurrence of a regular expression in a string. To find the second and subsequent instances of the expression or of subexpressions in it, you call this function more than once, each time with a different start position. To determine the next start position, use the `returnsubexpressions` parameter, and add the value returned in the first element of the length array to the value in the first element of the position array.

### Example

```
<h3>REFind Example</h3>
<p>This example shows the use of the REFind function with and without the
    <i>returnsubexpressions</i> parameter set to True.
    If you do not use the <i>returnsubexpressions</i> parameter,
    REFind returns the position of the first occurrence of a regular
    expression in a string starting from the specified position.
    Returns 0 if no occurrences are found.</p>

<p>REFind("a+c+", "abcaaccdd"):
<cfoutput>#REFind("a+c+", "abcaaccdd")#</cfoutput></p>
<p>REFind("a+c*", "abcaaccdd"):
<cfoutput>#REFind("a+c*", "abcaaccdd")#</cfoutput></p>
<p>REFind("[[:upper:]]", "abcaacCDD"):
<cfoutput>#REFind("[[:upper:]]", "abcaacCDD")#</cfoutput></p>
<p>REFind("[\?&]rep = ", "report.cfm?rep = 1234&u = 5"):
    <cfoutput>#REFind("[\?&]rep = ", "report.cfm?rep = 1234&u = 5")#
    </cfoutput>
</p>
<!-- Set startPos to one; returnMatchedSubexpressions = TRUE -->
<hr size = "2" color = "#0000A0">
<p>If you use the <i>returnsubexpression</i> parameter, REFind returns the
    position and length of the first occurrence of a regular expression
    in a string starting from the specified position. The position and
    length variables are stored in a structure. To access position and length
    information, use the keys <i>pos</i> and <i>len</i>, respectively.</p>
<cfset teststring = "The cat in the hat hat came back!">
<p>The string in which the function is to search is:
<cfoutput><b>#teststring#</b></cfoutput>.</p>
<p>The first call to REFind to search this string is:
    <b>REFind("[A-Za-z]+",testString,1,"TRUE")</b></p>
<p>This function returns a structure that contains two arrays: pos and len.</p>
<p>To create this structure you can use a CFSET statement, for example: </p>
<cfset st = REFind("[[:alpha:]]",testString,1,"TRUE")>
<cfset st = REFind("[[:alpha:]]",testString,1,"TRUE")>
<p>
    <cfoutput>
        The number of elements in each array: #ArrayLen(st.pos)#.
    </cfoutput></p>
<p><b>The number of elements in the pos and len arrays is always one
    if you do not use parentheses in the regular expression.</b></p>
<p>The value of st.pos[1] is: <cfoutput>#st.pos[1]#</cfoutput></p>
<p>The value of st.len[1] is: <cfoutput>#st.len[1]#</cfoutput></p>
<p>
<cfoutput>
    Substring is <b>[#Mid(testString,st.pos[1],st.len[1])#]</B>
</cfoutput></p>
<hr size = "2" color = "#0000A0">
<p>However, if you use parentheses in the regular expression, the first
    element contains the position and length of the first instance
```

of the whole expression. The position and length of the first instance of each parenthesized subexpression within is included in additional array elements.

For example:

```
<cfset st1 = REFind("([[:alpha:]]+)(\1)",testString,1,"TRUE")>
```

The number of elements in each array is `<cfoutput>#ArrayLen(st1.pos)#`

First whole expression match; position is

```
<cfoutput>#st1.pos[1]#;
    length is #st1.len[1]#; whole expression match is
    <B>[#Mid(testString,st1.pos[1],st1.len[1])#]</B>
</cfoutput>
```

Subsequent elements of the arrays provide the position and length of the first instance of each parenthesized subexpression therein.

```
<cfloop index = "i" from = "2" to = "#ArrayLen(st1.pos)#">
  <p><cfoutput>Position is #st1.pos[i]#; Length is #st1.len[i]#;
  Substring is <B>[#Mid(testString,st1.pos[i],st1.len[i])#]
  </B></cfoutput></p>
</cfloop><br>
```

## REFindNoCase

### Description

Uses a regular expression (RE) to search a string for a pattern, starting from a specified position. The search is case-insensitive.

For more information on regular expressions, including escape sequences, anchors, and modifiers, see *Using Regular Expressions in Functions in the Developing ColdFusion Applications*.

### Returns

Depends on the value of the `returnsubexpressions` parameter:

- If `returnsubexpressions = "False"`:
  - The position in the string where the match begins
  - 0, if the regular expression is not matched in the string
- If `returnsubexpressions = "True"`: a structure that contains two arrays, `len` and `pos`. The array elements are as follows:
  - If the regular expression is found in the string, the first element of the `len` and `pos` arrays contains the length and position, respectively, of the first match of the entire regular expression.
  - If the regular expression contains parentheses that group subexpressions, each subsequent array element contains the length and position, respectively, of the first occurrence of each group.
  - If the regular expression is not found in the string, the first element of the `len` and `pos` arrays contains 0.

<cfloop index = "i" from = "2" to = "#ArrayLen(st1.pos)#">
<p><cfoutput>Position is #st1.pos[i]#; Length is #st1.len[i]#;
Substring is <B>[#Mid(testString,st1.pos[i],st1.len[i])#]</B>
</cfoutput></p>
</cfloop><br>
```

## REMatch

### Description

Uses a regular expression (RE) to search a string for a pattern, starting from a specified position. The search is case sensitive.

For more information on regular expressions, including escape sequences, anchors, and modifiers, see Using Regular Expressions in Functions in the *Developing ColdFusion Applications*.

### Returns

An array of strings that match the expression.

### Category

[String functions](#)

### Function syntax

```
REMatch(reg_expression, string)
```

### See also

[Find](#), [FindNoCase](#), [REFind](#), [REReplace](#), [REReplaceNoCase](#), [REMatchNoCase](#)

### Parameters

Parameter	Description
<i>reg_expression</i>	Regular expression for which to search. Case sensitive.  For more information, see Using Regular Expressions in Functions in the <i>Developing ColdFusion Applications</i> .
<i>string</i>	A string or a variable that contains one. String in which to search.

### Usage

This function finds all occurrence of a regular expression in a string.

### Example

```
<!--- Find all the URLs in a web page retrieved via cfhttp: . --->
<!--- The search is case sensitive. --->
result = REMatch("https?:/([-\w\.]++)+(?:\d+)?(/([w/_\.]*(\?\S+)?)?)?", cfhttp.filecontent);
```

## REMatchNoCase

### Description

Uses a regular expression (RE) to search a string for a pattern, starting from a specified position. The search is case-insensitive.

For more information on regular expressions, including escape sequences, anchors, and modifiers, see Using Regular Expressions in Functions in the *Developing ColdFusion Applications*.

### Returns

An array of strings that match the expression.

### Category

[String functions](#)

### Function syntax

```
REMatchNoCase(reg_expression, string)
```

### See also

[Find](#), [FindNoCase](#), [REFind](#), [REReplace](#), [REReplaceNoCase](#), [REMatch](#)

### Parameters

Parameter	Description
reg_expression	Regular expression for which to search. Case-insensitive.  For more information, see Using Regular Expressions in Functions in the <i>Developing ColdFusion Applications</i> .
string	A string or a variable that contains one. String in which to search.

### Example

```
<!-- Find all the URLs in a web page retrieved via cfhttp: -->  
result = REMatch("https?://([-\\w\\.]+)(:\\d+)?(/[\\w/_\\.]*(\\?\\S+)?)?", cfhttp.filecontent);
```

## ReleaseComObject

### Description

Releases a COM Object and frees up resources that it used.

### Returns

Nothing.

### Category

[Extensibility functions](#)

### Function syntax

```
ReleaseComObject (objectName)
```

### See also

[CreateObject](#), [cfobject](#)

### History

ColdFusion MX 6.1: Added this function.

### Parameters

Parameter	Description
objectName	Variable name of a COM object that was created using the <a href="#">CreateObject</a> function or <a href="#">cfobject</a> tag.

### Usage

This function forcefully terminates and releases the specified COM object and all COM objects that it created. Use this function when the object is no longer in use, to quickly free up resources. If the COM object has a method, such as a `quit` method, that terminates the program, call this method before you call the `ReleaseComObject` function.

This function can improve processing efficiency, but is not required for an application to work. If you do not use this function, the Java garbage collection mechanism eventually frees the resources. If you use this function on an object that is in use, the object is prematurely released and your application will get exceptions.

### Example

```
<h3>ReleaseComObject Example</h3>
<cfscript>
obj = CreateObject("Com", "excel.application.9");
//code that uses the object goes here???I'd like to fill this in with something???
obj.quit();
ReleaseComObject(obj);
</cfscript>
```

## RemoveChars

### Description

Removes characters from a string.

### Returns

A copy of the string, with *count* characters removed from the specified start position. If no characters are found, returns zero.

### Category

[String functions](#)

### Function syntax

`RemoveChars(string, start, count)`

### See also

[Insert](#), [Len](#)

### Parameters

Parameter	Description
<code>string</code>	A string or a variable that contains one. String in which to search.
<code>start</code>	A positive integer or a variable that contains one. Position at which to start search.
<code>count</code>	Number of characters to remove.

### Example

`<h3>RemoveChars Example</h3>`

Returns a string with `<I>count</I>` characters removed from the start position. Returns 0 if no characters are found.

```
<cfif IsDefined("FORM.myString")>
    <cfif (FORM.numChars + FORM.start) GT Len(FORM.myString)>
        <p>Your string is only <cfoutput>#Len(FORM.myString)#
        </cfoutput> characters long.
        Please enter a longer string, select fewer characters to remove or
        begin earlier in the string.
    <cfelse>
        <cfoutput>
            <p>Your original string: #FORM.myString#
            <p>Your modified string: #RemoveChars(FORM.myString,
            FORM.start, FORM.numChars)#
        </cfoutput>
    </cfif>
</cfif>
```

## RepeatString

### Description

Creates a string that contains a specified number of repetitions of the specified string.

### Returns

A string.

### Category

[String functions](#)

### Function syntax

`RepeatString(string, count)`

### See also

[CJustify](#), [LJustify](#), [RJustify](#)

### Parameters

Parameter	Description
<code>string</code>	A string or a variable that contains one.
<code>count</code>	Number of repeats.

### Example

```
<h3>RepeatString Example</h3>
<p>RepeatString returns a string created from <I>string</I>, repeated
a specified number of times.
<ul>
  <li>RepeatString("-", 10): <cfoutput>#RepeatString("-", 10)#</cfoutput>
  <li>RepeatString("&lt;BR&gt;", 3): <cfoutput>#RepeatString("<br>", 3)#
    </cfoutput>
  <li>RepeatString("", 5): <cfoutput>#RepeatString("", 5)#</cfoutput>
  <li>RepeatString("abc", 0): <cfoutput>#RepeatString("abc", 0)#</cfoutput>
  <li>RepeatString("Lorem Ipsum", 2):
    <cfoutput>#RepeatString("Lorem Ipsum", 2)#</cfoutput>
</ul>
```

## Replace

### Description

Replaces occurrences of *substring1* in a string with *substring2*, in a specified scope. The search is case sensitive.

### Returns

The string, after making replacements.

### Category

[String functions](#)

### Function syntax

```
Replace(string, substring1, substring2 [, scope ])
```

### See also

[Find](#), [REFind](#), [ReplaceNoCase](#), [ReplaceList](#), [REReplace](#)

### Parameters

Parameter	Description
string	A string or a variable that contains one. String in which to search.
substring1	A string or a variable that contains one. String for which to search
substring2	String that replaces substring1
scope	<ul style="list-style-type: none"><li>one: replaces the first occurrence (default)</li><li>all: replaces all occurrences</li></ul>

### Usage

To remove a string, specify the empty string ("" ) as *substring2*.

You do not need to escape comma characters in strings. For example, the following code deletes the commas from the sentence:

```
replace("The quick brown fox jumped over the lazy cow, dog, and cat.", ",", "", "All")
```

### Example

```
<h3>Replace Example</h3>
```

```
<p>The Replace function returns <I>string</I> with <I>substring1</I>  
  replaced by <I>substring2</I> in the specified scope. This  
  is a case-sensitive search.
```

```
<cfif IsDefined("FORM.MyString")>  
<p>Your original string, <cfoutput>#FORM.MyString#</cfoutput>  
<p>You wanted to replace the substring <cfoutput>#FORM.MySubstring1#  
  </cfoutput>  
  with the substring <cfoutput>#FORM.MySubstring2#</cfoutput>.  
<p>The result: <cfoutput>#Replace(FORM.myString,  
  FORM.MySubstring1, FORM.mySubString2)#</cfoutput>  
</cfif>
```

## ReplaceList

### Description

Replaces occurrences of the elements from a delimited list in a string with corresponding elements from another delimited list. The search is case sensitive.

### Returns

A copy of the string, after making replacements.

### Category

[List functions](#), [String functions](#)

### Function syntax

```
ReplaceList(string, list1, list2)
```

### See also

[Find](#), [REFind](#), [Replace](#), [REReplace](#)

### Parameters

Parameter	Description
<i>string</i>	A string, or a variable that contains one, within which to replace substring
<i>list1</i>	Comma-delimited list of substrings for which to search
<i>list2</i>	Comma-delimited list of replacement substrings

### Usage

The list of substrings to replace is processed sequentially. If a *list1* element is contained in *list2* elements, recursive replacement might occur. The second example shows this.

### Example

```
<p>The ReplaceList function returns <I>string</I> with  
<I>substringlist1</I> (e.g. "a,b") replaced by <I>substringlist2</I>  
    (e.g. "c,d") in the specified scope.  
<cfif IsDefined("FORM.MyString")>  
<p>Your original string, <cfoutput>#FORM.MyString#</cfoutput>  
<p>You wanted to replace the substring <cfoutput>#FORM.MySubString1#  
    </cfoutput>  
with the substring <cfoutput>#FORM.MySubString2#</cfoutput>.  
<p>The result: <cfoutput>#ReplaceList(FORM.myString,  
FORM.MySubString1, FORM.mySubString2)#</cfoutput>  
</cfif>  
<form action = "replacelist.cfm" method="post">  
<p>String 1  
<br><input type = "Text" value = "My Test String" name = "MyString">  
<p>SubString 1 (find this list of substrings)  
<br><input type = "Text" value = "Test, String" name = "MySubString1">  
<p>SubString 2 (replace with this list of substrings)  
<br><input type = "Text" value = "Replaced, Sentence" name = "MySubString2">  
<p><input type = "Submit" value = "Replace and display" name = "">  
</form>  
  
<h3>ReplaceList Example Two</h3>  
<cfset stringtoreplace = "The quick brown fox jumped over the lazy dog.">  
<cfoutput>  
    #ReplaceList(stringtoreplace,"dog,brown,fox,black", "cow,black,ferret,white")#  
</cfoutput>
```

## ReplaceNoCase

### Description

Replaces occurrences of *substring1* with *substring2*, in the specified scope. The search is case-insensitive.

### Returns

A copy of the string, after making replacements.

### Category

[String functions](#)

### Function syntax

```
ReplaceNoCase(string, substring1, substring2 [, scope ])
```

### See also

[Find](#), [REFind](#), [Replace](#), [ReplaceList](#), [REReplace](#)

### Parameters

Parameter	Description
string	A string (or variable that contains one) within which to replace substring.
substring1	String (or variable that contains one) to replace, if found.
substring2	String (or variable that contains one) that replaces substring1.
scope	<ul style="list-style-type: none"><li>one: replaces the first occurrence (default).</li><li>all: replaces all occurrences.</li></ul>

### Example

```
<h3>ReplaceNoCase Example</h3>
<p>The ReplaceNoCase function returns <I>string</I> with <I>substring1</I>
    replaced by <I>substring2</I> in the specified scope.
    The search/replace is case-insensitive.

<cfif IsDefined("FORM.MyString")>
<p>Your original string, <cfoutput>#FORM.MyString#</cfoutput>
<p>You wanted to replace the substring <cfoutput>#FORM.MySubstring1#
    </cfoutput>
with the substring <cfoutput>#FORM.MySubstring2#</cfoutput>.
<p>The result: <cfoutput>#ReplaceNoCase(FORM.myString,
FORM.MySubstring1, FORM.mySubString2)#</cfoutput>
</cfif>
```

## REReplace

### Description

Uses a regular expression (RE) to search a string for a string pattern and replace it with another. The search is case sensitive.

### Returns

If the *scope* parameter is set to *one*, returns a string with the first occurrence of the regular expression replaced by the value of *substring*.

If the *scope* parameter is set to *all*, returns a string with all occurrences of the regular expression replaced by the value of *substring*.

If the function finds no matches, it returns a copy of the string unchanged.

### Category

[String functions](#)

### Function syntax

```
REReplace(string, reg_expression, substring [, scope ])
```

### See also

[REFind](#), [Replace](#), [ReplaceList](#), [REReplaceNoCase](#)

## History

ColdFusion MX: Added supports for the following special codes in a replacement substring, to control case conversion:

- \u - uppercase the next character
- \l - lowercase the next character
- \U - uppercase until \E
- \L - lowercase until \E
- \E - end \U or \L

For more information on new features, see [REFind](#).

## Parameters

Parameter	Description
string	A string or a variable that contains one. String within which to search.
reg_expression	Regular expression to replace. The search is case sensitive.
substring	A string or a variable that contains one. Replaces reg_expression.
scope	<ul style="list-style-type: none"><li>• one: replaces the first occurrence (default).</li><li>• all: replaces all occurrences.</li></ul>

## Usage

For details on using regular expressions, see Using Regular Expressions in Functions in the *Developing ColdFusion Applications*.

## Example

```
<p>The REReplace function returns <i>string</i> with a regular expression replaced
    with <i>substring</i> in the specified scope. Case-sensitive search.
<p>REReplace("CABARET","C|B","G","ALL"):
<cfoutput>#REReplace("CABARET","C|B","G","ALL")#</cfoutput>
<p>REReplace("CABARET","[A-Z]","G","ALL"):
<cfoutput>#REReplace("CABARET","[A-Z]","G","ALL")#</cfoutput>
<p>REReplace("I love jellies","jell(y|ies)","cookies"):
<cfoutput>#REReplace("I love jellies","jell(y|ies)","cookies")#
    </cfoutput>
<p>REReplace("I love jelly","jell(y|ies)","cookies"):
<cfoutput>#REReplace("I love jelly","jell(y|ies)","cookies")#</cfoutput>
```

## REReplaceNoCase

### Description

Uses a regular expression to search a string for a string pattern and replace it with another. The search is case-insensitive.

### Returns

- If scope = "one": returns a string with the first occurrence of the regular expression replaced by the value of *substring*.

- If `scope = "all"`: returns a string with all occurrences of the regular expression replaced by the value of *substring*.
- If the function finds no matches: returns a copy of the string, unchanged.

## Category

[String functions](#)

## Function syntax

```
REReplaceNoCase(string, reg_expression, substring [, scope ])
```

## See also

[REFind](#), [REFindNoCase](#), [Replace](#), [ReplaceList](#)

## History

ColdFusion MX: Changed behavior: this function inserts the following special characters in regular expression replacement strings, to control case conversion: `\u`, `\U`, `\l`, `\L`, and `\E`. If any of these strings is present in a ColdFusion 5 application, insert a backslash before it (for example, change `"\u"` to `"\\u"`).

## Parameters

Parameter	Description
<code>string</code>	A string or a variable that contains one.
<code>reg_expression</code>	Regular expression to replace. For more information, see <i>Using Regular Expressions in Functions in the Developing ColdFusion Applications</i> .
<code>substring</code>	A string or a variable that contains one. Replaces <code>reg_expression</code> .
<code>scope</code>	<ul style="list-style-type: none"><li>• <code>one</code>: replaces the first occurrence of the regular expression. Default.</li><li>• <code>all</code>: replaces all occurrences of the regular expression.</li></ul>

## Usage

For details on using regular expressions, see *Using Regular Expressions in Functions in the Developing ColdFusion Applications*.

## Example

```
<p>The REReplaceNoCase function returns <i>string</i> with a regular
  expression replaced with <i>substring</i> in the specified scope.
  This is a case-insensitive search.
<p>REReplaceNoCase("cabaret", "C|B", "G", "ALL") :
<cfoutput>#REReplaceNoCase("cabaret", "C|B", "G", "ALL")#</cfoutput>
<p>REReplaceNoCase("cabaret", "[A-Z]", "G", "ALL") :
<cfoutput>#REReplaceNoCase("cabaret", "[A-Z]", "G", "ALL")#</cfoutput>
<p>REReplaceNoCase("I LOVE JELLIES", "jell(y|ies)", "cookies") :
<cfoutput>#REReplaceNoCase("I LOVE JELLIES", "jell(y|ies)", "cookies")#
</cfoutput>
<p>REReplaceNoCase("I LOVE JELLY", "jell(y|ies)", "cookies") :
<cfoutput>#REReplaceNoCase("I LOVE JELLY", "jell(y|ies)", "cookies")#
</cfoutput>
```

## Reverse

### Description

Reverses the order of items, such as the characters in a string or the digits in a number.

### Returns

A copy of *string*, with the characters in reverse order.

### Category

[String functions](#)

### Function syntax

`Reverse(string)`

### See also

[Left](#), [Mid](#), [Right](#)

### Parameters

Parameter	Description
<code>string</code>	A string or a variable that contains one

### Usage

You can call this function on a number with code such as the following:

```
<cfoutput>reverse(6*2) equals #reverse(6*2)#</cfoutput>
```

This code outputs the following:

```
reverse(6*2) equals 21
```

### Example

```
<h3>Reverse Example</h3>
```

```
<p>Reverse returns your string with the positions of the characters reversed.
```

```
<cfif IsDefined("FORM.myString")>
```

```
  <cfif FORM.myString is not ">
```

```
    <p>Reverse returned:
```

```
    <cfoutput>#Reverse(FORM.myString)#</cfoutput>
```

```
  <cfelse>
```

```
    <p>Please enter a string to be reversed.
```

```
  </cfif>
```

```
</cfif>
```

```
<form action = "reverse.cfm">
```

```
<p>Enter a string to be reversed:
```

```
<input type = "Text" name = "MyString">
```

```
<p><input type = "Submit" name = ">
```

```
</form>
```

## Right

### Description

Gets a specified number of characters from a string, beginning at the right.

Returns the specified number of characters from the end (or *right* side) of the specified string.

### Returns

- If the length of the string is greater than or equal to *count*, the rightmost *count* characters of the string
- If *count* is greater than the length of the string, the whole string
- If *count* is greater than 1, and the string is empty, an empty string

### Category

[String functions](#)

### Function syntax

`Right(string, count)`

### See also

[Left](#), [Mid](#), [Reverse](#)

### Parameters

Parameter	Description
string	A string or a variable that contains one.
count	A positive integer that specifies the maximum number of characters to return.

### Example

```
<!--- Simple Right Example--->
<cfoutput>
#Right("See the quick red fox jump over the fence", 9)#
<br>
#Right("ColdFusion", 6)#
</cfoutput>

<!--- Right Example using form input --->
<h3>Right Example</h3>
<cfif IsDefined("Form.MyText")>
<!--- If len returns 0 (zero), then show error message. --->
    <cfif Len(Form.myText)>
        <cfif Len(Form.myText) LTE Form.RemoveChars>
            <cfoutput><p style="color: red; font-weight: bold">Your string
#Form.myText# only has #Len(Form.myText)# characters. You cannot output
the #Form.removeChars# rightmost characters of this string because it
is not long enough.</p></cfoutput>
        <cfelse>
            <cfoutput><p>Your original string: <strong>#Form.myText#</strong>
<p>Your changed string, showing only the <strong>#Form.removeChars#
</strong> rightmost characters:
<strong>#right(Form.myText, Form.removeChars)#</strong></p>
        </cfif>
    </cfif>
</cfif>
```

```
        </cfoutput>
    </cfif>
    <cfelse>
        <p style="color: red; font-weight: bold">Please enter a string of more
        than 0 (zero) characters.</p>
    </cfif>
</cfif>

<form action="<cfoutput>#CGI.ScriptName#</cfoutput>" method="POST">
<p>Type in some text<br />
<input type="Text" name="myText"></p>
<p>How many characters from the right do you want to show?
<select name="RemoveChars">
<option value="1">1
<option value="3" selected>3
<option value="5">5
<option value="7">7
<option value="9">9</select>
<input type="Submit" name="Submit" value="Remove characters"></p>
</form>
```

## RJustify

### Description

Right justifies characters of a string.

### Returns

A copy of a string, right-justified in the specified field length.

### Category

[Display and formatting functions](#), [String functions](#)

### Function syntax

`RJustify(string, length)`

### See also

[CJustify](#), [LJustify](#)

### Parameters

Parameter	Description
<code>string</code>	A string enclosed in quotation marks, or a variable that contains one.
<code>length</code>	A positive integer or a variable that contains one. Length of field in which to justify string.

### Example

```
<!--- This example shows how to use RJustify --->
<cfparam name = "jstring" default = "">

<cfif IsDefined("FORM.justifyString")>
    <cfset jstring = rjustify(FORM.justifyString, 35)>
</cfif>
<html>
<head>
<title>RJustify Example</title>
</head>
<body>
<h3>RJustify Function</h3>
<p>Enter a string. It will be right justified within the sample field

<form action = "rjustify.cfm">
<p><input type = "Text" value = "<cfoutput>#jString#</cfoutput>"
    size = 35 name = "justifyString">

<p><input type = "Submit" name = ""> <input type = "reset">
</form>
```

## Round

### Description

Rounds a number to the closest integer.

### Returns

An integer.

### Category

[Mathematical functions](#)

### Function syntax

`Round (number)`

### See also

[Ceiling](#), [Fix](#), [Int](#)

### Parameters

Parameter	Description
number	Number to round

### Usage

Use this function to round a number. This function rounds numbers that end with .5 up to the nearest integer. It rounds 3.5 to 4 and -3.5 to -3.

### Example

```
<h3>Round Example</h3>
<p>This function rounds a number to the closest integer.
<ul>
  <li>Round(7.49) : <cfoutput>#Round(7.49)#</cfoutput>
  <li>Round(7.5) : <cfoutput>#Round(7.5)#</cfoutput>
  <li>Round(-10.775) : <cfoutput>#Round(-10.775)#</cfoutput>
  <li>Round(-35.5) : <cfoutput>#Round(-35.5)#</cfoutput>
  <li>Round(35.5) : <cfoutput>#Round(35.5)#</cfoutput>
  <li>Round(1.2345*100)/100 : <cfoutput>#Round(1.2345*100)/100#</cfoutput>
</ul>
```

## RTrim

### Description

Removes spaces from the end of a string.

### Returns

A copy of *string*, after removing trailing spaces.

### Category

[String functions](#)

### Function syntax

`RTrim(string)`

### See also

[LTrim](#), [Trim](#)

### Parameters

Parameter	Description
<code>string</code>	A string or a variable that contains one

### Example

```
<h3>RTrim Example</h3>

<cfif IsDefined("FORM.myText")>
<cfoutput>
<pre>
Your string:"#FORM.myText#"
Your string:"#RTrim(FORM.myText)#"
(right trimmed)
</pre>
</cfoutput>
</cfif>

<form action = "Rtrim.cfm" method="post">
<p>Enter some text. It will be modified by Rtrim to remove spaces from the right.
<p><input type = "Text" name = "myText" value = "TEST ">

<p><input type = "Submit" name = "">
</form>
```

## Functions s

### Second

#### Description

Extracts the ordinal for the second from a date/time object.

#### Returns

An integer in the range 0–59.

#### Category

[Date and time functions](#)

#### Function syntax

`Second(date)`

#### See also

[DatePart](#), [Hash](#), [Minute](#)

#### Parameters

Parameter	Description
date	A date/time object

#### Usage

When passing a date/time object as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

### Example

```
<!--- This example shows the use of Hour, Minute, and Second --->
<h3>Second Example</h3>
<cfoutput>
The time is currently #TimeFormat(Now())#.
We are in hour #Hour(Now())#, Minute #Minute(Now())#
and Second #Second(Now())# of the day.
</cfoutput>
```

## SendGatewayMessage

### Description

Sends an outgoing message through a ColdFusion event gateway.

### Returns

String. The value returned depends on the gateway type.

### Category

[Extensibility functions](#)

### Function syntax

`SendGatewayMessage (gatewayID, data)`

### See also

[GetGatewayHelper](#); [IM gateway message sending commands](#), [SMS Gateway CFEvent structure and commands](#), [CFML event gateway SendGatewayMessage data parameter](#), and [Sending a message using the SendGatewayMessage function in the \*Developing ColdFusion Applications\*](#)

### History

ColdFusion MX 7: Added this function.

### Parameters

Parameter	Description
gatewayID	Identifier of the gateway to send the message. Must be the Gateway ID of one of the ColdFusion event gateway instances configured on the ColdFusion Administrator Event Gateways section's Gateways page.
data	A ColdFusion structure. The contents of the structure depend on the event gateway type, but typically include a MESSAGE field that contains the message to send and a field that contains the destination address.

### Usage

The `SendGatewayMessage` function calls the specified gateway's `outgoingMessage` method. The value returned by the function depends on the gateway type. The following table describes the return values for standard ColdFusion gateway types:

Gateway type	Return values
Asynchronous CFML	If the message was queued for delivery to the CFC, returns True; False, otherwise.
Lotus SameTime	If the message or command was successful, returns OK. If an error occurred, returns a string indicating the cause.
SMS	If the gateway is in asynchronous mode, returns the empty string immediately. If the gateway is in synchronous mode, the function waits for the gateway to return a response. If the message was successfully sent to the short message service center (SMSC), returns the message ID from the SMSC. If an error occurred, returns a string indicating the cause.
XMPP	If the message or command was successful, returns OK If an error occurred, returns a string indicating the cause.

### Example

The following example uses an instance of the CFML gateway to log messages asynchronously to a file. To use this example, configure an instance of the CFML gateway with the name “Asynch Logger” in the ColdFusion Administrator. This gateway instance must use a CFC that takes the message and logs it. For sample CFC code, see *Using the CFML event gateway for asynchronous CFCs in the Developing ColdFusion Applications*.

```
Sending an event to the CFML event gateway that is registered in the  
ColdFusion Administrator as Asynch Logger.<br>  
<cfscript>  
    status = false;  
    props = structNew();  
    props.message = "Replace me with a variable with data to log";  
    status = SendGatewayMessage("Asynch Logger", props);  
    if (status IS True) WriteOutput('Event Message "#props.message#" has been sent.');
```

## SerializeJSON

### Description

Converts ColdFusion data into a JSON (JavaScript Object Notation) representation of the data.

### Returns

A string that contains a JSON representation of the parameter value.

### Category

[Conversion functions](#)

### Syntax

```
SerializeJSON(var[, serializeQueryByColumns])
```

### See also

[DeserializeJSON](#), [IsJSON](#), [cfajaxproxy](#), Using data interchange formats in the *Developing ColdFusion Applications*, <http://www.json.org>

### History

ColdFusion 8: Added function

### Parameters

Parameter	Description
var	A ColdFusion data value or variable that represents one.
serializeQueryByColumns	<p>A Boolean value that specifies how to serialize ColdFusion queries.</p> <ul style="list-style-type: none"><li>• <code>false</code> (the default): Creates an object with two entries: an array of column names and an array of row arrays. This format is required by the HTML format <code>cfgrid</code> tag.</li><li>• <code>true</code>: Creates an object that corresponds to WDDX query format.</li></ul> <p>For more information, see the Usage section.</p>

### Usage

This function is useful for generating JSON format data to be consumed by an Ajax application.

The `SerializeJSON` function converts ColdFusion dates and times into strings that can be easily parsed by the JavaScript `Date` object. The strings have the following format:

```
MonthName, DayNumber Year Hours:Minutes:Seconds
```

The `SerializeJSON` function converts the ColdFusion date time object for October 3, 2007 at 3:01 PM, for example, into the JSON string "October, 03 2007 15:01:00".

The `SerializeJSON` function with a `false` `serializeQueryByColumns` parameter (the default) converts a ColdFusion query into a row-oriented JSON Object with the following elements:

Element	Description
COLUMNS	An array of the names of the columns.
DATA	<p>A two-dimensional array, where:</p> <ul style="list-style-type: none"><li>• Each entry in the outer array corresponds to a row of query data.</li><li>• Each entry in the inner arrays is a column field value in the row, in the same order as the <code>COLUMNS</code> array entries.</li></ul>

For example, the `SerializeJSON` function with a `serializeQueryByColumns` parameter value of `false` converts a ColdFusion query with two columns, City, and State, and two rows of data into following format:

```
{ "COLUMNS": [ "CITY", "STATE" ], "DATA": [ [ "Newton", "MA" ], [ "San Jose", "CA" ] ] }
```

The `SerializeJSON` function with a `serializeQueryByColumns` parameter value of `true` converts a ColdFusion query into a column-oriented JSON Object that is equivalent to the WDDX query representation. The JSON Object has three elements:

Element	Description
ROWCOUNT	The number of rows in the query.
COLUMNS	An array of the names of the columns.
DATA	<p>An Object with the following:</p> <ul style="list-style-type: none"><li>• The keys are the query column names</li><li>• The values are arrays that contain the column data</li></ul>

The `SerializeJSON` function with a `serializeQueryByColumns` parameter value of `true` converts a ColdFusion query with two columns, City, and State, and two rows of data into following format:

```
{ "ROWCOUNT":2, "COLUMNS":["CITY","STATE"], "DATA":{"City":["Newton","San Jose"], "State":["MA","CA"]} }
```

**Note:** The `SerializeJSON` function generates an error if you try to convert binary data into JSON format.

The `SerializeJSON` function converts all other ColdFusion data types to the corresponding JSON types. It converts structures to JSON Objects, arrays to JSON Arrays, numbers to JSON Numbers, and strings to JSON Strings.

**Note:** ColdFusion internally represents structure key names using all-uppercase characters, and, therefore, serializes the key names to all-uppercase JSON representations. Any JavaScript that handles JSON representations of ColdFusion structures must use all-uppercase structure key names, such as `CITY` or `STATE`. You also use the all-uppercase names `COLUMNS` and `DATA` as the keys for the two arrays that represent ColdFusion queries in JSON format.

### Example

This example creates a JSON-format data feed with simple weather data for two cities. The data feed is in the form of a JavaScript application that consists of a single function call that has a JSON Object as its parameter. The example code does the following:

- 1 Creates a query object with two rows of weather data. Each row has a city, the current temperature, and an array of forecast structures, with each with the high, low, and weather prediction for one day. Normally, `datasource` provides the data; to keep the example simple, the example uses the same prediction for all cities and days.
- 2 Converts the query to a JSON format string and surrounds it in a JavaScript function call.
- 3 Writes the result to the output.

If you view this page in your browser, you see the resulting JavaScript function and JSON parameter. To use the results of this page in an application, put this file and the example for the [DeserializeJSON](#) function in an appropriate location under your ColdFusion web root, replace the URL in the `DeserializeJSON` example code with the correct URL for this page, and run the `DeserializeJSON` example.

```
<!--- Generate a clean feed by suppressing white space and debugging
      information. --->
<cfprocessingdirective suppresswhitespace="yes">
<cfsetting showdebugoutput="no">
<!--- Generate the JSON feed as a JavaScript function. --->
<cfcontent type="application/x-javascript">

<cfscript>
    // Construct a weather query with information on cities.
    // To simplify the code, we use the same weather for all cities and days.
    // Normally this information would come from a data source.
    weatherQuery = QueryNew("City, Temp, Forecasts");
    QueryAddRow(weatherQuery, 2);
    theWeather=StructNew();
    theWeather.High=73;
    theWeather.Low=53;
    theWeather.Weather="Partly Cloudy";
    weatherArray=ArrayNew(1);
    for (i=1; i<=5; i++) weatherArray[i]=theWeather;
    querySetCell(weatherQuery, "City", "Newton", 1);
    querySetCell(weatherQuery, "Temp", "65", 1);
    querySetCell(weatherQuery, "ForeCasts", weatherArray, 1);
    querySetCell(weatherQuery, "City", "San Jose", 2);
    querySetCell(weatherQuery, "Temp", "75", 2);
    querySetCell(weatherQuery, "ForeCasts", weatherArray, 2);

    // Convert the query to JSON.
    // The SerializeJSON function serializes a ColdFusion query into a JSON
    // structure.
    theJSON = SerializeJSON(weatherQuery);

    // Wrap the JSON object in a JavaScript function call.
    // This makes it easy to use it directly in JavaScript.
    writeOutput("onLoad( "&theJSON&" )");
</cfscript>
</cfprocessingdirective>
```

## SetEncoding

### Description

Sets the character encoding (character set) of Form and URL scope variable values; used when the character encoding of the input to a form, or the character encoding of a URL, is not in UTF-8 encoding.

### Returns

None

### Category

[International functions](#), [System functions](#)

### Function syntax

SetEncoding(*scope\_name*, *charset*)

### See also

[GetEncoding](#), [cfcontent](#), [cfprocessingdirective](#), [URLDecode](#), [URLEncodedFormat](#); Locales in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Added this function.

### Parameters

Parameter	Description
scope_name	<ul style="list-style-type: none"><li>• url</li><li>• form</li></ul>
charset	<p>The character encoding in which text in the scope variables is encoded. The following list includes commonly used values:</p> <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul>

### Usage

Use this function when the character encoding of the input to a form or the character encoding of a URL is not in UTF-8 encoding. For example, Traditional Chinese characters are often in Big5 encoding. This function resets URL and Form variables, so you should call it before using these variables (typically, in the `Application.cfm` page or `Application.cfc` file). Calling this function first also avoids interpreting the characters of the variables incorrectly.

For more information on character encoding, see the following web pages:

- [www.w3.org/International/O-charset.html](http://www.w3.org/International/O-charset.html) provides general information on character encoding and the web, and has several useful links.
- [www.iana.org/assignments/character-sets](http://www.iana.org/assignments/character-sets) is a complete list of character sets names used on the Internet, maintained by the Internet Assigned Numbers Authority.
- [java.sun.com/j2se/1.4.1/docs/guide/intl/encoding.doc.html](http://java.sun.com/j2se/1.4.1/docs/guide/intl/encoding.doc.html) lists the character encoding that Java 1.4.1, and therefore the default ColdFusion configuration, can interpret. If you use a JVM that does not conform to the Sun Java 2 Platform, Standard Edition, v 1.4.1, the supported locales may differ. The list uses Java internal names, not the IANA character encoding names that you normally use in the `SetEncodingcharset` parameter and other ColdFusion attributes and parameters. Java automatically converts standard IANA names to its internal names as needed.

### Example

```
<!--- This example sends and interprets the contents of two fields as
      big5 encoded text. Note that the form fields are received as URL variables
      because the form uses the GET method. --->
<cfcontent type="text/html; charset=big5">
<form action='#cgi.script_name#' method='get'>
<input name='xxx' type='text'>
<input name='yyy' type='text'>
<input type="Submit" value="Submit">
</form>

<cfif IsDefined("URL.xxx")>
<cfscript>
    SetEncoding("url", "big5");
    WriteOutput("URL.XXX is " & URL.xxx & "<br>");
    WriteOutput("URL.YYY is " & URL.yyy & "<br>");
theEncoding = GetEncoding("URL");
    WriteOutput("The URL variables were decoded using ' ' &
theEncoding & " ' encoding.");

WriteOutput("The encoding is " & theEncoding);
</cfscript>
</cfif>
```

## SetLocale

### Description

Sets the country/language locale for ColdFusion processing and the page returned to the client. The locale value determines the default format of date, time, number, and currency values, according to language and regional conventions.

### Returns

The locale value prior to setting the new locale, as a string.

### Category

[International functions](#), [System functions](#)

### Function syntax

*SetLocale* (*new\_locale*)

### See also

[GetHttpTimeString](#), [GetLocale](#), [GetLocaleDisplayName](#); *Locales in the Developing ColdFusion Applications*

### History

ColdFusion MX 7: Added support for all locales supported by the ColdFusion Java runtime.

ColdFusion MX:

- Changed formatting behavior: this function might return a different value than in earlier releases. This function uses Java standard locale determination and formatting rules on all platforms.

- Deprecated the Spanish (Mexican) locale option. It might not work, and it might cause an error, in later releases.
- Changed the Spanish (Modern) option: it now sets the locale to Spanish (Standard).

### Parameters

Parameter	Description
new_locale	The name of a locale; for example, "English (US)"

### Usage

You can specify any locale name that is listed in the `Server.Coldfusion.SupportedLocales` variable. This variable is a comma-delimited list of all locale names supported by the JVM, plus the locale names that were required by ColdFusion prior to ColdFusion MX 7.

The following locale names were used in ColdFusion releases through ColdFusion MX 6.1, and continue to be supported. If you use any of these values in the `SetLocale` function, the `GetLocale` function returns the name you set, not the corresponding Java locale name.

Chinese (China)	French (Belgian)	Korean
Chinese (Hong Kong)	French (Canadian)	Norwegian (Bokmal)
Chinese (Taiwan)	French (Standard)	Norwegian (Nynorsk)
Dutch (Belgian)	French (Swiss)	Portuguese (Brazilian)
Dutch (Standard)	German (Austrian)	Portuguese (Standard)
English (Australian)	German (Standard)	Spanish (Modern)
English (Canadian)	German (Swiss)	Spanish (Standard)
English (New Zealand)	Italian (Standard)	Swedish
English (UK)	Italian (Swiss)	
English (US)	Japanese	

ColdFusion determines the locale value as follows:

- By default, ColdFusion uses the JVM locale, and the default JVM locale is the operating system locale. You can set JVM locale value explicitly in ColdFusion in the ColdFusion Administrator Java and JVM Settings page JVM Arguments field; for example:  

```
-Duser.language=de -Duser.region=DE.
```
- A locale set using the `SetLocale` function persists for the current request or until it is reset by another `SetLocale` function in the request.
- If a request has multiple `SetLocale` functions, the current locale setting affects how locale-sensitive ColdFusion tags and functions, such as the functions that start with LS format data. The last `SetLocale` function that ColdFusion processes before sending a response to the requestor (typically the client browser) determines the value of the response `Content-Language` HTTP header. The browser that requested the page displays the response according to the rules for the language specified by the `Content-Language` header.
- ColdFusion ignores any `SetLocale` functions that follow a `cfflush` tag.

Because this function returns the previous locale setting, you can save the original locale value. You can restore the original locale by calling `SetLocale` again with the saved variable. For example, the following line saves the original locale in a Session variable:

```
<cfset Session.oldlocale = SetLocale(newLocale)>
```

The variable `server.ColdFusion.SupportedLocales` is initialized at startup with a comma-delimited list of the locales that ColdFusion and the operating system support. If you call `SetLocale` with a locale that is not in the list, the call generates an error.

**Note:** ColdFusion uses the Spanish (Standard) formats for Spanish (Modern) and Spanish (Standard).

### Example

```
<h3>SetLocale Example</h3>
<p>SetLocale sets the locale to the specified new locale for the current session.
<p>A locale encapsulates the set of attributes that govern the display and
    formatting of date, time, number, and currency values.
<p>The locale for this system is <cfoutput>#GetLocale()#</cfoutput>
<p><cfoutput><I>the old locale was #SetLocale("English (UK)")#</I>
<p>The locale is now #GetLocale()#</cfoutput>
```

## SetProfileString

### Description

Sets the value of a profile entry in an initialization file.

### Returns

An empty string, upon successful execution; otherwise, an error message.

### Category

[System functions](#)

### Function syntax

```
SetProfileString(iniPath, section, entry, value)
```

### See also

[GetProfileSections](#), [GetProfileString](#)

### Parameters

Parameter	Description
<code>iniPath</code>	Absolute path of initialization file
<code>section</code>	Section of the initialization file in which the entry is to be set
<code>entry</code>	Name of the entry to set
<code>value</code>	Value to which to set the entry

### Example

<h3>SetProfileString Example</h3>

This example uses SetProfileString to set the time-out value in an initialization file. Enter the full path of your initialization file, specify the time-out value, and submit the form.

```
<!-- This section checks whether the form was submitted. If so, this
      section sets the initialization path and time-out value to the
      path and time-out value specified in the form -->
<cfif Isdefined("Form.Submit")>

    <cfset IniPath = FORM.iniPath>
    <cfset Section = "boot loader">
    <cfset MyTimeout = FORM.MyTimeout>
    <cfset timeout = GetProfileString(IniPath, Section, "timeout")>

    <cfif timeout Is Not MyTimeout>
        <cfif MyTimeout Greater Than 0>
            <hr size = "2" color = "#0000A0">
            <p>Setting the time-out value to <cfoutput>#MyTimeout#</cfoutput>
            </p>
            <cfset code = SetProfileString(IniPath,
                Section, "timeout", MyTimeout)>
            <p>Value returned from SetProfileString:
                <cfoutput>#code#</cfoutput></p>
            <cfelse>
                <hr size = "2" color = "red">
                <p>The time-out value should be greater than zero in order to
                    provide time for user response.</p>
                <hr size = "2" color = "red">
            </cfif>
        <cfelse>
            <p>The time-out value in your initialization file is already
                <cfoutput>#MyTimeout#</cfoutput>.</p>
        </cfif>
        <cfset timeout = GetProfileString(IniPath, Section, "timeout")>
        <cfset default = GetProfileString(IniPath, Section, "default")>

    <h4>Boot Loader</h4>
    <p>The time-out is set to: <cfoutput>#timeout#</cfoutput>.</p>
    <p>Default directory is: <cfoutput>#default#</cfoutput>.</p>
```

```
</cfif>

<form action = "setprofilestring.cfm">
<hr size = "2" color = "#0000A0">
<table cellpadding = "2" cellspacing = "2" border = "0">
<tr>
<td>Full Path of Init File</td>
<td><input type = "Text" name = "IniPath"
value = "C:\myboot.ini"></td>
</tr>
<tr>
<td>Time-out</td>
<td><input type = "Text" name = "MyTimeout" value = "30"></td>
</tr>
<tr>
<td><input type = "Submit" name = "Submit" value = "Submit"></td>
<td></td>
</tr>
</table>
</form>
```

## SetVariable

### Description

Sets a variable in the `name` parameter to the value of the `value` parameter.

### Returns

The new value of the variable.

### Category

[Dynamic evaluation functions](#)

### Function syntax

```
SetVariable(name, value)
```

### See also

[DE](#), [Evaluate](#), [IIf](#)

### Parameters

Parameter	Description
name	Variable name
value	A string, the name of a string, or a number

### Usage

You can use direct assignment statements in place of this function to set values of dynamically named variables. To do so, put the dynamically named variable in quotation marks and number signs (#); for example:

```
<cfset DynamicVar2 = "ABD">
<cfset "#DynamicVar2#" = "Test Value2">
```

Also, the following lines are equivalent:

```
<cfset "myVar#i#" = myVal>  
SetVariable("myVar" & i, myVal)
```

For more information, see Using Expressions and Number Signs in the *Developing ColdFusion Applications*.

### Example

```
<h3>SetVariable Example</h3>  
  
<cfif IsDefined("FORM.myVariable")>  
<!-- strip out url, client., cgi., session., caller. --->  
<!-- This example only lets you set form variables --->  
<cfset myName = ReplaceList(FORM.myVariable,  
    "url,client,cgi,session,caller", "FORM,FORM,FORM,FORM,FORM")>  
  
<cfset temp = SetVariable(myName, FORM.myValue)>  
<cfset varName = myName>  
<cfset varNameValue = Evaluate(myName)>  
<cfoutput>  
    <p>Your variable, #varName#  
    <p>The value of #varName# is #varNameValue#  
</cfoutput>  
</cfif>
```

## Sgn

### Description

Determines the sign of a number.

### Returns

- 1, if *number* is positive.
- 0, if *number* is 0.
- -1, if *number* is negative.

### Category

[Mathematical functions](#)

### Function syntax

*Sgn* (*number*)

### See also

[Abs](#)

### Parameters

Parameter	Description
number	A number

### Example

```
<h3>Sgn Example</h3>
<p>Sgn determines the sign of a number. Returns 1 if number is positive;
    0 if number is 0; -1 if number is negative.
<p>Sgn(14): <cfoutput>#Sgn(14)#</cfoutput>
<p>Sgn(21-21): <cfoutput>#Sgn(21-21)#</cfoutput>
<p>Sgn(-0.007): <cfoutput>#Sgn(-0.007)#</cfoutput>
```

## Sin

### Description

Calculates the sine of an angle that is entered in radians.

### Returns

A number; the sine of the angle.

### Category

[Mathematical functions](#)

### Function syntax

`Sin(number)`

### See also

[ASin](#), [Cos](#), [ACos](#), [Tan](#), [Atn](#), [Pi](#)

### Parameters

Parameter	Description
number	Angle, in radians for which to calculate the sine.

### Usage

The range of the result is -1 to 1.

To convert degrees to radians, multiply degrees by  $\pi/180$ . To convert radians to degrees, multiply radians by  $180/\pi$ .

**Note:** Because the function uses floating point arithmetic, it returns a very small number (such as 6.12323399574E-017) for angles that should produce 0. To test for a 0 value, check whether the value is less than 0.00000000000001.

### Parameters

Parameter	Description
duration	Time, in milliseconds, to stop processing the thread.

### Description

The `Sleep` function is useful when one thread must wait until another thread performs some action. The thread that must wait uses the `Sleep` function to stop processing for a time, and, when it awakens, checks to see if the other thread is ready. If it is not, the thread can sleep again. This type of action is useful, for example, when one thread must wait for another thread to complete initialization operations that apply to both threads.

The `Sleep` function behaves identically to the `cfthread` tag with an `action` attribute value of `sleep`.

### Example

The following example has two threads. The second thread (threadB) uses the `sleep` function to ensure that the first thread (threadA) has completed before it starts processing.

```
<!--- ThreadA loops to simulate an initialization activity that might take time. --->
<cfthread name="threadA" action="run">
    <cfset thread.j=1>
    <cfloop index="i" from="1" to="99999">
        <cfset thread.j=thread.j+1>
    </cfloop>
</cfthread>

<!--- ThreadB loops while threadA is not finished, sleeping for
      1/2 second each time. --->
<cfthread name="threadB" action="run">
    <cfscript>
        thread.sleepTimes=0;
        thread.initialized=false;
        while ((threadA.Status != "COMPLETED") && (threadA.Status
            != "TERMINATED")) {
            sleep(500);
            thread.sleepTimes++;
        }
        // Only do the post-initilization code if the threadA completed.
        If (threadA.Status == "COMPLETED") {
            thread.initialized=true;
            // Post-initialization code would go here.
        }
    </cfscript>
</cfthread>

<!-- Join the threads. --->
<cfthread action="join" name="threadA,threadB" timeout="10000"/>

<!--- Display the thread information. --->
<!--- Different actions might be taken based on the thread status information. --->
<cfoutput>
    threadA index value: #threadA.j#<br />
    threadA status: #threadA.Status#<br>
    threadB status: #threadB.Status#<br>
    threadB sleepTimes: #threadB.sleepTimes#<br>
    threadB initialized: #threadB.initialized#<br>
</cfoutput>
```

## SpanExcluding

### Description

Gets characters from a string, from the beginning and stops when it encounters any of the characters in a specified set of characters. The search is case sensitive.

For example, `SpanExcluding("MyString", "inS")` excludes "String" from "MyString" and returns "My". Because, in the string "MyString", after "My", the character 'S' (which is present in the second string "inS") is encountered.

### Returns

A string; characters from *string*, from the beginning to a character that is in *set*.

### Category

[String functions](#)

### Function syntax

`SpanExcluding(string, set)`

### See also

[GetToken](#), [SpanIncluding](#); Caching parts of ColdFusion pages in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
string	A string or a variable that contains one
set	A string or a variable that contains one. Must contain one or more characters

### Example

```
<h3>SpanExcluding Example</h3>
```

```
<cfif IsDefined("FORM.myString")>
<p>Your string was <cfoutput>#FORM.myString#</cfoutput>
<p>Your set of characters was <cfoutput>#FORM.mySet#</cfoutput>
<p>Your string up until one of the characters in the set is:
<cfoutput>#SpanExcluding(FORM.myString, FORM.mySet)#</cfoutput>
</cfif>
```

<p>Returns all characters from string from beginning to a character from the set of characters. The search is case-sensitive.

```
<form method = post action = "spanexcluding.cfm">
<p>Enter a string:
<br><input type = "Text" name = "myString" value = "Hey, you!">
<p>And a set of characters:
<br><input type = "Text" name = "mySet" value = "Ey">
<br><input type = "Submit" name = "">
</form>
```

## SpanIncluding

### Description

Gets characters from a string, from the beginning and stops when it encounters any character that is not in a specified set of characters. The search is case sensitive.

For example, `SpanIncluding("mystring", "mystery")` returns "mystr". Because, in the string "mystring", after "mystr", the character 'i' (which is not present in the second string "mystery") is encountered.

### Returns

A string; characters from *string*, from the beginning to a character that is not in *set*.

### Category

[String functions](#)

### Function syntax

`SpanIncluding(string, set)`

### See also

[GetToken](#), [SpanExcluding](#); Caching parts of ColdFusion pages in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
string	A string or a variable that contains the search string.
set	A string or a variable that contains a set of characters. Must contain one or more characters.

### Example

```
<h3>SpanIncluding Example</h3>
<cfif IsDefined("FORM.myString")>
<p>Your string was <cfoutput>#FORM.myString#</cfoutput>
<p>Your set of characters was <cfoutput>#FORM.mySet#</cfoutput>
<p>Your string, until the characters in the set have been found, is:
<cfoutput>#SpanIncluding(FORM.myString, FORM.mySet)#</cfoutput>
</cfif>
```

<p>Returns characters of a string, from beginning to a character that is not in set. The search is case-sensitive.

```
<form action = "spanincluding.cfm" method="post">
<p>Enter a string:
<br><input type = "Text" name = "myString" value = "Hey, you!">
<p>And a set of characters:
<br><input type = "Text" name = "mySet" value = "ey,H">
<br><input type = "Submit" name = "">
</form>
```

## SpreadsheetAddColumn

### Description

Adds a column or column data to an Excel spreadsheet object.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetAddColumn(SpreadsheetObj, data[, startRow, startColumn, insert]);
```

### See also

[SpreadsheetAddImage](#), [SpreadsheetAddRow](#), [SpreadsheetAddRows](#), [SpreadsheetDeleteColumn](#), [SpreadsheetDeleteColumns](#), [SpreadsheetFormatColumn](#), [SpreadsheetFormatColumns](#), [SpreadsheetShiftColumns](#)

## History

ColdFusion 9: Added the function.

## Parameters

Parameter	Description
spreadsheetObj	The Excel spreadsheet object to which to add the column.
data	A comma delimited list of cell entries, one per row being added to the column.
startRow	<p>This parameter is optional.</p> <p>The number of the row at which to start adding the column data. If <code>insert="true"</code>, all rows in the column above the start row have empty cells.</p> <p>If you omit this parameter the columns are inserted starting at the first row, following the last current column, and you cannot specify a column.</p>
startColumn	<p>This parameter is optional.</p> <p>The number of the column in which to add the column data.</p>
insert	<p>This parameter is optional.</p> <p>A Boolean value specifying whether to insert a column. If <code>false</code>, the function replaces data in the specified column entries.</p>

## Usage

The `spreadsheetaddcolumn` function can accept either two or five arguments.

You can specify the `spreadsheetaddcolumn` function using two parameters as follows:

```
<cfset spreadsheetAddColumn(SpreadsheetObj, "newcol1,newcol2,newcol3")>
```

You can specify the `spreadsheetaddcolumn` function using five parameters as follows:

```
<cfset spreadsheetAddColumn(SpreadsheetObj, "newcol1,newcol2,newcol3", 2, 3, false)>
```

## Example

The following example creates an Excel spreadsheet object from a query and inserts a new column 2, with data starting at row 3. The existing columns 2 and greater increment by one.

```
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER,DEPT_ID,COURSE_ID,CORNAME
    FROM COURSELIST
</cfquery>

<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "courses.xls";
    //Create a new Spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");
    SpreadsheetAddRows(theSheet,courses);
    //Insert a new second column to the sheet, with data starting in row 3.
    SpreadsheetAddColumn(theSheet,
        "Basic,Intermediate,Advanced,Basic,Intermediate,Advanced,Basic,Intermediate,Advanced"
        ,3,2,true);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet" sheet=1
sheetname="courses" overwrite=true>
```

## SpreadsheetAddImage

### Description

Adds an image to an Excel spreadsheet object.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetAddImage(SpreadsheetObj, imageFilePath, anchor)
SpreadsheetAddImage(SpreadsheetObj, imageData, imageType, anchor)
```

### See also

[SpreadsheetAddColumn](#), [SpreadsheetAddRow](#), [SpreadsheetAddRows](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadsheetObj	The Excel spreadsheet object to which to add the column.
anchor	<p>The image location, as a comma delimited list in either of the following formats:</p> <ul style="list-style-type: none"><li>• <i>startRow,startColumn,endRow,endColumn</i></li><li>• <i>startXPosition,startYPosition,endXPosition,endYPositions,startRow,startColumn,endRow,endColumn</i></li></ul> <p>The first format specifies only the row and column numbers, the second also specifies the positions in the cell, using pixel X and Y coordinates relative to the cell upper left corner. If you use the first format, the image corner positions within the top left and bottom right cell are 0,0 and ,0,255.</p>
imageData	A ColdFusion image object.
imageFilePath	The absolute path to the image file.
imageType	<p>The image format, one of the following:</p> <ul style="list-style-type: none"><li>• jpg or jpeg</li><li>• png</li><li>• dib</li></ul>

### Usage

#### Example

The following example creates a PNG format chart, puts it in a new spread sheet as rows 5-12 and column 5-10, and saves the sheet to disk.

```
<cfchart format="png"
  scalefrom="-100" scaleTo="100"
  gridlines="5"
  name="test">
  <cfchartseries type="line">
    <cfchartdata item="Point1" value="-50">
    <cfchartdata item="Point2" value="-25">
    <cfchartdata item="Point3" value="1">
    <cfchartdata item="Point4" value="25">
    <cfchartdata item="Point5" value="50">
    <cfchartdata item="Point6" value="75">
    <cfchartdata item="Point7" value="99">
  </cfchartseries>
</cfchart>

<cfscript>
  theDir=GetDirectoryFromPath(GetCurrentTemplatePath());
  SpreadsheetObj=SpreadsheetNew();
  SpreadsheetAddImage(SpreadsheetObj,test,"png","5,5,12,10");
</cfscript>

<cfspreadsheet action="write" name=SpreadsheetObj filename="#theDir#imagesheet.xls"
  sheetname="chart" overwrite=true>
```

## SpreadsheetAddFreezePane

### Description

Locks or freezes specific rows or columns in the worksheet.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetAddFreezePane (spreadsheetobj, freezcol, freezrow[, col, row])
```

### See also

[SpreadsheetAddColumn](#), [SpreadsheetAddImage](#), [SpreadsheetAddRow](#), [SpreadsheetDeleteRow](#),  
[SpreadsheetDeleteRows](#), [SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#), [SpreadsheetShiftRows](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadsheetobj	The Excel spreadsheet object to which to add the freeze pane.
freezcol	Specifies the column boundary of the freeze pane. The columns contained within the column boundary are frozen, while the rest of the worksheet scrolls.
freezrow	Specifies the row boundary of the freeze pane. The rows contained within the row boundary are frozen, while the rest of the worksheet scrolls.
col	This parameter is optional.  The column that should appear next to the <code>freezcol</code> that you specify. This parameter is useful in hiding data. For example, in a worksheet, you can specify column 5 to appear immediately after column 2, and hide column 3 and column 4.
row	This parameter is optional. The row that should appear next to the <code>freezrow</code> that you specify. This parameter is useful in hiding data. For example, in a worksheet, you can specify row 10 to appear immediately after row 7, and hide row 8 and row 9.

### Usage

You can keep an area of the worksheet visible while scrolling to another area of the worksheet by freezing panes. When you freeze a pane, you lock or freeze specific rows and columns in the worksheet. The rows and columns that are frozen in the worksheet are indicated by a solid line.

**Note:** You cannot split the pane into two worksheet areas.

### Example

The following example freezes the spreadsheet at column 3 and row 2 of the worksheet.

```
SpreadSheetAddFreezePane (SpreadsheetObj , 3 , 2 ) ;
```

The following example freezes the spreadsheet at column 3 and row 2, and hides data in column 4 and rows 3 to 10.

```
SpreadSheetAddFreezePane (SpreadsheetObj , 3 , 2 , 5 , 10 ) ;
```

## SpreadsheetAddInfo

### Description

Sets document properties for a new spreadsheet or modifies properties for an existing spreadsheet.

### Returns

This function does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetAddInfo (spreadsheetobj, property_struct)
```

### See also

[SpreadsheetAddColumn](#), [SpreadsheetAddImage](#), [SpreadsheetAddRow](#), [SpreadsheetDeleteRow](#),  
[SpreadsheetDeleteRows](#), [SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#), [SpreadsheetShiftRows](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadsheetobj	The Excel spreadsheet object from which to get the value.
property_struct	The following properties of the spreadsheet can be modified or set: <ul style="list-style-type: none"><li>• AUTHOR</li><li>• CATEGORY</li><li>• LASTAUTHOR</li><li>• COMMENTS</li><li>• KEYWORDS</li><li>• MANAGER</li><li>• COMPANY</li><li>• SUBJECT</li><li>• TITLE</li></ul>

### Usage

This function is supported by Microsoft Office Excel 2007 (.xlsx) and Microsoft Office 2003 (.xls).

### Example

```
<cfspreadsheet action="read" src="#filename#" name="a" >
<cfset info = StructNew()>
<cfset info.title="Title">

## SpreadsheetAddRow

### Description

Adds a row to an Excel spreadsheet object.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

`SpreadsheetAddrow(spreadsheetObj, data [,row, column, insert])`

### See also

[SpreadsheetAddColumn](#), [SpreadsheetAddImage](#), [SpreadsheetAddRows](#), [SpreadsheetDeleteRow](#),  
[SpreadsheetDeleteRows](#), [SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#), [SpreadsheetShiftRows](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
<code>spreadsheetObj</code>	The Excel spreadsheet object to which to add the column.
<code>data</code>	A comma delimited list of cell entries, one per column.
<code>row</code>	The number of the row to insert. The row numbers of any existing rows with numbers equal to or greater than this value are incremented by one. If you specify a value for this parameter, you must also specify a value for <code>column</code> .  If you omit this parameter the rows are inserted following the last current row, and you cannot specify a column.
<code>column</code>	The number of the column in which to add the column data. All columns in the row to the left of the start column have empty cells. If you specify a value for this parameter, you must also specify a value for <code>row</code> .
<code>insert</code>	This parameter is optional. The default value is <code>true</code> .  A Boolean value specifying whether to insert a row. If <code>false</code> , the function replaces data in the specified row entries.

## Usage

### Example

The following example adds a row of data as row 10. The data starts at column 2, and any existing row numbers 10 and higher increment by one.

```
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER,DEPT_ID,COURSE_ID,CORNAME
    FROM COURSELIST
</cfquery>

<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "courses.xls";
    //Create a new Spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");

    SpreadsheetAddRows(theSheet,courses);
    //Insert a new eighth row to the sheet, with data starting in column 1.
    SpreadsheetAddRow(theSheet,"150,ENGL,95,Poetry 1",8,1);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

## SpreadsheetAddRows

### Description

Adds multiple rows from a query to an Excel spreadsheet object.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetAddRows(spreadsheetObj, data[, row, column, insert])
```

### See also

[SpreadsheetAddColumn](#), [SpreadsheetAddImage](#), [SpreadsheetAddRow](#), [SpreadsheetDeleteRow](#),  
[SpreadsheetDeleteRows](#), [SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#), [SpreadsheetShiftRows](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadsheetObj	The Excel spreadsheet object to which to add the column.
data	A query object with the row data or an array.
row	The number of the row at which to insert the rows. The row numbers of any existing rows with numbers equal to or greater than this value are incremented by number of added rows. If you specify a value for this parameter, you must also specify a value for column.  If you omit this parameter the rows are inserted following the last current row.
column	The number of the column in which to add the column data. All columns in the row to the left of the start column have empty cells. If you specify a value for this parameter, you must also specify a value for row.
insert	This parameter is optional. The default value is true.  A Boolean value specifying whether to insert a row. If false, the function replaces data in the specified row entries.

### Example

The following example creates a spreadsheet by creating a new Excel spreadsheet object and using the AddRows function to add the data from a query.

```
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER,DEPT_ID,COURSE_ID,CORNAME
    FROM COURSELIST
</cfquery>

<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "courses.xls";
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");

    SpreadsheetAddRows(theSheet,courses);SpreadsheetAddRows(theSheet,["1,a", "2,B,b"]);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

## SpreadsheetAddSplitPane

### Description

Splits panes into four separate worksheet areas.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetAddSplitPane (spreadsheetobj, x-position, y-position, splitcol, splitrow  
[,position])
```

### See also

[SpreadsheetAddColumn](#), [SpreadsheetAddImage](#), [SpreadsheetAddRow](#), [SpreadsheetDeleteRow](#),  
[SpreadsheetDeleteRows](#), [SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#), [SpreadsheetShiftRows](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadsheetobj	The Excel spreadsheet object to which to add the split pane.
x-position	Specifies the x-axis position of the first quadrant. The x-position value is 1/20th the value of a pixel in the worksheet.
y-position	Specifies the y-axis position of the first quadrant. The y-position value is 1/20th the value of a pixel in the worksheet.
splitcol	Specifies the columns that appear in quadrant 2 of the spreadsheet.
splitrow	Specifies the rows that appear in quadrant 3 of the spreadsheet.
position	<p>This attribute is optional.</p> <p>Specifies the position to apply the split bar to split the pane. It can be one of the following:</p> <ul style="list-style-type: none"><li>• LOWER_LEFT</li><li>• LOWER_RIGHT</li><li>• UPPER_RIGHT</li><li>• UPPER_LEFT</li></ul>

### Usage

You can split the pane into four worksheet areas in the spread sheet. The split is applied at the pixel level. You can adjust the worksheet area by dragging the split bar, as required.

**Note:** You cannot split the pane into two worksheet areas.

### Example

The following example splits the spreadsheet into four quadrants. The x and y positions are at 2000 and 2000 values. Column 5 of the spreadsheet appears in quadrant 2; and row 7 of the spreadsheet appears in quadrant 7. The split bar appears at the lower left side of the spreadsheet.

```
SpreadSheetAddSplitPane (spreadsheetobj, 2000, 2000, 5, 7, LOWER_LEFT );
```

## SpreadsheetCreateSheet

### Description

Creates an additional spreadsheet.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

`SpreadsheetCreateSheet(spreadsheetObj, [sheetname])`

### See also

[SpreadsheetAddColumn](#), [SpreadsheetDeleteColumns](#), [SpreadsheetDeleteRow](#), [SpreadsheetDeleteRows](#),  
[SpreadsheetFormatColumn](#), [SpreadsheetFormatColumns](#),  
[SpreadsheetShiftColumns](#), [SpreadsheetSetActiveSheet](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
<code>spreadsheetObj</code>	The Excel spreadsheet object from which you create the additional sheet.
<code>sheetname</code>	Name of the new sheet. This is optional.

### Example

The following example creates two sheets: CourseData and EvaluationSheet.

```
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER, DEPT_ID, COURSE_ID, CORNAME
    FROM COURSELIST
</cfquery>

<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "courses.xls";
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");

    SpreadsheetAddRows(theSheet, courses);
    //Add a new sheet.
    SpreadsheetCreateSheet (theSheet, "EvaluationSheet");
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

## SpreadsheetDeleteColumn

### Description

Deletes the data from a column of an Excel spreadsheet object. It does not delete the column.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetDeleteColumn(spreadsheetObj, column)
```

### See also

[SpreadsheetAddColumn](#), [SpreadsheetDeleteColumns](#), [SpreadsheetDeleteRow](#), [SpreadsheetDeleteRows](#), [SpreadsheetFormatColumn](#), [SpreadsheetFormatColumns](#), [SpreadsheetShiftColumns](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
<code>spreadsheetObj</code>	The Excel spreadsheet object from which to delete the columns.
<code>column</code>	The column to delete.

### Example

The following example deletes the data from column 2 from a spreadsheet.

```
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER,DEPT_ID,COURSE_ID,CORNAME
    FROM COURSELIST
</cfquery>

<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & courses.xls";
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");

    SpreadsheetAddRows(theSheet,courses);
    //Delete the second column of the sheet.
    SpreadsheetDeleteColumn(theSheet,2);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

## SpreadsheetDeleteColumns

### Description

Deletes the data from multiple columns of an Excel spreadsheet object. This function does not remove the columns.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetDeleteColumns(spreadsheetObj, range)
```

### See also

[SpreadsheetAddColumn](#), [SpreadsheetDeleteColumn](#), [SpreadsheetDeleteRow](#), [SpreadsheetDeleteRows](#),  
[SpreadsheetFormatColumn](#), [SpreadsheetFormatColumns](#), [SpreadsheetShiftColumns](#)

### History

ColdFusion 9: Added the function.

**Parameters**

Parameter	Description
spreadsheetObj	The Excel spreadsheet object from which to delete the columns.
range	<p>A string containing the columns to delete, using any combination of the following formats:</p> <ul style="list-style-type: none"><li>• <i>startColumn-endColumn</i> — Delete columns in a single range.</li><li>• <i>column,column,column...</i> — Delete one or more individual columns.</li></ul> <p>You can also provide both the formats together. For example, 1, 2, 3-5, 7-12.</p>

**Example**

The following example deletes the data from columns 2-4 and column 6 from a spreadsheet.

```
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER,DEPT_ID,CORLEVEL,COURSE_ID,CORNAME,CORDESC, LASTUPDATE
    FROM COURSELIST
</cfquery>

<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & courses.xls";
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");

    SpreadsheetAddRows(theSheet,courses);
    //Delete columns 2 though 4 and 6.
    SpreadsheetDeleteColumns(theSheet,"2-4,6");
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

## SpreadsheetDeleteRow

**Description**

Deletes all data from a row of an Excel spreadsheet object. It does not delete the row.

**Returns**

Does not return a value.

**Category**

Microsoft Office Integration

**Function syntax**

```
SpreadsheetDeleteRow(spreadsheetObj, row)
```

### See also

[SpreadsheetDeleteColumn](#), [SpreadsheetDeleteColumns](#), [SpreadsheetDeleteRows](#), [SpreadsheetFormatRows](#), [SpreadsheetShiftRows](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadsheetObj	The Excel spreadsheet object from which to delete the row.
row	The row to delete.

### Example

The following example deletes row 10 from a spreadsheet.

```
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER, DEPT_ID, CORLEVEL, COURSE_ID, CORNAME, CORDESC, LASTUPDATE
    FROM COURSELIST
</cfquery>

<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "courses.xls";
    ///Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");
    SpreadsheetAddRows(theSheet, courses);

    ///Delete row 10.
    SpreadsheetDeleteRow(theSheet, "10");
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

## SpreadsheetDeleteRows

### Description

Deletes all data from multiple rows of an Excel spreadsheet object. It does not delete the row.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

## Function syntax

`SpreadsheetDeleteRows (spreadsheetObj, range)`

## See also

[SpreadsheetDeleteColumn](#), [SpreadsheetDeleteColumns](#), [SpreadsheetDeleteRow](#), [SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#), [SpreadsheetShiftRows](#)

## History

ColdFusion 9: Added the function.

## Parameters

Parameter	Description
spreadsheetObj	The Excel spreadsheet object in which to delete the rows.
range	<p>The rows to delete, using any combination of the following form:</p> <ul style="list-style-type: none"><li>• <i>startRow-endRow</i> — Insert rows in a single range.</li><li>• <i>row,row,row...</i> — Insert one or more individual rows.</li></ul> <p>You can also provide both the formats together. For example, 1, 2, 3-5, 7-12.</p>

## Example

The following example deletes rows 1 and 5-10 from a spreadsheet.

```
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER,DEPT_ID,CORLEVEL,COURSE_ID,CORNAME,CORDESC, LASTUPDATE
    FROM COURSELIST
</cfquery>

<cfscript>
    //We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & courses.xls";
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");

    SpreadsheetAddRows(theSheet,courses);
    //Delete rows 1 and 5 though 10.
    SpreadsheetDeleteRows(theSheet,"1,5-10");
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

# SpreadsheetFormatCell

## Description

Formats the contents of a single cell of an Excel spreadsheet object.

## Returns

Does not return a value.

## Category

Microsoft Office Integration

## Function syntax

```
SpreadsheetFormatCell(spreadsheetObj, format, row, column)
```

## See also

[SpreadsheetFormatColumn](#), [SpreadsheetFormatColumns](#), [SpreadsheetFormatRow](#),  
[SpreadsheetFormatRowsSpreadsheetShiftRows](#)

## History

ColdFusion 9: Added the function.

## Parameters

Parameter	Description
<code>spreadsheetObj</code>	The Excel spreadsheet object to which to set the format.
<code>format</code>	A structure containing the format information. For details see Usage.
<code>row</code>	The row number of the cell.
<code>column</code>	The column number of the cell.

## Usage

The `format` structure can specify any or all of the following values

Name	Valid values
<code>alignment</code>	Any of the following: <ul style="list-style-type: none"> <li>(ColdFusion 9) left (default), right, center, justify, general, fill, center_selection, vertical_top, vertical_bottom, vertical_center, vertical_justify</li> <li>(ColdFusion 9.0.1): left (default), right, center, justify, general, fill, and center_selection</li> </ul>
<code>bold</code>	A Boolean value. The default value is false.
<code>bottomborder</code>	A border format, any of the following: none (default), thin, medium, dashed, hair, thick, double, dotted, medium_dashed, dash_dot, medium_dash_dot, dash_dot_dot, medium_dash_dot_dot, slanted_dash_dot
<code>bottombordercolor</code>	See the color field for the complete list of colors.
<code>color</code>	Any value in the <code>org.apache.poi.hssf.util.HSSFColor</code> class:  black, brown, olive_green, dark_green, dark_teal, dark_blue, indigo, grey_80_percent, orange, dark_yellow, green, teal, blue, blue_grey, grey_50_percent, red, light_orange, lime, sea_green, aqua, light_blue, violet, grey_40_percent, pink, gold, yellow, bright_green, turquoise, dark_red, sky_blue, plum, grey_25_percent, rose, light_yellow, light_green, light_turquoise, light_turquoise, pale_blue, lavender, white, cornflower_blue, lemon_chiffon, maroon, orchid, coral, royal_blue, light_cornflower_blue

Name	Valid values
dataformat	<p>An Excel data format. Most of the formats supported by MS Excel are supported. The following are the built-in formats:</p> <p>General</p> <p>0</p> <p>0.00</p> <p>#,##0</p> <p>#,##0.00</p> <p>(\$#,##0_(\$#,##0)</p> <p>(\$#,##0_[Red] (\$#,##0)</p> <p>(\$#,##0.00 (\$#,##0.00)</p> <p>(\$#,##0.00_[Red] (\$#,##0.00)</p> <p>0%</p> <p>0.00%</p> <p>0.00E+00</p> <p># ?/?</p> <p># ??/??</p> <p>m/d/yy</p> <p>d-mmm-yy</p> <p>d-mmm</p> <p>mmm-yy</p> <p>h:mm AM/PM</p> <p>h:mm:ss AM/PM</p> <p>h:mm</p> <p>h:mm:ss</p> <p>m/d/yy h:mm</p> <p>(#,##0_(\$#,##0)</p> <p>(#,##0_[Red] (\$#,##0)</p> <p>(#,##0.00_(\$#,##0.00)</p> <p>(#,##0.00_[Red] (\$#,##0.00)</p> <p>_( *#,##0_ ( * ( #,##0_ ( * \- \_ (@_)</p> <p>_( \$*#,##0_ ( \$* ( #,##0_ ( \$* \- \_ (@_)</p> <p>_( *#,##0.00_ ( * ( #,##0.00_ ( * \- \_ (@_)</p> <p>_( \$*#,##0.00_ ( \$* ( #,##0.00_ ( \$* \- \_ (@_)</p> <p>mm:ss</p> <p>[h] :mm:ss</p> <p>mm:ss.0</p> <p>##0.0E+0</p> <p>@</p>
fgcolor	See the color field for the complete list of colors.
fillpattern	<p>Any of the following:</p> <p>big_spots (default), squares, nofill, solid_foreground, fine_dots, alt_bars, sparse_dots, thick_horz_bands, thick_vert_bands, thick_backward_diag, thick_forward_diag, diamonds, less_dots, least_dots</p>
font	A valid system font name.
fontsize	An integer point value.
hidden	A Boolean value. The default value is false.
indent	A positive integer number of default character spaces.
italic	No value required.
leftborder	A border format. See bottomborder for valid values.
leftbordercolor	See the color field for the complete list of colors.
locked	A Boolean value. The default value is false.
rightborder	A border format. See bottomborder for valid values.
rightbordercolor	See the color field for the complete list of colors.
rotation	An integer number of degrees in the range -90 — 90.
strikeout	No value required.

Name	Valid values
textwrap	A Boolean value. The default value is false.
topborder	A border format. See bottomborder for valid values.
topbordercolor	See the color field for the complete list of colors.
verticalalignment (added in ColdFusion 9.0.1)	Any of the following: vertical_top, vertical_bottom, vertical_center, vertical_justify For example, <pre>&lt;cfscript&gt;SpreadsheetFormatCellRange(theSheet,{verticalalignment="VERTICAL_TOP"}, 3,4,30,10);&lt;/cfscript&gt;</pre>
underline	A Boolean value. The default value is false.

### Enhancement in ColdFusion 9.0.1

ColdFusion 9.0.1 allows preformatting of a cell while you use `SpreadsheetFormatCell` as shown in the following example:

```
<cfscript>
sheet= SpreadsheetNew();
SpreadsheetFormatCell(sheet,{dataformat="@"},1,1);
spreadsheetSetCellValue(sheet,'000006534',1,1);
</cfscript>
```

Here, the cell is preformatted and the data is taken as it is provided.

### Example

The following example creates a sheet, sets a simple format for the cell at row 3 column 4, and writes the result to a file:

```
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER,DEPT_ID,CORLEVEL,COURSE_ID,CORNAME,CORDESC, LASTUPDATE
    FROM COURSELIST
</cfquery>

<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "courses.xls";
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");
    SpreadsheetAddRows(theSheet,courses);
    // Define a format for the cell.
    format1=StructNew();
    format1.font="serif";
    format1.fontsize="12";
    format1.color="dark_green";
    format1.bold="true";
    format1.alignment="center";
    SpreadsheetFormatCell(theSheet,format1,3,4);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

The following examples show how to use dataformat:

```
<cfset a = spreadsheetnew()>
<cfset format = structnew()>
<cfset format.dataformat = "0.00">
<cfset spreadsheetaddrow(a,"1,2,3,4",2,1)>
<cfset spreadsheetformatrow(a,format,2)>
<cfset format.dataformat = "0.00%">
<cfset spreadsheetaddrow(a,"1,2,3,4",4,1)>
<cfset spreadsheetformatrow(a,format,4)>
<cfset format.dataformat = "0.00E+00">
<cfset spreadsheetaddrow(a,".000000000000001",5,1)>
<cfset spreadsheetformatrow(a,format,5)>
<cfset format.dataformat = "## ??/??">
<cfset spreadsheetaddrow(a,"3.33",7,1)>
<cfset spreadsheetformatrow(a,format,7)>
<cfset format.dataformat = "m/d/yy">
<cfset spreadsheetaddrow(a,"01/06/09",8,1)>
<cfset spreadsheetformatrow(a,format,8)>
<cfset format.dataformat = "##,##0.00">
<cfset spreadsheetaddrow(a,"2100000",13,1)>
<cfset spreadsheetformatrow(a,format,13)>
<cfset format.dataformat = " (##,##0_);(##,##0) ">
<cfset spreadsheetaddrow(a,"-300",14,1)>
<cfset spreadsheetformatrow(a,format,14)>
<cfspreadsheet action="write" filename="#expandpath('.')#/test.xls" name="a"
overwrite="true">
```

## SpreadsheetFormatColumn

### Description

Formats the contents of a single column of an Excel spreadsheet object.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

`SpreadsheetFormatColumn(spreadsheetObj, format, column)`

### See also

[SpreadsheetFormatCell](#), [SpreadsheetFormatColumns](#), [SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadsheetObj	The Excel spreadsheet object in which to set the format.
format	A structure containing the format information. For details see <a href="#">SpreadsheetFormatCell</a> .
column	The column number.

### Example

The following example creates a sheet, sets a format for column 5, and writes the result to a file:

```
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT  CORNUMBER, DEPT_ID, CORLEVEL, COURSE_ID, CORNAME, CORDESC, LASTUPDATE
    FROM    COURSELIST
</cfquery>

<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "courses.xls";
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");
    SpreadsheetAddRows(theSheet, courses);
    // Define a format for the column.
    format1=StructNew()
    format1.font="Courier";
    format1.fontsize="10";
    format1.color="dark_blue";
    format1.italic="true";
    format1.bold="true";
    format1.alignment="left";
    format1.textwrap="true";
    format1.fgcolor="pale_blue";
    format1.bottomborder="dotted";
    format1.bottombordercolor="blue_grey";
    format1.leftborder="thick";
    format1.leftbordercolor="blue_grey";
    format1.rightborder="thick";
    format1.rightbordercolor="blue_grey";
    SpreadsheetFormatColumn(theSheet, format1, 5);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

## SpreadsheetFormatCellRange

### Description

Formats the cells within the given range.

### Returns

Nothing

### Category

Microsoft Office Integration

### Function syntax

`SpreadsheetFormatCellRange (spreadsheetObj, format, startRow, startColumn, endRow, endColumn)`

### See also

[SpreadsheetFormatCell](#), [SpreadsheetFormatColumns](#), [SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#)

### History

ColdFusion 9.0.1: Added the function. Supports preformatting of a cell while you use this function.

### Parameters

Parameter	Description
spreadsheetObj	The Excel spreadsheet object for which you want to format the cells.
format	A structure that contains format information.
startRow	The number of the first row to format.
startColumn	The number of the first column to format.
endRow	The number of the last row to format.
endColumn	The number of the last column to format.

### Example

```
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT  CORNUMBER,DEPT_ID,CORLEVEL,COURSE_ID,CORNAME,CORDESC, LASTUPDATE
    FROM  COURSELIST
</cfquery>
<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "courses.xls";
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");
    SpreadsheetAddRows(theSheet,courses);
    // Define a format for the column.
    format1=StructNew()
    format1.font="Courier";
    format1.fontsize="10";
    format1.color="dark_blue";
    format1.italic="true";
    format1.bold="true";
    format1.alignment="left";
    SpreadsheetFormatCellRange(theSheet,format1, 3,4,30,10);
</cfscript>
<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

## SpreadsheetFormatColumns

### Description

Formats the contents of multiple columns of an Excel spreadsheet object.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetFormatColumns(spreadsheetObj, format, columns)
```

### See also

[SpreadsheetFormatCell](#), [SpreadsheetFormatColumn](#), [SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#)

### History

ColdFusion 9: Added the function.

## Parameters

Parameter	Description
spreadsheetObj	The Excel spreadsheet object in which to set the format.
format	A structure containing the format information. For details see <a href="#">SpreadsheetFormatCell</a> .
columns	The columns to format, in one of the following formats: <ul style="list-style-type: none"> <li><i>startColumn-endColumn</i> — Insert columns in a single range.</li> <li><i>column,column,column...</i> — Insert one or more individual columns.</li> </ul>

## Example

The following example creates a sheet, sets a format for columns 1-5, and writes the result to a file:

```
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER,DEPT_ID,CORLEVEL,COURSE_ID,CORNAME,CORDESC, LASTUPDATE
    FROM COURSELIST
</cfquery>

<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "courses.xls";
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");
    SpreadsheetAddRows(theSheet,courses);
    // Define a format for the column.
    format1=StructNew()
    format1.font="Courier";
    format1.fontsize="10";
    format1.color="dark_blue";
    format1.italic="true";
    format1.bold="true";
    format1.alignment="left";
    format1.textwrap="true";
    format1.fgcolor="pale_blue";
    format1.bottomborder="dotted";
    format1.bottombordercolor="blue_grey";
    format1.leftborder="thick";
    format1.leftbordercolor="blue_grey";
    format1.rightborder="thick";
    format1.rightbordercolor="blue_grey";
    SpreadsheetFormatColumns(theSheet,format1,"1-5");
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

## SpreadsheetFormatRow

### Description

Formats the contents of a single row of an Excel spreadsheet object.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetFormatRow(spreadsheetObj, format, row)
```

### See also

Other Spreadsheet\* functions

[SpreadsheetFormatCell](#), [SpreadsheetFormatColumn](#), [SpreadsheetFormatColumns](#), [SpreadsheetFormatRows](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
<code>spreadsheetObj</code>	The Excel spreadsheet object in which to set the format.
<code>format</code>	A structure containing the format information. For details see <a href="#">SpreadsheetFormatColumn</a> .
<code>row</code>	The row number.

### Example

The following example creates a sheet, sets a format for rows 1, 3, and 5, and writes the result to a file:

```
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER,DEPT_ID,CORLEVEL,COURSE_ID,CORNAME,CORDESC, LASTUPDATE
    FROM COURSELIST
</cfquery>

<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "courses.xls";
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");
    SpreadsheetAddRows(theSheet,courses);
    // Define a format for the column.
    format1=StructNew()
    format1.font="Courier";
    format1.fontsize="10";
    format1.color="dark_blue";
    format1.italic="true";
    format1.bold="true";
    format1.alignment="left";
    format1.textwrap="true";
    format1.fgcolor="pale_blue";
    format1.bottomborder="thick";
    format1.bottombordercolor="blue_grey";
    format1.topbordercolor="blue_grey";
    format1.topborder="thick";
    format1.leftborder="dotted";
    format1.leftbordercolor="blue_grey";
    format1.rightborder="dotted";
    format1.rightbordercolor="blue_grey";
    SpreadsheetFormatRow(theSheet,format1,"5");
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

## SpreadsheetFormatRows

### Description

Formats the contents of multiple rows of an Excel spreadsheet object.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetFormatRows(spreadsheetObj, format, rows)
```

### See also

[SpreadsheetFormatCell](#), [SpreadsheetFormatColumn](#), [SpreadsheetFormatColumns](#), [SpreadsheetFormatRow](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
<code>spreadsheetObj</code>	The Excel spreadsheet object in which to set the format.
<code>format</code>	A structure containing the format information. For details see <a href="#">SpreadsheetFormatColumn</a> .
<code>row</code>	<p>The rows to format, in one of the following formats:</p> <ul style="list-style-type: none"><li>• <code>startRow-endRow</code> — Insert rows in a single range.</li><li>• <code>row, row, row...</code> — Insert one or more individual rows.</li></ul> <p>You can also provide the formats together. For example, <code>1-5, 6, 7, 9-12</code>.</p>

### Example

The following example creates a sheet, sets a format for rows 1, 3, and 5, and writes the result to a file:

```
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER,DEPT_ID,CORLEVEL,COURSE_ID,CORNAME,CORDESC, LASTUPDATE
    FROM COURSELIST
</cfquery>

<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "courses.xls";
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");
    SpreadsheetAddRows(theSheet,courses);
    // Define a format for the column.
    format1=StructNew()
    format1.font="Courier";
    format1.fontsize="10";
    format1.color="dark_blue";
    format1.italic="true";
    format1.bold="true";
    format1.alignment="left";
    format1.textwrap="true";
    format1.fgcolor="pale_blue";
    format1.bottomborder="thick";
    format1.bottombordercolor="blue_grey";
    format1.topbordercolor="blue_grey";
    format1.topborder="thick";
    format1.leftborder="dotted";
    format1.leftbordercolor="blue_grey";
    format1.rightborder="dotted";
    format1.rightbordercolor="blue_grey";
    SpreadsheetFormatRows(theSheet,format1,"1,3,5");
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

## SpreadsheetGetCellComment

### Description

Gets the comment for an Excel spreadsheet object cell as a structure with formatting information, or all comments for the object.

### Returns

If the parameters include the row and column: a structure containing the comment information for the specified cell.  
If the function has only a `spreadsheetObj` parameter, an array containing a structure for each comment. Each structure has the following information:

Field	Contents
Author	A string containing the name of the comment author.
Column	The cell column number.
Comment	A string containing the comment text.
Row	The cell row number.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetGetCellComment (spreadsheetObj[, row, column])
```

### See also

[SpreadsheetFormatCell](#), [SpreadsheetGetCellFormula](#), [SpreadsheetGetCellValue](#),  
[SpreadsheetMergeCells](#), [SpreadsheetSetCellComment](#), [SpreadsheetSetCellFormula](#),  
[SpreadsheetSetCellValue](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadsheetObj	The Excel spreadsheet object from which to get the comment.
row	The row number of the cell from which to get the comment.
column	The column number of the cell from which to get the comment.

### Example

The following example sets and gets a comment for the cell at row 3column 5.

```
<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "comment.xls";
    //Create an Excel spreadsheet object.
    theSheet = SpreadsheetNew();
    // Define a cell comment.

    comment1.anchor="1,1,15,20";
    comment1.author="Adobe Systems";
    comment1.bold="true";
    comment1.color="lavender";
    comment1.comment="This is the cell in row three, column 5 (E).";
    comment1.fillcolor="yellow";
    comment1.font="Courier";
    comment1.horizontalalignment="left";
    comment1.linestyle="dashsys";
    comment1.size="10";
    comment1.verticalalignment="top";
    //Set the comment.
    SpreadsheetSetCellComment(theSheet,comment1,3,5);
    //Get the comment from the Excel spreadsheet object.
    theComment=SpreadsheetGetCellComment(theSheet,3,5);
</cfscript>
<cfoutput>
Row,Column: #theComment.row#, #theComment.column#<br />
Author: #theComment.author#<br />
Comment: #theComment.comment#
</cfoutput>
<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

## SpreadsheetGetCellFormula

### Description

Gets the formula for an Excel spreadsheet object cell, or all formulas for the object.

### Returns

If the parameters include the row and column: a string containing the formula. If the function has the spreadsheetObj parameter, an array containing structures for each formula.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetGetCellFormula(spreadsheetObj[, row, column])
```

### See also

[SpreadsheetGetCellComment](#), [SpreadsheetFormatCell](#), [SpreadsheetGetCellValue](#),  
[SpreadsheetMergeCells](#), [SpreadsheetSetCellComment](#), [SpreadsheetSetCellFormula](#),  
[SpreadsheetSetCellValue](#)

## History

ColdFusion 9: Added the function.

## Parameters

Parameter	Description
spreadsheetObj	The Excel spreadsheet object from which to get the formula.
row	The row number of the cell from which to get the formula.
column	The column number of the cell from which to get the formula.

## Usage

If you specify only the `spreadsheetObj` parameter, the function returns an array of the structures with the following contents. The array has one entry for each cell that contains a formula.

Field	Valid values
formula	The formula for the cell.
row	The row number of the cell.
column	The column number of the cell.

## Example

The following example sets a cell formula, and gets the cell formula and value.

```
<cfscript>
    //Create a new Excel spreadsheet object.
    theSheet=SpreadsheetNew();
    //Set the values of column 3 rows 1-10 to the row number.
    for (i=1; i<= 10; i=i+1)
        SpreadsheetSetCellValue(theSheet,i,i,3);
    //Set the formula for the cell in row 11 column 3 to be the sum of
    //Columns 1-10.
    SpreadsheetSetCellFormula(theSheet,"SUM(C1:C10)",11,3);
    //Get the formula from the Excel spreadsheet object.
    theValue=SpreadsheetGetCellFormula(theSheet,11,3);
    //Get the value of row 11 column 5 from the Excel spreadsheet object.
    theValue=SpreadsheetGetCellValue(theSheet,11,3);
</cfscript>

<cfoutput>
Row 11, Column 3 value: #SpreadsheetGetCellValue(theSheet,11,3)#<br />
Row 11, Column 3 formula: #SpreadsheetGetCellFormula(theSheet,11,3)#<br />
</cfoutput>
```

## SpreadsheetGetCellValue

### Description

Gets the Value for an Excel spreadsheet object cell.

### Returns

A string containing the cell value.

## Category

Microsoft Office Integration

## Function syntax

`SpreadsheetGetCellValue(spreadsheetObj, row, column)`

## See also

[SpreadsheetGetCellComment](#), [SpreadsheetFormatCell](#), [SpreadsheetGetCellFormula](#),  
[SpreadsheetMergeCells](#), [SpreadsheetSetCellComment](#), [SpreadsheetSetCellFormula](#),  
[SpreadsheetSetCellValue](#)

## History

ColdFusion 9: Added the function.

## Parameters

Parameter	Description
<code>spreadsheetObj</code>	The Excel spreadsheet object from which to get the value.
<code>row</code>	The row number of the cell from which to get the formula.
<code>column</code>	The column number of the cell from which to get the formula.

## Example

The following lines create an Excel spreadsheet object, set the value of the cell at row 3, column 5 - 365, gets the value and displays it:

```
<cfscript>
    //Create a new Excel spreadsheet object.
    theSheet=SpreadsheetNew();
    //Set the value of the cell at row 3 column 5.
    SpreadsheetSetCellValue(theSheet,365,3,5);
    //Get the value from the Excel spreadsheet object.
    theValue=SpreadsheetGetCellValue(theSheet,3,5);
    WriteOutput("The value of column 5 row 3 is: " & theValue);
</cfscript>
```

## SpreadsheetInfo

### Description

Gets the property of an Excel spreadsheet object.

### Returns

Returns a spreadsheet property that can be one of the following:

- AUTHOR
- CATEGORY
- COMMENTS
- CREATIONDATE
- LASTEDITED

- LASTAUTHOR
- LASTSAVED
- KEYWORDS
- MANAGER
- COMPANY
- SUBJECT
- TITLE
- SHEETS
- SHEETNAMES
- SPREADSHEETTYPES

### Category

Microsoft Office Integration

### Function syntax

`SpreadsheetInfo(spreadsheetobj)`

### See also

[SpreadsheetAddColumn](#), [SpreadsheetAddImage](#), [SpreadsheetAddRow](#), [SpreadsheetDeleteRow](#),  
[SpreadsheetDeleteRows](#), [SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#), [SpreadsheetShiftRows](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
<code>spreadsheetobj</code>	The Excel spreadsheet object from which to get the value.

### Usage

This function is supported by Microsoft Office Excel 2007 and Microsoft Office 2003.

### Example

```
<cfspreadsheet action="read" src="#dirname#SingleSheet.xls" name="SpreadsheetObj" >
  <cfset info = SpreadsheetInfo(SpreadsheetObj)>
  <cfoutput> AUTHOR : #info.author#<br> </cfoutput>
  <cfoutput> Creation Date : #info.creationdate#<br> </cfoutput>
  <cfoutput> LAST AUTHOR : #info.lastauthor#<br> </cfoutput>
  <cfoutput> SHEETS : #info.sheets#<br> </cfoutput>
  <cfoutput> SPREADSHEETTYPE : #info.SPREADSHEETTYPE#<br> </cfoutput>
  <cfoutput>SUBJECT : #info.SUBJECT#<br></cfoutput>
  <cfoutput>TITLE : #info.TITLE#<br></cfoutput>
```

## SpreadsheetMergeCells

### Description

Merges a rectangular block of two or more Excel spreadsheet object cells.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetMergeCells(spreadsheetObj, startRow, endRow, startColumn, endColumn)
```

### See also

[SpreadsheetGetCellComment](#), [SpreadsheetFormatCell](#), [SpreadsheetGetCellFormula](#),  
[SpreadsheetGetCellValue](#), [SpreadsheetSetCellComment](#), [SpreadsheetSetCellFormula](#),  
[SpreadsheetSetCellValue](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
<code>spreadsheetObj</code>	The Excel spreadsheet object containing the cells to merge.
<code>startRow</code>	The number of the first row to merge.
<code>endRow</code>	The row number of the last row to merge.
<code>startColumn</code>	The column number of the first cell to merge.
<code>endColumn</code>	The column number of the last cell to merge.

### Usage

If you merge two cells using this function, the merged cell by default displays the value in the cell that is on the left-hand side of the spreadsheet. For example, if you merge the cell (20,3) and cell (20,4), then the value in the cell (20, 3) is displayed. If the cell (20, 3) is blank, then after merging, the cell displays blank.

### Example

The following example merges cells 4-6 in rows 1-3 of an Excel spreadsheet object. It puts text in the merged cells and saves the sheet to a file so you can see the result.

```
<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "mergencells.xls";
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");
    //Merges cells 4-6 in the first three rows of the Excel spreadsheet object.
    SpreadsheetMergeCells(theSheet,1,3,4,6);
    //Set the value of the merged cell.
    SpreadsheetSetCellValue(theSheet,"Columns 4-6 of rows 1-3 are merged",1,4);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet" overwrite=true>
```

## SpreadsheetNew

### Description

Creates a ColdFusionExcel spreadsheet object, which represents a single sheet of an Excel document.

### Returns

ColdFusionExcel spreadsheet object.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetNew([sheetName, xmlformat])
```

### See also

All Other Spreadsheet\* functions; see Microsoft Office Integration list.

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
sheetName	A string containing the sheet name to assign to the Excel spreadsheet object.
xmlformat	A Boolean value.  True or Yes: Creates a .xlsx file that is supported by Microsoft Office Excel 2007.  False or No: Creates a .xls file.

### Usage

This function supports Microsoft Office Excel 2007.

To create a simple .xls spreadsheet object with a default worksheet name, your code can be as follows:

```
<cfset SpreadsheetObj = spreadsheetNew()>
```

To create a simple .xls spreadsheet object by specifying the worksheet name as "mySheet", your code can be as follows:

```
<cfset SpreadsheetObj = spreadsheetNew("mySheet")>
```

To create spreadsheet objects that are supported by Microsoft Office Excel 2007 (.xlsx), your code can be as follows:

```
<cfset SpreadsheetObj = spreadsheetNew("true")>
<cfset SpreadsheetObj = spreadsheetNew("mysheet", "yes")>
```

**Note:** You can specify either “true” or “yes” to create a .xlsx file.

### Example

The following example creates an Excel spreadsheet object with the sheet name Expenses, sets a cell value, and saves the result to a file.

```
<cfscript>
    //We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "newSpreadsheet.xls";
    //Create a new Excel spreadsheet object.
    theSheet = SpreadsheetNew("Expenses");
    //Set the value a cell.
    SpreadsheetSetCellValue(theSheet, "365", 1, 4);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet" overwrite=true>
```

## SpreadsheetRead

### Description

Reads a sheet from a spreadsheet file and stores it in a ColdFusion spreadsheet object.

### Returns

Returns spreadsheet object.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadSheetRead(fileName [, sheetName|sheet])
```

### See also

[SpreadsheetWrite](#), [SpreadsheetAddColumn](#), [SpreadsheetAddImage](#), [SpreadsheetAddRow](#),  
[SpreadsheetDeleteRow](#), [SpreadsheetDeleteRows](#), [SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#),  
[SpreadsheetShiftRows](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
fileName	A string specifying the path to the spreadsheet file.
sheetName	Optional parameter; name of the sheet. You can specify <code>sheet</code> or <code>sheetName</code> .
sheet	Optional parameter; number of the sheet. You can specify <code>sheet</code> or <code>sheetName</code> .

### Usage

Use this function to read an Excel file with multiple sheets.

### Example

```
<cfscript>
    a = SpreadsheetRead("C:\Files\Report.xls", "Annual Report")
</cfscript>
```

## SpreadsheetReadBinary

### Description

Reads and stores content from a spreadsheet object and returns it as a byte array.

### Returns

Returns a byte array of the stored spreadsheet information using the `cfcontent` tag.

### Category

Microsoft Office Integration

### Function syntax

`SpreadsheetReadBinary(spreadsheetobj)`

### See also

[SpreadsheetAddColumn](#), [SpreadsheetAddImage](#), [SpreadsheetAddRow](#), [SpreadsheetDeleteRow](#),  
[SpreadsheetDeleteRows](#), [SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#), [SpreadsheetShiftRows](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadSheetObject	The Excel spreadsheet object to read.

## Usage

### Example

```
<cfheader name="Content-Disposition" value="inline; filename=test.xls">
<cfset a = spreadsheetNew() >
<cfset spreadsheetAddRow(a,"a,b,c") >
<!---You can do all the processing--->
<cfset bin = spreadsheetReadBinary(a)>
<cfcontent type="application/vnd-ms.excel" variable="#bin#" reset="true">
```

## SpreadsheetRemoveSheet

### Description

Deletes a spreadsheet.

### Returns

Nothing

### Category

Microsoft Office Integration

### Function syntax

SpreadsheetRemoveSheet (spreadsheetObj, sheetname)

### See also

[SpreadsheetSetActiveSheetNumber](#), [SpreadsheetAddColumn](#), [SpreadsheetAddImage](#), [SpreadsheetAddRow](#), [SpreadsheetDeleteRow](#), [SpreadsheetDeleteRows](#), [SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#), [SpreadsheetShiftRows](#)

### History

ColdFusion 9.0.1: Added the function.

### Parameters

Parameter	Description
spreadsheetObj	The Excel spreadsheet object from which you delete the sheet.
sheetname	Name of the sheet that must be removed.

### Example

```
<cfset spreadsheetVar= spreadsheetNew("New") >
<cfset spreadsheetCreateSheet (spreadsheetVar, "A") >
<cfset spreadsheetCreateSheet (spreadsheetVar, "B") >
<cfspreadsheet action="write" filename="#dirname#mySpreadSheet.xls" name="spreadsheetVar"
overwrite="true" >
<cfspreadsheet action="read" src="#dirname#mySpreadSheet.xls" name="spreadSheetVar" >
<cfset spreadsheetRemoveSheet (spreadsheetVar, "B") >
<cfspreadsheet action="write" filename="#dirname#mySpreadSheet.xls" name="spreadsheetVar"
overwrite="true" >
```

## SpreadsheetSetActiveSheet

### Description

Sets a specified sheet as active sheet.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetSetActiveSheet(spreadsheetobj, sheetname)
```

### See also

[SpreadsheetSetActiveSheetNumber](#), [SpreadsheetAddColumn](#), [SpreadsheetAddImage](#), [SpreadsheetAddRow](#),  
[SpreadsheetDeleteRow](#), [SpreadsheetDeleteRows](#), [SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#),  
[SpreadsheetShiftRows](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
<code>spreadsheetobj</code>	The Excel spreadsheet object to which to add the split pane.
<code>sheetname</code>	The spreadsheet that must be set as active.

### Usage

You can set only one sheet as active at a time. Therefore, any sheet operation is limited to a particular sheet. For operations in any other sheet, you must set that sheet as active.

### Example

The following example shows how to switch from one sheet to another and perform operations.

```
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT CORNUMBER,DEPT_ID,COURSE_ID,CORNAME
    FROM COURSELIST
</cfquery>

<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & courses.xls";
    //Create a new Excel spreadsheet object and add the query data.
    theSheet = SpreadsheetNew("CourseData");

    SpreadsheetAddRows(theSheet,courses);
    //Create a new sheet.
    SpreadsheetCreateSheet (theSheet, "EvaluationSheet");
    //Set the sheet as active.
    SpreadsheetSetActiveSheet (theSheet, "EvaluationSheet");
    //Add a new row to the sheet.
    SpreadsheetAddRows(theSheet,courses);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

## SpreadsheetSetActiveSheetNumber

### Description

Sets a specified sheetnumber as active sheet.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetSetActiveSheetNumber(spreadsheetobj, sheetnumber)
```

### See also

[SpreadsheetSetActiveSheet](#), [SpreadsheetAddColumn](#), [SpreadsheetAddImage](#), [SpreadsheetAddRow](#),  
[SpreadsheetDeleteRow](#), [SpreadsheetDeleteRows](#), [SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#),  
[SpreadsheetShiftRows](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadsheetobj	The Excel spreadsheet object to which to add the split pane.
sheetnumber	The spreadsheet number that must be set as active.

### Usage

You can set only one sheet as active at a time. Therefore, any sheet operation is limited to a particular sheet. For operations in any other sheet, you must set that sheet as active.

### Example

The following example shows how to switch from one sheet to another and perform operations.

```
<!--- Get the spreadsheet data as a query. --->
<cfquery
    name="courses" datasource="cfdocexamples"
    cachedwithin="#CreateTimeSpan(0, 6, 0, 0)#">
    SELECT  CORNUMBER,DEPT_ID,COURSE_ID,CORNAME
    FROM    COURSELIST
</cfquery>
<cfset theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & courses.xls">
<cfspreadsheet action="read" name=theSheet src="#theFile#" sheet="1">

<cfscript>
    SpreadsheetAddRows(theSheet,courses);
    //Set the sheetnumber 2 as active.
    SpreadsheetSetActiveSheetNumber (theSheet, 2);
    //Add a new row to the sheet 2.
    SpreadsheetAddRows(theSheet,courses);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

## SpreadsheetSetCellComment

### Description

Specifies the comment for an Excel spreadsheet object cell.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetSetCellComment(spreadsheetObj, comment, row, column)
```

### See also

[SpreadsheetGetCellComment](#), [SpreadsheetFormatCell](#), [SpreadsheetGetCellFormula](#),  
[SpreadsheetGetCellValue](#), [SpreadsheetMergeCells](#), [SpreadsheetSetCellFormula](#),  
[SpreadsheetSetCellValue](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadsheetObj	The Excel spreadsheet object to which to add the comment.
comment	A structure containing the comment including text, formatting, and placement in the cell. See Usage for the structure contents.
row	The row number of the cell to which to add the comment.
column	The column number of the cell to which to add the comment.

### Usage

The comment structure can have the following fields. Excel determines the default field values.

Field	Valid values
anchor	A comma separated list of integers specifying the position and size of the comment, in rows and columns, in the order top column, left row, bottom column, right row. For example: "4,8,6,11" specifies a comment with an upper left corner in row 4 column 8 and a lower right corner in row 6 column 11.
author	The author's name.
bold	A Boolean value specifying whether the text is bold.
color	The text color, Any value in the Apache <a href="#">org.apache.poi.hssf.util.HSSFColor</a> class:  black, brown, olive_green, dark_green, dark_teal, dark_blue, indigo, grey_80_percent, orange, dark_yellow, green, teal, blue, blue_grey, grey_50_percent, red, light_orange, lime, sea_green, aqua, light_blue, violet, grey_40_percent, pink, gold, yellow, bright_green, turquoise, dark_red, sky_blue, plum, grey_25_percent, rose, light_yellow, light_green, light_turquoise, light_turquoise, pale_blue, lavender, white, cornflower_blue, lemon_chiffon, maroon, orchid, coral, royal_blue, light_cornflower_blue.
comment	A string containing the comment text.
fillcolor	A <a href="#">J2SE v1.4 java.awt.Color</a> class color value: white, lightGray, light_gray, gray, darkGray, dark_gray, black, red, pink, orange, yellow, green, magenta, cyan, blue. (Because ColdFusion is case independent, you do not need to specify the values if defined in the Java class.)
font	Any valid system font name.
horizontalalignment	The horizontal alignment of the text: left, center, right, justify, distributed.
italic	A Boolean value specifying whether the text is italic.
linestyle	The style of the top and right borders of the comment box: solid, dashsys, dotsys, dashdotsys, dashdotdotsys, dotgel, dashgel, longdashgel, dashdotgel, longdashdotgel, longdashdotdotgel.
linestylecolor	A Java color value (Does not work: BUG 72501).
size	The size of the text in points.

Field	Valid values
strikeout	A Boolean value specifying whether the text is struck out.
underline	A Boolean value specifying whether the text is underlined.
verticalalignment	The vertical alignment of the text: top, center, bottom, justify, distributed.
visible	A Boolean value specifying whether the text is visible.

### Example

The following example sets and gets a comment for the cell at row 3column 5.

```
<cfscript>
    //We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "comment.xls";
    //Create an Excel spreadsheet object.
    theSheet = SpreadsheetNew();
    // Define a cell comment.

    comment1=structNew()
    comment1.anchor="0,0,5,8";
    comment1.author="Adobe Systems";
    comment1.bold="true";
    comment1.color="dark_green";
    comment1.comment="This is the cell in row three, column 5 (E).";
    comment1.fillcolor="light_gray";
    comment1.font="Courier";
    comment1.horizontalalignment="left";
    comment1.linestyle="dashsys";
    comment1.size="10";
    comment1.verticalalignment="top";

    //Set the comment.
    SpreadsheetSetCellComment(theSheet,comment1,3,5);
    //Get the comment from the Excel spreadsheet object.
    theComment=SpreadsheetGetCellComment(theSheet,3,5);
</cfscript>

<cfoutput>
Row,Column: #theComment.row#,#theComment.column#<br />
Author: #theComment.author#<br />
Comment: #theComment.comment#
</cfoutput>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet"
    sheet=1 sheetname="courses" overwrite=true>
```

## SpreadsheetSetCellFormula

### Description

Specifies the formula for an Excel spreadsheet object cell.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetSetCellFormula(spreadsheetObj, formula, row, column)
```

### See also

[SpreadsheetGetCellComment](#), [SpreadsheetFormatCell](#), [SpreadsheetGetCellFormula](#),  
[SpreadsheetGetCellValue](#), [SpreadsheetMergeCells](#), [SpreadsheetSetCellComment](#),  
[SpreadsheetSetCellValue](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
<code>spreadsheetObj</code>	The Excel spreadsheet object to which to add the comment.
<code>formula</code>	A string containing the formula.
<code>row</code>	The row number of the cell to which to add the formula.
<code>column</code>	The column number of the cell to which to add the formula.

### Usage

This function replaces any existing value, including specific entered values.

### Example

The following line sets the formula for the cell at row 2 column 11 to be the sum of the cells in the column's rows 1 through 12.

The following example sets a cell formula, and gets the cell formula and value.

```
<cfscript>
    //Create a new Excel spreadsheet object.
    theSheet=SpreadsheetNew();
    //Set the values of column 3 rows 1-10 to the row number.
    for (i=1; i<= 10; i=i+1)
        SpreadsheetSetCellValue(theSheet,i,i,3);
    //Set the fomula for the cell in row 11 column 3 to be the sum of
    //Columns 1-10.
    SpreadsheetSetCellFormula(theSheet,"SUM(C1:C10)",11,3);
    //Get the formula from the Excel spreadsheet object.
    theValue=SpreadsheetGetCellFormula(theSheet,11,3);
    //Get the value of row 11 column 5 from the Excel spreadsheet object.
    theValue=SpreadsheetGetCellValue(theSheet,11,3);
</cfscript>

<cfoutput>
Row 11, Column 3 value: #SpreadsheetGetCellValue(theSheet,11,3)#<br />
Row 11, Column 3 formula: #SpreadsheetGetCellFormula(theSheet,11,3)#<br />
</cfoutput>
```

## SpreadsheetSetCellValue

### Description

Specifies the value of an Excel spreadsheet object cell.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetSetCellValue(spreadsheetObj, value, row, column)
```

### See also

[SpreadsheetGetCellComment](#), [SpreadsheetFormatCell](#), [SpreadsheetGetCellFormula](#),  
[SpreadsheetGetCellValue](#), [SpreadsheetMergeCells](#), [SpreadsheetSetCellComment](#),  
[SpreadsheetSetCellFormula](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadsheetObj	The Excel spreadsheet object to which to add the comment.
value	A string containing the cell value.
row	The row number of the cell to which to set the value.
column	The column number of the cell to which to set the value.

### Example

The following lines create an Excel spreadsheet object, set the value of the cell at row 3, column 5 to 365, and get the value:

```
<cfscript>
    //Create a new Excel spreadsheet object.
    theSheet=SpreadsheetNew();
    //Set the value of the cell at row 3 column 5.
    SpreadsheetSetCellValue(theSheet,365,3,5);
    //Get the value from the Excel spreadsheet object.
    theValue=SpreadsheetGetCellValue(theSheet,3,5);
    WriteOutput("The value of column 5 row 3 is: " & theValue);
</cfscript>
```

## SpreadsheetSetColumnWidth

### Description

Sets the width of a column in a worksheet.

### Returns

Nothing

### Category

Microsoft Office Integration

### Function syntax

```
SpreadSheetSetColumnWidth(spreadhsheetobj, column number, width)
```

### See also

[SpreadsheetGetCellComment](#), [SpreadsheetFormatCell](#), [SpreadsheetGetCellFormula](#),  
[SpreadsheetGetCellValue](#), [SpreadsheetMergeCells](#), [SpreadsheetSetCellFormula](#),  
[SpreadsheetSetCellValue](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadsheetobj	The Excel spreadsheet object to which to set the column width.
column number	Specifies the column to set the width. The
width	Specifies the width in points.

### Example

The following example creates a spreadsheet, adds columns to the spreadsheet, and sets the column width for the newly added columns.

```
<cfscript>
a=SpreadSheetNew();
SpreadSheetAddRow(a,"1,2,3,4,5,6,7,8");
SpreadSheetAddRow(a,"1,2,3,4,5,6,7,8",2,1);
</cfscript>
<cfset SpreadSheetSetColumnWidth(a,2,10)>
<cfset SpreadSheetSetColumnWidth(a,3,25)>
<cfspreadsheet action="write" filename="#expandpath('.')#/b.xls" name="a" overwrite="true">
```

## SpreadsheetSetFooter

### Description

Adds a footer to the specified worksheet.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetSetFooter(spreadhsheetobj, left footer, center footer, right footer)
```

### See also

[SpreadsheetGetCellComment](#), [SpreadsheetFormatCell](#), [SpreadsheetGetCellFormula](#),  
[SpreadsheetGetCellValue](#), [SpreadsheetMergeCells](#), [SpreadsheetSetCellFormula](#),  
[SpreadsheetSetCellValue](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadsheetobj	The Excel spreadsheet object to which to add the footer.
left footer	Adds the footer in the left side of the worksheet.
center footer	Adds the footer in the center of the worksheet.
right footer	Adds the footer in the right side of the worksheet.

### Usage

The footer that you add appears on the printed worksheet document.

### Example

The following example adds a footer in the left side of the worksheet.

```
<cfspreadsheet action="read" src="#dirname#SingleSheet.xls" sheet="2" name="SpreadsheetObj" >
<cfset spreadsheetSetHeader(SpreadsheetObj,"left header","center header","right header")>
<cfset spreadsheetSetFooter(SpreadsheetObj,"left footer","center footer","right footer")>
<cfspreadsheet action="write" filename="#dirname#MySheet.xls" name="SpreadsheetObj"
overwrite="true" >
```

## SpreadsheetSetHeader

### Description

Adds a header to the specified worksheet.

### Returns

Nothing

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetSetHeader(spreadhsheetobj, left header, center header, right header)
```

### See also

[SpreadsheetGetCellComment](#), [SpreadsheetFormatCell](#), [SpreadsheetGetCellFormula](#),  
[SpreadsheetGetCellValue](#), [SpreadsheetMergeCells](#), [SpreadsheetSetCellFormula](#),  
[SpreadsheetSetCellValue](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadsheetobj	The Excel spreadsheet object to which to add the header.
left header	Adds the header in the left side of the worksheet.
center header	Adds the header in the center of the worksheet.
right header	Adds the header in the right side of the worksheet.

### Usage

The header that you add appears on the printed worksheet document.

### Example

The following example adds a header in the center of the worksheet.

```
<cfspreadsheet action="read" src="#dirname#SingleSheet.xls" sheet="2" name="SpreadsheetObj">
<cfset spreadsheetSetHeader(SpreadsheetObj,"left header","center header","right
header")><cfset spreadsheetSetFooter(SpreadsheetObj,"left footer","center footer","right
footer")><cfspreadsheet action="write" filename="#dirname#MySheet.xls" name="SpreadsheetObj"
overwrite="true" >
```

## SpreadsheetSetRowHeight

### Description

Sets the height of a row in a worksheet.

### Returns

Nothing

### Category

Microsoft Office Integration

### Function syntax

`SpreadSheetSetRowHeight (spreadhsheetobj, row number, height)`

### See also

[SpreadsheetGetCellComment](#), [SpreadsheetFormatCell](#), [SpreadsheetGetCellFormula](#),  
[SpreadsheetGetCellValue](#), [SpreadsheetMergeCells](#), [SpreadsheetSetCellFormula](#),  
[SpreadsheetSetCellValue](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadsheetobj	The Excel spreadsheet object to which to set the column width.
row number	Specifies the row to set the height.
height	Specifies the height in points.

### Usage

#### Example

The following example creates a spreadsheet, adds rows to the spreadsheet, and sets the row height for the newly added rows.

```
<cfscript>
a=SpreadSheetNew();
SpreadSheetAddRow(a,"1,2,3,4,5,6,7,8");
SpreadSheetAddRow(a,"1,2,3,4,5,6,7,8",2,1);
</cfscript>
<cfset SpreadSheetSetRowHeight(a,2,10)>
<cfset SpreadSheetSetRowHeight(a,3,25)>
<cfspreadsheet action="write" filename="#expandpath('.')#/b.xls" name="a" overwrite="true">
```

## SpreadsheetShiftColumns

### Description

Shifts one or more columns in Excel spreadsheet object left or right.

### Returns

Does not return a value.

## Category

Microsoft Office Integration

## Function syntax

```
SpreadsheetShiftColumns(spreadsheetObj, start [, cols]  
SpreadsheetShiftColumns(spreadsheetObj, start, end [, cols])
```

## See also

[SpreadsheetAddColumn](#), [SpreadsheetDeleteColumn](#), [SpreadsheetDeleteColumns](#),  
[SpreadsheetFormatColumn](#), [SpreadsheetFormatColumns](#), [SpreadsheetShiftRows](#)

## History

ColdFusion 9: Added the function.

## Parameters

Parameter	Description
<code>spreadsheetObj</code>	The Excel spreadsheet object in which to make the shift.
<code>start</code>	The number of the first, or only, column to shift
<code>end</code>	The number of the last column to shift. If you omit this parameter, the function shifts a single column.
<code>columns</code>	The positive (right) or negative (left) number of columns by which to shift the columns. If you omit this parameter, the function shifts the column right by one unit.

## Usage

## Example

The following line shifts columns 6 and 7 two columns to the left.

```
<cfset SpreadsheetShiftColumns(SpreadsheetObj,10,11,2)><cfscript>  
    ///We need an absolute path, so get the current directory path.  
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "shiftcolumns.xls";  
    //Create a new Excel spreadsheet object.  
    theSheet = SpreadsheetNew("Expenses");  
    //Set some cell values, indicating their initial location.  
    SpreadsheetSetCellValue(theSheet,"Cell D10",10,4);  
    SpreadsheetSetCellValue(theSheet,"Cell E12",12,5);  
    SpreadsheetSetCellValue(theSheet,"Cell F12",12,6);  
    SpreadsheetSetCellValue(theSheet,"Cell G13",13,7);  
    //Shift columns 6 and 7 left 2 columns.  
    SpreadsheetShiftColumns(theSheet,6,7,-2);  
</cfscript>  
  
<!--- Write the spreadsheet to a file, replacing any existing file. --->  
<cfspreadsheet action="write" filename="#theFile#" name="theSheet" overwrite=true>
```

## SpreadsheetShiftRows

### Description

Shifts one or more rows in Excel spreadsheet object up or down. The contents of the shifted row, including empty cells, overwrites data in the column to which it is shifted.

### Returns

Does not return a value.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadsheetShiftRows(spreadsheetObj, start [, rows]  
SpreadsheetShiftRows(spreadsheetObj, start, end, rows)
```

### See also

[SpreadsheetAddRow](#), [SpreadsheetAddRows](#), [SpreadsheetDeleteRow](#), [SpreadsheetDeleteRows](#),  
[SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#), [SpreadsheetShiftColumns](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
<code>spreadsheetObj</code>	The Excel spreadsheet object in which to make the shift.
<code>start</code>	The number of the first row to shift
<code>end</code>	The number of the last row to shift. If you omit this parameter, the function shifts a single row.
<code>rows</code>	The positive (down) or negative (up) number of rows by which to shift the rows. If you omit this parameter, the function shifts the row down by one unit.

### Usage

### Example

The following line shifts 10 and 11 down two rows. Notice that the shifted rows completely overwrite the previous rows 12 and 13.

```
<cfscript>
    ///We need an absolute path, so get the current directory path.
    theFile=GetDirectoryFromPath(GetCurrentTemplatePath()) & "shiftrows.xls";
    //Create a new Excel spreadsheet object.
    theSheet = SpreadsheetNew("Expenses");
    //Set some cell values, indicating their initial location.
    SpreadsheetSetCellValue(theSheet,"Cell D10",10,4);
    SpreadsheetSetCellValue(theSheet,"Cell E11",11,5);
    SpreadsheetSetCellValue(theSheet,"Cell A12",12,1);
    SpreadsheetSetCellValue(theSheet,"Cell B13",13,2);
    //Shift rows 10 and 11 down 2 rows.
    SpreadsheetShiftRows(theSheet,10,11,2);
</cfscript>

<!--- Write the spreadsheet to a file, replacing any existing file. --->
<cfspreadsheet action="write" filename="#theFile#" name="theSheet" overwrite=true>
```

## SpreadsheetWrite

### Description

Writes single sheet to a new XLS file from a ColdFusion spreadsheet object.

### Category

Microsoft Office Integration

### Function syntax

```
SpreadSheetWrite(SpreadsheetObj, fileName)
SpreadSheetWrite(SpreadsheetObj, fileName [,overwrite])
SpreadSheetWrite(SpreadsheetObj, fileName [, password])
SpreadSheetWrite(SpreadsheetObj, fileName [, password,overwrite])
```

### See also

[SpreadsheetRead](#), [SpreadsheetAddRow](#), [SpreadsheetAddRows](#), [SpreadsheetDeleteRow](#),  
[SpreadsheetDeleteRows](#), [SpreadsheetFormatRow](#), [SpreadsheetFormatRows](#), [SpreadsheetShiftColumns](#)

### History

ColdFusion 9: Added the function.

### Parameters

Parameter	Description
spreadSheetObj	The Excel spreadsheet object to which to write.
fileName	The pathname of the file that is written.
overwrite	A Boolean value specifying whether to overwrite an existing file. Specify <i>yes</i> to overwrite.
password	Password to protect the active sheet. Password is applicable only for Excel 97 - 2003 file formats. It will be ignored for XML file format (Excel 2007).

## Usage

Use this function to:

- Write multiple sheets to a single file.
- Update an existing file, read all sheets in the file, modify one or more sheets, and to rewrite the entire file.

## Example

```
<cfscript>
    spreadsheet = SpreadsheetRead("C:\Files\Report.xls","Annual Report");
    SpreadsheetWrite(spreadsheet,"C:\Files\Report.xls","Password","yes");
</cfscript>
```

## Example 2

```
<cfscript>
    spObj = spreadsheetread("#dirname#SingleSheet.xls","Sheet2");
    spreadsheetCreateSheet(spObj,"A");
    spreadsheetaddrow(spObj,"x,x,x,x,x",3,1);
    spreadsheetsetActiveSheet(spObj,"A");
    spreadsheetaddrow(spObj,"z,z,z,z,z",3,1);
    spreadsheetsetActiveSheetNumber(spObj,1);
    spreadsheetaddrow(spObj,"a,b,c,d,e",3,1);
    SpreadsheetWrite(spObj,"#dirname#SingleSheet1.xls","yes");
</cfscript>
```

# Sqr

## Description

Calculates the square root of a number.

## Returns

Number; square root of *number*.

## Category

[Mathematical functions](#)

## Function syntax

`Sqr (number)`

## See also

[Abs](#)

## Parameters

Parameter	Description
number	A positive integer or a variable that contains one. Number whose square root to get.

## Usage

The value in `number` must be greater than or equal to 0.

### Example

```
<h3>Sqr Example</h3>
```

```
<p>Returns the square root of a positive number.
```

```
<p>Sqr(2): <cfoutput>#Sqr(2)#</cfoutput>
```

```
<p>Sqr(Abs(-144)): <cfoutput>#Sqr(Abs(-144))#</cfoutput>
```

```
<p>Sqr(25^2): <cfoutput>#Sqr(25^2)#</cfoutput>
```

## StripCR

### Description

Deletes return characters from a string.

### Returns

A copy of *string*, after removing return characters.

### Category

[Display and formatting functions](#), [String functions](#)

### Function syntax

```
StripCR(string)
```

### See also

[ParagraphFormat](#)

### Parameters

Parameter	Description
string	A string or a variable that contains one

### Usage

Useful for preformatted (between `<pre>` and `</pre>` tags) HTML display of data entered in `textarea` fields.

### Example

```
<h3>StripCR Example</h3>

<p>Function StripCR is useful for preformatted HTML display of data
(PRE) entered in textarea fields.
<cfif isdefined("Form.myTextArea")>

<pre>
<cfoutput>#StripCR(Form.myTextArea)#</cfoutput>
</pre>
</cfif>
<!-- use #Chr(10)##Chr(13)# to simulate line feed/carriage return combination -->
<form action = "stripcr.cfm">
<textarea name = "MyTextArea" cols = "35" rows = 8>
This is sample text and you see how it scrolls
    <cfoutput>#Chr(10)##Chr(13)#</cfoutput>
From one line
    <cfoutput>#Chr(10)##Chr(13)##Chr(10)##Chr(13)#</cfoutput>
to the next
</textarea>
<input type = "Submit" name = "Show me the HTML version">
</form>
```

## StructAppend

### Description

Appends one structure to another.

### Returns

True, upon successful completion; False, otherwise.

### Category

[Structure functions](#)

### Function syntax

```
StructAppend(struct1, struct2, overwriteFlag)
```

### See also

[Structure functions](#); Modifying a ColdFusion XML object in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

### Parameters

Parameter	Description
struct1	Structure to which struct2 is appended.
struct2	Structure that contains the data to append to struct1
overwriteFlag	<ul style="list-style-type: none"><li>• True or Yes: values in struct2 overwrite corresponding values in struct1. Default.</li><li>• False or No: values in struct2 do not overwrite corresponding values in struct1.</li></ul>

### Usage

This function appends the fields and values of struct2 to struct1; struct2 is not modified. If struct1 already contains a field of struct2, overwriteFlag determines whether the value in struct2 overwrites it.

A structure's keys are unordered.

### Example

```
<html>
<body>
<!-- Create a Name structure -->
<cfset nameCLK=StructNew()>
<cfset nameCLK.first="Chris">
<cfset nameCLK.middle="Lloyd">
<cfset nameCLK.last="Gilson">
<!-- Create an address struct -->
<cfset addrCLK=StructNew()>
<cfset addrCLK.street="17 Gigantic Rd">
<cfset addrCLK.city="Watertown">
<cfset addrCLK.state="MA">
<cfset addrCLK.zip="02472">
<!-- Create a Person structure -->
<cfset personCLK=StructNew()>
<cfset personCLK.name=#nameCLK#>
<cfset personCLK.addr=#addrCLK#>
<!-- Display the contents of the person struct before the Append -->
<p>
The person struct <b>before</b> the Append call:<br>
<cfloop collection=#personCLK# item="myItem">
<cfoutput>
#myItem#<br>
</cfoutput>
</cfloop>
<!-- Merge the address struct into the top-level person struct -->
<cfset bSuccess = StructAppend( personCLK, addrCLK )>

<!-- Display the contents of the person struct, after the Append -->
<p>
The person struct <b>after</b> the Append call:<br>
<cfloop collection=#personCLK# item="myItem">
  <cfoutput>
    #myItem#<br>
  </cfoutput>
</cfloop>
```

## StructClear

### Description

Removes all data from a structure.

### Returns

True, on successful execution; False, otherwise.

### Category

[Structure functions](#)

### Function syntax

```
StructClear(structure)
```

### See also

[Structure functions](#); Modifying a ColdFusion XML object in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

### Parameters

Parameter	Description
<code>structure</code>	Structure to clear

### Usage

Do not call this function on a session variable. For more information, see TechNote, “*ColdFusion 4.5 and the StructClear(Session) function*,” at [go.adobe.com/kb/ts\\_tn\\_17479\\_en-us](http://go.adobe.com/kb/ts_tn_17479_en-us). (The article applies to ColdFusion 4.5, 5.x, and ColdFusion MX.)

### Example

```
<!--- Shows StructClear function. Calls cf_addemployee custom tag which
      uses the addemployee.cfm file. --->
<body>
<h1>Add New Employees</h1>
<!--- Establish params for first time through --->
<cfparam name = "Form.firstname" default = "">
<cfparam name = "Form.lastname" default = "">
<cfparam name = "Form.email" default = "">
<cfparam name = "Form.phone" default = "">
<cfparam name = "Form.department" default = "">
<cfif form.firstname eq "">
    <p>Please fill out the form.
<cfelse>
    <cfoutput>
<cfscript>
    employee = StructNew();
    StructInsert(employee, "firstname", Form.firstname);
    StructInsert(employee, "lastname", Form.lastname);
    StructInsert(employee, "email", Form.email);
    StructInsert(employee, "phone", Form.phone);
    StructInsert(employee, "department", Form.department);
</cfscript>
    </cfoutput>
<!--- Call the custom tag that adds employees --->
    <cf_addemployee empinfo = "#employee#">
    <cfscript>StructClear(employee);</cfscript>
</cfif>
```

## StructCopy

### Description

Copies a structure. Copies top-level keys, values, and arrays in the structure by value; copies nested structures by reference.

### Returns

A copy of a structure, with the same keys and values; if *structure* does not exist, throws an exception.

### Category

[Structure functions](#)

### Function syntax

```
StructCopy(structure)
```

### See also

[Structure functions](#); Structure functions in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
structure	Structure to copy

Usage

The following code shows how this function copies a structure that contains a string field, a number field, and a two-dimensional array at the top-level:

```
<cfoutput>
    <cfset assignedCopy = StructNew(>
<cfset assignedCopy.string = #struct.string#>
    <cfset assignedCopy.number = #struct.number#>
    <cfset assignedCopy.array = ArrayNew(2)>
    <cfset assignedCopy.array[1][1] = #struct.array[1][1]#>
    <cfset assignedCopy.array[1][2] = #struct.array[1][2]#>
</cfoutput>
```

The following code shows how StructCopy copies a nested structure:

```
<cfoutput>
<cfset assignedCopy.nestedStruct = struct.nestedStruct>
</cfoutput>
```

To copy a structure entirely by value, use “[Duplicate](#)” on page 829.

The following table shows how variables are assigned:

Variable type	Assigned by
structure.any_simple_value Boolean Binary Base64	Value
structure.array	Value
structure.nested_structure	Reference
structure.object	Reference
structure.query	Reference

### Example

```
<!--- This code shows assignment by-value and by-reference. --->
// This script creates a structure that StructCopy copies by value. <br>
<cfscript>
    // Create elements.
    s = StructNew();
    s.array = ArrayNew(2);

    // Assign simple values to original top-level structure fields.
    s.number = 99;
    s.string = "hello tommy";

    // Assign values to original top-level array.
    s.array[1][1] = "one one";
    s.array[1][2] = "one two";
</cfscript>

<!--- Output original structure --->
<hr>
<b>Original Values</b><br>
<cfoutput>
    // Simple values <br>
    s.number = #s.number#<br>
    s.string = #s.string#<br>
    // Array value <br>
    s.array[1][1] = #s.array[1][1]#<br>
    s.array[1][2] = #s.array[1][2]#<br>
</cfoutput>

// Copy this structure to a new structure. <br>
<cfset copied = StructCopy(s)>

<cfscript>
// Change the values of the original structure. <br>
    s.number = 100;
    s.string = "hello tommy (modified)";
    s.array[1][1] = "one one (modified)";
    s.array[1][2] = "one two (modified)";
</cfscript>
<hr>
<b>Modified Original Values</b><br>
<cfoutput>
    // Simple values <br>
    s.number = #s.number#<br>
    s.string = #s.string#<br>
    // Array value <br>
    s.array[1][1] = #s.array[1][1]#<br>
    s.array[1][2] = #s.array[1][2]#<br>
</cfoutput>
<hr>
<b>Copied structure values should be the same as the original.</b><br>

    duplicated.nested.array[1][1] = #duplicated.nested.array[1][1]#<br>
    duplicated.nested.array[1][2] = #duplicated.nested.array[1][2]#<br>
</cfoutput>
```

## StructCount

### Description

Counts the keys in a structure.

### Returns

A number; if *structure* does not exist, throws an exception.

### Category

[Structure functions](#)

### Function syntax

```
StructCount(structure)
```

### See also

[Structure functions](#); Modifying a ColdFusion XML object in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

### Parameters

Parameter	Description
structure	Structure to access

### Example

```
<!--- This view-only example shows use of StructCount. --->
<p>This file is similar to addemployee.cfm, which is called by
    StructNew, StructClear, and StructDelete. To test, copy
    StructCount function to appropriate place in addemployee.cfm.
<!---
<cfswitch expression = "#ThisTag.ExecutionMode#">
<cfcase value = "start">
    <cfif StructIsEmpty(attributes.EMPINFO)>
<cfoutput>Error. No employee data was passed.</cfoutput>
    <cfexit method = "ExitTag">
    <cfelse>
<cfquery name = "AddEmployee" datasource = "cfdocexamples">
    INSERT INTO Employees
    (FirstName, LastName, Email, Phone, Department)
VALUES
    <cfoutput>
    (
        '#StructFind(attributes.EMPINFO, "firstname")#' ,
        '#StructFind(attributes.EMPINFO, "lastname")#' ,
        '#StructFind(attributes.EMPINFO, "email")#' ,
        '#StructFind(attributes.EMPINFO, "phone")#' ,
        '#StructFind(attributes.EMPINFO, "department")#'
    )
    </cfoutput>
</cfquery>
</cfif>
    <cfoutput><hr>Employee Add Complete
    <p>#StructCount(attributes.EMPINFO)# columns added.</cfoutput>
</cfcase>
</cfswitch> --->
```

## StructDelete

### Description

Removes an element from a structure.

### Returns

Boolean value. The value depends on the `indicateNotExisting` parameter value.

### Category

[Structure functions](#)

### Function syntax

```
StructDelete(structure, key [, indicateNotExisting ])
```

### See also

[Structure functions](#); Modifying a ColdFusion XML object in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

### Parameters

Parameter	Description
structure	Structure or a variable that contains one. Contains element to remove.
key	Element to remove.
indicatesnotexisting	<ul style="list-style-type: none"> <li>• True: returns Yes if key exists; No if it does not.</li> <li>• False: returns Yes regardless of whether key exists. Default.</li> </ul>

### Example

```
<h3>StructDelete Function</h3>
<!-- Delete the surrounding comments to make this page work
<p>This example uses the StructInsert and StructDelete functions.
<!-- Establish params for first time through --->
<cfparam name = "firstname" default = "Mary">
<cfparam name = "lastname" default = "Sante">
<cfparam name = "email" default = "msante@allaire.com">
<cfparam name = "phone" default = "777-777-7777">
<cfparam name = "department" default = "Documentation">

    <cfif IsDefined("FORM.Delete")>
    <cfoutput>
        Field to be deleted: #form.field#
    </cfoutput>
<p>
<CFScript>
    employee = StructNew();
    StructInsert(employee, "firstname", firstname);
    StructInsert(employee, "lastname", lastname);
    StructInsert(employee, "email", email);
    StructInsert(employee, "phone", phone);
    StructInsert(employee, "department", department);
</CFScript>
    Before deletion, employee structure looks like this:
<cfdump var="#employee#">
<br>
    <cfset rc = StructDelete(employee, "#form.field#", "True")>
```

```
        <cfoutput>
        Did I delete the field "#form.field#"? The code indicates: #rc#<br>
        The structure now looks like this:<br>
<cfdump var="#employee#">
<br>
        </cfoutput>
</cfif>
<br><br>
<form method="post" action = "#CGI.Script_Name#">
    <p>Select the field to be deleted:&nbsp;  <br>
    <select name = "field">
        <option value = "firstname">first name
        <option value = "lastname">last name
        <option value = "email">email
        <option value = "phone">phone
        <option value = "department">department
    </select>
    <input type = "submit" name = "Delete" value = "Delete">
</form>
Delete this comment to make this page work --->
```

## StructFind

### Description

Determines the value associated with a key in a structure.

### Returns

The value associated with a key in a structure; if *structure* does not exist, throws an exception.

### Category

[Structure functions](#)

### Function syntax

```
StructFind(structure, key)
```

### See also

[Structure functions](#); Structure functions in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
structure	Structure that contains the value to return
key	Key whose value to return

### Usage

A structure's keys are unordered.

### Example

```
<!--- This view-only example shows the use of StructFind. --->
<p>This file is identical to addemployee.cfm, which is called by StructNew,
    StructClear, and StructDelete. It adds employees. Employee information
    is passed through the employee structure (EMPINFO attribute). In UNIX,
    you must also add the Emp_ID.
<!--- <cfswitch expression = "#ThisTag.ExecutionMode#">
<cfcase value = "start">
    <cfif StructIsEmpty(attributes.EMPINFO)>
<cfoutput>Error. No employee data was passed.</cfoutput>
    <cfexit method = "ExitTag">
    <cfelse>
    <cfquery name = "AddEmployee" datasource = "cfdocexamples">
        INSERT INTO Employees (FirstName, LastName, Email, Phone, Department)
        VALUES
        <cfoutput>
        (
            '#StructFind(attributes.EMPINFO, "firstname")#' ,
            '#StructFind(attributes.EMPINFO, "lastname")#' ,
            '#StructFind(attributes.EMPINFO, "email")#' ,
            '#StructFind(attributes.EMPINFO, "phone")#' ,
            '#StructFind(attributes.EMPINFO, "department")#' )
        </cfoutput>
    </cfquery>
    </cfif>
    <cfoutput><hr>Employee Add Complete</cfoutput>
</cfcase>
</cfswitch> --->
```

## StructFindKey

### Description

Searches recursively through a substructure of nested arrays, structures, and other elements, for structures whose values match the search key in the *value* parameter.

### Returns

An array that contains structures with values that match *value*.

### Category

[Structure functions](#)

### Function syntax

```
StructFindKey(top, value, scope)
```

### See also

[Structure functions](#); Structure functions in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
top	ColdFusion object (structure or array) from which to start search. This parameter requires an object, not a name of an object.
value	String or a variable that contains one for which to search.
scope	<ul style="list-style-type: none"><li>• one: returns one matching key. Default.</li><li>• all: returns all matching keys.</li></ul> If the key is not found, an empty array is returned.

### Usage

Returns an array that includes one structure for each of the specified values it finds. The fields of each of these structures are:

- Value: value held in the found key
- Path: string that can be used to reach the found key
- Owner: parent object that contains the found key

A structure's keys are unordered.

### Example

```
<cfset aResults = StructFindKey( #request#, "bass" )>
```

## StructFindValue

### Description

Searches recursively through a substructure of nested arrays, structures, and other elements for structures with values that match the search key in the `value` parameter.

### Returns

An array that contains structures with values that match the search key *value*. If none are found, returns an array of size 0.

### Category

[Structure functions](#)

### Function syntax

```
StructFindValue( top, value [, scope] )
```

### See also

[Structure functions](#); Structure functions in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
top	ColdFusion structure from which to start search. This parameter requires an object, not a name of an object.
value	String or a variable that contains one for which to search. The type must be a simple object. Arrays and structures are not supported.
scope	<ul style="list-style-type: none"><li>• one: function returns one matching key (default).</li><li>• all: function returns all matching keys.</li></ul>

### Usage

The fields of each structure in the returned array are:

- **Key:** name of the key in which the value was found
- **Path:** string which could be used to reach the found key
- **Owner:** parent object that contains the found key

A structure's keys are unordered.

### Example

```
<cfset aResults = StructFindValue( #request#, "235" )>
```

## StructGet

### Description

Gets a structure(s) from a specified path.

### Returns

An alias to the variable in the *pathDesired* parameter. If necessary, `StructGet` creates structures or arrays to make *pathDesired* a valid variable "path."

### Category

[Structure functions](#)

### Function syntax

```
StructGet(pathDesired)
```

### See also

[Structure functions](#); Modifying a ColdFusion XML object in the *Developing ColdFusion Applications*

### History

ColdFusion MX:

- Changed behavior: this function can be used on XML objects.
- Changed behavior: if there is no structure or array present in *pathDesired*, this function creates structures or arrays to make *pathDesired* a valid variable "path."

### Parameters

Parameter	Description
pathDesired	Pathname of variable that contains structure or array from which ColdFusion retrieves structure.

### Usage

You can inadvertently create invalid structures using this function. For example, if array notation is used to expand an existing array, the specified new element is created, regardless of the type currently held in the array.

### Example

```
<!--- GetStruct() test --->
<cfset test = StructGet( "dog.myscope.test" )>
<cfset test.foo = 1>
<cfif NOT IsDefined("dog")>
    Dog is not defined<br>
</cfif>
<cfif NOT IsDefined("dog.myscope")>
    Dog.Myscope is not defined<br>
</cfif>
<cfif NOT Isdefined("dog.myscope.test")>
    Dog.Myscope.Test is not defined<br>
</cfif>
<cfif NOT Isdefined("dog.myscope.test.foo")>
    Dog.Myscope.Test.Foo is not defined<br>
</cfif>
<cfoutput>
    #dog.myscope.test.foo#<br>
</cfoutput>
<cfset test = StructGet( "request.myscope[1].test" )>
<cfset test.foo = 2>
<cfoutput>
    #request.myscope[1].test.foo#<br>
</cfoutput>
<cfset test = StructGet( "request.myscope[1].test[2]" )>
<cfset test.foo = 3>
<cfoutput>
    #request.myscope[1].test[2].foo#<br>
</cfoutput>
```

## StructInsert

### Description

Inserts a key-value pair into a structure.

### Returns

True, upon successful completion. If structure does not exist, or if key exists and allowoverwrite = "False", ColdFusion throws an exception.

### Category

[Structure functions](#)

## Function syntax

```
StructInsert(structure, key, value [, allowoverwrite ])
```

## See also

[Structure functions](#); Modifying a ColdFusion XML object in the *Developing ColdFusion Applications*

## History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

## Parameters

Parameter	Description
structure	Structure to contain the new key-value pair.
key	Key that contains the inserted value.
value	Value to add.
allowoverwrite	Optional. Whether to allow overwriting a key. The default value is False.

## Usage

A structure's keys are unordered.

## Example

```
<h1>Add New Employees</h1>
<!-- Establish params for first time through -->
<cfparam name = "FORM.firstname" default = "">
<cfparam name = "FORM.lastname" default = "">
<cfparam name = "FORM.email" default = "">
<cfparam name = "FORM.phone" default = "">
<cfparam name = "FORM.department" default = "">

<cfif FORM.firstname EQ "">
    <p>Please fill out the form.
<cfelse>
    <cfoutput>
<CFScript>
    employee = StructNew();
    StructInsert(employee, "firstname", FORM.firstname);
    StructInsert(employee, "lastname", FORM.lastname);
    StructInsert(employee, "email", FORM.email);
    StructInsert(employee, "phone", FORM.phone);
    StructInsert(employee, "department", FORM.department);
</CFScript>

    <p>First name is #StructFind(employee, "firstname")#</p>
    <p>Last name is #StructFind(employee, "lastname")#</p>
    <p>EMail is #StructFind(employee, "email")#</p>
    <p>Phone is #StructFind(employee, "phone")#</p>
    <p>Department is #StructFind(employee, "department")#</p>
</cfoutput>
```

```
<!--- Call the custom tag that adds employees --->
<CF_ADDEMPLOYEE EMPINFO = "#employee#">
</cfif>

<Hr>
<form action = "structinsert.cfm">
  <p>First Name:&nbsp;<input name = "firstname" type = "text" hspace = "30" maxlength = "30">
  <p>Last Name:&nbsp;<input name = "lastname" type = "text" hspace = "30" maxlength = "30">
  <p>Email:&nbsp;<input name = "email" type = "text" hspace = "30" maxlength = "30">
  <p>Phone:&nbsp;<input name = "phone" type = "text" hspace = "20" maxlength = "20">
  <p>Department:&nbsp;<input name = "department" type = "text" hspace = "30" maxlength = "30">
  <p>
  <input type = "submit" value = "OK">
</form>
```

## StructIsEmpty

### Description

Determines whether a structure contains data.

### Returns

True, if *structure* is empty; if *structure* does not exist, ColdFusion throws an exception.

### Category

[Decision functions](#), [Structure functions](#)

### Function syntax

`StructIsEmpty(structure)`

### See also

[Structure functions](#); Modifying a ColdFusion XML object in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

### Parameters

Parameter	Description
structure	Structure to test

### Example

```
<!--- This example illustrates use of StructIsEmpty. --->
<p>This file is identical to addemployee.cfm, which is called by StructNew,
    StructClear, and StructDelete. It adds employees. Employee information
    is passed through employee structure (EMPINFO attribute). In UNIX, you
    must also add the Emp_ID.
<cfswitch expression = "#ThisTag.ExecutionMode#">
<cfcase value = "start">
    <cfif StructIsEmpty(attributes.EMPINFO)>
<cfoutput>Error. No employee data was passed.</cfoutput>
    <cfexit method = "ExitTag">
    <cfelse>
<!--- Add the employee; In UNIX, you must also add the Emp_ID --->
    <cfquery name = "AddEmployee" datasource = "cfdocexamples">
        INSERT INTO Employees
        (FirstName, LastName, Email, Phone, Department)
VALUES
    <cfoutput>
    (
        '#StructFind(attributes.EMPINFO, "firstname")#' ,
        '#StructFind(attributes.EMPINFO, "lastname")#' ,
        '#StructFind(attributes.EMPINFO, "email")#' ,
        '#StructFind(attributes.EMPINFO, "phone")#' ,
        '#StructFind(attributes.EMPINFO, "department")#'
    )
    </cfoutput>
</cfquery>
    </cfif>
    <cfoutput><hr>Employee Add Complete</cfoutput>
</cfcase>
</cfswitch>
```

## StructKeyArray

### Description

Finds the keys in a ColdFusion structure.

### Returns

An array of keys; if *structure* does not exist, ColdFusion throws an exception.

### Category

[Structure functions](#)

### Function syntax

```
StructKeyArray(structure)
```

### See also

[Structure functions](#); Modifying a ColdFusion XML object in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
structure	Structure from which to extract a list of keys

### Usage

A structure's keys are unordered.

### Example

```
<!--- Shows StructKeyArray function to copy keys from a structure to an array.
      Uses StructNew to create structure and fills its fields with the
      information the user enters in the form fields. --->
<h3>StructKeyArray Example</h3>
<h3>Extracting the Keys from the Employee Structure</h3>
<!-- Create structure. Check whether Submit was pressed. If so, define fields
      in employee structure with user entries on form. ----->
<cfset employee = StructNew()>
<cfif Isdefined("Form.Submit")>
    <cfif Form.Submit is "OK">
        <cfset employee.firstname = FORM.firstname>
        <cfset employee.lastname = FORM.lastname>
        <cfset employee.email = FORM.email>
        <cfset employee.phone = FORM.phone>
        <cfset employee.company = FORM.company>
    <cfelseif Form.Submit is "Clear">
        <cfset rc = StructClear(employee)>
    </cfif>
</cfif>
<p> This example uses the StructNew function to create a structure called
      "employee" that supplies employee info. Its fields are filled by
      the form. After you enter employee information in structure, the
      example uses StructKeyArray function to copy all of the keys from
      the structure into an array. </p>
<hr size = "2" color = "#0000A0">
<form action = "structkeyarray.cfm">
<table cellpadding = "2" cellspacing = "2" border = "0">
    <tr>
        <td>First Name:</td>
        <td><input name = "firstname" type = "text"
            value = "" hspace = "30" maxlength = "30"></td>
    </tr>
    <tr>
        <td>Last Name:</td>
        <td><input name = "lastname" type = "text"
            value = "" hspace = "30" maxlength = "30"></td>
    </tr>
    <tr>
        <td>EMail</td>
        <td><input name = "email" type = "text"
            value = "" hspace = "30" maxlength = "30"></td>
    </tr>
    <tr>
        <td>Phone:</td>
        <td><input name = "phone" type = "text"
            value = "" hspace = "20" maxlength = "20"></td>
```

```
</tr>
<tr>
<td>Company:</td>
<td><input name = "company" type = "text"
value = "" hspace = "30" maxlength = "30"></td>
</tr>
<tr>
<td><input type = "submit" name = "submit"
value = "OK"></td>
<td><b>After you submit the FORM, scroll down to see the array.</b>
</td>
</tr>
</table>
</form>
<cfif NOT StructIsEmpty(employee)>
<hr size = "2" color = "#0000A0">
<cfset keysToStruct = StructKeyArray(employee)>
<cfloop index = "i" from = "1" to = "#ArrayLen(keysToStruct)#">
<p><cfoutput>Key#i# is #keysToStruct[i]#</cfoutput></p>
<p><cfoutput>Value#i# is #employee[keysToStruct[i]]#</cfoutput>
</p>
</cfloop>
</cfif>
```

## StructKeyExists

### Description

Determines whether a specific key is present in a structure.

### Returns

True, if *key* is in *structure*.

### Category

[Decision functions](#), [Structure functions](#)

### Function syntax

```
StructKeyExists(structure, "key")
```

### See also

[Structure functions](#); Structure functions in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
structure	Name of structure to test
key	Key to test

### Usage

This function can sometimes be used in place of the `IsDefined` function, when working with the URL and Form scopes, which are structures. The following pieces of code are equivalent:

```
<cfif IsDefined("Form.JediMaster")>
<cfif StructKeyExists(Form,"JediMaster")>
```

A structure's keys are unordered.

### Example

```
<!--- This example shows the use of StructKeyExists. --->
<p>This file is similar to addemployee.cfm, which is called by StructNew,
    StructClear, and StructDelete. To test, copy the &LT;CFELSEIf&GT;
    statement to the appropriate place in addemployee.cfm. It is a custom tag
    to add employees. Employee information is passed through the employee
    structure (the EMPINFO attribute). In UNIX, you must also add the Emp_ID.

<cfswitch expression = "#ThisTag.ExecutionMode#">
<cfcase value = "start">
    <cfif StructIsEmpty(attributes.EMPINFO)>
<cfoutput>Error. No employee data was passed.</cfoutput>
    <cfexit method = "ExitTag">
    <cfelseif NOT StructKeyExists(attributes.EMPINFO, "department")>
<cfscript>StructUpdate(attributes.EMPINFO, "department",
"Unassigned");
    </cfscript>
<cfexit method = "ExitTag">
    <cfelse>
```

## StructKeyList

### Description

Extracts keys from a ColdFusion structure.

### Returns

A list of keys; if *structure* does not exist, ColdFusion throws an exception.

### Category

[Structure functions](#)

### Function syntax

```
StructKeyList(structure [, delimiter])
```

### See also

[Structure functions](#); Modifying a ColdFusion XML object in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
structure	Structure from which to extract a list of keys.
delimiter	Optional. Character that separates keys in list. The default value is comma.

### Usage

A structure's keys are unordered.

### Example

```
<!-- This example shows how to use StructKeyList to list the keys
      in a structure. It uses StructNew function to create structure
      and fills it with information user enters in form fields. --->
<!-- This section creates structure and checks whether Submit has been pressed.
      If so, code defines fields in the employee structure with what the
      user entered in the form. --->
<cfset employee = StructNew()>
<cfif Isdefined("Form.Submit")>
    <cfif Form.Submit is "OK">
        <cfset employee.firstname = FORM.firstname>
        <cfset employee.lastname = FORM.lastname>
        <cfset employee.email = FORM.email>
        <cfset employee.phone = FORM.phone>
        <cfset employee.company = FORM.company>
    <cfelseif Form.Submit is "Clear">
        <cfset rc = StructClear(employee)>
    </cfif>
</cfif>
<html>

## StructNew

### Description

Creates a structure.

### Returns

A structure.

### Category

[Structure functions](#)

### Function syntax

```
StructNew()
```

### See also

[Structure functions](#); Structure functions in the *Developing ColdFusion Applications*

### Parameters

None

### Example

```
<!--- Shows StructNew. Calls CF_ADDEMPLOYEE, which uses the |
      addemployee.cfm file to add employee record to database. --->
<h1>Add New Employees</h1>
<cfparam name = "FORM.firstname" default = "">
<cfparam name = "FORM.lastname" default = "">
<cfparam name = "FORM.email" default = "">
<cfparam name = "FORM.phone" default = "">
<cfparam name = "FORM.department" default = "">
<cfif FORM.firstname EQ "">
    <p>Please fill out the form.
</cfif>
<cfelse>
    <cfoutput>
<cfscript>
    employee = StructNew();
    StructInsert(employee, "firstname", FORM.firstname);
    StructInsert(employee, "lastname", FORM.lastname);
    StructInsert(employee, "email", FORM.email);
    StructInsert(employee, "phone", FORM.phone);
    StructInsert(employee, "department", FORM.department);
</cfscript>
    <p>First name is #StructFind(employee, "firstname")#
    <p>Last name is #StructFind(employee, "lastname")#
    <p>EMail is #StructFind(employee, "email")#
    <p>Phone is #StructFind(employee, "phone")#
    <p>Department is #StructFind(employee, "department")#
</cfoutput>
<!--- Call the custom tag that adds employees --->
    <CF_ADDEMPLOYEE EMPINFO = "#employee#">
</cfif>
```

## StructSort

### Description

Returns a sorted array of the top level keys in a structure. Sorts using alphabetic or numeric sorting, and can sort based on the values of any structure element.

### Returns

An array of top-level key names (strings), sorted by the value of the specified subelement.

### Category

[Structure functions](#)

### Function syntax

`StructSort(base, sortType, sortOrder, pathToSubElement)`

### See also

[Structure functions](#); Structure functions in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
base	A ColdFusion structure with one field (an associative array).
sortType	<ul style="list-style-type: none"><li>• numeric</li><li>• text: case sensitive (all lowercase letters precede the first uppercase letter). Default.</li><li>• textnocase</li></ul>
sortOrder	<ul style="list-style-type: none"><li>• asc: ascending (a to z) sort order. Default.</li><li>• desc: descending (z to a) sort order</li></ul>
pathToSubElement	String or a variable that contains one.  Path to apply to each top-level key, to reach element value by which to sort. The default value is nothing (top-level entries sorted by their own values).

### Usage

The `pathToSubElement` string does not support array notation, and only supports substructures of structures.

This function does not sort or change the structure.

### Example

```
<cfscript>
    salaries = StructNew() ;
    employees = StructNew() ;
    departments = StructNew() ;
    for ( i=1; i lt 6; i=i+1 )
    {
        salary = 120000 - i*10000 ;
        salaries["employee#i#"] = salary ;

        employee = StructNew() ;
        employee["salary"] = salary ;
        // employee.salary = salary ;
        employees["employee#i#"] = employee ;

        departments["department#i#"] = StructNew() ;
        departments["department#i#"].boss = employee ;
    }
</cfscript>

<cfoutput>
<p>list of employees based on the salary (text search): <br>
1) #ArrayToList( StructSort( salaries ) )#<br>
2) #ArrayToList( StructSort( salaries, "text", "ASC" ) )#<br>
3) #ArrayToList( StructSort( salaries, "textnocase", "ASC" ) )#<br>
4) #ArrayToList( StructSort( salaries, "text", "DESC" ) )#<br>
<p>list of employees based on the salary (numeric search): <br>
5) #ArrayToList( StructSort( salaries, "numeric", "ASC" ) )#<br>
6) #ArrayToList( StructSort( salaries, "numeric", "DESC" ) )#<br>
<p>list of employees based on the salary (subfield search): <br>
```

```
7) #ArrayToList( StructSort( employees, "numeric", "DESC", "salary" ) )#<br>
8) #ArrayToList( StructSort( employees, "text", "ASC", "salary" ) )#<br>
<p>list of departments based on the salary (sub-sub-field search): <br>
9) #ArrayToList( StructSort( departments, "text", "ASC", "boss.salary" ) )#<br>
</cfoutput>

<!--- add an invalid element and test that it throws an error --->
<p><p>
<cfset employees[ "employee4" ] = StructNew()>
<cftry>
    <cfset temp = StructSort( employees, "text", "ASC", "salary" )>
    <cfoutput>We have a problem - this was supposed to throw an exception!<br>
</cfoutput>
<cfcatch type="any">
    <cfoutput>
        ERROR: <b>This error was expected!</b><br>
        #cfcatch.message# - #cfcatch.detail#<br>
    </cfoutput>
</cfcatch>
</cftry>
```

## StructUpdate

### Description

Updates a key with a value.

### Returns

True, on successful execution; if the structure does not exist, ColdFusion throws an error.

### Category

[Structure functions](#)

### Function syntax

`StructUpdate(structure, key, value)`

### See also

[Structure functions](#); Modifying a ColdFusion XML object in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Changed behavior: this function can be used on XML objects.

### Parameters

Parameter	Description
structure	Structure to update
key	Key, the value of which to update
value	New value

### Example

```
<!--- This example shows the use of StructUpdate. --->
<p>This file is similar to addemployee.cfm, which is called by StructNew,
    StructClear, and StructDelete. To test this file, copy the
    &LT;CFELSEIF&GT; statement to the appropriate place in
    addemployee.cfm. It is an example of a custom tag used to add
    employees. Employee information is passed through the employee
    structure (the EMPINFO attribute). In UNIX, you must also add the Emp_ID.

<cfswitch expression = "#ThisTag.ExecutionMode#">
<cfcase value = "start">
    <cfif StructIsEmpty(attributes.EMPINFO)>
<cfoutput>Error. No employee data was passed.</cfoutput>
        <cfexit method = "ExitTag">
            <cfelseif StructFind(attributes.EMPINFO, "department") EQ "">
<cfscript>
            StructUpdate(attributes.EMPINFO, "department", "Unassigned");
</cfscript>
        <cfexit method = "ExitTag">
            <cfelse>
```

## Functions t-z

### Tan

#### Description

Calculates the tangent of an angle that is entered in radians.

#### Returns

A number; the tangent of an angle.

#### Category

[Mathematical functions](#)

#### Function syntax

*Tan (number)*

#### See also

[Atn](#), [Cos](#), [ACos](#), [Sin](#), [ASin](#), [Pi](#)

#### Parameters

Parameter	Description
number	Angle, in radians, for which to calculate the tangent.

#### Usage

To convert degrees to radians, multiply degrees by p/180. To convert radians to degrees, multiply radians by 180/p.

### Parameters

Parameter	Description
threadName	The name of the thread or threads to join to the current thread. To specify multiple threads, use a comma-separated list.
timeout	The number of milliseconds for which to suspend thread processing.

### Usage

Makes the current thread wait until the thread or threads specified in the `threadName` parameter complete processing, or until the period specified in the `timeout` parameter passes, before continuing processing.

- `ThreadJoin()` : Current thread waits for all ColdFusion threads to complete processing.
- `ThreadJoin(threadName)` : Makes current thread wait for the specified thread to finish execution.
- `ThreadJoin(threadName, timeout)` : Makes the current thread wait until execution timeout for one or many threads specified by `threadName`. If you do not specify a timeout and the thread you are joining to does not finish, the current thread also cannot finish processing.

### Example

```
<cfscript>
thread name="t1"
{
    sleep(5000);
}
thread name="t2"
{
    threadjoin("t1",1000);
}
threadjoin("t2");
</cfscript>
<cfoutput>Status of the thread T1 = #t1.Status#<br></cfoutput>
<cfoutput>Status of the thread T2 = #t2.Status#<br></cfoutput>
```

## ThreadTerminate

### Description

Terminates the thread specified by `threadName`. Behaves same as `cfthread action="terminate"`.

### Category

[Exception handling functions](#), [Data output functions](#)

### Function syntax

`ThreadTerminate(threadName)`

### See also

[cfscript](#), [cfthrow](#), [cftry](#), [cfcatch](#)

### History

ColdFusion 9: Added this function.

### Parameters

Parameter	Description
threadName	The name of the thread to stop.

### Usage

Use this function to stop processing of the thread specified in the `threadName`. If you terminate a thread, the thread scope includes an `ERROR` metadata structure that provides information about the termination.

### Example

```
<cfscript>
    thread name="t1"
    {
        sleep(3000);
    }
    sleep(1000);
    threadTerminate("t1");
    sleep(1000);
</cfscript>
<cfoutput>Status of the thread = #t1.Status#<br></cfoutput>
```

## Throw

### Description

A function equivalent of the `cfthrow` tag and is used in the `<cfscript>` mode.

### Parameters

Same as the `<cfthrow>` tag.

### Category

[Exception handling functions](#), [Data output functions](#)

### Function syntax

For name=value pair:

```
throw (message = "message", type = "exception type", detail, errorCode = "error code",
extendedInfo = "additional info", object = "java exception object")
```

For positional notations, the sequence must be followed exactly in the same manner as provided in the syntax. If you do not provide one of the attributes, use an empty string instead.

### See also

[cfscript](#), [cfthrow](#), [cftry](#), [cfcatch](#)

### Usage

You can call this function by passing arguments as name=value pair or as positional arguments. For positional notations, specify the arguments in the sequence mentioned in the function syntax.

### Example

```
<cfscript>
function TotalInterest(principal, annualRate, months)
{
    var years = 0;
    var interestRate = 0;
    var totalInterest = 0;
    principal = REReplace(trim(principal), "[\$", "", "ALL");
    annualRate = Replace(trim(annualRate), "%", "", "ALL");

    if ((principal <= 0) OR (annualRate <= 0) OR (months <= 0)) {
        Throw(type="InvalidData",message="All values must be greater than 0.");

        //Use of Throw function in cfscript
    }
    interestRate = annualRate / 100;
    years = months / 12;
    totalInterest = principal * ((1 + interestRate) ^ years) - 1;
    return DollarFormat(totalInterest);
}

try {
    WriteOutput(TotalInterest("$2500.00", "5.5%", "12"));
} catch(InvalidData ex){
    //Displayig exception details on screen
    WriteOutput("<p>An InvalidData exception was thrown.</p>");
    WriteOutput("<p>#ex.message#</p>");
}
</cfscript>
```

## TimeFormat

### Description

Formats a time value using U.S. English time formatting conventions.

### Returns

A custom-formatted time value. If no mask is specified, returns a time value using the `hh:mm tt` format. For international time formatting, see [LSTimeFormat](#).

### Category

[Date and time functions](#), [Display and formatting functions](#)

### Function syntax

```
TimeFormat(time [, mask ])
```

### See also

[CreateTime](#), [Now](#), [ParseDateTime](#), [LSTimeFormat](#), [DateFormat](#)

### History

ColdFusion MX 6.1: Added the mask character L or l to represent milliseconds.

ColdFusion MX:

- Changed the way extra characters are processed: this function processes extra characters within the `mask` value differently than in earlier releases, as follows:
  - ColdFusion 5 and earlier: the function returns the time format and an apostrophe-delimited list of the extra characters. For example, `TimeFormat(Now(), "hh:mm:ss dog")` returns `8:17:23 d'o'g`.
  - ColdFusion MX: the function returns the time format and the extra characters. For example, for the call above, it returns `8:17:23 dog`.

If the extra characters are single-quoted (for example, `hh:mm:ss 'dog'`), ColdFusion 5 and ColdFusion MX return the time format and the extra characters: `8:17:23 dog`.

- Added support for the following *mask* parameter options: `short`, `medium`, `long`, and `full`.

### Parameters

Parameter	Description
<code>time</code>	A date/time value or string to convert
<code>mask</code>	<p>Masking characters that determine the format:</p> <ul style="list-style-type: none"><li>• <code>h</code>: hours; no leading zero for single-digit hours (12-hour clock)</li><li>• <code>hh</code>: hours; leading zero for single-digit hours (12-hour clock)</li><li>• <code>H</code>: hours; no leading zero for single-digit hours (24-hour clock)</li><li>• <code>HH</code>: hours; leading zero for single-digit hours (24-hour clock)</li><li>• <code>m</code>: minutes; no leading zero for single-digit minutes</li><li>• <code>mm</code>: minutes; a leading zero for single-digit minutes</li><li>• <code>s</code>: seconds; no leading zero for single-digit seconds</li><li>• <code>ss</code>: seconds; leading zero for single-digit seconds</li><li>• <code>l</code> or <code>L</code>: milliseconds, with no leading zeros</li><li>• <code>t</code>: one-character time marker string, such as <code>A</code> or <code>P</code></li><li>• <code>tt</code>: multiple-character time marker string, such as <code>AM</code> or <code>PM</code></li><li>• <code>short</code>: equivalent to <code>h:mm tt</code></li><li>• <code>medium</code>: equivalent to <code>h:mm:ss tt</code></li><li>• <code>long</code>: medium followed by three-letter time zone; as in, <code>2:34:55 PM EST</code></li><li>• <code>full</code>: same as <code>long</code></li></ul>

### Usage

When passing a date/time value as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date/time object.

Database query results for date and time values can vary in sequence and formatting unless you use functions to format the results. To ensure that dates and times display with appropriate formatting, and that users of your ColdFusion application are not confused by dates and times displayed, Adobe recommends that you use the `DateFormat` and `TimeFormat` functions to format date and time values from queries. For more information and examples, see TechNote, “*ColdFusion (5 and 4.5.x) with Oracle: Formatting Date and Time Query Results*,” at [go.adobe.com/kb/ts\\_tn\\_18070\\_en-us](http://go.adobe.com/kb/ts_tn_18070_en-us).

### Example

```
<cfset todayDate = #Now()#>
<body>
<h3>TimeFormat Example</h3>
<p>Today's date is <cfoutput>#todayDate#</cfoutput>.
<p>Using TimeFormat, we can display the value in different ways:
<cfoutput>
<ul>
  <li>#TimeFormat(todayDate)#
  <li>#TimeFormat(todayDate, "hh:mm:ss")#
  <li>#TimeFormat(todayDate, "hh:mm:ssT")#
  <li>#TimeFormat(todayDate, "hh:mm:ssTT")#
  <li>#TimeFormat(todayDate, "HH:mm:ss")#
</li>
</ul>
</cfoutput>
<p>To generate a standard ISO 8601 W3C Date and Time string like
1997-07-16T19:20, concatenate a DateFormat function, the character T, and a
TimeFormat function.
For example: dateFormat(now(), "yyyy-mm-dd")#T#TimeFormat(now(), "HH:mm:ss")
produces:</p>
<cfoutput>#dateFormat(now(), "yyyy-mm-dd")#T#TimeFormat(now(), "HH:mm:ss")#</cfoutput>
</body>
```

## ToBase64

### Description

Calculates the Base64 representation of a string or binary object. The Base64 format uses printable characters, allowing binary data to be sent in forms and e-mail, and stored in a database or file.

### Returns

The Base64 representation of a string or binary object.

### Category

[Conversion functions](#), [String functions](#)

### Function syntax

```
ToBase64(string or binary_object[, encoding])
```

### See also

- [BinaryEncode](#) for conversion of binary data to base64
- [cffile](#) for information about loading and reading binary data
- [cfwddx](#) for information about serializing and deserializing binary data

- [IsBinary](#) and [ToBinary](#) for checking for binary data and converting a Base64 object to binary format

## History

ColdFusion MX: Added the *encoding* parameter.

## Parameters

Parameter	Description
string or binary_object	A string, the name of a string, or a binary object.
encoding	<p>For a string, defines how characters are represented in a byte array. The following list includes commonly used values:</p> <ul style="list-style-type: none"> <li>• utf-8</li> <li>• iso-8859-1</li> <li>• windows-1252</li> <li>• us-ascii</li> <li>• shift_jis</li> <li>• iso-2022-jp</li> <li>• euc-jp</li> <li>• euc-kr</li> <li>• big5</li> <li>• euc-cn</li> <li>• utf-16</li> </ul> <p>For more information on character encoding, see: <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>.</p> <p>The default value is the encoding of the page on which the function is called. See <a href="#">cfcontent</a>. For a binary object, this parameter is ignored.</p>

## Usage

Adobe recommends that you use the [BinaryEncode](#) function to convert binary data to Base64-encoded data in all new applications.

```
<h3>ToBase64 Example</h3>
<!--- Initialize data. ---->
<cfset charData = "">
<!--- Create string of ASCII characters (32-255); concatenate them --->
<cfloop index = "data" from = "32" to = "255">
    <cfset ch = chr(data)>
    <cfset charData = charData & ch>
</cfloop>
<p>
The following string is the concatenation of all characters (32 to 255)
from the ASCII table.<br>
<cfoutput>#charData#</cfoutput>
</p>
<!--- Create a Base64 representation of this string. ---->
<cfset data64 = toBase64(charData)>

<!----- Convert string to binary. ----->
<cfset binaryData = toBinary(data64)>
<!--- Convert binary back to Base64. ---->
<cfset another64 = toBase64(binaryData)>
<!----- Compare another64 with data64 to ensure that they are equal. ---->
<cfif another64 eq data64>
    <h3>Base64 representations are identical.</h3>
<cfelse>
    <h3>Conversion error.</h3>
</cfif>
```

## ToBinary

### Description

Calculates the binary representation of Base64-encoded data or of a PDF document.

### Returns

A binary representation of the data.

### Category

[Conversion functions](#), [String functions](#)

### Function syntax

*ToBinary(Data)*

### See also

- [BinaryDecode](#) for conversion of binary-encoded data, including Base64, to binary data
- [cffile](#) for information about loading and reading binary data
- [cfwddx](#) for information about serializing and deserializing binary data
- [IsBinary](#) and [ToBase64](#) for checking format and converting to Base64
- [Len](#) for determining the length of a binary object
- Binary data type and binary encoding in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
Data	A variable representing data in Base64-encoded format or a PDF document.

### Usage

The `toBinary` function can take as a parameter a PDF document variable (specified by the `cfpdf` tag name attribute). In this case, the `toBinary` function returns a byte array (`byte[]`) representation of the document. You can use the results of this function, for example, to store the PDF in a database as a BLOB, or, in a `cfcontent` tag, to write the PDF to the browser. You can use this binary representation with a read operation in the `cfpdf` tag to create a variable.

The following example reads an unprotected PDF file, applies protections, and displays it in the browser:

```
<cfpdf action="read" source="Copy of coldfusion11.pdf" name="p">
<cfpdf action="protect" source="p" newUserpassword="user" permissions="none"
      newOwnerpassword="owner">
<cfcontent type="application/pdf" variable="#toBinary(p)#">
```

Adobe recommends that you use the [BinaryDecode](#) function to convert Base64 encoded data to binary data in all new applications.

If you pass a binary value to this function, it returns the input value.

### Example

```
<h3>ToBinary Example</h3>
<!--- Initialize data. ---->
<cfset charData = "">
<!--- Create a string of ASCII characters (32-255); concatenate them. ---->
<cfloop index = "data" from = "32" to = "255">
    <cfset ch = chr(data)>
    <cfset charData = charData & ch>
</cfloop>
<p>The following string is the concatenation of all characters (32 to 255)
    from the ASCII table.<br>
<cfoutput>#charData#</cfoutput></p>
<!--- Create a Base64 representation of this string. ---->
<cfset data64 = toBase64(charData)>

<!--- Convert string to binary. ---->
<cfset binaryData = toBinary(data64)>
<!--- Convert binary back to Base64. --->
<cfset another64 = toBase64(binaryData)>
<!--- Compare another64 with data64 to ensure that they are equal. ---->
<cfif another64 eq data64>
    <h3>Base64 representation of binary data is identical to the Base64
        representation of string data.</h3>
<cfelse>
    <h3>Conversion error.</h3>
</cfif>
```

## ToScript

### Description

Creates a JavaScript or ActionScript expression that assigns the value of a ColdFusion variable to a JavaScript or ActionScript variable. This function can convert ColdFusion strings, numbers, arrays, structures, and queries to JavaScript or ActionScript syntax that defines equivalent variables and values.

### Returns

A string that contains a JavaScript or ActionScript variable definition corresponding to the specified ColdFusion variable value.

### Category

[Conversion functions](#), [Extensibility functions](#)

### Function syntax

```
ToScript(cfvar, javascriptvar, outputformat, ASFormat)
```

### See also

[cfwddx](#); [WDDX JavaScript Objects](#)

### History

ColdFusion MX 7: Added this function.

### Parameters

Parameter	Description
<i>cfvar</i>	A ColdFusion variable. This can contain one of the following: <ul style="list-style-type: none"><li>• String</li><li>• Number</li><li>• Array</li><li>• Structure</li><li>• Query</li></ul>
<i>javascriptvar</i>	A string that specifies the name of the JavaScript variable that the <code>ToScript</code> function creates.
<i>outputformat</i>	Optional. A Boolean value that determines whether to create WDDX (JavaScript) or ActionScript style output for structures and queries: <ul style="list-style-type: none"><li>• True: creates WDDX-style output (default).</li><li>• False: creates ActionScript-style output.</li></ul>
<i>ASFormat</i>	Optional. A Boolean value that specifies whether to use ActionScript shortcuts in the script: <ul style="list-style-type: none"><li>• True: creates new Objects and Arrays with ActionScript shortcuts: <code>[]</code> for New Array(), and <code>{}</code> for New Object. Using ActionScript shortcuts allows you to pass ActionScript into <code>cfform</code> attributes without triggering ActionScript validation.</li><li>• False: does not use ActionScript shortcuts to create new Objects and new Arrays when generating the script. Instead, generates <code>New Object()</code> and <code>New Array()</code> in the script (default).</li></ul>

## Usage

To use a ColdFusion variable in JavaScript or ActionScript, the `ToScript` function must be in a `cfoutput` region and be surrounded by number signs (#). For example, the following code uses the `ToScript` function to convert a ColdFusion variable to a JavaScript variable:

```
<cfset thisString="hello world">
<script type="text/javascript" language="JavaScript">
    <cfoutput>
        var #toScript(thisString, "jsVar")#;
    </cfoutput>
</script>
```

When ColdFusion runs this code, it sends the following to the client:

```
<script type="text/javascript" language="JavaScript">
    var jsVar = "hello world";
</script>
```

An HTML script tag must enclose the JavaScript code. The `cfoutput` tag does not need to be inside the script block; it can also surround the block.

WDDX-style output generates JavaScript code that creates a `WDDXRecordset` object, where the key of each record set entry is a column name, and the value of the recordlist entry is an array of the corresponding query column entries, as follows:

```
WDDXQuery = new WddxRecordset();
col0 = new Array();
col0[0] = "John";
col0[1] = "John";
WDDXQuery["firstname"] = col0;
col0 = null;
col1 = new Array();
col1[0] = "Lund";
col1[1] = "Allen";
WDDXQuery["lastname"] = col1;
col1 = null;
```

To use WDDX-style output, first load the `cf_webroot/CFIDE/scripts/wddx.js` script, which defines JavaScript WDDX objects, as in the following line:

```
<script type="text/javascript" src="/CFIDE/scripts/wddx.js"> </script>
```

For more information on WDDX in JavaScript, see [“WDDX JavaScript Objects”](#) on page 1569.

ActionScript-style output generates code that creates an array of objects, where the array is indexed by row number, and the objects consist of column name - column value pairs, as follows:

```
ActionScriptQuery = new Array();
ActionScriptQuery[0] = new Object();
ActionScriptQuery[0]['firstname'] = "John";
ActionScriptQuery[0]['lastname'] = "Lund";
ActionScriptQuery[1] = new Object();
ActionScriptQuery[1]['firstname'] = "John";
ActionScriptQuery[1]['lastname'] = "Allen";
```

An ActionScript-style array does not require you to include the `wddx.js` file, and creates a variable that you can use in ActionScript on a Flash format form, for example, in an `onChange` attribute.

If the `outputformat` parameter is `False`, setting `ASFormat` to `True` causes `ToScript` to use the ActionScript shortcut `[]` in place of `NewArray()` and the shortcut `{}` in place of `NewObject()`. Using these shortcuts allows you to pass ActionScript into `cfparam` attributes without triggering ActionScript validation. If `ASFormat` is `False`, `ToScript` generates `NewArray()` and `NewObject()` in the script.

### Example

The following example shows the results of converting a ColdFusion string, array, and query object to JavaScript variables. It also uses the string and array in JavaScript code.

```
<h2>ToScript</h2>

<h3>Converting a string variable</h3>
<cfset thisString = "This is a string">
<cfoutput>
    <b>The thisString variable in ColdFusion</b><br>
    #thisString#<br>
    <br>
    <strong>The output of ToScript(thisString, "jsVar")</strong><br>
    #ToScript(thisString, "jsVar")#<br>
    <br>
    <strong>In a JavaScript script, convert thisString Variable to JavaScript
    and output the resulting variable:</strong><br>
    <script type="text/javascript" language="JavaScript">
        var #ToScript(thisString, "jsVar")#;
        document.write("jsVar in JavaScript is: " + jsVar);
    </script>
</cfoutput>

<h3>Converting an array</h3>
<!-- Create and populate a one-dimensional array -->
<cfset myArray=ArrayNew(1)>
<cfloop index="i" from="1" to="4">
    <cfset myArray[i]="This is array element" & i>
</cfloop>

<cfoutput>
<b>The ColdFusion myArray Array</b><br>
<!-- Write the contents of the myArray variable in ColdFusion -->
    <cfloop index="i" from="1" to="#arrayLen(myArray)#">
        myArray[#i#]: #myArray[i]#<br>
    </cfloop>
    <br>
    <strong>The output of ToScript(myArray, "jsArray")</strong><br>
    #toScript(myArray, "jsArray")#<br>
    <br>
    <strong>In JavaScript, convert myArray to a JavaScript variable and write it's
    contents</strong><br>
    <script type="text/javascript" language="JavaScript">
        var #ToScript(myArray, "jsArray")#;
        for (i in jsArray)
        {
            document.write("myArray[" + i + "]: " + jsArray[i] + "<br>");
        }
    </script>
<br>
<h3>Converting a query</h3>
```

This section converts the following query object to both WDDX format and ActionScript type JavaScript objects.<br>

```
<!--- Query a database --->
<cfquery name="thisQuery" datasource="cfdocexamples">
    SELECT FirstName,LastName
    FROM employee
    WHERE FirstName = 'John'
</cfquery>
<br>
The Query in ColdFusion
<cftable query="thisQuery" headerlines="1" colheaders>
    <cfcol align="left" width="9" header="<b>FirstName</b>" text="#FirstName#">
    <cfcol align="left" width="9" header="<b>LastName</b>" text="#LastName#">
</cftable>

<strong>JavaScript generated by ToScript(thisQuery, "WDDXQuery"):</strong><br>
    #toScript(thisQuery, "WDDXQuery")#;<br>
<br>
<strong>JavaScript generated by ToScript(thisQuery, "ActionScriptQuery",
    False):</strong><br>
    #toScript(thisQuery, "ActionScriptQuery", False)#<br>
<br>
<!--- Convert to both WDDX format and ActionScript format --->
<script type="text/javascript" language="JavaScript">
    #ToScript(thisQuery, "WDDXQuery")#;
    #ToScript(thisQuery, "ActionScriptQuery", False)#;
</script>
<!--- For brevity, this example does not use JavaScript query variables --->
</cfoutput>
```

## ToString

### Description

Converts a value to a string.

### Returns

A string.

### Category

[Conversion functions](#), [String functions](#)

### Function syntax

`ToString(value[, encoding])`

### See also

[ToBase64](#), [ToBinary](#), [CharsetEncode](#); Using XML and WDDX in the *Developing ColdFusion Applications*

## History

ColdFusion MX:

- Changed Unicode support: ColdFusion supports the Java UCS-2 representation of Unicode character values 0–65535. (ColdFusion 5 and earlier releases supported ASCII values 1–255.)
- Added the *encoding* parameter.
- Added ability to convert an XML document object to a string.

## Parameters

Parameter	Description
value	Value to convert to a string; can be a simple value such as an integer, a binary object, or an XML document object.
encoding	<p>The character encoding (character set) of the string. Optional for binary data. Generates an error if used for a simple value or XML document object.</p> <p>The following list includes commonly used values:</p> <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> <p>For more information on character encoding, see: <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>.</p> <p>The default value is the encoding of the page on which the function is called. See <a href="#">cfcontent</a>.</p>

## Usage

This function can convert simple values and binary values that do not contain Byte zero. If this function cannot convert a value, it throws an exception. This function can also convert an XML document object to a string XML representation.

Adobe recommends that you use the [CharsetEncode](#) function to convert binary data to a string.

### Example

```
<h3>ToString Example</h3>
<!--- Initialize data. ---->
<cfset charData = "">
<!--- Create string of ASCII characters (32-255) and concatenate them. ---->
<cfloop index = "data" from = "32" to = "255">
    <cfset ch = chr(data)>
    <cfset charData = charData & ch>
</cfloop>
<p>The following string is the concatenation of characters (32 to 255)
    from the ASCII table.<br>
<cfoutput>#charData#</cfoutput></p>

<!--- Create a Base64 representation of this string. ---->
<cfset data64 = toBase64(#charData#)>
<p>
The following string is the Base64 representation of the string.<br>
<cfoutput>#data64#</cfoutput></p>
<!--- Create a binary representation of Base64 data. --->
<cfset dataBinary = toBinary(data64)>

<!--- Create the string representation of the binary data. ---->
<cfset dataString = ToString(dataBinary)>
<p>The following is the string representation of the binary data.<br>
<cfoutput>#dataString#</cfoutput></p>
```

## Trace

### Description

A function equivalent of the `<cftrace>` tag and is used in the `<cfscript>` mode.

### Parameters

Same as the `<cftrace>` tag.

### Category

[Debugging functions](#)

### Function syntax

```
trace (var, text, type, category, inline, abort)
```

For positional notations, the sequence must be followed exactly in the same manner as provided in the syntax. If you do not provide one of the parameters, use an empty string instead. This does not apply to Boolean values for which you must provide proper values even if you have to skip them.

### See also

[cfscript](#), [cftrace](#)

### Usage

You can call this function as name=value pair or as positional argument.

### Example

```
<cfscript>
    function TotalInterest(principal, annualRate, months) {
        var years = 0;
        var interestRate = 0;
        var totalInterest = 0;
        principal = REReplace(trim(principal), "[\$", "", "ALL");
        annualRate = Replace(trim(annualRate), "%", "", "ALL");

        if ((principal <= 0) OR (annualRate <= 0) OR (months <= 0)) {
            Throw(type="InvalidData",message="All values must be greater than 0.");
        }
        interestRate = annualRate / 100;
        years = months / 12;
        totalInterest = principal * (((1 + interestRate) ^ years) - 1);
        return DollarFormat(totalInterest);
    }
    try {
        Trace(type="Information", inline="true", text="Calculating interest."); //Use of
        trace function in cfsript
        WriteOutput(TotalInterest("$2500.00", "5.5%", "12"));
        Trace(type="Information", inline="true", text="Interest calculation done.");
    }

    catch(InvalidData ex) {
        //Displayig exception details on screen
        WriteOutput("<p>An InvalidData exception was thrown.</p>");
        WriteOutput("<p>#ex.message#</p>");
        //Writting the exception to log file under logs folder of web server.
        WriteLog(type="Error", file="myapp.log", text="#ex.type# #ex.message#");
    }
}
```

## TransactionCommit

### Description

Commits the current active transaction.

### Returns

Nothing

### Category

[“Transaction functions”](#) on page 696

### Function Syntax

```
TransactionCommit()
```

### See also

[TransactionRollback](#), [TransactionSetSavePoint](#)

### History

ColdFusion 9: Added this function.

### Usage

You can call this function only from within an active transaction.

### Example

```
<cfscript>
q = new query();
q.setDatasource("cfartgallery");
WriteDump(q.execute(sql="select * from art where artid = 60").getResult());
transaction
{
    q.execute(sql="insert into art (artid,artistid,artname,description,price) values
(60,3,'tom','tom',2000)");
    transactionSetSavePoint('sp1');
    WriteDump(q.execute(sql="select * from art where artid = 60").getResult());
    transaction
    {
        q.execute(sql="update art set artistid=4 where artid = 60");
        transactionSetSavePoint('sp2');
        WriteDump(q.execute(sql="select * from art where artid = 60").getResult());
        transaction
        {
            try
            {
                q.execute(sql="update art set artistid='badvalue' where artid = 60");
            }
            catch(any e)
            {
                WriteLog("rolling back the transaction");
                transactionRollback("sp1");
            }
        }
    }
}
WriteDump(q.execute(sql="select * from art where artid = 60").getResult());
transaction
{
    WriteLog("deleting the record");
    q.execute(sql="delete from art where artid = 60");
    WriteDump(q.execute(sql="select * from art where artid = 60").getResult());
}
</cfscript>
```

## TransactionRollback

### Description

Rolls back the current active transaction to the specified savepoint.

### Returns

Nothing

### Category

[“Transaction functions”](#) on page 696

### Function Syntax

```
TransactionRollback([savepoint])
```

### See also

[TransactionCommit](#), [TransactionSetSavePoint](#)

### History

ColdFusion 9: Added this function.

### Parameters

Parameter	Description
savepoint	An optional string identifier for the savepoint. Savepoints let you roll back portions of a transaction.

### Usage

You can call this function only from within an active transaction.

If you do not specify a savepoint, the current active transaction rolls back to the top-level (original) transaction.

### Example

See the example for [TransactionCommit](#).

## TransactionSetSavePoint

### Description

Creates and stores a new savepoint for the current transaction. You can add multiple savepoints by calling this function multiple times.

### Returns

Nothing

### Category

“[Transaction functions](#)” on page 696

### Function Syntax

```
TransactionSetSavepoint(savepoint)
```

### See also

[TransactionCommit](#), [TransactionRollback](#)

### History

ColdFusion 9: Added this function.

### Parameters

Parameter	Description
savepoint	An optional string identifier for the savepoint. Savepoints let you roll back portions of a transaction.

### Usage

You can call this function only from within an active transaction.

### Example

See the example for [TransactionCommit](#).

## Trim

### Description

Removes leading and trailing spaces and control characters from a string.

### Returns

A copy of the *string* parameter, after removing leading and trailing spaces and control characters.

### Category

[String functions](#)

### Function syntax

Trim(string)

### See also

[LTrim](#), [RTrim](#)

### Parameters

Parameter	Description
string	A string or a variable that contains a string.

### Example

```
<h3>Trim Example</h3>
<cfif IsDefined("FORM.myText")>
    <cfoutput>
        <pre>
            Your string:"#FORM.myText#"
            Your string:"#Trim(FORM.myText)#"
            (trimmed on both sides)
        </pre>
    </cfoutput>
</cfif>
<form method = "post" action = "trim.cfm">
<p>Type in some text, and it will be modified by trim to remove leading
    spaces from the left and right
<p><input type = "Text" name = "myText" value = " TEST ">
<p><input type = "Submit" name = "">
</form>
```

## UCase

### Description

Converts the alphabetic characters in a string to uppercase.

### Returns

A copy of a string, converted to uppercase.

### Category

[String functions](#)

### Function syntax

UCase(string)

### See also

[LCase](#)

### Parameters

Parameter	Description
string	A string or a variable that contains one

### Example

```
<h3>UCase Example</h3>

<cfif IsDefined("FORM.sampleText")>
    <cfif FORM.sampleText is not "">
        <p>Your text, <cfoutput>#FORM.sampleText#</cfoutput>,
        returned in uppercase is <cfoutput>#UCase(FORM.sampleText)#</cfoutput>.
    <cfelse>
        <p>Please enter some text.
    </cfif>
</cfif>

<form action = "ucase.cfm">
<p>Enter your sample text, and press "submit" to see the text returned in
    uppercase:
<p><input type = "Text" name = "SampleText" value = "sample">

<input type = "Submit" name = "" value = "submit">
</form>
```

## URLDecode

### Description

Decodes a URL-encoded string.

### Returns

A copy of a string, decoded.

## Category

[Conversion functions](#), [Other functions](#), [String functions](#)

## Function syntax

```
URLDecode(urlEncodedString[, charset])
```

## See also

[URLEncodedFormat](#); Tags and functions for globalizing applications in the *Developing ColdFusion Applications*

## History

ColdFusion MX 6.1: Changed the default charset: the default charset is the character encoding of the URL scope.

ColdFusion MX:

- Changed Unicode support: ColdFusion supports the Java UCS-2 representation of Unicode character values 0–65535. (Earlier releases supported ASCII values.)
- Added the `charset` parameter.

## Parameters

Parameter	Description
<code>urlEncodedString</code>	URL-encoded string or a variable that contains one.
<code>charset</code>	<p>The character encoding in which the URL is encoded. Optional.</p> <p>The following list includes commonly used values:</p> <ul style="list-style-type: none"><li>• <code>utf-8</code></li><li>• <code>iso-8859-1</code></li><li>• <code>windows-1252</code></li><li>• <code>us-ascii</code></li><li>• <code>shift_jis</code></li><li>• <code>iso-2022-jp</code></li><li>• <code>euc-jp</code></li><li>• <code>euc-kr</code></li><li>• <code>big5</code></li><li>• <code>euc-cn</code></li><li>• <code>utf-16</code></li></ul> <p>For more information on character encoding, see: <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>.</p> <p>The default value is the character encoding of the URL scope.</p>

## Usage

URL encoding formats some characters with a percent sign and the two-character hexadecimal representation of the character. For example, a character whose code is 129 is encoded as `%81`. A space is encoded with a plus sign.

Query strings in HTTP are always URL-encoded.

### Example

This example creates, encodes, and decodes a string that contains ASCII character codes:

```
<cfscript>
    // Build string
    s = "";
    for (c = 1; c lte 256; c = c + 1)
    {
        s = s & chr(c);
    }
    // Encode string and display result
    enc = URLEncodedFormat(s);
    WriteOutput("Encoded string is: '#enc#'.<br>");
    // Decode and compare result with original
    dec = URLDecode(enc);
    if (dec neq s)
    {
        WriteOutput("Decoded is not the same as encoded.");
    }
    else
    {
        WriteOutput("All's quiet on the Western front.");
    }
}
</cfscript>
```

## URLEncodedFormat

### Description

Generates a URL-encoded string. For example, it replaces spaces with %20, and non-alphanumeric characters with equivalent hexadecimal escape sequences. Passes arbitrary strings within a URL (ColdFusion automatically decodes URL parameters that are passed to a page).

### Returns

A copy of a string, URL-encoded.

### Category

[Conversion functions](#), [Other functions](#), [String functions](#)

### Function syntax

```
URLEncodedFormat(string [, charset ])
```

### See also

[URLDecode](#); Tags and functions for globalizing applications in the *Developing ColdFusion Applications*

### History

ColdFusion MX 6.1: Changed the default encoding to be the response character encoding.

ColdFusion MX: Added the `charset` parameter.

### Parameters

Parameter	Description
string	A string or a variable that contains one
charset	<p>The character encoding in which the string is encoded. Optional.</p> <p>The following list includes commonly used values:</p> <ul style="list-style-type: none"><li>• utf-8</li><li>• iso-8859-1</li><li>• windows-1252</li><li>• us-ascii</li><li>• shift_jis</li><li>• iso-2022-jp</li><li>• euc-jp</li><li>• euc-kr</li><li>• big5</li><li>• euc-cn</li><li>• utf-16</li></ul> <p>For more information on character encoding, see: <a href="http://www.w3.org/International/O-charset.html">www.w3.org/International/O-charset.html</a>.</p> <p>The default value is the character encoding of the response. See <a href="#">cfcontent</a>.</p>

### Usage

URL encoding formats some characters with a percent sign and the two-character hexadecimal representation of the character. For example, a character whose code is 129 is encoded as %81. A space is replaced with %20.

Query strings in HTTP are always URL-encoded.

### Example

```
<h3>URLEncodedFormat Example</h3>
<cfif IsDefined("url.myExample")>
    <p>The url variable url.myExample was passed from the previous link ...
    its value is:
    <br><b>"<cfoutput>#url.myExample#</cfoutput>"</b>
</cfif>
<p>This function returns a URL encoded string.
<cfset s = "My url-encoded string has special characters & other stuff">
<p> <A HREF = "urlencodedformat.cfm?myExample=<cfoutput>#URLEncodedFormat(s)#
</cfoutput>">Click me</A>
```

## URLSessionFormat

### Description

Depending on whether a client computer accepts cookies, this function does the following:

- If the client does not accept cookies: automatically appends all required client identification information to a URL

- If the client accepts cookies: does not append information

This function automatically determines which identifiers are required, and sends only the required information. It provides a more secure and robust method for supporting client identification than manually encoding the information in each URL, because it sends only required information, when it is required, and it is easier to code.

**Returns**

A URL; if cookies are disabled for the browser, client and session data are appended.

**Category**

[Other functions](#); Maintaining client identity in the *Developing ColdFusion Applications*

**Function syntax**

```
URLSessionFormat (request_URL)
```

**Parameters**

Parameter	Description
request_URL	URL of a ColdFusion page

**Usage**

In the following example, the `cfform` tag posts a request to another page and sends the client identification, if necessary. If cookie support is detected, the function returns the following:

```
myactionpage.cfm
```

If the detected cookie is not turned on, or cookie support cannot be reliably detected, the function return value is as follows:

```
myactionpage.cfm?jsessionid=xxxx;cfdid=xxxx&cftoken=xxxxxxxxx
```

**Example**

```
<cfform
  method="Post"
  action="#URLSessionFormat ("MyActionPage.cfm") #">
</cfform>
```

## Val

**Description**

Converts numeric characters that occur at the beginning of a string to a number.

**Returns**

A number. If conversion fails, returns zero.

**Category**

[Conversion functions](#), [String functions](#)

**Function syntax**

```
Val (string)
```

## See also

[IsNumeric](#)

## Parameters

Parameter	Description
string	A string or a variable that contains one

## Usage

This function works as follows:

- If `TestValue = "234A56?7"`, `Val (TestValue)` returns 234.
- If `TestValue = "234'5678'9?"`, `Val (TestValue)` returns 234.
- If `TestValue = "BG234"`, `Val (TestValue)` returns the value 0, (not an error).
- If `TestValue = "0"`, `Val (TestValue)` returns the value 0, (not an error).

## Example

```
<h3>Val Example</h3>
<cfif IsDefined("FORM.theTestValue")>
    <cfif Val (FORM.theTestValue) is not 0>
        <h3>The string <cfoutput>#DE (FORM.theTestValue) #</cfoutput>
        can be converted to a number:
        <cfoutput>#Val (FORM.theTestValue) #</cfoutput></h3>
    <cfelse>
        <h3>The beginning of the string <cfoutput>#DE (FORM.theTestValue) #
        </cfoutput> cannot be converted to a number</h3>
    </cfif>
</cfif>
<form action = "val.cfm">
<p>Enter a string, and determine whether its beginning can be evaluated
    to a numeric value.
<p>
<input type = "Text"
    name = "TheTestValue"
    value = "123Boy">
<input type = "Submit"
    value = "Is the beginning numeric?"
    name = "">
</form>
```

## ValueList

### Description

Inserts a delimiter between each value in an executed query. ColdFusion does not evaluate the arguments.

### Returns

A delimited list of the values of each record returned from an executed query.

### Category

[List functions](#), [Query functions](#)

### Function syntax

```
ValueList(query.column [, delimiter ])
```

### See also

[QuotedValueList](#)

### Parameters

Parameter	Description
query.column	Name of an executed query and column. Separate query name and column name with a period.
delimiter	A delimiter character to separate column data items. The default value is comma (,).

### Example

```
<h3>ValueList Example</h3>
```

```
<!-- use the contents of a query to create another dynamically -->
<cfquery name = "GetDepartments" datasource = "cfdocexamples">
    SELECT Dept_ID FROM Departments
    WHERE Dept_ID IN ('BIOL')
</cfquery>
```

```
<cfquery name = "GetCourseList" datasource = "cfdocexamples">
    SELECT *
    FROM CourseList
    WHERE Dept_ID IN ('#GetDepartments.Dept_ID#')
</cfquery>
```

Value list of all BIOL Course ID's using (--) as the delimiter:<br>

```
<cfoutput>
#ValueList(GetCourseList.Course_ID, "--")#<br>
</cfoutput>
```

Value list of all BIOL Course Numbers using (;) as the delimiter:<br>

```
<cfoutput>
#ValueList(GetCourseList.CorNumber, ";")#<br>
</cfoutput>
```

## VerifyClient

### Description

Requires remote invocations of the page or calls to functions on the page to include an encrypted security token.

### Returns

Does not return a value.

### Category

[Security functions](#)

### Function syntax

```
VerifyClient()
```

### See also

[cffunction](#), Improving security in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function.

### Parameters

Does not take any parameters

### Usage

Use this function to help prevent security attacks where an unauthorized party attempts to perform an action on the server, such as changing a password. As a general rule, use this feature for Ajax requests to the server to perform sensitive actions, such as updating passwords.

If you call this function, you must enable client management or session management in your application; otherwise, you do not get an error, but ColdFusion does not verify clients. Use this function only on pages that respond to client-side ColdFusion Ajax features, such as bind expressions. These features include code that correctly sends the security token when needed.

## Week

### Description

From a date/time object, determines the week number within the year.

### Returns

An integer in the range 1–53; the ordinal of the week, within the year.

### Category

[Date and time functions](#)

### Function syntax

`Week (date)`

### See also

[DatePart](#)

### Parameters

Parameter	Description
date	A date/time object in the range 100 AD–9999 AD.

### Usage

When passing date as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date.

### Example

```
<h3>Week Example</h3>
<cfif IsDefined("FORM.year")>
More information about your date:
<cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
<cfoutput>
  <p>Your date, #DateFormat(yourDate)#.
  <br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#, day
    #DayOfWeek(yourDate)# in the week.
  <br>This is day #Day(YourDate)# in the month of
    #MonthAsString(Month(yourDate))#, which has #DaysInMonth(yourDate)# days.
  <br>We are in week #Week(yourDate)# of #Year(yourDate)# (day
    #DayOfYear(yourDate)# of #DaysInYear(yourDate)#). <br>
  <cfif IsLeapYear(Year(yourDate))>This is a leap year
  <cfelse>This is not a leap year
  </cfif>
</cfoutput>
</cfif>
```

## Wrap

### Description

Wraps text so that each line has a specified maximum number of characters.

**Note:** The wrap function does not insert line breaks by placing the `<br>` tag in HTML text. Instead, it wraps the text in the display without adding the `<br>` tag.

### Returns

String containing the wrapped text.

### Category

[String functions](#)

### Function syntax

```
Wrap(string, limit[, strip])
```

### See also

[cfmail](#)

### History

ColdFusion MX 6.1: Added this function.

### Parameters

Parameter	Description
string	String or variable that contains one. The text to wrap.
limit	Positive integer maximum number of characters to allow on a line.
strip	Boolean value specifying whether to remove all existing newline and carriage return characters in the input string with spaces before wrapping the text. The default value is False.

### Usage

Inserts line break at the location of the first white space character (such as a space, tab, or new line) before the specified limit on a line. If a line has no whitespace characters before the limit, inserts a line break at the limit. Uses the operating-system specific line break: newline for UNIX, carriage return and newline on Windows.

If you specify the `strip` parameter, all existing line breaks are removed, so any paragraph formatting is lost.

Use this function to limit the length of text lines, such as text to be included in a mail message. The `cfmail` and `cfmailpart` tag `wraptext` attributes use this function

### Example

```
<h3>Wrap Example</h3>
<cfset inputText="This is an example of a text message that we want to wrap. It is rather long
and needs to be broken into shorter lines.">
<cfoutput>#Wrap(inputText, 59)#</cfoutput>
```

## WriteDump

### Description

A function equivalent to the `<cfdump>` tag which can be used in `<cfscript>`.

### Parameters

Same as `<cfdump>` tag.

### Category

[Other functions](#), [Data output functions](#)

### Function syntax

```
WriteDump (var, output, format, abort, label, metainfo, top, show, hide, keys, expand,
showUDFs);
```

### See also

[cfdump](#), [cfscript](#)

### History

ColdFusion 9: Added this function.

### Usage

You can call this function providing arguments as name=value pair or as positional arguments.

For positional notations, the sequence must be followed exactly in the same manner as provided in the syntax. If you do not provide one of the parameters, use an empty string instead. This does not apply to Boolean values for which you must provide proper values even if you have to skip them.

### Example

```
<cfscript>
filename = "log.txt";
    try {
        result = FileOpen(expandpath(filename));
        WriteDump(result);
    }
catch(Expression exception) {
    WriteOutput("<p>An Expression exception was thrown.</p>");
    WriteOutput("<p>#exception.message#</p>");
    WriteLog(type="Error", file="myapp.log", text="[exception.type]
    #exception.message#");
}
</cfscript>
```

## WriteLog

### Description

A function equivalent of the `cflog` tag, which can be used in `<cfscript>`.

### Parameters

Same as the `<cflog>` tag.

### Category

[Data output functions](#)

### Function syntax

`WriteLog (text, type, application, file, log)`

For positional notations, the sequence must be followed exactly in the same manner as provided in the syntax. If you do not provide one of the parameters, use an empty string instead. This does not apply to Boolean values for which you must provide proper values even if you have to skip them.

### See also

[cfscript](#), [cflog](#)

### Usage

You can call this function as name=value pair or as positional argument.

### Example

```
<cfscript>
    //Example: 1
    function TotalInterest(principal, annualRate, months) {
        var years = 0;
        var interestRate = 0;
        var totalInterest = 0;
        principal = REReplace(trim(principal), "[\$", "", "ALL");
        annualRate = Replace(trim(annualRate), "%", "", "ALL");

        if ((principal <= 0) OR (annualRate <= 0) OR (months <= 0)) {
            Throw(type="InvalidData",message="All values must be greater than 0.");
        }

        interestRate = annualRate / 100;
        years = months / 12;
        totalInterest = principal * (((1 + interestRate) ^ years) - 1);
        return DollarFormat(totalInterest);
    }

    try {
        Trace(type="Information", inline="true", text="Calculating interest.");
        WriteOutput(TotalInterest("$2500.00", "5.5%", "12"));
        Trace(type="Information", inline="true", text="Interest calculation done.");
    }

    catch(InvalidData ex) {
        //Writting the exception to log file under logs folder of web server.
        WriteLog(type="Error", file="myapp.log", text="#ex.type# #ex.message#");
    }
</cfscript>
```

## WriteOutput

### Description

Appends text to the page-output stream.

This function writes to the page-output stream regardless of conditions established by the [cfsetting](#) tag.

### Category

[Other functions](#), [System functions](#), [Data output functions](#)

### Function syntax

`WriteOutput(string)`

### Parameters

Parameter	Description
string	A string or a variable that contains one

### Usage

Within the `cfquery` and `cfmail` tags, this function does not output to the current page; it writes to the current SQL statement or mail text. Do not use `WriteOutput` within `cfquery` and `cfmail`.

Although you can call this function anywhere within a page, it is most useful inside a `cfscript` block.

### Example

```
...
<cfscript>
employee = StructNew();
StructInsert(employee, "firstname", FORM.firstname);
StructInsert(employee, "lastname", FORM.lastname);
StructInsert(employee, "email", FORM.email);
StructInsert(employee, "phone", FORM.phone);
StructInsert(employee, "department", FORM.department);
WriteOutput("About to add " & FORM.firstname & " " & FORM.lastname);
</cfscript>
```

## XmlChildPos

### Description

Gets the position of a child element within an XML document object.

### Returns

The position, in an `XmlChildren` array, of the *N*th child that has the specified name.

### Category

[XML functions](#)

### Function syntax

```
XmlChildPos(elem, childName, N)
```

### See also

[IsXmlElement](#), [XmlElementNew](#), [XmlSearch](#), [XmlTransform](#); Using XML and WDDX in the *Developing ColdFusion Applications*

### History

ColdFusion MX: Added this function.

### Parameters

Parameter	Description
<code>elem</code>	XML element within which to search.
<code>childName</code>	XML child element for which to search. Must be an immediate child of the <code>elem</code> parameter.
<code>N</code>	Index of XMLchild element for which to search.

### Usage

You can use the returned index in the `ArrayInsertAt` and `ArrayDeleteAt` functions to change XML document objects. If the specified child is not found, the function returns -1.

### Example

The following example searches XML document element, `xmlobject.employee.name[1]`, for its second `Status` element child and uses the position in an `ArrayDeleteAt` function to remove the element:

```
<!-- Create an XML document object -->
<cfxml variable="xmlobject">
  <employee>
    <!-- A list of employees -->
    <name EmpType="Regular">
      <first>Almanzo</first>
      <last>Wilder</last>
      <Status>Medical Absence</Status>
      <Status>Extended Leave</Status>
    </name>
    <name EmpType="Contract">
      <first>Laura</first>
      <last>Ingalls</last>
    </name>
  </employee>
</cfxml>

<!-- Find the second Status child of the first employee.name element -->
<cfscript>
  elempos=XMLChildPos(xmlobject.employee.name[1], "Status", 2);
  ArrayDeleteAt(xmlobject.employee.name[1].XmlChildren, elempos);
</cfscript>

<!-- Dump the resulting document object to confirm the deletion -->
<cfdump var="#xmlobject#">
```

## XmlElemNew

### Description

Creates an XML document object element.

### Returns

An XML document object element.

### Category

[XML functions](#)

### Function syntax

```
XmlElemNew(xmlObj[, namespace], childName)
```

### See also

[cfxml](#), [IsXmlElem](#), [XmlChildPos](#), [XmlFormat](#), [XmlNew](#), [XmlParse](#); Using XML and WDDX in the *Developing ColdFusion Applications*

### History

ColdFusion MX 7: Added the `namespace` parameter.

ColdFusion MX: Added this function.

### Parameters

Parameter	Description
<code>xmlObj</code>	Name of the XML document object in which you are creating the element
<code>namespace</code>	(Optional) URI of the namespace to which this element belongs
<code>childName</code>	Name of the element to create

### Usage

The function's return variable specifies the location of the new element in the document object. It must specify a valid location in the document object identified by the `xmlObj` parameter. The following statements show this use:

```
MyDoc.MyRoot.XmlChildren[2] = XmlElemNew(MyDoc,"childNodes");  
ArrayAppend(MyDoc.MyRoot.XmlChildren, XmlElemNew(MyDoc,"childNodes"));
```

If you do not specify a namespace URI and use a namespace prefix in the `childName` parameter, ColdFusion checks to see if a namespace URI has already been specified for the prefix, and if so, uses that namespace.

### Example

The following example creates and displays a ColdFusion document object:

```
<cfscript>  
    MyDoc = XmlNew();  
    MyDoc.xmlRoot = XmlElemNew(MyDoc,"MyRoot");  
    if (testVar IS TRUE)  
        MyDoc.MyRoot.XmlText = "The value of testVar is True.";  
    else  
        MyDoc.MyRoot.XmlText = "The value of testVar is False.";  
    for (i = 1; i LTE 4; i = i + 1)  
    {  
        MyDoc.MyRoot.XmlChildren[i] = XmlElemNew(MyDoc,"childNodes");  
        MyDoc.MyRoot.XmlChildren[i].XmlText = "This is Child node " & i & ".";  
    }  
</cfscript>  
<cfdump var=#MyDoc#>
```

## XmlFormat

### Description

Escapes special XML characters in a string so that the string can be used as text in XML.

### Returns

A copy of the *string* parameter that is safe to use as text in XML.

### Category

[String functions](#), [XML functions](#)

## Function syntax

`XmlFormat(string, escapeChars)`

## See also

[cfxml](#), [XmlNew](#), [XmlParse](#), [XmlValidate](#); Using XML and WDDX in the *Developing ColdFusion Applications*

## History

ColdFusion MX: Added this function.

## Parameters

Parameter	Description
string	A string or a variable that contains one
escapeChars	Set to true to escape the characters restricted as per XML standards. For details, see <a href="http://www.w3.org/TR/2006/REC-xml11-20060816/#NT-RestrictedChar">http://www.w3.org/TR/2006/REC-xml11-20060816/#NT-RestrictedChar</a> .

## Usage

This function escapes characters as follows:

Text character	Escaped representation
Greater than symbol (>)	&gt;
Less than symbol (<)	&lt;
Single-quotation mark (')	&apos;
Double-quotation mark (")	&quot;
Ampersand symbol (&)	&amp;
Carriage return (but not line feed)	Removed from the text.
High ASCII characters in the range 159-255.	Replaced by unicode escape sequence; for example, É (capital E with an Acute symbol) is replaced by &#xc9;

## Example

The following example shows how `XmlFormat` escapes special XML characters. Use the View Source command in the browser to see the results. ColdFusion interprets the `"` in the second text string as representing a single-quotation mark in text before it applies the `XmlFormat` function.

```
<?xml version = "1.0"?>
<cfoutput>
<someXML>
    <someElement someAttribute="#XmlFormat('a quoted value', "true")#">
        #XmlFormat("Body of element with <, >, " and & goes here.", "true")#
    </someElement>
</someXML>
</cfoutput>
```

## XmlGetNodeType

### Description

Determines the type of an XML document object node.

### Returns

A string identifying the XML node type. The following values are valid:

ATTRIBUTE_NODE	CDATA_SECTION_NODE
COMMENT_NODE	DOCUMENT_FRAGMENT_NODE
DOCUMENT_NODE	DOCUMENT_TYPE_NODE
ELEMENT_NODE	ENTITY_NODE
ENTITY_REFERENCE_NODE	NOTATION_NODE
PROCESSING_INSTRUCTION_NODE	TEXT_NODE

If the argument is not a document object node, the function generates an error.

### Category

[XML functions](#)

### Function syntax

`XmlGetNodeType (xmlNode)`

### See also

[IsXmlAttribute](#), [IsXmlDoc](#), [IsXmlElem](#), [IsXmlNode](#), [IsXmlRoot](#), [XmlChildPos](#), [XmlValidate](#); Using XML and WDDX in the *Developing ColdFusion Applications*

### History

ColdFusion MX 7: Added this function.

### Parameters

Parameter	Description
xmlNode	An XML DOM object node

### Usage

The `XmlGetNodeType` function can determine the types of the nodes returned by the [XmlSearch](#) function, or the types of the entries in an element's `XmlNodes` array.

### Example

The following example checks the node types of various parts of an XML document object:

```
<!--- Create an XML document object --->
<cfxml variable="xmlobject">
<?xml version="1.0" encoding="UTF-8"?>
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <!-- This item is coded to show several node types -->
      <![CDATA["Our Best" hammer & chisel set!!!]]> Imported from France
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
  </items>
</order>
</cfxml>

<!--- Display the node types --->
<cfoutput>
<h3>Node Types</h3>
xmlobject: #XMLGetNodeType(xmlobject)#<br>
xmlobject.order: #XMLGetNodeType(xmlobject.order)#<br>
<br>
Now check the types of all the nodes in the xmlobject.order.items.item
element's XmlNodes array.<br>
  Note the many apparently empty Text nodes generated by whitespace characters in the XML
  text source.<br><br>
<cfset descnodes=xmlobject.order.items.item.XmlNodes>
<cfloop from="1" to="#ArrayLen(descnodes)#" index="i">
  #i# Node type is: #XMLGetNodeType(descnodes[i])#<br>
  #i# Node name is: #descnodes[i].XmlName#<br>
  <cfif (descnodes[#i#].XmlValue NEQ "")>
    #i# Node value is: #descnodes[i].XmlValue#<br>
  </cfif>
  <br>
</cfloop>
</cfoutput>
```

## XmlNew

### Description

Creates an XML document object.

### Returns

An empty XML document object.

### Category

[XML functions](#)

### Function syntax

```
XmlNew([caseSensitive])
```

**See also**

[cfxml](#), [IsXmlDoc](#), [ToString](#), [XmlFormat](#), [XmlParse](#), [XmlValidate](#); Using XML and WDDX in the *Developing ColdFusion Applications*

**History**

ColdFusion MX: Added this function.

**Parameters**

Parameter	Description
<code>caseSensitive</code>	Determines how ColdFusion processes the case of XML document object component identifiers: <ul style="list-style-type: none"><li>• True: maintains case</li><li>• False: ColdFusion ignores case. Default.</li></ul>

**Usage**

An XML document object is represented in ColdFusion as a structure.

The *caseSensitive* parameter value determines whether identifiers whose characters are of varying case, but are otherwise the same, refer to different components; for example:

- If True, the element or attribute names “name” and “NAME” refer to different elements or attributes.
- If False, these names refer to the same elements or attributes.

If your XML object is case sensitive, you cannot use dot notation to reference an element or attribute name. Use the name in associative array (bracket) notation, or a reference that does not use the case-sensitive name (such as `xmlChildren[1]`) instead. In the following code, the first line will work with a case-sensitive XML object. The second and third lines cause errors:

```
MyDoc.xmlRoot.XmlAttributes["Version"] = "12b";
MyDoc.xmlRoot.XmlAttributes.Version = "12b";
MyDoc.MyRoot.XmlAttributes["Version"] = "12b";
```

To convert an XML document object into a string, use the [ToString](#) function.

**Example**

The following example creates and displays a ColdFusion document object:

```
<cfset testVar = True>
<cfscript>
    MyDoc = XmlNew();
    MyDoc.xmlRoot = XmlElemNew(MyDoc, "MyRoot");
    if (testVar IS TRUE)
        MyDoc.MyRoot.XmlText = "The value of testVar is True.";
    else
        MyDoc.MyRoot.XmlText = "The value of testVar is False.";
    for (i = 1; i LTE 4; i = i + 1){
        MyDoc.MyRoot.XmlChildren[i] = XmlElemNew(MyDoc, "childNodes");
        MyDoc.MyRoot.XmlChildren[i].XmlText = "This is Child node " & i & ".";
    }
</cfscript>
<cfdump var=#MyDoc#>
```

## XmlParse

### Description

Converts XML text into an XML document object.

### Returns

An XML document object.

### Category

[Conversion functions](#), [XML functions](#)

### Function syntax

```
XmlParse(xmlText [, caseSensitive ], validator)
```

### See also

[cfxml](#), [IsXML](#), [ToString](#), [XmlFormat](#), [XmlNew](#), [XmlSearch](#), [XmlTransform](#), [XmlValidate](#); [Using XML and WDDX in the \*Developing ColdFusion Applications\*](#)

### History

ColdFusion MX 7:

- Added the `validator` parameter.
- Added support for filenames and URLs in the `xmlText` parameter.
- Added support for relative URLs and pathnames.

ColdFusion MX: Added this function.

### Parameters

Parameter	Description
<code>xmlText</code>	Any of the following: <ul style="list-style-type: none"><li>• A string containing XML text.</li><li>• The name of an XML file.</li><li>• The URL of an XML file; valid protocol identifiers include http, https, ftp, and file.</li></ul>
<code>caseSensitive</code>	<ul style="list-style-type: none"><li>• Yes: maintains the case of document elements and attributes.</li><li>• No: Default</li></ul>
<code>validator</code>	Any of the following: <ul style="list-style-type: none"><li>• The name of a Document Type Definition (DTD) or XML Schema file.</li><li>• The URL of a DTD or Schema file; valid protocol identifiers include http, https, ftp, and file.</li><li>• A string representation of a DTD or Schema.</li><li>• An empty string; in this case, the XML file must contain an embedded DTD or Schema identifier, which is used to validate the document.</li></ul>

### Usage

If you specify a relative URL or pathname in a parameter, ColdFusion uses the directory (or, for URLs, the logical directory) that contains the current ColdFusion page as the path root.

The *caseSensitive* parameter value determines whether identifiers whose characters are of varying case, but are otherwise the same, refer to different components; for example:

- If true, the element or attribute names “name” and “NAME” refer to different elements or attributes.
- If false, these names refer to the same elements or attributes.

If your XML object is case sensitive, you cannot use dot notation to reference an element or attribute name. Use the name in associative array (bracket) notation, or a reference that does not use the case-sensitive name (such as `xmlChildren[1]`) instead. In the following code, the first line will work with a case-sensitive XML object. The second and third lines cause errors:

```
MyDoc.xmlRoot.XmlAttributes["Version"] = "12b";  
MyDoc.xmlRoot.XmlAttributes.Version = "12b";  
MyDoc.MyRoot.XmlAttributes["Version"] = "12b";
```

The optional *validator* parameter specifies a DTD or Schema to use to validate the document. If the parser encounters a validation error, ColdFusion generates an error and stops parsing the document. Specify a *validator* parameter to make the `XmlParse` function validate your document. If you do not specify a *validator* parameter, the XML file must specify the DTD or schema using the `xsi:noNamespaceSchemaLocation` tag. If you specify a *validator* parameter, also specify a *caseSensitive* parameter.

**Note:** If you specify an empty string as the third parameter to the `XmlParse` function and specify a validator such as `xsi:noNamespaceSchemaLocation` within an XML document, it must specify a complete URL. However, with `XMLValidate`, it can be just a filename that is found relative to the CFML template doing validation.

If you do not specify a *validator* parameter, the *xmlText* parameter can specify a well-formed XML fragment, and does not have to specify a complete document.

**Note:** To convert an XML document object back into a string, use the [ToString](#) function.

### Example

The following example has three parts: an XML file, a DTD file, and a CFML page that parses the XML file and uses the DTD for validation. The CFML file displays the returned XML document object. To show the results of invalid XML, modify the `bmenuD.xml`.

**Note:** The DTD used in the following example represents the same XML structure as the Schema used in the [XmlValidate](#) example

The `custorder.xml` file is as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE order SYSTEM "C:\ColdFusion\wwwroot\examples\custorder.dtd">
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <name>Deluxe Carpenter's Hammer</name>
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
    <item id="54">
      <name>" Plastic Rake</name>
      <quantity>2</quantity>
      <unitprice>6.95</unitprice>
    </item>
    <item id="68">
      <name>Standard paint thinner</name>
      <quantity>3</quantity>
      <unitprice>8.95</unitprice>
    </item>
  </items>
</order>
```

The custorder.dtd file is as follows:

```
<!ELEMENT order (customer, items)>
<!ATTLIST order
  id CDATA #REQUIRED>
<!ELEMENT customer EMPTY>
<!ATTLIST customer
  firstname CDATA #REQUIRED
  lastname CDATA #REQUIRED
  accountNum CDATA #REQUIRED>
<!ELEMENT items (item+)>
<!ELEMENT item (name, quantity, unitprice)>
<!ATTLIST item
  id CDATA #REQUIRED>
<!ELEMENT name (#PCDATA)>
<!ELEMENT quantity (#PCDATA)>
<!ELEMENT unitprice (#PCDATA)>
```

The CFML file is as follows. It uses a filename for the XML file and a URL for the DTD. Note that the XML and URL paths must be absolute.

```
<cfset
myDoc=XMLParse("C:\ColdFusion\wwwroot\examples\custorder.xml",
false, "http://localhost:8500/examples/custorder.dtd">
Dump of myDoc XML document object<br>
<cfdump var="#myDoc#">
```

## XMLSearch

### Description

Uses an XPath language expression to search an XML document object.

### Returns

The results of the XPath search. For details, see Usage.

### Category

[XML functions](#)

### Function syntax

```
XmlSearch(xmlDoc, xPathString)
```

### See also

[cfxml](#), [IsXML](#), [XmlChildPos](#), [XmlParse](#), [XmlTransform](#); Using XML and WDDX in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added support for returning any valid XPath result, not just arrays of XML object nodes.

ColdFusion MX 7: Added support for attribute searches.

ColdFusion MX: Added this function.

### Parameters

Parameter	Description
xmlDoc	XML document object
xPathString	XPath expression

### Usage

The `XmlSearch` function attempts to return the values returned by the search whenever possible. For example, if the XPath expression returns a Boolean, the CFML variable is assigned a `true` or `false` value.

The following table lists XPath expression result data types and how they are represented in the CFML return value.

XPath return type	ColdFusion representation
Boolean	Boolean
Null	"" (empty string)
Number	Number
String	String
NodeSet	Array of XML nodes
Result Tree Fragment	Array of XML nodes

Results that are `Unknown` or have an unresolved variable in the expression throw an error.

XPath is specified by the World Wide Web Consortium (W3C). For detailed information on XPath, including XPath expression syntax, see the W3C website at [www.w3.org/TR/xpath](http://www.w3.org/TR/xpath).

### Example

The following example extracts the elements named *last*, which contain employee last names, from an XML file, and displays the names.

The employeesimple.xml file contains the following XML:

```
<?xml version="1.0" encoding="UTF-8"?>
<employee>
  <!-- A list of employees -->
    <name EmpType="Regular">
      <first>Almanzo</first>
      <last>Wilder</last>
    </name>
    <name EmpType="Contract">
      <first>Laura</first>
      <last>Ingalls</last>
    </name>
  </employee>
```

The CFML file contains the following lines:

```
<cfscript>
  myxmldoc = XmlParse("C:\CFusionMX7\wwwroot\examples\employeesimple.xml");
  selectedElements = XmlSearch(myxmldoc, "/employee/name/last");
  for (i = 1; i LTE ArrayLen(selectedElements); i = i + 1)
    writeoutput(selectedElements[i].XmlText & "<br>");
</cfscript>
```

## XmlTransform

### Description

Applies an Extensible Stylesheet Language Transformation (XSLT) to XML. The XML can be in string format or an XML document object.

### Returns

A string containing the results of applying the XSLT to the XML.

### Category

[Conversion functions](#), [XML functions](#)

### Function syntax

```
XmlTransform(xml, xsl[, parameters])
```

### See also

[cfxml](#), [XmlFormat](#), [XmlNew](#), [XmlParse](#), [XmlSearch](#), [XmlValidate](#); Using XML and WDDX in the *Developing ColdFusion Applications*

### History

ColdFusion MX 7: Added the `parameters` parameter and the ability to use a file for the XSL.

ColdFusion MX: Added this function.

## Parameters

Parameter	Description
xml	An XML document in string format, or an XML document object
xsl	<p>XSLT transformation to apply; can be any of the following:</p> <p>Any of the following:</p> <ul style="list-style-type: none"><li>• A string containing XSL text.</li><li>• The name of an XSLT file. Relative paths start at the directory containing the current CFML page.</li><li>• The URL of an XSLT file; valid protocol identifiers include http, https, ftp, and file. Relative paths start at the directory containing the current CFML page.</li></ul>
parameters	A structure containing XSL template parameter name-value pairs to use in transforming the document. The XSL transform defined in the xslString parameter uses these parameter values in processing the XML.

## Usage

An XSLT converts an XML document to another format or representation by applying an Extensible Stylesheet Language (XSL) stylesheet to it. XSL, including XSLT syntax is specified by the World Wide Web Consortium (W3C). For detailed information on XSL and XSLT, see the W3C website at [www.w3.org/Style/XSL/](http://www.w3.org/Style/XSL/).

If the XSLT code contains include statements with relative paths, ColdFusion resolves them relative to the location of the XSLT file, or for an XSL string, the location of the current ColdFusion page.

## Example

The following example converts an XML document that represents a customer order into an HTML document with the customer name and a table with the order items and quantities:

The custorder.xml file that represents a customer order has the following lines:

```
<?xml version="1.0" encoding="UTF-8"?>
<order id="4323251">
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <name>Deluxe Carpenter&apos;s Hammer</name>
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
    <item id="54">
      <name>36" Plastic Rake</name>
      <quantity>2</quantity>
      <unitprice>6.95</unitprice>
    </item>
    <item id="68">
      <name>Standard paint thinner</name>
      <quantity>3</quantity>
      <unitprice>8.95</unitprice>
    </item>
  </items>
</order>
```

The custorder.xsd XSLT file that transforms the XML to HTML that displays the customer's name, and the items and quantities ordered has the following lines:

```
<?xml version="1.0"?>
<xsl:stylesheet version="1.0" xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<xsl:output method="html" doctype-public="-//W3C//DTD HTML 4.0 Transitional//EN" />
  <xsl:template match="/">
    <html>
      <body>
        <table border="2" bgcolor="yellow">
          <tr>
            <th>Name</th>
            <th>Price</th>
          </tr>
          <xsl:for-each select="breakfast_menu/food">
            <tr>
              <td>
                <xsl:value-of select="name"/>
              </td>
              <td>
                <xsl:value-of select="price"/>
              </td>
            </tr>
          </xsl:for-each>
        </table>
      </body>
    </html>
  </xsl:template>
</xsl:stylesheet>
```

The CFML file has the following lines:

```
<cffile action="read" file="C:\CFusionMX7\wwwroot\examples\custorder.xml"
variable="xmltrans">
<cfset xmldoc = XmlParse("C:\CFusionMX7\wwwroot\examples\custorder.xml")>
<cfoutput>#XmlTransform(xmldoc, xmltrans)#</cfoutput>
```

## XmlValidate

### Description

Uses a Document Type Definition (DTD) or XML Schema to validate an XML text document or an XML document object.

### Returns

The following validation structure:

Field	Description
Errors	An array containing any validator error messages. These messages indicate that the document does not conform to the DTD or Schema (is not valid).

Field	Description
<code>FatalErrors</code>	An array containing any validator fatal error messages. Fatal errors indicate that the document contains XML formatting errors (is not well-formed XML).
<code>Status</code>	A Boolean value: <ul style="list-style-type: none"><li>• True if the document is valid.</li><li>• False if the validation check failed.</li></ul>
<code>Warning</code>	An array containing any validator warnings. A well-formed and valid document can produce warning messages.

## Category

[XML functions](#)

## Function syntax

```
XmlValidate(xmlDoc[, validator])
```

## See also

[cfxml](#), [IsXmlDoc](#), [IsXML](#), [XmlFormat](#), [XmlNew](#), [XmlParse](#), [XmlSearch](#), [XmlTransform](#); Using XML and WDDX in the *Developing ColdFusion Applications*

## History

ColdFusion MX 7: Added this function.

## Parameters

Parameter	Description
<code>xmlDoc</code>	Any of the following: <ul style="list-style-type: none"><li>• A string containing an XML document.</li><li>• The name of an XML file.</li><li>• The URL of an XML file; valid protocol identifiers include http, https, ftp, and file.</li><li>• An XML document object, such as one generated by the <a href="#">XmlParse</a> function.</li></ul>
<code>validator</code>	Any of the following: <ul style="list-style-type: none"><li>• A string containing a DTD or Schema.</li><li>• The name of a DTD or Schema file.</li><li>• The URL of a DTD or Schema file; valid protocol identifiers include http, https, ftp, and file.</li></ul>

## Usage

If you specify a relative URL or filename in a parameter, ColdFusion uses the directory (or, for URLs, the virtual directory) that contains the current ColdFusion page as the path root.

The *validator* parameter specifies a DTD or Schema to use to validate the document. If you omit the parameter, the XML document must contain one of the following:

- A `!DOCTYPE` tag to specify the DTD or its location
- An `xsi:schemaLocation` or `xsi:noNamespaceSchemaLocation` tag to specify the Schema location

If you use a *validator* parameter and the XML document specifies a DTD or Schema, the `xmlValidate` function uses the *validator* parameter, and ignores the specification in the XML document.

If you do not use a *validator* parameter, and the XML document does not specify a DTD or Schema, the function returns a structure with an error message in the `Errors` field.

This function attempts to process the complete XML document, and reports all errors found during the processing. As a result, the returned structure can have a combination of `Warning`, `Error`, and `FatalError` fields, and each field can contain multiple error messages.

### Example

The following example has three parts: an XML file, an XSD Schema file, and a CFML page that parses the XML file and uses the Schema for validation. The CFML file displays the value of the returned structure's `Status` field and displays the returned structure. To show the results of invalid XML, modify the `custorder.xml` file.

**Note:** The Schema used in the following example represents the same XML structure as the DTD used in the [XmlParse](#) example.

The `custorder.xml` file is as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<order xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="http://localhost:8500/something.xsd" id="4323251" >
  <customer firstname="Philip" lastname="Cramer" accountNum="21"/>
  <items>
    <item id="43">
      <name>Deluxe Carpenter's Hammer</name>
      <quantity>1</quantity>
      <unitprice>15.95</unitprice>
    </item>
    <item id="54">
      <name>36" Plastic Rake</name>
      <quantity>2</quantity>
      <unitprice>6.95</unitprice>
    </item>
    <item id="68">
      <name>Standard paint thinner</name>
      <quantity>3</quantity>
      <unitprice>8.95</unitprice>
    </item>
  </items>
</order>
```

The `custorder.xsd` file is as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
  elementFormDefault="qualified">
  <xs:element name="customer">
    <xs:complexType>
      <xs:attribute name="firstname" type="xs:string" use="required"/>
      <xs:attribute name="lastname" type="xs:string" use="required"/>
      <xs:attribute name="accountNum" type="xs:string" use="required"/>
    </xs:complexType>
  </xs:element>
  <xs:element name="name" type="xs:string"/>
  <xs:element name="quantity" type="xs:string"/>
  <xs:element name="unitprice" type="xs:string"/>
  <xs:element name="item">
    <xs:complexType>
      <xs:sequence>
        <xs:element ref="name"/>
        <xs:element ref="quantity"/>
        <xs:element ref="unitprice"/>
      </xs:sequence>
      <xs:attribute name="id" type="xs:integer" use="required">
      </xs:attribute>
    </xs:complexType>
  </xs:element>
  <xs:element name="items">
    <xs:complexType>
      <xs:sequence>
        <xs:element ref="item" maxOccurs="unbounded"/>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="order">
    <xs:complexType>
      <xs:sequence>
        <xs:element ref="customer"/>
        <xs:element ref="items"/>
      </xs:sequence>
      <xs:attribute name="id" type="xs:string" use="required"/>
    </xs:complexType>
  </xs:element>
</xs:schema>
```

The CFML file is as follows. It uses a filename for the XML file and a URL for the Schema. The XML and URL paths must be absolute.

```
<cfset
myResults=XMLValidate("C:\CFusionMX7\wwwroot\examples\custorder.xml",
"http://localhost:8500/examples/custorder.xsd")>
<cfoutput>
Did custorder.xml validate against custorder.xsd? #myResults.status#<br><br>
</cfoutput>
Dump of myResults structure returned by XMLValidate<br>
<cfdump var="#myResults#">
```

## Year

### Description

From a date/time object, gets the year value.

### Returns

The year value of *date*.

### Category

[Date and time functions](#)

### Function syntax

```
Year(date)
```

### See also

[DatePart](#), [IsLeapYear](#)

### Parameters

Parameter	Description
<code>date</code>	A date/time object in the range 100 AD–9999 AD.

### Usage

When passing a date as a string, enclose it in quotation marks. Otherwise, it is interpreted as a number representation of a date.

### Example

```
<h3>Year Example</h3>
<cfif IsDefined("FORM.year")>
    More information about your date:
    <cfset yourDate = CreateDate(FORM.year, FORM.month, FORM.day)>
    <cfoutput>
        <p>Your date, #DateFormat(yourDate)#.
        <br>It is #DayOfWeekAsString(DayOfWeek(yourDate))#,
        day #DayOfWeek(yourDate)# in the week.
        <br>This is day #Day(yourDate)#
        in the month of #MonthAsString(Month(yourDate))#,
        which has #DaysInMonth(yourDate)# days.
        <br>We are in week #Week(yourDate)# of #Year(YourDate)#
        (day #DayOfYear(yourDate)# of #DaysInYear(yourDate)#). <br>
    <cfif IsLeapYear(Year(yourDate))>
        This is a leap year
    <cfelse>This is not a leap year
    </cfif>
    </cfoutput>
</cfif>
```

## YesNoFormat

### Description

Evaluates a number or Boolean value.

### Returns

Yes, for a nonzero value; No for zero, false, and no Boolean values, and an empty string ("").

### Category

[Decision functions](#), [Display and formatting functions](#)

### Function syntax

```
YesNoFormat (value)
```

### See also

[IsBinary](#), [IsNumeric](#)

### Parameters

Parameter	Description
value	A number or Boolean value

### Example

```
<h3>YesNoFormat Example</h3>
```

The YesNoFormat function returns non-zero values as "Yes"; zero, false and no Boolean values, and empty strings ( "") as "No".

```
<cfoutput>
<ul>
  <li>YesNoFormat (1) :#YesNoFormat (1) #
  <li>YesNoFormat (0) :#YesNoFormat (0) #
  <li>YesNoFormat ("1123") :#YesNoFormat ("1123") #
  <li>YesNoFormat ("No") :#YesNoFormat ("No") #
  <li>YesNoFormat (True) :#YesNoFormat (True) #
</ul>
</cfoutput>
```

# Chapter 5: Ajax JavaScript Functions

You can use the JavaScript functions listed below on pages that use ColdFusion Ajax features.

## Function summary

The following table briefly describes the JavaScript functions that you can use in ColdFusion pages that use Ajax features:

Function	Description
<a href="#">ColdFusion.Ajax.submitForm</a>	Submits form data without refreshing the entire page when the results are returned.
<a href="#">ColdFusion.getElementValue</a>	Gets the value of an attribute of a bindable ColdFusion control.
<a href="#">ColdFusion.Grid.getGridObject</a>	Gets the underlying Ext JS - JavaScript Library object for the specified HTML <code>cfgrid</code> control.
<a href="#">ColdFusion.Grid.refresh</a>	Manually refreshes a displayed grid.
<a href="#">ColdFusion.Grid.sort</a>	Sorts the specified HTML grid.
<a href="#">ColdFusion.JSON.decode</a>	Converts a JSON-encoded string into a JavaScript variable
<a href="#">ColdFusion.JSON.encode</a>	converts a JavaScript variable into a JSON string.
<a href="#">ColdFusion.Layout.collapseAccordion</a>	Collapses an area of an accordion layout.
<a href="#">ColdFusion.Layout.collapseArea</a>	Collapses an area of a border layout ( <code>cflayout</code> tag with a <code>type</code> attribute of <code>border</code> ).
<a href="#">ColdFusion.Layout.createAccordionPanel</a>	Creates a panel in an existing accordion layout ( <code>cflayout</code> tag with a <code>type</code> attribute of <code>accordion</code> ).
<a href="#">ColdFusion.Layout.createTab</a>	Creates a tab in an existing tabbed layout ( <code>cflayout</code> tag with a <code>type</code> attribute of <code>tab</code> ).
<a href="#">ColdFusion.Layout.disableTab</a>	Disables the specified tab so it cannot be selected.
<a href="#">ColdFusion.Layout.enableTab</a>	Enables the specified tab so users can select it and display the area contents.
<a href="#">ColdFusion.Layout.expandAccordion</a>	Expands a collapsed area of an accordion layout.
<a href="#">ColdFusion.Layout.expandArea</a>	Expands a collapsed area of a border layout.
<a href="#">ColdFusion.Layout.getAccordionLayout</a>	Gets the underlying Ext JS - JavaScript Library object for the specified accordion type <code>cflayout</code> control.
<a href="#">ColdFusion.Layout.getBorderLayout</a>	Gets the underlying Ext JS - JavaScript Library object for the specified border type <code>cflayout</code> control.
<a href="#">ColdFusion.Layout.getTabLayout</a>	Gets the underlying Ext JS - JavaScript Library object for the specified tab type <code>cflayout</code> control.
<a href="#">ColdFusion.Layout.hideAccordion</a>	Hides an accordion.
<a href="#">ColdFusion.Layout.hideArea</a>	Hides a bordered layout area.
<a href="#">ColdFusion.Layout.hideTab</a>	Hides a tab.
<a href="#">ColdFusion.Layout.selectAccordion</a>	Selects an accordion and displays the layout area contents.
<a href="#">ColdFusion.Layout.selectTab</a>	Selects a tab and displays the layout area contents.

Function	Description
<a href="#">ColdFusion.Layout.showAccordion</a>	Shows an accordion that was hidden using the <code>inithide</code> attribute or the <code>hideArea()</code> function.
<a href="#">ColdFusion.Layout.showArea</a>	Shows an area of a border layout that was hidden using the <code>inithide</code> attribute or the <code>hideArea()</code> function.
<a href="#">ColdFusion.Layout.showTab</a>	Shows a tab that was hidden using the <code>inithide</code> attribute or the <code>hideTab()</code> function.
<a href="#">ColdFusion.Log.debug</a>	Displays a debug-level message in the log window.
<a href="#">ColdFusion.Log.dump</a>	Displays information about a complex variable in the log window.
<a href="#">ColdFusion.Log.error</a>	Displays an error-level message in the log window.
<a href="#">ColdFusion.Log.info</a>	Displays an information-level message in the log window.
<a href="#">ColdFusion.Map.addEvent</a>	Enables event handling in a map.
<a href="#">ColdFusion.Map.addMarker</a>	Adds a marker to the map.
<a href="#">ColdFusion.Map.getLatitudeLongitude</a>	Gets the latitude/longitude coordinates for a given address.
<a href="#">ColdFusion.Map.getMapObject</a>	Gets the Google map component.
<a href="#">ColdFusion.Map.setCenter</a>	Sets the center of map to the address that you specify.
<a href="#">ColdFusion.Map.setZoomlevel</a>	Sets the zoom level of the map to the new value.
<a href="#">ColdFusion.Mediaplayer.resize</a>	Changes the current size of the media player.
<a href="#">ColdFusion.Mediaplayer.setMute</a>	Mutes or unmutes the sound of the media player.
<a href="#">ColdFusion.Mediaplayer.setSource</a>	Sets the URL of the FLV file.
<a href="#">ColdFusion.Mediaplayer.setVolume</a>	Sets the volume of sound of the media player.
<a href="#">ColdFusion.Mediaplayer.startPlay</a>	Plays the FLV file.
<a href="#">ColdFusion.Mediaplayer.stopPlay</a>	Stops playing the FLV file.
<a href="#">ColdFusion.MessageBox.create</a>	Creates a ColdFusion message box. Equivalent to the <code>cfmessagebox</code> tag.
<a href="#">ColdFusion.MessageBox.show</a>	Displays a ColdFusion message box.
<a href="#">ColdFusion.MessageBox.getMessageBoxObject</a>	Gets the underlying Ext JS - JavaScript Library object for the specified HTML <code>cfmessagebox</code> control.
<a href="#">ColdFusion.MessageBox.isMessageBoxDefined</a>	Checks if a message box is defined.
<a href="#">ColdFusion.MessageBox.update</a>	Updates message box properties.
<a href="#">ColdFusion.MessageBox.updateMessage</a>	Updates the message property.
<a href="#">ColdFusion.MessageBox.updateTitle</a>	Updates the message box title.
<a href="#">ColdFusion.navigate</a>	Displays the output of a link URL in a specified <code>cfdiv</code> , <code>cflayoutarea</code> , <code>cfpod</code> , or <code>cfwindow</code> container.
<a href="#">ColdFusion.ProgressBar.getProgressBarObject</a>	Gets the progress bar object.
<a href="#">ColdFusion.ProgressBar.hide</a>	Hides the progress bar if it is displayed.
<a href="#">ColdFusion.ProgressBar.reset</a>	Resets the progress.
<a href="#">ColdFusion.ProgressBar.show</a>	Shows the progress bar if it is hidden.

Function	Description
<a href="#">ColdFusion.ProgressBar.start</a>	Stops the underlying progress bar object that is running.
<a href="#">ColdFusion.ProgressBar.stop</a>	Starts the underlying progress bar object.
<a href="#">ColdFusion.ProgressBar.update</a>	Updates the attributes <code>duration</code> , <code>interval</code> , and <code>oncomplete</code> .
<a href="#">ColdFusion.ProgressBar.updatestatus</a>	Lets you manually update the status and message of the progress bar.
<a href="#">ColdFusion.setGlobalErrorHandler</a>	Replaces the global JavaScript error handler for displaying information about ColdFusion Ajax errors.
<a href="#">ColdFusion.Slider.disable</a>	Disables the slider control.
<a href="#">ColdFusion.Slider.enable</a>	Enables the slider control.
<a href="#">ColdFusion.Slider.getSliderObject</a>	Gets the slider control.
<a href="#">ColdFusion.Slider.getValue</a>	Gets the numeric value of the slider control.
<a href="#">ColdFusion.Slider.hide</a>	Hides the slider control.
<a href="#">ColdFusion.Slider.show</a>	Shows the slider control.
<a href="#">ColdFusion.Slider.setValue</a>	Sets the numeric value of the slider control.
<a href="#">ColdFusion.FileUpload.cancelUpload</a>	Cancels the file upload at any point during the file upload.
<a href="#">ColdFusion.FileUpload.clearAllFiles</a>	Clears all the files selected for upload.
<a href="#">ColdFusion.FileUpload.startUpload</a>	Starts uploading the selected files.
<a href="#">ColdFusion.Tree.getTreeObject</a>	Gets the underlying Yahoo YUI Library object for the specified HTML <code>cftree</code> control.
<a href="#">ColdFusion.Tree.refresh</a>	Manually refreshes a displayed HTML tree.
<a href="#">ColdFusion.Window.create</a>	Creates a ColdFusion pop-up window. Equivalent to the <code>cfwindow</code> tag.
<a href="#">ColdFusion.Window.getWindowObject</a>	Gets the underlying Ext JS - JavaScript Library object for the specified HTML <code>cfwindow</code> control.
<a href="#">ColdFusion.Window.hide</a>	Hides a window
<a href="#">ColdFusion.Window.onHide</a>	Specifies a JavaScript function to run each time a specific window hides.
<a href="#">ColdFusion.Window.onShow</a>	Specifies a JavaScript function to run each time a specific window shows.
<a href="#">ColdFusion.Window.show</a>	Shows a hidden window.

### More Help topics

[“JavaScript Functions in ColdFusion 9 Update 1”](#) on page 1392

## ColdFusion.Ajax.submitForm

### Description

Submits form data without refreshing the page when the results are returned.

### Function syntax

```
ColdFusion.Ajax.submitForm(formId, URL[, callbackhandler, errorHandler, httpMethod, asynch])
```

### See also

[cfajaxproxy](#), [ColdFusion.navigate](#), Using the ColdFusion.Ajax.submitForm function in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function.

### Parameters

Parameter	Description
formId	The ID or name attribute of the form.
URL	The URL to which to submit the form.
callbackhandler	The JavaScript function to handle a normal response. The function must take a single argument, that contains the response body. This method is used only if the form submission is asynchronous.
errorHandler	The JavaScript function to handle an HTTP error response. The function must take two arguments: the HTTP status code, and the error message. This method is used only if the form submission is asynchronous.
httpMethod	The HTTP method to use for the submission, must be one of the following: <ul style="list-style-type: none"><li>• GET</li><li>• POST (the default)</li></ul>
asynch	A Boolean value specifying whether to submit the form asynchronously. The default value is <code>true</code> .

### Returns

If the `asynch` argument is `false`, returns the response body. Otherwise, the function does not return a value.

### Usage

If the page that calls this function does not have any ColdFusion AJAX-based controls, use a `cfajaximport` tag on the page to ensure that the page includes the JavaScript definition for this function.

**Note:** This function does not submit the contents of file fields.

### Example

See Using the ColdFusion.Ajax.submitForm function in the *Developing ColdFusion Applications*.

## ColdFusion.FileUpload.cancelUpload

### Description

At any point during the upload of files, you can choose to cancel the upload. When you cancel the upload, any further upload of files stops.

### Function syntax

```
ColdFusion.FileUpload.cancelUpload(name)
```

### See also

[ColdFusion.FileUpload.clearAllFiles](#), [ColdFusion.FileUpload.startUpload](#)

## History

ColdFusion 9: Added this function

## Parameters

Parameter	Description
name	The value of the name attribute in the cffileupload tag.

## Returns

This function does not return a value.

## Example

This example includes a button for the Cancel Upload action. When you click this button, the file upload is canceled.

<h3>This is an example of the FileUpload.cancelUpload function. Add a few files to upload and click Upload. During upload, click the Cancel Upload HTML button to cancel the upload.</h3>

```
<script language="JavaScript" type="text/javascript">
function onCancel() {
ColdFusion.FileUpload.cancelUpload('myupload');
};
</script>
<cffileupload
url="uploadAll.cfm"
progressbar="true"
name="myupload"
addButtonLabel = "Add File"
clearButtonlabel = "Clear it"
width=600
height=400
title = "File Upload"
maxuploadsize="30"
extensionfilter="*.jpg, *.png, *.flv, *.txt"
BGCOLOR="####F"
MAXFILESELECT=10
UPLOADBUTTONLABEL="Upload now"/>
<cfform name="form01">
<cfinput type="button" name="cancelupld" value="Cancel Upload"
onclick="onCancel()">
</cfform>
```

# ColdFusion.FileUpload.clearAllFiles

## Description

Before upload or after you cancel upload, you can choose to clear all the files selected for upload. When you do this, the selected files are removed from the Upload view list.

## Function syntax

ColdFusion.FileUpload.clearAllFiles (name)

### See also

[ColdFusion.FileUpload.cancelUpload](#), [ColdFusion.FileUpload.startUpload](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	The value of the name attribute in the <code>cffileupload</code> tag.

### Returns

This function does not return a value.

### Example

This example includes a button for the `ClearAllFiles` action. When you click this button, the files selected for upload are removed.

<h3>This is an example of the `FileUpload.clearAllFiles` function. Add a few files to upload and click Upload. During upload, click the Clear Upload HTML button to clear all the files selected for upload.</h3>

```
<script language="JavaScript" type="text/javascript">
function onClear() {
ColdFusion.FileUpload.clearAllFiles('myupload');
};
</script>
<cffileupload
url="uploadAll.cfm"
progressbar="true"
name="myupload"
addButtonLabel = "Add File"
clearButtonLabel = "Clear it"
width=600
height=400
title = "File Upload"
maxuploadsize="30"
extensionfilter="*.jpg, *.png, *.flv, *.txt"
BGCOLOR="##FFFFFF"
MAXFILESELECT=10
UPLOADBUTTONLABEL="Upload now"/>
<cfform name="form01">
<cfinput type="button" name="clearupload" value="Cancel Upload"
onclick="onClear()">
</cfform>
```

## ColdFusion.FileUpload.startUpload

### Description

Starts uploading the selected files.

### Function syntax

`ColdFusion.FileUpload.startUpload(name)`

### See also

[ColdFusion.FileUpload.cancelUpload](#), [ColdFusion.FileUpload.clearAllFiles](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	The value of the name attribute in the <code>cffileupload</code> tag.

### Returns

This function does not return a value.

### Example

This example includes a button to start the Upload action. When you click this button, the selected files start uploading.

```
<script language="JavaScript" type="text/javascript">
function onUpload() {
ColdFusion.FileUpload.startUpload('myupload');
};
</script>
<cffileupload
url="uploadAll.cfm"
progressbar="true"
name="myupload"
addButtonLabel = "Add File"
clearButtonlabel = "Clear it"
width=600
height=400
title = "File Upload"
maxuploadsize="30"
extensionfilter="*.jpg, *.png, *.flv, *.txt"
BGCOLOR="##FFFFFF"
MAXFILESELECT=10
UPLOADBUTTONLABEL="Upload now"/>
<cfform name="form01">
<cfinput type="button" name="startupload" value="Start Upload"
onclick="onUpload()">
</cfform>
```

## ColdFusion.getElementValue

### Description

Gets the value of an attribute of a bindable ColdFusion control.

### Function syntax

```
ColdFusion.getElementValue(elementId [, formId, attributeName])
```

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
elementId	The ID or name attribute of the control.
formId	The ID attribute of the form that contains the control. Omit this attribute if the element ID is unique on the page. If you omit this attribute and the element ID is not unique, the function uses the first element on the page with the specified ID.
attributeName	<p>The control attribute to get; by default, the value attribute, or, for <code>cfselect</code>, the value of the selected element in the control.</p> <p>For <code>cfgrid</code> controls, use this attribute and specify the name of the column whose value you are getting; the function returns the entry in the currently selected row.</p> <p>For <code>cftree</code> controls, use this attribute and specify <code>PATH</code> or <code>NODE</code>. The function returns the item path or node value of the currently selected tree item.</p>

### Returns

The value of the specified attribute.

### Usage

You can bind to, and get the attribute values of, the following HTML controls:

- `cfgrid`
- `cfinput` controls with checkbox, datefield, file, hidden, radio, or text types
- `cfselect`
- `cftextarea`
- `cftree`

## ColdFusion.Grid.getGridObject

### Description

Gets the underlying Ext (Ext JS JavaScript library) object for the specified HTML grid.

### Function syntax

```
ColdFusion.Grid.getGridObject(name)
```

### See also

[cfgrid](#), [ColdFusion.Grid.refresh](#), [ColdFusion.Grid.sort](#), [Ext JS - JavaScript Library Documentation](#), Using HTML grids in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
name	The value of the name attribute of the cfgrid tag for which you want the object.

### Returns

If the grid is editable, an object of type `Ext.grid.EditableGrid`; otherwise, an object of type `Ext.grid.Grid`.

### Usage

Use this function to get the Ext toolkit (`Ext.grid`) object that underlies the ColdFusion HTML `cfgrid` control. You can then use the raw object to modify the displayed grid. For documentation on the objects and how to manage them, see the [Ext documentation](#).

## ColdFusion.Grid.refresh

### Description

Manually refreshes a displayed grid.

### Function syntax

```
ColdFusion.Grid.refresh(name [, preservePage])
```

### See also

[cfgrid](#), [ColdFusion.Grid.getGridObject](#), [ColdFusion.Grid.sort](#), [Ext JS - JavaScript Library Documentation](#),  
Using HTML grids in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
name	The value of the name attribute of the cfgrid tag to refresh.
preservePage	A Boolean value specifying whether to redisplay the current page of data ( <code>true</code> ), or display the first page of data ( <code>false</code> , the default). This attribute applies only if the grid data requires multiple grid pages to display.

### Returns

This function does not return a value.

### Usage

This function is useful to refresh a grid when an event occurs that changes the underlying data but does not normally trigger a grid update.

### Example

The following code snippet comes from an example that lets users delete rows from a grid. When the user selects a grid row and clicks the delete button, the Ajax proxy calls a `mycfc.deleteRow` function to delete the row from the database. When the function returns successfully, the proxy calls `ColdFusion.Grid.refresh` to update the grid and remove the row.

```
<cfajaxproxy bind="cfc:mycfc.deleteRow({deletebutton@click},{mygrid.id@none}"  
  onSuccess="ColdFusion.Grid.refresh('mygrid', true)">
```

## ColdFusion.Grid.sort

### Description

Sorts the specified HTML grid.

### Function syntax

```
ColdFusion.Grid.sort(name [, columnName, direction])
```

### See also

[cfgrid](#), [ColdFusion.Grid.getGridObject](#), [ColdFusion.Grid.refresh](#), [Ext JS - JavaScript Library Documentation](#), Using HTML grids in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
name	The value of the <code>name</code> attribute of the <code>cfgrid</code> tag to sort.
columnName	The name of the column that determines the sort order.
direction	The sort direction. Must be one for these values: <ul style="list-style-type: none"><li>• ASC (default)</li><li>• DESC</li></ul>

### Returns

This function does not return a value.

### Usage

This function sorts the data displayed by the grid by using a case-insensitive sort for string data, or a numeric sort for numeric data. It uses the specified column contents to determine the displayed grid order. When a grid has a remote data source, the bound CFC function that provides the data gets the column name and sort direction in the `cfgridsortcolumn` and `cfgridsortdirection` bind attributes. The CFC function must use these values and perform the sort appropriately.

# ColdFusion.JSON.decode

## Description

Converts a JSON-encoded string to a JavaScript variable.

## Function syntax

```
ColdFusion.JSON.decode(string)
```

## See also

[ColdFusion.JSON.encode](#), [DeserializeJSON](#), [SerializeJSON](#), Using Ajax Data and Development Features in the *Developing ColdFusion Applications*, <http://www.json.org>

## History

ColdFusion 8: Added this function

## Parameters

Parameter	Description
<code>string</code>	The string to encode.

## Returns

A Javascript variable containing the data in the JSON encoded string.

## Usage

Use this function when you must explicitly convert between JavaScript and JSON format, for example, when you must call a remote function that is not in a CFC.

If the JSON string has a security prefix as defined by the Server Settings > Settings page of the ColdFusion Administrator or specified in the `cfapplication` or `cffunction` tags, the function strips the prefix before decoding the string.

## Example

The following example uses the `ColdFusion.JSON.decode` and `ColdFusion.JSON.encode` functions. When the user clicks the “Call” link, the `callMe` function encodes the String as JSON and calls the `echo` CFC’s `plainEcho` function with the result. The function also sets the return format to plain, so that the CFC function does not automatically convert its return value to JSON, and sends plain text instead.

The `echo.cfc` component has two functions:

- The `plainEcho` function converts its argument from JSON to a ColdFusion variable, calls the `echo` function, converts the result to JSON, and returns it to the caller.
- The `echo` function creates a structure, sets the structure’s entry to the input parameter, and returns the result. (You could call this function remotely using to see the result of calling a function that does not encode JSON when you request a plain return type. To see the results, use the `cfdebug` HTTP parameter when you run the main page.)

The main page has the following lines:

```
<cfajaxproxy cfc="echo">
<cfajaximport>

<html>
  <head>
    <script>
      function callme()
      {
        var e = new echo();
        e.setReturnFormat('plain');
        var args = {a:"Hello again!"};
        var argsJSON = ColdFusion.JSON.encode(args);
        var json = e.plainEcho(argsJSON);
        var o = ColdFusion.JSON.decode(json);
        alert(o.A);
      }
    </script>
  </head>

  <body>
    <a href="javascript:callme()">Call</a>
  </body>
</html>
```

The echo.cfc file has the following lines:

```
<cfcomponent output="false">

  <cffunction name="echo" access="remote">
    <cfargument name="text">
    <cfset var ret = StructNew()>
    <cfset ret.a = text>
    <cfreturn ret>
  </cffunction>

  <cffunction name="plainEcho" access="remote">
    <cfargument name="text">
    <cfset t = deserializeJSON(text)>
    <cfset ret = echo(t.A)>
    <cfreturn serializeJSON(ret)>
  </cffunction>

</cfcomponent>
```

## ColdFusion.JSON.encode

### Description

Converts a JavaScript expression to a JSON-encoded string.

### Function syntax

`ColdFusion.JSON.encode(expression)`

#### See also

[ColdFusion.JSON.decode](#), [DeserializeJSON](#), [SerializeJSON](#), Using Ajax Data and Development Features in the *Developing ColdFusion Applications*, <http://www.json.org>

#### History

ColdFusion 8: Added this function

#### Parameters

Parameter	Description
name	An expression with the data to encode.

#### Returns

A String containing the data in JSON encoded format.

#### Usage

Use this function when you must explicitly convert between JavaScript and JSON format, for example, when you must call a remote function that is not in a CFC.

#### Example

See the example in [ColdFusion.JSON.decode](#).

## ColdFusion.Layout.collapseAccordion

#### Description

Collapses an area of an accordion layout.

#### Function syntax

```
ColdFusion.Layout.collapseAccordion(layoutname, layoutareaname)
```

#### See also

[cflayout](#), [ColdFusion.Layout.createAccordionPanel](#), [ColdFusion.Layout.expandAccordion](#), [ColdFusion.Layout.getAccordionLayout](#), [ColdFusion.Layout.hideAccordion](#), [ColdFusion.Layout.selectAccordion](#), [ColdFusion.Layout.showAccordion](#), Using layouts in the *Developing ColdFusion Applications*

#### History

ColdFusion 9: Added this function

#### Parameters

Parameter	Description
layoutname	The name attribute of the accordion layout that contains the panel to collapse.
layoutareaname	The name of the panel in the accordion layout to collapse.

### Returns

This function does not return a value.

### Usage

This function has no effect if the accordion is already collapsed.

### Example

The following code snippet collapses the accordion layout when the user clicks the button.

```
<cfinput name="collapse2" width="100" value="Collapse Area 2" type="button"
onClick="ColdFusion.Layout.collapseAccordion('thelayout', 'panel2')>
```

## ColdFusion.Layout.collapseArea

### Description

Collapses an area of a border layout.

### Function syntax

```
ColdFusion.Layout.collapseArea(layout, layoutArea)
```

### See also

[cflayout](#), [cflayoutarea](#), [ColdFusion.Layout.expandArea](#), [ColdFusion.Layout.getTabLayout](#),  
[ColdFusion.Layout.showArea](#), [Using layouts in the \*Developing ColdFusion Applications\*](#)

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
layout	The name attribute of the border layout that contains the area to collapse.
layoutArea	The position in the layout of the area to collapse. Must be one of the following: bottom, left, right, or top.

### Returns

This function does not return a value.

### Usage

This function has no effect if the area is already collapsed.

### Example

The following code snippet collapses the left area of the layout border layout when the user clicks the button.

```
<cfinput name="collapse2" width="100" value="Collapse Area 2" type="button"
onClick="ColdFusion.Layout.collapseArea('thelayout', 'left');">
```

# ColdFusion.Layout.createAccordionPanel

## Description

Creates a panel in a ColdFusion accordion layout.

## Function syntax

```
ColdFusion.Layout.createAccordionPanel(layoutname, layoutareaname, title, URL [, config])
```

## See also

[cflayout](#), [ColdFusion.Layout.collapseAccordion](#), [ColdFusion.Layout.expandAccordion](#), [ColdFusion.Layout.getAccordionLayout](#), [ColdFusion.Layout.hideAccordion](#), [ColdFusion.Layout.selectAccordion](#), [ColdFusion.Layout.showAccordion](#), [Using layouts in the Developing ColdFusion Applications](#)

## History

ColdFusion 9: Added this function

## Parameters

Parameter	Description
layoutname	The name attribute of the accordion layout in which to add the panel.
layoutareaname	The name to assign for the new accordion panel. Must be unique on the accordion.
title	The text to display on the panel. You can use HTML mark-up to control the title appearance.
URL	The URL from which to get the panel area contents. This attribute can use URL parameters to pass data to the page. ColdFusion uses standard page path resolution rules to locate the page.
config	An object containing configuration parameters. For details, see "Usage".

## Returns

This function does not return a value.

## Usage

This function dynamically creates panels in an accordion layout; it is equivalent to putting a `cflayoutarea` tag inside a `cflayout` tag with a `type` attribute of `accordion`. The *configuration* parameter defines panel characteristics; it can have any or all the following entries:

Entry	Default	Description
align	The <code>cflayout</code> tag <code>align</code> attribute value	Specifies how to align child controls within the panel area. The following values are valid: <ul style="list-style-type: none"> <li>• <code>center</code></li> <li>• <code>justify</code></li> <li>• <code>left</code></li> <li>• <code>right</code></li> </ul>
callbackHandler		A function that is called when the layout accordion body has loaded. This function must not take any arguments.
errorHandler		A function that is called if an error occurs in loading the tab body. This function must take two arguments: <ul style="list-style-type: none"> <li>• The HTTP status code, or -1 if the error is not an HTTP error</li> <li>• An error message</li> </ul>
overflow	auto	Specifies how to display child content whose size would cause the tab layout area to overflow the window boundaries. The following values are valid: <ul style="list-style-type: none"> <li>• <code>auto</code>: Show scroll bars when necessary.</li> <li>• <code>hidden</code>: Do not allow access to overflowing content.</li> <li>• <code>scroll</code>: Always show horizontal and vertical scroll bars, even if they are not needed.</li> <li>• <code>visible</code>: Content can display outside the bounds of the layout area.</li> </ul> <p><b>Note:</b> In Internet Explorer, layout areas with the <code>visible</code> setting expand to fit the size of the contents, rather than having the contents extend beyond the layout area.</p>
selected	false	A Boolean value specifying whether this tab is initially selected so that its contents appears in the layout.
style		A CSS style specification that controls the appearance of the layout area.
titleicon		Specifies the location of the icon to display with the title.

### Example

The following example creates an accordion layout with one panel. When you click the button it creates a second panel that is immediately visible and selected.

The main page looks as follows:

```
<html>
<head>
</head>
<body>
<cform name="panels">
  <cfinput type="button" name="CreateAccordionPanel"
    onClick="ColdFusion.Layout.createAccordionPanel('AccordionPanel','panel2',
      'Panel 2','_panelUrl.cfm',{inithide:false,selected:true})"
    value="Create Panel">
</cform>

<cflayout type="panel" name="AccordionPanel">
  <cflayoutarea name="panel1" title="Panel 1" align="left">
    Default Panel
  </cflayoutarea>
</cflayout>
</body>
</html>
```

The `_tabURL.cfm` page looks as follows:

```
<h3>Panel 2</h3>
This is an accordion panel
```

## ColdFusion.Layout.createTab

### Description

Creates a tab and layout area in a ColdFusion tabbed layout.

### Function syntax

```
ColdFusion.Layout.createTab(layout, layoutArea, Title, URL [, configObject])
```

### See also

[cflayout](#), [cflayoutarea](#), [ColdFusion.Layout.disableTab](#), [ColdFusion.Layout.enableTab](#),  
[ColdFusion.Layout.showArea](#), [ColdFusion.Layout.hideTab](#), [ColdFusion.Layout.selectTab](#),  
[ColdFusion.Layout.showTab](#), [Using layouts in the Developing ColdFusion Applications](#)

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
layout	The name attribute of the tabbed layout in which to add the tab
layoutArea	The name to assign to the layout area that is created for the new tab. Must be unique on the page.
title	The text to display on the tab. You can use HTML mark-up to control the title appearance.
URL	The URL from which to get the layout area contents. This attribute can use URL parameters to pass data to the page. ColdFusion uses standard page path resolution rules to locate the page.
configObject	An object containing window configuration parameters. For details, see "Usage".

**Returns**

This function does not return a value.

**Usage**

This function dynamically creates tabs in a tabbed layout; it is equivalent to putting a `cflayoutarea` tag inside a `cflayout` tag with a `type` attribute of `tab`. The *configuration* parameter defines tab characteristics; it can have any or all the following entries:

Entry	Default	Description
align	The <code>cflayout</code> tag <code>align</code> attribute value	Specifies how to align child controls within the layout area. The following values are valid: <ul style="list-style-type: none"><li>• <code>center</code></li><li>• <code>justify</code></li><li>• <code>left</code></li><li>• <code>right</code></li></ul>
callbackhandler		A function that is called when the layout tab body has loaded. This function must not take any arguments.
closable	false	A Boolean value specifying whether the user can close the window. If <code>true</code> , the tab has an X close icon.
disabled	false	A Boolean value specifying whether the tab is disabled, that is, whether user can select the tab to display its contents. Disabled tabs are grayed out.  Ignored if there is a <code>true</code> <code>selected</code> entry.
errorHandler		A function that is called if an error occurs in loading the tab body. This function must take two arguments: <ul style="list-style-type: none"><li>• The HTTP status code, or -1 if the error is not an HTTP error</li><li>• An error message</li></ul>
inithide	false	A Boolean value specifying whether the tab is initially hidden. To show an initially hidden tab, use the <code>ColdFusion.Layout.showTab</code> function.
overflow	auto	Specifies how to display child content whose size would cause the tab layout area to overflow the window boundaries. The following values are valid: <ul style="list-style-type: none"><li>• <code>auto</code>: Show scroll bars when necessary.</li><li>• <code>hidden</code>: Do not allow access to overflowing content.</li><li>• <code>scroll</code>: Always show horizontal and vertical scroll bars, even if they are not needed.</li><li>• <code>visible</code>: Content can display outside the bounds of the layout area.</li></ul> <b>Note:</b> In Internet Explorer, layout areas with the <code>visible</code> setting expand to fit the size of the contents, rather than having the contents extend beyond the layout area.
selected	false	A Boolean value specifying whether this tab is initially selected so that its contents appears in the layout.
style		A CSS style specification that controls the appearance of the layout area.

**Example**

The following example creates a tabbed layout with one tab. When you click the button it creates a second tab that is immediately visible and selected.

The main page looks as follows:

```
<html>
<head>
</head>
<body>
<cfform name="layouts">
  <cfinput type="button" name="CreateTab"
    onClick="ColdFusion.Layout.createTab('tabLayout','tab2',
      'Tab 2','_tabUrl.cfm',{inithide:false,selected:true})"
    value="Create Tab">
</cfform>

<cflayout type="tab" name="tabLayout">
  <cflayoutarea name="tab1" title="Tab 1" align="left">
    Default Tab
  </cflayoutarea>
</cflayout>
</body>
</html>
```

The \_tabURL.cfm page looks as follows:

```
<h3>Tab 2</h3>
This is a simple tab
```

## ColdFusion.Layout.disableTab

### Description

Disables the specified tab so it cannot be selected.

### Function syntax

```
ColdFusion.Layout.disableTab(layout, layoutArea)
```

### See also

[cflayout](#), [cflayoutarea](#), [ColdFusion.Layout.createTab](#), [ColdFusion.Layout.enableTab](#),  
[ColdFusion.Layout.showArea](#), [ColdFusion.Layout.hideTab](#), [ColdFusion.Layout.selectTab](#),  
[ColdFusion.Layout.showTab](#), *Using layouts in the Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
layout	The name attribute of the tabbed layout that contains the area to disable.
layoutArea	The name attribute of the tab layout area to disable.

### Returns

This function does not return a value.

### Usage

This function has no effect on the currently selected tab. A disabled tab appears grayed out.

### Example

The following example lets you enable and disable a tab by clicking a link.

```
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
</head>

<body>
<!-- The tabheight attribute sets the height of all tab content areas. --->
<cflayout type="tab" name="mainTab" tabheight="300px" style="width:400px">
  <cflayoutarea title="First Tab" name="tab1">
    <h2>The First Tab</h2>
    Here are the contents of the first tab.
  </cflayoutarea>

  <cflayoutarea title="Second Tab" name="tab2">
    <h2>The Second Tab</h2>
    This is the content of the second tab.
  </cflayoutarea>
</cflayout>

<p>
Use these links to test disabling/enabling via JavaScript.
Note that you cannot disable the currently selected tab.<br />
<a href="" onClick="ColdFusion.Layout.enableTab('mainTab','tab1');
  return false;">Click here to enable tab 1.</a><br />
<a href="" onClick="ColdFusion.Layout.disableTab('mainTab','tab1');
  return false;">Click here to disable tab 1.</a><br />
</p>
</body>
</html>
```

## ColdFusion.Layout.enableTab

### Description

Enables the specified tab so it can be selected.

### Function syntax

```
ColdFusion.Layout.enableTab(layout, layoutArea)
```

### See also

[cflayout](#), [cflayoutarea](#), [ColdFusion.Layout.createTab](#), [ColdFusion.Layout.disableTab](#), [ColdFusion.Layout.showArea](#), [ColdFusion.Layout.hideTab](#), [ColdFusion.Layout.selectTab](#), [ColdFusion.Layout.showTab](#), *Using layouts in the Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
layout	The name attribute of the tabbed layout that contains the area to enable.
layoutArea	The name attribute of the tab layout area to enable.

### Returns

This function does not return a value.

### Example

See [ColdFusion.Layout.disableTab](#)

## ColdFusion.Layout.expandAccordion

### Description

Expands a panel in an accordion layout.

### Function syntax

```
ColdFusion.Layout.expandAccordion(layoutname, layoutareaname)
```

### See also

[cflayout](#), [ColdFusion.Layout.collapseAccordion](#), [ColdFusion.Layout.createAccordionPanel](#), [ColdFusion.Layout.getAccordionLayout](#), [ColdFusion.Layout.hideAccordion](#), [ColdFusion.Layout.selectAccordion](#), [ColdFusion.Layout.showAccordion](#), [Using layouts in the Developing ColdFusion Applications](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
layoutname	The name attribute of the accordion layout that contains the panel to expand.
layoutareaname	The name of the panel to expand. Must be one of the following: <code>bottom</code> , <code>left</code> , <code>right</code> , or <code>top</code> .

### Returns

This function does not return a value.

### Usage

This function has no effect if the panel is already expanded.

### Example

The following code snippet expands the left area of the panel when the user clicks the button.

```
<cfinput name="expand2" width="100" value="Expand Area 2" type="button"
  onClick="ColdFusion.Layout.expandAccordion('thelayout', 'left');">
```

## ColdFusion.Layout.expandArea

### Description

Expands an area of a border layout.

### Function syntax

```
ColdFusion.Layout.expandArea(layout, layoutArea)
```

### See also

[cfLayout](#), [cfLayoutArea](#), [ColdFusion.Layout.collapseArea](#), [ColdFusion.Layout.getTabLayout](#), [ColdFusion.Layout.showArea](#), [Using layouts in the \*Developing ColdFusion Applications\*](#)

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
layout	The name attribute of the border layout that contains the area to expand.
layoutArea	The position in the layout of the area to expand. Must be one of the following: bottom, left, right, or top.

### Returns

This function does not return a value.

### Usage

This function has no effect if the area is already expanded.

### Example

The following code snippet expands the left area of the layout border layout when the user clicks the button.

```
<cfinput name="expand2" width="100" value="Expand Area 2" type="button"
  onClick="ColdFusion.Layout.expandArea('theLayout', 'left');">
```

## ColdFusion.Layout.getAccordionLayout

### Description

Gets the underlying Ext (Ext JS JavaScript library) object for the specified accordion layout.

### Function syntax

```
ColdFusion.Layout.getAccordionLayout(name)
```

### See also

[cfLayout](#), [ColdFusion.Layout.collapseAccordion](#), [ColdFusion.Layout.createAccordionPanel](#), [ColdFusion.Layout.expandAccordion](#), [ColdFusion.Layout.hideAccordion](#), [ColdFusion.Layout.selectAccordion](#), [ColdFusion.Layout.showAccordion](#), [Using layouts in the \*Developing ColdFusion Applications\*](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	The value of the <code>name</code> attribute of the <code>accordion</code> type <code>cflayout</code> tag for which you want the object.

### Returns

An object of type `Ext.AccordionLayout`.

### Usage

Use this function to get the Ext toolkit (`Ext.AccordionLayout`) object that underlies the ColdFusion HTML `cflayout` control. You can then use the raw object to modify the displayed layout. For documentation on the objects and how to manage them, see the [Ext documentation](#).

## ColdFusion.Layout.getBorderLayout

### Description

Gets the underlying Ext (Ext JS JavaScript library) object for the specified bordered layout.

### Function syntax

```
ColdFusion.Layout.getBorderLayout (name)
```

### See also

[cflayout](#), [cflayoutarea](#), [ColdFusion.Layout.getTabLayout](#), [Ext JS - JavaScript Library Documentation](#), Using layouts in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
name	The value of the <code>name</code> attribute of the <code>border</code> type <code>cflayout</code> tag for which you want the object.

### Returns

An object of type `Ext.BorderLayout`.

### Usage

Use this function to get the Ext toolkit (`Ext.BorderLayout`) object that underlies the ColdFusion HTML `cflayout` control. You can then use the raw object to modify the displayed layout. For documentation on the objects and how to manage them, see the [Ext documentation](#).

## ColdFusion.Layout.getTabLayout

### Description

Gets the underlying Ext (Ext JS JavaScript library) object for the specified tabbed layout.

### Function syntax

```
ColdFusion.Layout.getTabLayout (name)
```

### See also

[cflayout](#), [cflayoutarea](#), [ColdFusion.Layout.getBorderLayout](#), [Ext JS - JavaScript Library Documentation](#), Using layouts in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
name	The value of the name attribute of the border type <code>cflayout</code> tag for which you want the object.

### Returns

An object of type `Ext.BorderLayout`.

### Usage

Use this function to get the Ext toolkit (`Ext.BorderLayout`) object that underlies the ColdFusion HTML `cflayout` control. You can then use the raw object to modify the displayed layout. For documentation on the objects and how to manage them, see the [Ext documentation](#).

## ColdFusion.Layout.hideAccordion

### Description

Hides the specified panel and its accordion layout.

### Function syntax

```
ColdFusion.Layout.hideAccordion (layoutname, layoutareaname)
```

### See also

[cflayout](#), [ColdFusion.Layout.collapseAccordion](#), [ColdFusion.Layout.createAccordionPanel](#), [ColdFusion.Layout.expandAccordion](#), [ColdFusion.Layout.getAccordionLayout](#), [ColdFusion.Layout.selectAccordion](#), [ColdFusion.Layout.showAccordion](#), Using layouts in the *Developing ColdFusion Applications*

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
layoutname	The name attribute of the accordion layout that contains the panel to hide.
layoutareaname	The name attribute of the panel to hide.

### Returns

This function does not return a value.

### Example

The following example creates an accordion layout with two panels. Click the buttons to show and hide the second panel.

```
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
</head>

<body>
<cflayout type="accordion" name="accordionLayout" accordionheight="300px"
  style="width:400px">
  <cflayoutarea title="First Panel" name="panel1">
    <h2>The First Panel</h2>
    Here are the contents of the first panel.
  </cflayoutarea>

  <cflayoutarea title="Second Panel" name="panel2">
    <h2>The Second Panel</h2>
    This is the content of the second panel.
  </cflayoutarea>
</cflayout>
<br />

<cfform name="layouts">
  <cfinput type="button" name="ShowAccordion" value="Show Accordion"
    onClick="ColdFusion.Layout.showAccordion('accordionLayout','panel2')">
  <cfinput type="button" name="ShowAccordion" value="Hide Panel"
    onClick="ColdFusion.Layout.hideAccordion('accordionLayout','panel2')">
</cfform>
</body>
</html>
```

## ColdFusion.Layout.hideArea

### Description

Hides an area of a border layout.

### Function syntax

```
ColdFusion.Layout.hideArea(layout, layoutArea)
```

### See also

[cflayout](#), [cflayoutarea](#), [ColdFusion.Layout.collapseArea](#), [ColdFusion.Layout.expandArea](#), [ColdFusion.Layout.showArea](#), [Using layouts in the \*Developing ColdFusion Applications\*](#)

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
layout	The name attribute of the border layout that contains the area to hide.
layoutArea	The position in the layout of the area to hide. Must be one of the following: <code>bottom</code> , <code>left</code> , <code>right</code> , or <code>top</code> .

### Returns

This function does not return a value.

### Usage

This function has no effect if the area is already hidden.

### Example

The following code snippet hides the left area of the layout border layout when the user clicks the button.

```
<cinput name="hide2" width="100" value="Hide Area 2" type="button"
onClick="ColdFusion.Layout.hideArea('thelayout', 'left');">
```

## ColdFusion.Layout.hideTab

### Description

Hides the specified tab and its layout area.

### Function syntax

```
ColdFusion.Layout.hideTab(layout, layoutArea)
```

### See also

[cflayout](#), [cflayoutarea](#), [ColdFusion.Layout.createTab](#), [ColdFusion.Layout.disableTab](#), [ColdFusion.Layout.enableTab](#), [ColdFusion.Layout.selectTab](#), [ColdFusion.Layout.showTab](#), [Using layouts in the \*Developing ColdFusion Applications\*](#)

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
layout	The name attribute of the tabbed layout that contains the area to hide.
layoutArea	The name attribute of the tab layout area to hide.

### Returns

This function does not return a value.

### Example

The following example creates a layout with two tabs. Click the buttons to show and hide the second tab.

```
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
</head>

<body>
<cflayout type="tab" name="tabLayout" tabheight="300px"
  style="width:400px">
  <cflayoutarea title="First Tab" name="tab1">
    <h2>The First Tab</h2>
    Here are the contents of the first tab.
  </cflayoutarea>

  <cflayoutarea title="Second Tab" name="tab2">
    <h2>The Second Tab</h2>
    This is the content of the second tab.
  </cflayoutarea>
</cflayout>
<br />

<cform name="layouts">
  <cfinput type="button" name="ShowTab" value="Show Tab"
    onClick="ColdFusion.Layout.showTab('tabLayout','tab2')">
  <cfinput type="button" name="ShowTab" value="Hide Tab"
    onClick="ColdFusion.Layout.hideTab('tabLayout','tab2')">
</cform>
</body>
</html>
```

## ColdFusion.Layout.selectAccordion

### Description

Selects the specified accordion layout and displays its panels.

### Function syntax

```
ColdFusion.Layout.selectAccordion(layoutname, layoutareaname)
```

### See also

[cflayout](#), [ColdFusion.Layout.collapseAccordion](#), [ColdFusion.Layout.createAccordionPanel](#),  
[ColdFusion.Layout.expandAccordion](#), [ColdFusion.Layout.getAccordionLayout](#),  
[ColdFusion.Layout.hideAccordion](#), [ColdFusion.Layout.showAccordion](#), [Using layouts in the Developing ColdFusion Applications](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
layoutname	The name attribute of the accordion layout that contains the area to select.
layoutareaname	The name attribute of the panel to select.

### Returns

This function does not return a value.

### Usage

This function has no effect on a disabled panel.

### Example

The following code lets you select each of the two panels in an accordion layout.

```
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
</head>

<body>
<cflayout type="accordion" name="mainAccordion" accordionheight="300px" style="width:400px">
  <cflayoutarea title="First Panel" name="panel1">
    <h2>The First Panel</h2>
    Here are the contents of the first panel.
  </cflayoutarea>

  <cflayoutarea title="Second Panel" name="panel2">
    <h2>The Second Panel</h2>
    This is the content of the second panel.
  </cflayoutarea>
</cflayout>

<p>
Use these links to test selecting tabs via JavaScript:<br />
<a href="#" onClick="ColdFusion.Layout.selectAccordion('mainAccordion','panel1');
return false;">Click here to select panel 1.</a><br />
<a href="#" onClick="ColdFusion.Layout.selectAccordion('mainAccordion','panel2');
return false;">Click here to select panel 2.</a><br />
</p>

</body>
</html>
```

## ColdFusion.Layout.selectTab

### Description

Selects the specified tab and displays its layout area.

### Function syntax

```
ColdFusion.Layout.selectTab(layout, layoutArea)
```

### See also

[cflayout](#), [cflayoutarea](#), [ColdFusion.Layout.createTab](#), [ColdFusion.Layout.disableTab](#), [ColdFusion.Layout.enableTab](#), [ColdFusion.Layout.hideTab](#), [ColdFusion.Layout.showTab](#), [Using layouts in the Developing ColdFusion Applications](#)

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
layout	The name attribute of the tabbed layout that contains the area to select.
layoutArea	The name attribute of the tab layout area to select.

### Returns

This function does not return a value.

### Usage

This function has no effect on a disabled tab.

### Example

The following code lets you select each of the two tabs in a layout.

```
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
</head>

<body>
<cflayout type="tab" name="mainTab" tabheight="300px" style="width:400px">
  <cflayoutarea title="First Tab" name="tab1">
    <h2>The First Tab</h2>
    Here are the contents of the first tab.
  </cflayoutarea>

  <cflayoutarea title="Second Tab" name="tab2">
    <h2>The Second Tab</h2>
    This is the content of the second tab.
  </cflayoutarea>
</cflayout>

<p>
Use these links to test selecting tabs via JavaScript:<br />
<a href="" onClick="ColdFusion.Layout.selectTab('mainTab','tab1');
  return false;">Click here to select tab 1.</a><br />
<a href="" onClick="ColdFusion.Layout.selectTab('mainTab','tab2');
  return false;">Click here to select tab 2.</a><br />
</p>

</body>
</html>
```

## ColdFusion.Layout.showAccordion

### Description

Shows a panel in the accordion layout that was hidden using the `coldfusion.layout.hideAccordion` function.

### Function syntax

```
ColdFusion.Layout.showAccordion(layoutname, layoutareaname)
```

### See also

[cflayout](#), [ColdFusion.Layout.collapseAccordion](#), [ColdFusion.Layout.createAccordionPanel](#), [ColdFusion.Layout.expandAccordion](#), [ColdFusion.Layout.getAccordionLayout](#), [ColdFusion.Layout.hideAccordion](#), [ColdFusion.Layout.selectAccordion](#), [Using layouts in the Developing ColdFusion Applications](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
layoutname	The name attribute of the accordion layout that contains the panels to show.
layoutareaname	The name attribute of the accordion layout area whose panels you want to show.

### Returns

This function does not return a value.

### Usage

This function shows only the panel of an accordion layout area; it does not show the display area. To show the display area of a hidden panel, call this function, followed by `ColdFusion.Layout.selectAccordion`.

This function does not show a panel that a user closed by clicking the x icon on the panel.

### Example

See [ColdFusion.Layout.hideAccordion](#).

## ColdFusion.Layout.showArea

### Description

Shows an area of a border layout that was hidden by using the `cflayoutarea` tag `inithide` attribute or the `ColdFusion.Layout.hideArea()` JavaScript function.

### Function syntax

```
ColdFusion.Layout.showArea(layout, layoutArea)
```

#### See also

[cflayout](#), [cflayoutarea](#), [ColdFusion.Layout.collapseArea](#), [ColdFusion.Layout.expandArea](#), [ColdFusion.Layout.getTabLayout](#), [Using layouts](#) in the *Developing ColdFusion Applications*

#### History

ColdFusion 8: Added this function

#### Parameters

Parameter	Description
layout	The name attribute of the border layout that contains the area to show.
layoutArea	The position in the layout of the area to show. Must be one of the following: <code>bottom</code> , <code>left</code> , <code>right</code> , or <code>top</code> .

#### Returns

This function does not return a value.

#### Usage

This function does not show an area that a user closed by clicking the x icon on the title bar. Other areas move, if needed, to accommodate the area.

This function has no effect if the area is already visible.

#### Example

The following code snippet shows the left area of the layout border layout when the user clicks the button.

```
<cfinput name="show2" width="100" value="Show Area 2" type="button"
onClick="ColdFusion.Layout.showArea('thelayout', 'left');">
```

## ColdFusion.Layout.showTab

#### Description

Shows a tab that was hidden by using the `inithide` attribute of the `cflayoutarea` tag or the `hideTab()` JavaScript function.

#### Function syntax

```
ColdFusion.Layout.showTab(layout, layoutArea)
```

#### See also

[cflayout](#), [cflayoutarea](#), [ColdFusion.Layout.createTab](#), [ColdFusion.Layout.disableTab](#), [ColdFusion.Layout.enableTab](#), [ColdFusion.Layout.hideTab](#), [ColdFusion.Layout.selectTab](#), [Using layouts](#) in the *Developing ColdFusion Applications*

#### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
layout	The name attribute of the tabbed layout that contains the tab to show.
layoutArea	The name attribute of the tab layout area whose tab you want to show.

### Returns

This function does not return a value.

### Usage

This function shows only the tab of a layout area; it does not show the display area. To show the display area of a hidden tab, call this function, followed by [ColdFusion.Layout.selectTab](#).

This function does not show a tab that a user closed by clicking the x icon on the tab.

### Example

See [ColdFusion.Layout.hideTab](#).

## ColdFusion.Log.debug

### Description

Displays a debug-level message in a log window.

### Function syntax

```
ColdFusion.Log.debug(message [, category])
```

### See also

[ColdFusion.Log.dump](#), [ColdFusion.Log.error](#), [ColdFusion.Log.info](#), Logging information in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
message	The text message to display in the log window. The log message can include HTML markup and JavaScript variables.
category	A category identifier that you can use in the logging window to filter the output. You can specify any arbitrary category in this function. The default value is <code>global</code> .

### Returns

This function does not return a value.

### Usage

If the page that calls this function does not have any ColdFusion AJAX-based controls, you use a [cfajaximport](#) tag on the page to ensure that the page includes the JavaScript definition for this function.

The log window appears if you specify a URL parameter of the format `cfdebug` or `cfdebug="true"` in your page request and you select the Enable Ajax Debug Log Window option on the ColdFusion Administrator Debugging & Logging > Debug Output Settings page.

#### Example

```
ColdFusion.Log.debug("<b>Debug argument:</b><br>" + arg.A, "Pod A");
```

## ColdFusion.Log.dump

#### Description

Displays a debug-level message in the log window that shows a `cfdump`-like representation of a complex JavaScript object. The log window does not have a separate dump level.

#### Function syntax

```
ColdFusion.Log.dump(object [, category])
```

#### See also

[ColdFusion.Log.debug](#), [ColdFusion.Log.error](#), [ColdFusion.Log.info](#), Logging information in the *Developing ColdFusion Applications*

#### History

ColdFusion 8: Added this function

#### Parameters

Parameter	Description
object	The variable whose contents you want to display. You cannot specify additional contents, such as a text message, when you dump a complex object. To provide additional information, also use the <a href="#">ColdFusion.Log.debug</a> function.
category	A category identifier that you can use in the logging window to filter the output. You can specify any arbitrary category in this function. The default value is <code>global</code> .

#### Returns

This function does not return a value.

#### Usage

If the page that calls this function does not have any ColdFusion AJAX-based controls, you use a [cfajaximport](#) tag on the page to ensure that the page includes the JavaScript definition for this function.

The log window appears if you specify a URL parameter of the format `cfdebug` or `cfdebug="true"` in your page request and you select the Enable Ajax Debug Log Window option on the ColdFusion Administrator Debugging & Logging > Debug Output Settings page.

#### Example

```
ColdFusion.Log.dump(objArg, "Pod A");
```

## ColdFusion.Log.error

### Description

Displays an error-level message in a log window.

### Function syntax

```
ColdFusion.Log.error(message [, category])
```

### See also

[ColdFusion.Log.debug](#), [ColdFusion.Log.dump](#), [ColdFusion.Log.info](#), Logging information in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
message	The text message to display in the log window. The log message can include HTML markup and JavaScript variables.
category	A category identifier that you can use in the logging window to filter the output. You can specify any arbitrary category in this function. The default value is <code>global</code> .

### Returns

This function does not return a value.

### Usage

If the page that calls this function does not have any ColdFusion AJAX-based controls, you use a `cfajaximport` tag on the page to ensure that the page includes the JavaScript definition for this function.

The log window appears if you specify a URL parameter of the format `cfdebug` or `cfdebug="true"` in your page request and you select the Enable Ajax Debug Log Window option on the ColdFusion Administrator Debugging & Logging > Debug Output Settings page.

### Example

```
ColdFusion.Log.error("<b>Invalid value:</b><br>" + arg.A, "Pod A");
```

## ColdFusion.Log.info

### Description

Displays an information-level message in a log window.

### Function syntax

```
ColdFusion.Log.info(message [, category])
```

### See also

[ColdFusion.Log.debug](#), [ColdFusion.Log.dump](#), [ColdFusion.Log.error](#), Logging information in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
message	The text message to display in the log window. The log message can include HTML markup and JavaScript variables.
category	A category identifier that you can use in the logging window to filter the output. You can specify any arbitrary category in this function. The default value is <code>global</code> .

### Returns

This function does not return a value.

### Usage

If the page that calls this function does not have any ColdFusion AJAX-based controls, you use a [cfajaximport](#) tag on the page to ensure that the page includes the JavaScript definition for this function.

The log window appears if you specify a URL parameter of the format `cfdebug` or `cfdebug="true"` in your page request and you select the Enable Ajax Debug Log Window option on the ColdFusion Administrator Debugging & Logging > Debug Output Settings page.

### Example

```
ColdFusion.Log.info("<b>arg.A is:</b><br>" + arg.A, "Window Z");
```

## ColdFusion.Map.addEvent

### Description

Executes a custom JavaScript function to enable event handling in a map.

### Function syntax

```
ColdFusion.Map.addEvent(name, event, listener, scopeObject)
```

### See also

[ColdFusion.Map.getLatitudeLongitude](#), [ColdFusion.Map.getMapObject](#), [ColdFusion.Map.setCenter](#), [ColdFusion.Map.setZoomlevel](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	Name of the map.
event	The event to handle, for example <code>click</code> , <code>dblclick</code> , <code>singleRightClick</code> and <code>mapTypeChange</code> . For more events, refer to the Events section in the Google Maps API Reference documentation.
listener	The function that is called when the event is fired.
scopeObject	A JavaScript object that is set in the <code>this</code> scope.

### Usage

This function does not return a value.

### Example

<h3>This is an example of the `Map.addmarker` function. Click the HTML button labeled "Add marker" to set the marker to the specified Address.</h3>

```
<script>
var markerObj={
address: '201 S. Division St. Suite 500 Ann Arbor, MI 48104'
};
function addmarker(){
ColdFusion.Map.addMarker('mapID', markerObj);
}
</script>
<h3>MAP 1</h3>
<cfform name="map01">
<cfinput type="button" value="Add marker" name="markerbutton"
onclick="javascript:addmarker();" >
</cfform>
<cfmap name="mapID"
centerlatitude=42.261
centerlongitude=-87.717
displayscale=true
doubleclickzoom="true"
overview=true
scrollwheelzoom=true
tips="My Map" zoomlevel="4">
</cfmap>
```

## ColdFusion.Map.addMarker

### Description

Adds a marker to the map.

### Function syntax

```
ColdFusion.Map.addMarker(name, markerObj)
```

### See also

[ColdFusion.Map.getLatitudeLongitude](#), [ColdFusion.Map.getMapObject](#), [ColdFusion.Map.setCenter](#), [ColdFusion.Map.setZoomlevel](#)

## History

ColdFusion 9: Added this function

## Parameters

Parameter	Description
name	Specifies the value of the name attribute of the cfmap tag.
markerObj	Specifies the marker object for a given address. The following are the associated properties: latitude, longitude, address, title, markercolor, markericon, address, markerwindowcontent, and showmarkerwindow

## Returns

This function does not return a value.

## Example

<h3>This is an example of the Map.addmarker function. Click the HTML button labeled "Add marker" to set the marker to the specified Address.</h3>

```
<script>
var markerObj={
address: '201 S. Division St. Suite 500 Ann Arbor, MI 48104'
};
function addmarker(){
ColdFusion.Map.addMarker('mapID', markerObj);
}
</script>
<h3>MAP 1</h3>
<cfform name="map01">
<cfinput type="button" value="Add marker" name="markerbutton"
onclick="javascript:addmarker();">
</cfform>
<cfmap name="mapID"
centerlatitude=42.261
centerlongitude=-87.717
displayscale=true
doubleclickzoom="true"
overview=true
scrollwheelzoom=true
tips="My Map" zoomlevel="4">
</cfmap>
```

# ColdFusion.Map.getLatitudeLongitude

## Description

Gets the latitude/longitude coordinates for a given address.

## Function syntax

```
ColdFusion.Map.getLatitudeLongitude("address", "callBack")
```

## See also

[ColdFusion.Map.addMarker](#), [ColdFusion.Map.getMapObject](#), [ColdFusion.Map.setCenter](#),  
[ColdFusion.Map.setZoomlevel](#)

## History

ColdFusion 9: Added this function

## Parameters

Parameter	Description
address	Specifies the value in the <code>address</code> attribute of the <code>cfmap</code> tag.
callback	The callback function that runs after the longitude/latitude values are successfully located.

## Returns

This function returns a callback function that gets the latitude and longitude values of the specified address.

## Example

`<h3>`This is an example of the `Map.getLatitudeLongitude` function. Click the HTML button labeled "GetLatitude-Longitude" to get the latitude and longitude of Ann Arbor,MI.`</h3>`

```
<script>
function getLongitudeLatitude()
{
    ColdFusion.Map.getLatitudeLongitude('201 S. Division St. Suite 500 Ann Arbor, MI 48104',
callbackHandler);
}
function callbackHandler(result)
{
    alert("The latitude-longitude of Ann Arbor,MI is: "+result);
}
</script>
<h3>MAP 1</h3>
<cfform name="map01">
<cfinput type="button" value="GetLatitude-Longitude" name="buttn03"
onclick="javascript:getLongitudeLatitude()">
</cfform>
<cfmap name="mapID" centerlatitude= 42
centerlongitude=-87
doubleclickzoom="true"
overview=true
scrollwheelzoom=true tips="My Map" zoomlevel="4">
</cfmap>
```

# ColdFusion.Map.getMapObject

## Description

Gets the Google map component. You can manipulate the map using supported Google Map APIs.

## Function syntax

```
ColdFusion.Map.getMapObject("name")
```

## See also

[ColdFusion.Map.addMarker](#), [ColdFusion.Map.getLatitudeLongitude](#), [ColdFusion.Map.setCenter](#),  
[ColdFusion.Map.setZoomlevel](#)

## History

ColdFusion 9: Added this function

## Parameters

Parameter	Description
name	Specifies the value of the <code>name</code> attribute of the <code>cfmap</code> tag.

## Returns

This function returns the Google map component. The map type can be `map`, `satellite`, or `hybrid`.

## Example

`<h3>`This is an example of the `Map.getMapObject` function. Click the HTML button labeled "GetMap" to get the map object and set the center to Palo Alto.`</h3>`

```
<script>
function getMapObject()
{
var mapObj = ColdFusion.Map.getMapObject('mapID');
mapObj.setCenter(new GLatLng(37.4419, -122.1419), 13);
}
</script>
<h3>MAP 1</h3>
<cfform name="map01">
<cfinput type="button" value="getMapObject and setCenter" name="htmlbutton"
onclick="javascript:getMapObject()" >
</cfform>
<cfmap name="mapID"
centerAddress='201 S. Division St. Suite 500 Ann Arbor, MI 48104'
displayscale=true
doubleclickzoom="true"
overview=true
scrollwheelzoom=true
tips="My Map"
zoomlevel="4">
</cfmap>
```

# ColdFusion.Map.setCenter

## Description

Sets the center of map to the address that you specify.

## Function syntax

```
ColdFusion.Map.setCenter("name", centerConfigObject)
```

## See also

[ColdFusion.Map.addMarker](#), [ColdFusion.Map.getLatitudeLongitude](#), [ColdFusion.Map.getMapObject](#), [ColdFusion.Map.setZoomlevel](#)

## History

ColdFusion 9: Added this function

## Parameters

Parameter	Description
name	Specifies the value of the <code>name</code> attribute of the <code>cfmap</code> tag.
centerConfigObject	The Center Address object.  The value of this object can either be the longitude/latitude value or the address property.

## Returns

This function does not return any value.

## Example 1

`<h3>This is an example of the Map.setcenter function using latitude-longitude and address values</h3>`

```
<script>
var centerLongLat={
latitude: 71.094224,
longitude: 42.339641
};
var center={
address: '345 Park Avenue, san jose, CA 95110-2704, USA'
};
function setcenter()
{
ColdFusion.Map.setCenter('mapID', centerLongLat);
}
function setcenterlatlong()
{
ColdFusion.Map.setCenter('mapID', center);
}
</script>
<h3>MAP 1</h3>
<cfform name="mapID">
Click this button to set the center using Latitude and Longitude.
<cfinput type="button" value="setCenter using latitude-longitude"
name="buttn01" onclick="javascript:setcenterlatlong();">
<br>Click this button to set the center using Address.
<cfinput type="button" value="setCenter using Address"
name="buttn01" onclick="javascript:setcenter();">
</cfform>
<cfmap name="mapID" centerlatitude=71.094224
centerlongitude=42.339641
displayscale=true
doubleclickzoom="true"
overview=true
scrollwheelzoom=true
tips="My Map"
zoomlevel="4">
</cfmap>
```

# ColdFusion.Map.setZoomlevel

## Description

Sets the zoom level of the map to the new value.

## Function syntax

```
ColdFusion.Map.setZoomlevel("name", zoomLevelValue)
```

## See also

[ColdFusion.Map.addMarker](#), [ColdFusion.Map.getLatitudeLongitude](#), [ColdFusion.Map.getMapObject](#), [ColdFusion.Map.setCenter](#)

## History

ColdFusion 9: Added this function

## Parameters

Parameter	Description
name	Specifies the value of the name attribute of the cfmap tag.
zoomLevelValue	The value of the integer in the zoomlevel attribute of the cfmap tag.

## Returns

This function does not return any value.

## Example

<h3>This is an example of the Map.setzoomlevel function. Click the Set Zoom Level button to set the zoom level to 6.</h3>

```
<script>
function setZoom(zoomlevel)
{
ColdFusion.Map.setZoomLevel('mapID', zoomlevel);
}
</script>
<h3>MAP 1</h3>
<cfform name="map01">
<cfinput type="button" value="Set Zoom Level" name="buttn04"
onclick="javascript:setZoom(6)">
</cfform>
<cfmap name="mapID"
centerlatitude=42.094224
centerlongitude=72.339641
displayscale=true
doubleclickzoom="true"
overview=true
scrollwheelzoom=true
tips="My Map"
zoomlevel="4" >
</cfmap>
```

# ColdFusion.Mediaplayer.resize

## Description

Changes the current size of the media player.

## Function syntax

```
ColdFusion.Mediaplayer.resize("name", "height", "width")
```

## See also

[ColdFusion.Mediaplayer.setMute](#), [ColdFusion.Mediaplayer.setSource](#),  
[ColdFusion.Mediaplayer.setVolume](#), [ColdFusion.Mediaplayer.startPlay](#),  
[ColdFusion.Mediaplayer.stopPlay](#)

## History

ColdFusion 9: Added this function

## Parameters

Parameter	Description
name	Specifies the value of the name attribute of the cfmediaplayer tag.
height	The height (in pixels) to set for the media player. The height is 360 pixels, by default.
width	The width (in pixels) to set for the media player. The width is 480 pixels, by default.

## Returns

This function does not return any value.

## Example

In this example, the FLV file is stored in the web root used by the ColdFusion server. Store an FLV file - video.flv in the location *web\_root\xyz\*.

<h3>This is an example of the Mediaplayer.resize function. Clicking the Resize Mediaplayer button resizes the media player component.</h3>

```
<script language="JavaScript" type="text/javascript">
function onResize() {
ColdFusion.Mediaplayer.resize('Myvideo', 500, 800);
};
</script>
<br>
<form>
<input type="button" name="resize" value="Resize Mediaplayer" onClick="onResize()" >
</form>
<br/>
<cfmediaplayer name="Myvideo" source="\xyz\video.flv"
width=500 height=400 align="middle"
quality="high" fullscreencontrol="true"/>
```

# ColdFusion.Mediaplayer.setMute

## Description

Mutes or unmutes the sound of the media player.

## Function syntax

```
ColdFusion.Mediaplayer.setMute("name", mute)
```

## See also

[ColdFusion.Mediaplayer.resize](#), [ColdFusion.Mediaplayer.setSource](#),  
[ColdFusion.Mediaplayer.setVolume](#), [ColdFusion.Mediaplayer.startPlay](#),  
[ColdFusion.Mediaplayer.stopPlay](#)

## History

ColdFusion 9: Added this function

## Parameters

Parameter	Description
name	Specifies the value of the name attribute of the cfmediaplayer tag.
mute	A Boolean value specifying whether to mute the sound (true), or to turn off the mute (false).

## Returns

This function does not return any value.

## Example

In this example, the FLV file is stored in the web root used by the ColdFusion server. Store an FLV file - video.flv in the location *web\_root\xyz\*.

```
<h3>This is an example of the Mediaplayer.setmute function. Clicking the Mute button mutes  
the media player.</h3>  
<script language="JavaScript" type="text/javascript">  
    function onMute() {  
        ColdFusion.Mediaplayer.setMute('Myvideo', true);  
    };  
</script>  
<br>  
<form>  
<input type="button" name="mute" value="Mute" onClick="onMute()">  
</form>  
<cfmediaplayer name="Myvideo" source="/xyz/video.flv"  
width=500 height=400 align="middle"  
quality="high" fullscreencontrol="true"/>
```

# ColdFusion.Mediaplayer.setSource

## Description

Sets the URL of the FLV file. The URL can point to a location on the ColdFusion server or any other server.

### Function syntax

```
ColdFusion.Mediaplayer.setSource("name", newURL)
```

### See also

[ColdFusion.Mediaplayer.setMute](#), [ColdFusion.Mediaplayer.setMute](#),  
[ColdFusion.Mediaplayer.setVolume](#), [ColdFusion.Mediaplayer.startPlay](#),  
[ColdFusion.Mediaplayer.stopPlay](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	Specifies the value of the name attribute of the cfmediaplayer tag.
newURL	The URL to the FLV file. This can be a URL relative to the current page. You can store the FLV file on the ColdFusion server or any other streaming server.

### Returns

This function does not return any value.

### Example

In this example, the source of the FLV file is changed from video.flv to newvideo.flv. The media player then plays the newvideo.flv file.

<h3>This is an example of the Mediaplayer.setsource function. Clicking the Set Source button changes the video playing in the media player.</h3>

```
<script language="JavaScript" type="text/javascript">
function setSource()
{
ColdFusion.Mediaplayer.setSource('Myvideo', "/xyz/newvideo.flv");
};
</script>
<br>
<form>
<input type="button" name="setSource" value="Set Source"
onClick="setSource()" ">
</form>
<cfmediaplayer name="Myvideo"
source="/xyz/video.flv"
width=500 height=400 align="middle"
quality="high" fullscreencontrol="true"/>
```

## ColdFusion.Mediaplayer.setVolume

### Description

Sets the volume of sound of the media player.

### Function syntax

```
ColdFusion.Mediaplayer.setVolume("name", "volume")
```

### See also

[ColdFusion.Mediaplayer.resize](#), [ColdFusion.Mediaplayer.setMute](#),  
[ColdFusion.Mediaplayer.setSource](#), [ColdFusion.Mediaplayer.startPlay](#),  
[ColdFusion.Mediaplayer.stopPlay](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	Specifies the value of the name attribute of the cfmediaplayer tag.
volume	The value of the volume. It can take any value from 0.0 through 1.0.

### Returns

This function does not return any value.

### Example

In this example, the FLV file is stored in the web root used by the ColdFusion server. Store an FLV file - video.flv in the location *web\_root\xyz\*.

<h3>This is an example of the Mediaplayer.setvolume function. Clicking the Set Volume button increases the volume of the media player.</h3>

```
<script language="JavaScript" type="text/javascript">
function setVol() {
    ColdFusion.Mediaplayer.setVolume('Myvideo', 1.0);
};
</script>
<br>
<form>
<input type="button" name="setVolume" value="Set Volume" onClick="setVol()">
</form>
<cfmediaplayer name="Myvideo" source="\xyz\video.flv"
width=500 height=400 align="middle"
quality="high" fullscreencontrol="true"/>
```

## ColdFusion.Mediaplayer.startPlay

### Description

Plays the FLV file.

### Function syntax

```
ColdFusion.Mediaplayer.startPlay("name")
```

#### See also

#### History

ColdFusion 9: Added this function

#### Parameters

Parameter	Description
name	Specifies the value of the name attribute of the cfmediaplayer tag.

#### Returns

This function does not return any value.

#### Example

In this example, the FLV file is stored in the web root used by the ColdFusion server. Store an FLV file - video.flv in the location *web\_root\xyz\*.

```
<h3>This is an example of the Mediaplayer.startplay function. Clicking the Start Play button  
plays the video.</h3>  
  <script language="JavaScript" type="text/javascript">  
    function onStart() {  
      ColdFusion.Mediaplayer.startPlay('Myvideo');  
    };  
  </script>  
  <br>  
  <form>  
    <input type="button" name="startplay" value="Start Play" onClick="onStart()">  
  </form>  
  <cfmediaplayer name="Myvideo" source="/xyz/video.flv"  
    width=500 height=400 align="middle"  
    quality="high" fullscreencontrol="true"/>
```

## ColdFusion.Mediaplayer.stopPlay

#### Description

Stops playing the FLV file.

#### Function syntax

```
ColdFusion.Mediaplayer.stopPlay("name")
```

#### See also

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	Specifies the value of the name attribute of the cfmediaplayer tag.

### Returns

This function does not return any value.

### Example

In this example, the FLV file is stored in the web root used by the ColdFusion server. Store an FLV file - video.flv in the location *web\_root\xyz\*.

```
<h3>This is an example of the MediaPlayer.stopplay function. Clicking the Stop Play button
stops playing the video.</h3>
<script language="JavaScript" type="text/javascript">
function onStop()
{
ColdFusion.Media player.stopPlay('Myvideo' );
};
</script>
<br>
<form>
<input type="button" name="stopPlay" value="Stop Play" onClick="onStop()">
</form>
<cfmediaplayer name="Myvideo" source="/xyz/video.flv"
width=500 height=400 align="middle"
quality="high" fullscreencontrol="true"/>
```

## ColdFusion.MessageBox.create

### Description

Creates a ColdFusion message box. This function is equivalent to the cfmessagebox tag.

### Function syntax

```
ColdFusion.MessageBox.create(name, type, title, message, callbackhandler [, configuration])
```

### See also

[ColdFusion.MessageBox.isMessageBoxDefined](#), [ColdFusion.MessageBox.getMessageBoxObject](#),  
[ColdFusion.MessageBox.update](#), [ColdFusion.MessageBox.updateMessage](#),  
[ColdFusion.MessageBox.updateTitle](#), [ColdFusion.MessageBox.show](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	The name of the message box. This attribute is required to show and update the message box. The message box name must be unique on the page.
type	The control type. Must be one of the following: <ul style="list-style-type: none"><li>• alert - A message with a single OK button.</li><li>• confirm - A message box with two buttons YES and NO or three buttons YES, NO, and CANCEL.</li><li>• prompt - A message box with a single-line or multiline text input area and OK and CANCEL buttons.</li></ul>
title	The text to display on the message box title bar.
message	The text to display inside the message box.
callbackhandler	The function that the control calls when a user clicks one of the buttons.
configuration	An object containing message box configuration parameters. For details, see "Usage".

### Returns

This function does not return a value.

### Usage

This function is equivalent to the `cfmessagebox` tag.

If you do not also use a `cfmessagebox` tag on a page that calls this function, specify a `cfajaximport` tag on the page and specify `cfmessagebox` in the `tags` attribute. Doing so ensures that the page includes the necessary JavaScript to create the message box. For example, use the following line if you do not have to import the JavaScript for any other ColdFusion Ajax features:

```
<cfajaximport tags="cfmessagebox">
```

The *configuration* parameter defines the message box characteristics; it can have any or all the following entries:

Entry	Default	Description
bodystyle		A CSS style specification for the body of the message box. Generally, you use this attribute to set color and font styles.
buttontype	yesno	Applies to the control type - <code>confirm</code> . The buttons to display on the message box: <ul style="list-style-type: none"><li>• <code>yesno</code>: displays the buttons Yes and No</li><li>• <code>yesnocancel</code>: displays the buttons Yes, No, and Cancel</li></ul>
icon		Specifies the following CSS classes: <ul style="list-style-type: none"><li>• <code>error</code>: Provides the error icon. You can use this icon when displaying error messages.</li><li>• <code>info</code>: Provides the info icon. You can use this icon when displaying any information.</li><li>• <code>question</code>: Provides the question icon. You can use this icon in a confirmation message box that prompts a user response.</li><li>• <code>warning</code>: Provides the warning icon. You can use this icon when displaying a warning message.</li></ul>

Entry	Default	Description
labelcancel	Cancel	The text to put on the cancel button of a prompt message box.
labelok	OK	The text to put on an alert button and prompt message box OK button.
labelno	No	The text to put on the button used for a negative response in a confirm message box.
labelyes	Yes	The text to put on the button used for a positive response a confirm message box.
modal	yes	A Boolean value that specifies if the message box is a modal window: <ul style="list-style-type: none"><li>• yes</li><li>• no</li></ul>
multiline	false	Valid only for prompt type message boxes. A Boolean value specifying whether the prompt input text box has a single or multiple lines for text input.
width		Width of the message box in pixels.
x		The X (horizontal) coordinate of the upper-left corner of the message box. ColdFusion ignores this attribute if you do not set the y attribute.
y		The Y (vertical) coordinate of the upper-left corner of the message box. ColdFusion ignores this attribute if you do not set the x attribute.

**Note:** Entry names in the configuration object must be all-lowercase.

### Example

The following minimal CFML application creates a message box of type confirmation.

```
<cfajaximport tags="cfmessagebox">

<cfform name="test">
    <cfinput type="button" name="x" value="Create Message Box"
        onClick="ColdFusion.MessageBox.create('Messagebox1', 'confirm','Confirm',
            'Do you want to save the file?',
            onfinish, {width:200, modal:false})">
</cfform>

<script language="JavaScript" type="text/javascript">
function onfinish()
{
    alert('Button clicked');
};
</script>
```

## ColdFusion.MessageBox.show

### Description

Used to display a ColdFusion message box.

### Function syntax

```
ColdFusion.MessageBox.show(name)
```

### See also

[ColdFusion.MessageBox.isMessageBoxDefined](#), [ColdFusion.MessageBox.getMessageBoxObject](#),  
[ColdFusion.MessageBox.update](#), [ColdFusion.MessageBox.updateMessage](#),  
[ColdFusion.MessageBox.updateTitle](#), [ColdFusion.MessageBox.create](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	Name of the message box that you want to display.

### Returns

This function does not return a value.

### Usage

You can create a messagebox using the `cfmessagebox` tag or the JavaScript function `ColdFusion.MessageBox.create`. But to show it, you must use this function.

### Example

```
<cfajaximport tags="cfmessagebox, cfform">
<cfform name="ajax">
    <br><input type="button" name="showMessageBox" value="Show Message Box"
onClick="ColdFusion.MessageBox.create('mb', 'Alert', 'ALERT', 'Sample
Alert!'); ColdFusion.MessageBox.show('mb');">
</cfform>
```

## ColdFusion.MessageBox.getMessageBoxObject

### Description

Gets the underlying Ext JS - JavaScript Library object for the specified HTML `cfmessagebox` control.

### Function syntax

```
ColdFusion.MessageBox.getMessageBoxObject (name)
```

### See also

[ColdFusion.MessageBox.create](#), [ColdFusion.MessageBox.isMessageBoxDefined](#),  
[ColdFusion.MessageBox.update](#), [ColdFusion.MessageBox.updateMessage](#),  
[ColdFusion.MessageBox.updateTitle](#)

### History

ColdFusion 9: Added this function

#### Parameters

Parameter	Description
name	The name of the message box object.

#### Returns

A JavaScript object.

#### Usage

Use this function to get the JavaScript object that contains all the defined properties.

## ColdFusion.MessageBox.isMessageBoxDefined

#### Description

Checks if a message box is defined.

#### Function syntax

```
ColdFusion.MessageBox.isMessageBoxDefined(name)
```

#### See also

[ColdFusion.MessageBox.create](#), [ColdFusion.MessageBox.getMessageBoxObject](#),  
[ColdFusion.MessageBox.update](#), [ColdFusion.MessageBox.updateMessage](#),  
[ColdFusion.MessageBox.updateTitle](#)

#### History

ColdFusion 9: Added this function

#### Parameters

Parameter	Description
name	The name of the message box object.

#### Returns

A Boolean value, that is, true or false.

#### Usage

Use this function to check if the message box is defined for a specific name.

## ColdFusion.MessageBox.update

#### Description

Updates the ColdFusion message box properties. This JavaScript function lets you update all the message box properties except name and type.

## Function syntax

```
ColdFusion.MessageBox.update(name, configuration)
```

## See also

[ColdFusion.MessageBox.create](#), [ColdFusion.MessageBox.getMessageBoxObject](#),  
[ColdFusion.MessageBox.isMessageBoxDefined](#), [ColdFusion.MessageBox.updateMessage](#),  
[ColdFusion.MessageBox.updateTitle](#)

## History

ColdFusion 9: Added this function

## Parameters

Parameter	Description
name	The name of the message box. This attribute is required to show and update the message box. The message box name must be unique on the page.
configuration	An object containing message box configuration parameters. For details, see "Usage".

## Returns

This function does not return a value.

## Usage

This function is used to update a set of message box properties. For example, you can update the width, message, and title of the message box using the *configuration* parameter.

The *configuration* parameter defines the message box characteristics; it can have any or all the following entries:

Entry	Description
bodystyle	A CSS style specification for the body of the message box. Generally, you use this attribute to set color and font styles.
buttontype	Applies to the control type - confirm. The buttons to display on the message box: <ul style="list-style-type: none"><li>• yesno: displays the buttons Yes and No</li><li>• yesnocancel: displays the buttons Yes, No, and Cancel</li></ul>
callbackhandler	The function that the control calls when a user clicks one of the buttons. For more information see Usage.
icon	Specifies the following CSS classes: <ul style="list-style-type: none"><li>• error: Provides the error icon. You can use this icon when displaying error messages.</li><li>• info: Provides the info icon. You can use this icon when displaying any information.</li><li>• question: Provides the question icon. You can use this icon in a confirmation message box that prompts a user response.</li><li>• warning: Provides the warning icon. You can use this icon when displaying a warning message.</li></ul>
labelcancel	The text to put on the cancel button of a prompt message box.
labelok	The text to put on an alert button and prompt message box OK button.

Entry	Description
labelno	The text to put on the button used for a negative response in a confirm message box.
labelyes	The text to put on the button used for a positive response in a confirm message box.
modal	A Boolean value that specifies if the message box is a modal window: <ul style="list-style-type: none"> <li>• yes</li> <li>• no</li> </ul>
message	The text to display inside the message box.
multiline	Valid only for prompt type message boxes. A Boolean value specifying whether the prompt input text box has a single or multiple lines for text input.
title	The title for the message box. If you do not specify a title, ColdFusion assigns the control type value as the default title.
width	Width of the message box in pixels.
x	The X (horizontal) coordinate of the upper-left corner of the message box. ColdFusion ignores this attribute if you do not set the y attribute.
y	The Y (vertical) coordinate of the upper-left corner of the message box. ColdFusion ignores this attribute if you do not set the x attribute.

**Note:** Entry names in the configuration object must be all-lowercase.

### Example

The following minimal CFML application updates a message box.

```
<cfajaximport tags="cfmessagebox">

<cform name="test">
    <cfinput type="button" name="x" value="Update Message Box"
        onClick="ColdFusion.MessageBox.update('Messagebox1',
            {width:400, modal:false, x:200, y:300, labelyes:'yes'})">
</cform>
```

## ColdFusion.MessageBox.updateMessage

### Description

Updates the message property of the ColdFusion message box component.

### Function syntax

```
ColdFusion.MessageBox.updateMessage(name, newmessage)
```

### See also

[ColdFusion.MessageBox.create](#), [ColdFusion.MessageBox.getMessageBoxObject](#),  
[ColdFusion.MessageBox.isMessageBoxDefined](#), [ColdFusion.MessageBox.update](#),  
[ColdFusion.MessageBox.updateTitle](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	The name of the message box object.
newmessage	Overwrites an existing message.

### Returns

This function does not return a value.

### Usage

Use this function to update or change the message property of the message box.

## ColdFusion.MessageBox.updateTitle

### Description

Updates the title property of the ColdFusion message box component.

### Function syntax

```
ColdFusion.MessageBox.updateTitle(name, newtitle)
```

### See also

[ColdFusion.MessageBox.create](#), [ColdFusion.MessageBox.getMessageBoxObject](#),  
[ColdFusion.MessageBox.isMessageBoxDefined](#), [ColdFusion.MessageBox.update](#),  
[ColdFusion.MessageBox.updateMessage](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	The name of the message box object.
newmessage	Overwrites an existing title.

### Returns

This function does not return a value.

### Usage

Use this function to update or change the title property of the message box.

# ColdFusion.navigate

## Description

Displays the output of a link target in an Ajax `cfdiv`, `cflayoutarea`, `cfpod`, or `cfwindow` container. When the browser follows a link that is populated by this function, the link does not replace the current page. Instead, it populates the control specified by the `container` attribute.

## Function syntax

```
ColdFusion.navigate(URL [, container, callbackhandler, errorHandler, httpMethod, formId])
```

## See also

[AjaxLink](#), [cfajaximport](#), [ColdFusion.Ajax.submitForm](#), Control container contents in the *Developing ColdFusion Applications*

## History

ColdFusion 8: Added this function

## Parameters

Parameter	Description
URL	The URL of the link.
container	The name attribute value of the control in which to display the link output. The control must be a container control such as <code>cfdiv</code> , <code>cflayoutarea</code> , <code>cfpod</code> , or <code>cfwindow</code> .  If you omit this argument, the link is treated as a normal URL and the entire page is refreshed.
callbackhandler	The name of a JavaScript function to call after the target has been displayed.
errorHandler	The name of a JavaScript function to call if an error occurs when this function executes. The function can take two parameters: an HTTP error code, and an error message.
formId	The ID or name attribute of a form to submit to the URL.
httpMethod	The HTTP method to use when navigating to the URL: <ul style="list-style-type: none"><li>• GET (the default)</li><li>• POST</li></ul>

## Returns

This function does not return a value.

## Usage

If the page that calls this function does not have any ColdFusion AJAX-based controls, you must use a `cfajaximport` tag on the page to ensure that the page includes the JavaScript definition for this function.

The `callbackhandler` parameter can be useful for changing the display after the contents has been displayed. For example, before you make the `ColdFusion.navigate` call you might make a pod's title bar italic to indicate loading; you could then use the `callbackhandler` function to switch it back to normal or make it bold once navigate completes. Similarly, you could use a `callbackhandler` to update the page number in a book reader.

The `FormID` attribute lets you specify a form to submit to the specified URL. You can use the `ColdFusion.Navigate` function with this attribute to submit form data asynchronously from outside the form, for example, when the user clicks a menu item, and to direct the returned results to a specific container control.

### Example

When the user clicks the link in window 1, the `ColdFusion.navigate` function replaces the text in window 2 with the contents of `windowSrc.cfm`, and then calls the `myCallback` callback handler, which changes the innerHTML of the callback div region.

The main application page looks as follows:

```
<html>
<head>
<!-- The Callback handler puts text in the window.cfm callback div. -->
<script language="javascript">
    var mycallback = function(){
        document.getElementById("callback").innerHTML = "<br><br><b>This is printed by the
callback handler.</b>";
    }

<!-- The error handler pops an alert with the error code and message. -->
    var myerrorhandler = function(errorCode,errorMessage){
        alert("[In Error Handler]" + "\n\n" + "Error Code: " + errorCode + "\n\n" + "Error
Message: " + errorMessage);
    }
</script>
</head>

<body>
<cfwindow name="w1" title="CF Window 1" initShow=true
    x=10 y=10 width="200">
    This is a cfwindow control.<br><br>
    <a href="javascript:ColdFusion.navigate('windowSource.cfm','w2',
        mycallback,myerrorhandler);">Click</a> to navigate Window 2</a>
</cfwindow>

<cfwindow name="w2" title="CF Window 2" initShow=true
    x=250 y=10 width="200">
    This is a second cfwindow control.
</cfwindow>
</body>
</html>
```

The `windowSource.cfm` page looks as follows:

```
This is markup from "windowSource.cfm"
<!-- The callback handler puts its output in the following div block. -->
<div id="callback"></div>
```

## ColdFusion.ProgressBar.getProgressBarObject

### Description

Gets the progress bar object.

### Function syntax

`ColdFusion.ProgressBar.getProgressBarObject (name)`

### See also

[ColdFusion.ProgressBar.start](#), [ColdFusion.ProgressBar.stop](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	The name of the progress bar object.

### Returns

This function returns the underlying Ext JavaScript progress bar object.

### Usage

You call this function to get the progress bar object.

## ColdFusion.ProgressBar.hide

### Description

Hides the progress bar if it is displayed.

### Function syntax

`ColdFusion.ProgressBar.hide (progressBarId)`

### See also

[ColdFusion.ProgressBar.show](#), [ColdFusion.ProgressBar.update](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
progressBarId	Name of the progress bar object. This must be a valid ColdFusion identifier.

### Returns

This function does not return a value.

### Usage

This function lets you hide the progress bar if it is displayed.

You display the progressbar using the function `ColdFusion.ProgressBar.show` or by setting the attribute `autodisplay` to `true` in the tag `cfprogressbar`.

The following example shows how to use this function:

```
<cfprogressbar name="pBar" autodisplay="true">
<cfinput type="button"
    onClick="ColdFusion.ProgressBar.hide('pBar') ">
```

## ColdFusion.ProgressBar.reset

### Description

Resets the progress status and messages.

### Function syntax

```
ColdFusion.ProgressBar.reset(progressBarId)
```

### See also

[ColdFusion.ProgressBar.start](#), [ColdFusion.ProgressBar.stop](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
<code>progressBarId</code>	Name of the progress bar object. This must be a valid ColdFusion identifier.

### Returns

This function does not return a value.

### Usage

Resets the progress on a progress bar as shown in the following example:

```
<cfform>
<cfprogressbar name="pBar" width="500"/>
<cfinput type="button" name="pBtn" onClick="ColdFusion.ProgressBar.reset('pBar') ">
</cfform>
```

## ColdFusion.ProgressBar.show

### Description

Shows the progress bar if it is hidden.

### Function syntax

```
ColdFusion.ProgressBar.show(progressBarId)
```

### See also

[ColdFusion.ProgressBar.hide](#), [ColdFusion.ProgressBar.update](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
progressBarId	Name of the progress bar object. This must be a valid ColdFusion identifier.

### Returns

This function does not return a value.

### Usage

This function lets you display the progress bar if it is hidden.

You hide the progress bar using the function [ColdFusion.ProgressBar.hide](#) or by setting the attribute `autodisplay` to `false` in the `cfprogressbar` tag.

The following example shows how to use this function:

```
<cfprogressbar name="pBar" autodisplay="false">
<cfinput type="button"
    onClick="ColdFusion.ProgressBar.show('pBar') ">
```

## ColdFusion.ProgressBar.start

### Description

Starts the underlying Ext JS - JavaScript Library progress bar object.

### Function syntax

`ColdFusion.ProgressBar.start (name)`

### See also

[ColdFusion.ProgressBar.getProgressBarObject](#), [ColdFusion.ProgressBar.stop](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	The name of the progress bar object.

### Returns

This function does not return a value.

### Usage

The `cfprogressbar` tag creates the HTML markup; at runtime, you use this function to initiate the progress bar object. On initialization, ColdFusion calls the underlying CFC, which is defined using a bind expression, at specified intervals. The CFC returns the progress status, which is passed to the underlying Ext progress bar object to update the progress bar value.

The progress status object that the CFC returns must have `STATUS` and `MESSAGE` properties. The `STATUS` property has a numeric value from 0.0 to 1.0

## ColdFusion.ProgressBar.stop

### Description

Stops the underlying progress bar object that is running.

### Function syntax

```
ColdFusion.ProgressBar.stop(name, calloncomplete)
```

### See also

[ColdFusion.ProgressBar.getProgressBarObject](#), [ColdFusion.ProgressBar.start](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
<code>name</code>	The name of the progress bar object.
<code>calloncomplete</code>	A Boolean value that specifies whether to call oncomplete function: <ul style="list-style-type: none"><li><code>true</code></li><li><code>false</code></li></ul> The default value is <code>true</code> .

### Returns

This function does not return a value.

### Usage

You call this function to stop the progress bar object.

## ColdFusion.ProgressBar.update

### Description

Updates attribute values.

### Function syntax

`ColdFusion.ProgressBar.update(progressBarId, config)`

### See also

[ColdFusion.ProgressBar.hide](#), [ColdFusion.ProgressBar.show](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
<code>progressBarId</code>	Name of the progress bar object. This must be a valid ColdFusion identifier.
<code>configObject</code>	An object containing configuration parameters, <code>interval</code> , <code>duration</code> , and <code>oncomplete</code> .

### Returns

This function does not return a value.

### Usage

Updates any of the attribute values `duration`, `interval`, or `oncomplete` as shown in the following example:

```
<cfprogressbar name="pBar" autodisplay="false">
<cfinput type="button"
    onClick="ColdFusion.ProgressBar.update('pBar', {interval:6000, duration:10000,
oncomplete:newoncomplete}) ">
```

## ColdFusion.ProgressBar.updatestatus

### Description

Lets you manually update the status and message of the progress bar.

### Function syntax

`ColdFusion.ProgressBar.updatestatus(progressBarId, status, message)`

### See also

[ColdFusion.ProgressBar.update](#), [ColdFusion.ProgressBar.reset](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
<code>progressBarId</code>	Name of the progress bar object. This must be a valid ColdFusion identifier.
<code>message</code>	Text to be displayed in the progress bar.
<code>status</code>	Progress status.

### Returns

This function does not return a value.

### Usage

This function helps you to manually set the message and status in the progress bar. For instance, in the case of file upload, you can manually control the progress using this function.

The following snippet illustrates how to use the function:

```
<cfform>
<cfprogressbar name="pBar" width="500"/>
<cfinput type="button" name="pBtn" onClick="
ColdFusion.ProgressBar.updateStatus('pBar', 0.5, '50%') ">
</cfform>
```

## ColdFusion.setGlobalErrorHandler

### Description

Specifies a function that gets called, in place of the ColdFusion Ajax default error handler, if an error occurs when using a ColdFusion Ajax feature.

### Function syntax

```
ColdFusion.setGlobalErrorHandler(functionName)
```

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
<i>functionName</i>	The name of the JavaScript function to execute when there is an error in ColdFusion Ajax code, such as a binding error. This function must take a single argument, the error message string.

### Returns

This function does not return a value.

### Usage

If the page that calls this function does not have any ColdFusion AJAX-based controls, use a `cfajaximport` tag on the page to ensure that the page includes the JavaScript definition for this function.

The global error handler displays information about errors that occur in ColdFusion Ajax features. The default global error handler displays an alert with the error message. You can use this function to create a custom global error handler, for example, to display a custom error window with additional information about your application.

# ColdFusion.Slider.disable

## Description

Disables the slider control.

## Function syntax

`ColdFusion.Slider.disable (name)`

## See also

[ColdFusion.Slider.enable](#), [ColdFusion.Slider.getValue](#), [ColdFusion.Slider.getSliderObject](#), [ColdFusion.Slider.hide](#), [ColdFusion.Slider.show](#), [ColdFusion.Slider.setValue](#)

## History

ColdFusion 9: Added this function

## Parameters

Parameter	Description
name	Specifies the value of the name attribute in the <code>cfslider</code> tag.

## Returns

This function does not return any value.

## Example

`<h3>This is an example of the Slider.disable function. Click the Disable Slider button to disable the slider.</h3>`

```
<script language="JavaScript" type="text/javascript">
function disable(){
ColdFusion.Slider.disable('sliderID');
}
</script>
<br>
<cfform name="form01">
<br/>
<cfslider name="sliderID" format="HTML"
vertical="false" width="350"
value="100" min="0" max="200" increment="10" tip="true"/>
<cfinput type="button" name="htmlbutton"
value="Disable Slider" onclick="disable()">
</cfform>
```

# ColdFusion.Slider.enable

## Description

Enables the slider control.

## Function syntax

`ColdFusion.Slider.enable (name)`

### See also

[ColdFusion.Slider.disable](#), [ColdFusion.Slider.getValue](#), [ColdFusion.Slider.getSliderObject](#),  
[ColdFusion.Slider.hide](#), [ColdFusion.Slider.show](#), [ColdFusion.Slider.setValue](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	Specifies the value of the name attribute in the <code>cfslider</code> tag.

### Returns

This function does not return any value.

### Example

`<h3>`This is an example of the `Slider.enable` function. Click the Enable Slider button to enable the slider.`</h3>`

```
<script language="JavaScript" type="text/javascript">
function onload()
{
ColdFusion.Slider.disable('sliderID');
}
function enable(){
ColdFusion.Slider.enable('sliderID');
}
</script>
<br>
<cfform name="form01">
<br/>
<cfslider name="sliderID" format="HTML"
body onLoad="onload()"
vertical="false" width="350"
value="100" min="0" max="200"
increment="10" tip="true"/>
<cfinput type="button" name="htmlbutton"
value="Enable Slider" onclick="enable()">
</cfform>
```

## ColdFusion.Slider.getValue

### Description

Gets the numeric value of the slider control.

### Function syntax

`ColdFusion.Slider.getValue(name)`

### See also

[ColdFusion.Slider.disable](#), [ColdFusion.Slider.enable](#), [ColdFusion.Slider.getSliderObject](#), [ColdFusion.Slider.hide](#), [ColdFusion.Slider.show](#), [ColdFusion.Slider.setValue](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	Specifies the value of the name attribute in the <code>cfslider</code> tag.

### Returns

This function returns a numeric value.

### Example

`<h3>`This is an example of the `Slider.getvalue` function. Click the Get Value button to get the value of the slider.`</h3>`

```
<script language="JavaScript" type="text/javascript">
function getvalue(){
alert("The slider is currently at: "+ColdFusion.Slider.getValue('sliderID'));
}
</script>
<br>
<cfform name="form01">
<br/>
<cfslider name="sliderID" format="HTML"
vertical="false" width="350"
value="100" min="0" max="200" increment="10" tip="true"/>
<cfinput type="button" name="htmlbutton"
value="Get Value" onclick="getvalue()">
</cfform>
```

## ColdFusion.Slider.getSliderObject

### Description

Gets the underlying Ext JavaScript slider control.

### Function syntax

```
ColdFusion.Slider.getSliderObject (name)
```

### See also

[ColdFusion.Slider.disable](#), [ColdFusion.Slider.enable](#), [ColdFusion.Slider.getValue](#), [ColdFusion.Slider.hide](#), [ColdFusion.Slider.show](#), [ColdFusion.Slider.setValue](#)

### History

ColdFusion 9: Added this function

#### Parameters

Parameter	Description
name	Specifies the value of the <code>name</code> attribute in the <code>cfslider</code> tag.

#### Returns

This function returns the underlying Ext JavaScript slider control.

## ColdFusion.Slider.hide

#### Description

Hides the slider control.

#### Function syntax

```
ColdFusion.Slider.hide(name)
```

#### See also

[ColdFusion.Slider.disable](#), [ColdFusion.Slider.enable](#), [ColdFusion.Slider.getSliderObject](#), [ColdFusion.Slider.getValue](#), [ColdFusion.Slider.show](#), [ColdFusion.Slider.setValue](#)

#### History

ColdFusion 9: Added this function

#### Parameters

Parameter	Description
name	Specifies the value of the <code>name</code> attribute in the <code>cfslider</code> tag.

#### Returns

This function does not return any value.

### Example

<h3>This is an example of the Slider.hide function. Click the Hide button to hide the slider.</h3>

```
<script language="JavaScript" type="text/javascript">
function hide() {
ColdFusion.Slider.hide('sliderID');
}
</script>
<br>
<cfform name="form01">
<br/>
<cfslider name="sliderID" format="HTML"
vertical="false" width="350"
value="100" min="0" max="200"
increment="10" tip="true"/>
<cfinput type="button" name="htmlbutton"
value="Hide" onclick="hide()" ">
</cfform>
```

## ColdFusion.Slider.show

### Description

Shows the slider control.

### Function syntax

```
ColdFusion.Slider.show(name)
```

### See also

[ColdFusion.Slider.disable](#), [ColdFusion.Slider.enable](#), [ColdFusion.Slider.getSliderObject](#), [ColdFusion.Slider.getValue](#), [ColdFusion.Slider.hide](#), [ColdFusion.Slider.setValue](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	Specifies the value of the name attribute in the cfslider tag.

### Returns

This function does not return any value.

### Example

<h3>This is an example of the Slider.show function. Click the Show Slider button to show the slider.</h3>

```
<script language="JavaScript" type="text/javascript">
function onload(){
ColdFusion.Slider.hide('sliderID');
}
function show(){
ColdFusion.Slider.show('sliderID');
}
</script>
<br>
<cfform name="form01">
<br/>
<cfslider name="sliderID" format="HTML"
vertical="false" width="350"
value="100" min="0" max="200"
increment="10" tip="true"/>
<cfinput type="button" name="htmlbutton"
value="Show Slider" onclick="show()" ">
</cfform>
```

## ColdFusion.Slider.setValue

### Description

Sets the numeric value of the slider control.

### Function syntax

```
ColdFusion.Slider.setValue(name, newValue)
```

### See also

[ColdFusion.Slider.disable](#), [ColdFusion.Slider.enable](#), [ColdFusion.Slider.getSliderObject](#), [ColdFusion.Slider.getValue](#), [ColdFusion.Slider.hide](#), [ColdFusion.Slider.show](#)

### History

ColdFusion 9: Added this function

### Parameters

Parameter	Description
name	Specifies the value of the name attribute of the cfmediaplayer tag.
newValue	The numeric value of the slider control.

### Returns

This function does not return any value.

### Example

<h3>This is an example of the Slider.setValue function. Click the Set Value button to set the pointer to a new value,150.</h3>

```
<script language="JavaScript" type="text/javascript">
function setvalue(){
ColdFusion.Slider.setValue('sliderID','150');
}
</script>
<br>
<cfform name="form01">
<br/>
<cfslider name="sliderID" format="HTML"
vertical="false" width="350"
value="100" min="0" max="200"
increment="10" tip="true"/>
<cfinput type="button" name="htmlbutton"
value="Set Value" onclick="setvalue()">
</cfform>
```

## ColdFusion.Tree.getTreeObject

### Description

Gets the underlying object for the specified HTML tree.

### Function syntax

```
ColdFusion.Tree.getTreeObject (name)
```

### See also

[cftree](#), [cfajaximport](#), [ColdFusion.Tree.refresh](#), Using HTML trees in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
name	The value of the name attribute of the cftree tag for which you want the object.

### Returns

An object of type `YAHOO.widget.TreeView`.

### Usage

Use this function to get the Yahoo User Interface Library `YAHOO.widget.TreeView` object that underlies the HTML `cftree` control. You can then use the raw object to modify the displayed tree. For documentation on the objects and how to manage them, see the [Yahoo toolkit documentation](#).

# ColdFusion.Tree.refresh

## Description

Refreshes an HTML tree and updates it with the latest values of all items.

## Function syntax

```
ColdFusion.Tree.refresh(name)
```

## See also

[cftree](#), [cfajaximport](#), [ColdFusion.Tree.getTreeObject](#), Using HTML trees in the *Developing ColdFusion Applications*

## History

ColdFusion 8: Added this function

## Parameters

Parameter	Description
name	The value of the name attribute of the <code>cftree</code> tag for which you want the object.

## Returns

An object of type `YAHOO.widget.TreeView`.

## Usage

Use this function to manually update the tree. If you populate the tree by using a bind expression, the `refresh` call causes the bind expression to be re-evaluated and repopulates the tree root nodes. Use this function any time you must get the latest data from the server independent of an event that triggers the `cftree` bind expression, for example, use this function to periodically refresh a file/folder tree to represent the status of the server.

# ColdFusion.Window.create

## Description

Creates a ColdFusion pop-up window. This function is equivalent to the `cfwindow` tag.

## Function syntax

```
ColdFusion.Window.create(name, title, URL [, configuration])
```

## See also

[cfwindow](#), [ColdFusion.Window.getWindowObject](#), [ColdFusion.Window.hide](#), [ColdFusion.Window.onHide](#), [ColdFusion.Window.onShow](#), [ColdFusion.Window.show](#), [ColdFusion.Tree.getTreeObject](#), Using pop-up windows in the *Developing ColdFusion Applications*

## History

ColdFusion 8: Added this function

## Parameters

Parameter	Description
name	The name of the window. This attribute is required to interact with the window, including to dynamically show or hide it. If a window with the specified name exists, the function shows that window, and ignores the remaining parameters; otherwise, the name must be unique on the page.
title	The text to display on the window title bar. You can use HTML mark-up to control the title appearance.
URL	The URL from which to get the window body contents. This attribute can use URL parameters to pass data to the page. ColdFusion uses standard page path resolution rules to locate the page.  <b>Note:</b> If the page specified in this attribute contains tags that use ColdFusion Ajax features, such as the <code>cfform</code> , <code>cfgrid</code> , and <code>cfpod</code> tags, identify the tags in a <code>cfajaximport</code> tag on the page that includes this function. For more information, see <a href="#">cfajaximport</a> .
configuration	An object containing window configuration parameters. For details, see "Usage".

## Returns

This function does not return a value.

## Usage

This function is equivalent to the `cfwindow` tag.

If you do not also use a `cfwindow` tag on a page that calls this function, specify a `cfajaximport` tag on the page and specify `cfwindow` in the `tags` attribute. Doing so ensures that the page includes the necessary JavaScript to create the window. For example, use the following line if you do not have to import the JavaScript for any other ColdFusion Ajax features.:

```
<cfajaximport tags="cfwindow">
```

The *configuration* parameter defines the window characteristics; it can have any or all the following entries:

Entry	Default	Description
callbackhandler		A function that is called when the window body loads. This function must not take any arguments.
center	false	A Boolean value that specifies whether to center the window over the browser window. <ul style="list-style-type: none"><li>If <code>true</code>, ColdFusion ignores the <code>x</code> and <code>y</code> attribute values.</li><li>If <code>false</code>, and you do not specify <code>x</code> and <code>y</code> attributes, ColdFusion centers the window.</li></ul>
closable	true	A Boolean value that specifies whether the user can close the window. If <code>true</code> , the window has an X close icon.
draggable	true	A Boolean value that specifies whether the user can drag the window. To drag the window, click the mouse on the title bar and hold the button down while dragging. If the window does not have a title, users cannot drag it.
errorHandler		A function that is called if an error occurs in loading the window body. This function must take two arguments: <ul style="list-style-type: none"><li>The HTTP status code, or -1 if the error is not an HTTP error</li><li>An error message</li></ul>
height	300	Height of the window in pixels. If you specify a value greater than the available space, the window occupies the available space and the resize handles do not appear.
initshow	false	A Boolean value that specifies whether to display the window when the containing page first displays. If this value is <code>false</code> , use the <code>ColdFusion.Window.show</code> JavaScript function to display the window.

Entry	Default	Description
minheight	0	The minimum height, in pixels, to which users can resize the window. Specifying this parameter and a <code>resizable="false"</code> parameter causes an error.
minwidth	0	The minimum width, in pixels, to which users can resize the window. Specifying this parameter and a <code>resizable="false"</code> parameter causes an error.
modal	false	A Boolean value that specifies whether the window is modal, that is, whether the user can interact with the main window while this window is displaying. If <code>true</code> , the user <i>cannot</i> interact with the main window.
resizable	true	A Boolean value that specifies whether the user can resize the window.
width	500	Width of the window in pixels. If you specify a value greater than the available space, the window occupies the available space and the resize handles do not appear.
x		The X (horizontal) coordinate of the upper-left corner of the window, relative to the browser window. ColdFusion ignores this attribute if the <code>center</code> attribute value is <code>true</code> , and if you do not set the <code>y</code> attribute value.
y		The Y (vertical) coordinate of the upper-left corner of the window, relative to the browser window. ColdFusion ignores this attribute if the <code>center</code> attribute value is <code>true</code> , and if you do not set the <code>x</code> attribute value.

**Note:** Entry names in the configuration object must be all-lowercase.

### Example

The following minimal CFML application creates a window and gets the window contents from the `hello1.cfm` file.

```
<cfajaximport tags="cfwindow">

<cfform name="test">
    <cfinput type="button" name="x" value="Create Window"
        onClick="ColdFusion.Window.create('Window1', 'This is a CF window',
            'http://localhost:8500/My_stuff/AjaxUI/Book/hello1.cfm',
            {x:100,y:100,height:300,width:400,modal:false,closable:false,
            draggable:true,resizable:true,center:true,initshow:true,
            minheight:200,minwidth:200 }) ">
</cfform>
```

The `hello1.cfm` file can be as simple as the following line:

```
Hello from hello1.cfm
```

## ColdFusion.Window.getWindowObject

### Description

Gets the underlying object for the specified window.

### Function syntax

```
ColdFusion.Window.getWindowObject (name)
```

### See also

[cfwindow](#), [ColdFusion.Window.create](#), [ColdFusion.Window.hide](#), [ColdFusion.Window.onHide](#), [ColdFusion.Window.onShow](#), [ColdFusion.Window.show](#), [ColdFusion.Tree.getTreeObject](#), Using pop-up windows in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
name	The value of the name attribute of the cfwindow tag for which you want the object.

### Returns

An object of type `Ext.BasicDialog`.

### Usage

Use this function to get the Ext JavaScript Library `Ext.BasicDialog` object that underlies the HTML `cfwindow` control. You can then use the raw object to modify the displayed window. For documentation on the objects and how to manage them, see the [Ext JavaScript library documentation](#).

## ColdFusion.Window.hide

### Description

Hides a window that is currently displayed.

### Function syntax

```
ColdFusion.Window.hide (name)
```

### See also

[cfwindow](#), [ColdFusion.Window.create](#), [ColdFusion.Window.getWindowObject](#), [ColdFusion.Window.onHide](#), [ColdFusion.Window.onShow](#), [ColdFusion.Window.show](#), [ColdFusion.Tree.getTreeObject](#), Using pop-up windows in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
name	The name attribute of the window to hide.

### Returns

This function does not return a value.

### Usage

This tag has no effect if the window is already hidden.

### Example

The following code lets you show and hide a window by clicking buttons:

```
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
</head>
<body>

<cfwindow name="testWindow" initshow=true title="test window" closable=true>
    Window contents
</cfwindow>

<cfform>
    <cfinput name="hidebutton" type="button" value="Hide Window"
        onclick="javascript:ColdFusion.Window.hide('testWindow');"/>
    <cfinput name="showbutton" type="button" value="Show Window"
        onclick="javascript:ColdFusion.Window.show('testWindow');"/>
</cfform>
</body>
</html>
```

## ColdFusion.Window.onHide

### Description

Specifies a function to run each time a specific window hides.

### Function syntax

```
ColdFusion.Window.onHide(windowName, handler)
```

### See also

[cfwindow](#), [ColdFusion.Window.create](#), [ColdFusion.Window.getWindowObject](#), [ColdFusion.Window.hide](#), [ColdFusion.Window.onShow](#), [ColdFusion.Window.show](#), [ColdFusion.Tree.getTreeObject](#), [Using pop-up windows](#) in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
<code>windowName</code>	The name of the window. The handler function runs whenever this window hides.
<code>handler</code>	The JavaScript function to run when the window hides.

### Returns

This function does not return a value.

### Usage

The function specified in the *handler* parameter can optionally take one parameter, which contains the window name.

### Example

The following example uses the `ColdFusion.Window.onHide` function to display an alert with information about the window when you click a button that hides the window:

```
<head>
  <script language="javascript">
    function onhide(name) {
      alert("window hidden = " + name);
    }

    function test() {
      ColdFusion.Window.onHide("testWindow", onhide);
      ColdFusion.Window.hide("testWindow");
    }
  </script>
</head>
<body>

<cfwindow name="testWindow" initshow=true title="test window"
closable=true>
  Window contents
</cfwindow>

<cfform>
  <cfinput name="button" value="Hide Window" onclick="javascript:test()" type="button"/>
</cfform>
</body>
</html>
```

## ColdFusion.Window.onShow

### Description

Specifies a function to run each time a specific window shows, including when you create a window and specify an `initShow` attribute or configuration entry value of `true`.

### Function syntax

```
ColdFusion.Window.onShow(windowName, handler)
```

### See also

[cfwindow](#), [ColdFusion.Window.create](#), [ColdFusion.Window.getWindowObject](#), [ColdFusion.Window.hide](#), [ColdFusion.Window.onHide](#), [ColdFusion.Window.show](#), [ColdFusion.Tree.getTreeObject](#), [Using pop-up windows](#) in the *Developing ColdFusion Applications*

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
windowName	The name of the window. The handler function runs whenever this window shows.
handler	The JavaScript function to run when the window shows.

### Returns

This function does not return a value.

### Usage

The function specified in the *handler* parameter can optionally take one parameter, which contains the window name.

One use for this function is to fetch window data only when the window shows. You could use a `cfajaxproxy` tag to create a JavaScript proxy for a CFC function that provides the data, and then a `ColdFusion.Window.onShow` function to specify a function that calls the proxy function and updates the window contents with the new data.

### Example

The following example uses the `ColdFusion.Window.onShow` function to display an alert with information about the window when you click a button that shows the window:

```
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
  <script language="javascript">
    function onshow(name) {
      alert("window shown = " + name);
    }

    function test() {
      ColdFusion.Window.onShow("testWindow", onshow);
      ColdFusion.Window.show("testWindow");
    }
  </script>
</head>
<body>

<cfwindow name="testWindow" initshow=false title="test window"
  closable=true>
  Window contents
</cfwindow>

<cfform>
  <cfinput name="button" value="show Window" onclick="javascript:test()" type="button"/>
</cfform>
</body>
</html>
```

## ColdFusion.Window.show

### Description

Shows a window that is currently hidden.

### Function syntax

```
ColdFusion.Window.show(name)
```

### See also

[cfwindow](#), [ColdFusion.Window.create](#), [ColdFusion.Window.getWindowObject](#), [ColdFusion.Window.hide](#), [ColdFusion.Window.onHide](#), [ColdFusion.Window.onShow](#), [ColdFusion.Tree.getTreeObject](#), [Using pop-up windows in the \*Developing ColdFusion Applications\*](#)

### History

ColdFusion 8: Added this function

### Parameters

Parameter	Description
name	The name attribute of the window to show.

### Returns

This function does not return a value.

### Usage

This function shows a window that you created with an `initShow` attribute or parameter value of `false`, or that you hid by calling the `ColdFusion.Window.hide` function. It does not show a window that a user closed by clicking the `x` icon on the title bar.

This function has no effect if the window is already shown.

### Example

See the example at [ColdFusion.Window.hide](#)

## JavaScript Functions in ColdFusion 9 Update 1

The following are the Ajax JavaScript functions added in this release:

### ColdFusion.Autosuggest.getAutosuggestObject

#### Description

Lets you access underlying YUI AutoComplete object thereby providing fine-grained control over the object, for example attaching an event.

#### Returns

The underlying AutoComplete object.

#### Function syntax

```
ColdFusion.Autosuggest.getAutosuggestObject (Id)
```

### Parameters

- `Id`: Name of the auto-suggest object.

### Example

```
<html>
  <!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">
  <head>
    <cfajaximport tags="cfinput-autosuggest">
    <script>
      var init = function()
      {
        autosuggestobj = ColdFusion.Autosuggest.getAutosuggestObject('state');
        autosuggestobj.itemSelectEvent.subscribe(foo);
      }
      var foo = function(event,args)
      {
        var msg = "";
        msg = msg + "Event: " + event + "\n\n";
        msg = msg + "Selected Item: " + args[2] + "\n\n";
        msg = msg + "Index: " + args[1]._nItemIndex + "\n\n";
        alert(msg);
      }
      var getStates = function(){
        return
["California","Connecticut","Colorado","Illinois","Alabama","Iowa","Utah","Alaska"];
      }
    </script>
  </head>
  <body>
    <h3>Attaching an event handler to the autosuggest object</h3>
    <cfform name="mycfform" method="post" >
      State:<BR>
      <cfinput
        type="text"
        name="state"
        autosuggest="javascript:getStates({cfautosuggestvalue})"
        autosuggestMinLength=1
        autosuggestBindDelay=1>
      <cfset ajaxOnLoad("init")>
    </cfform>
  </body>
</html>
```

## ColdFusion.Layout.disableSourceBind

### Description

Disables the source bind.

### Function syntax

`ColdFusion.Layout.disableSourceBind(Id)`

### Parameters

- `Id`: Name of the layout area.

### Usage

Assume that you are using `Coldfusion.navigate` to populate content into tab or accordion panels. You can have instances where content comes from the source bind call if the `source` attribute is defined for `cflayoutarea` (and is not from `ColdFusion.navigate`).

In such instances, you might disable the source bind to get content using `Coldfusion.navigate`.

### Example

`layout.cfm` uses the templates `Tab1_Src.cfm`, `Tab2_Src.cfm`, and `Tab3_Src.cfm`. If you run `layout.cfm`, you notice that clicking

- `navigate` populates content of `tab2_src.cfm` instead of `navigate.cfm`
- Disable Source bind ensures that the content of `navigate.cfm` is populated in `tab2_src`
- Enable Source Bind and then clicking `tab2_src` would again populate the content of `tab2_src`

#### Tab1\_Src.cfm

```
<br><cfdump var="#CGI#" keys="15" label="[CGI scope]"><br>
```

#### Tab2\_Src.cfm

```
<br><cfdump var="#server#" label="[Server scope]"><br>
```

#### Tab3\_Src.cfm

```
<br><cfdump var="#server.coldfusion#" label="[Showing key coldfusion in server scope]"><br>
```

#### Tab4\_Src.cfm

```
<br><cfdump var="#server.os#" label="[Showing key OS in server scope]"><br>
```

### layout.cfm

```
<script>
    var navigateToTab = function(layoutId,tabId){
        alert("Navigating to " + tabId);
        ColdFusion.Layout.selectTab(layoutId,tabId);
        ColdFusion.navigate('navigate.cfm',tabId);
    }
    var disableBind = function(tabId){
        alert("Disabling binding on source for " + tabId);
        ColdFusion.Layout.disableSourceBind(tabId);
    }
    var enableBind = function(tabId){
        alert("Enabling binding on source for " + tabId);
        ColdFusion.Layout.enableSourceBind(tabId);
    }
</script>
<cflayout type="tab" name="layout1">
    <cflayoutarea
        name = "tab1"

## ColdFusion.Layout.enableSourceBind

### Description

If disabled, enables the source bind.

### Function syntax

`ColdFusion.Layout.enableSourceBind(Id)`

### Parameters

- `Id`: Name of the layout area.

### Usage

See usage in [ColdFusion.Layout.disableSourceBind](#).

### Example

See example in [ColdFusion.Layout.disableSourceBind](#).

## ColdFusion.FileUpload.getSelectedFiles

### Description

Returns an array of objects containing the filename and size of the files selected for upload. The file size is returned in bytes.

The function also returns file upload status as YES|NO|Error.

## Function syntax

`ColdFusion.FileUpload.getSelectedFiles(Id)`

## Parameters

- **Id:** Name of the `cffileupload` control.

## Usage

In a real life scenario, you normally use the uploader with other controls. For example, a form with three fields: name, email, and uploader. Assume that you upload the files, but forget to click Submit or you select the files, submit the form, but forget to click Upload.

You can use this function to inform the user that there are files that have been selected for upload and provide the following details:

- **FILENAME:** Name of the file selected for upload.
- **SIZE:** Size of the file in bytes.
- **STATUS:** YES|NO|Error; YES indicates a successful upload, NO indicates that the upload is yet to occur, and Error indicates that an exception has occurred during the upload operation.

## Example

The following example illustrates a scenario where the user clicks Submit and is informed about the files selected for upload:

```
<html>
<head>
  <script language="javascript">
    var formatNumber = function(num){
      if(num < 1024) return num + " bytes";
      if(num < (1024 * 1024)) return (num/1024).toFixed(2) + " KB";
      if(num < (1024 * 1024 * 1024)) return (num/(1024 * 1024)).toFixed(2) + " MB";
      return (num/(1024 * 1024 * 1024)).toFixed(2) + " GB";
    }
    var getSelectedList = function(id){
      var files = ColdFusion.FileUpload.getSelectedFiles(id);
      var fileslist = "";
      if(files.length)
        fileslist = "You have selected The following files for upload: \n\n";
      for(var i=0;i < files.length; i++){
        fileslist = fileslist + files[i].FILENAME + " (" + formatNumber(files[i].SIZE)
+ " )"
        if(i != files.length-1)
          fileslist = fileslist + "\r\n";
      }
      if(files.length)
      {
        alert(fileslist);
      }
    }
  </script>
</head>
```

```
        }  
    }  
    </script>  
</head>  
<body>  
<br>  
<cfform name="frmUpload" method="POST">  
    First Name: <cfinput type="text" name="fname" value=""><br>  
    Last Name: <cfinput type="text" name="lname" value=""><br><br>  
    <cffileupload  
        url="uploadAll.cfm"  
        name="myuploader1"  
        hideUploadButton=false  
        onUploadComplete="foo"  
    /><br><br>  
    <cfinput type="button" name="submitForm2" value="Submit"  
    onClick="getSelectedList('myuploader1') ">  
</cfform>  
</body>  
</html>
```

## Coldfusion.fileUpload.setUrl

### Description

Used to set URL for the fileupload control dynamically.

### Returns

Nothing

### Function syntax

```
ColdFusion.fileUpload.setUrl(id, url)
```

### Parameters

- **id**: Name of upload control.
- **url**: URL can be an absolute URL, relative URL, or fully qualified URL.

### Example

```
<script language="javascript">
    var uploadDone = function(result){
        alert("File uploaded");
    }

    var setUploadUrl = function(id)
    {
        var selectedFiles = ColdFusion.FileUpload.getSelectedFiles(id);
        var uploadUrl = "/manual/ajaxui/cffileupload/setUrl/includes/_uploadall.cfm";
        alert("Upload URL : " + uploadUrl);
        if(selectedFiles.length){
            ColdFusion.FileUpload.setURL(id,uploadUrl);
            ColdFusion.FileUpload.startUpload(id);
        }
    }
    var callbackhandler = function(obj)
    {
        var fileName = obj["FILENAME"];
        var status = obj["STATUS"];
        var message = obj["MESSAGE"];
        var msg = "In callbackhandler()" + "\n\n" +
            "FILENAME: " + fileName + "\n\n" +
            "STATUS: " + status + "\n\n" +
            "MESSAGE: " + message
        alert(msg);
    }
    var errorHandler = function()
    {
        alert("In errorHandler()");
    }
    var uploadcompleted = function()
    {
        alert("All files have been uploaded successfully");
    }
</script>
<cfform name="frmUpload">
    <br>
    <cffileupload name="uploader" hideuploadbutton="true" onComplete="uploadDone"
    onError="errorhandler" onUploadComplete="uploadcompleted">
    <br>
    <cfinput type="button" name="submit" value="Click to set URL and Upload Files"
    onClick="setUploadUrl('uploader')">
</cfform>
```

## ColdFusion.grid.getSelectedRows

### Description

Used to fetch data for the selected rows in the grid.

### Returns

An array of objects that contains row data.

### Function syntax

```
ColdFusion.grid.getSelectedRows(id)
```

### Parameters

- `id`: Name of the grid defined using `cfgrid`.

### See also

[FileUpload](#)

### Usage

See the example in [ColdFusion.grid.clearSelectedRows](#).

### Example

See the example in [ColdFusion.grid.clearSelectedRows](#).

## ColdFusion.grid.clearSelectedRows

### Description

Used to clear the selected rows in the grid.

### Returns

Nothing

### Function syntax

```
ColdFusion.grid.clearSelectedRows(id)
```

### Parameters

- `id`: Name of the grid defined using `cfgrid`.

### Usage

See the following example.

### Example

`Employee.cfm`

```
<html>
<head>
  <!DOCTYPE html PUBLIC "-//W3C//DTD XHTML 1.0 Transitional//EN"
"http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">

name="clearRows" value="Clear Selected Rows">
    <cfinput type="button" onClick="javascript:deleteAllSelectedRows('empListing')"
name="deleteRows" value="Delete Selected Rows">
</cform>
</body>
</html>

```

### Employee.cfc

```

<cfcomponent>
    <cfscript>
        empQuery = new query(name="emps", datasource="cfdocexamples");
        remote any function
getEmployees(page,pagesize,gridsortcolumn="EMP_ID",gridsortdirection="ASC",empName)
    {
        var orderBy = "EMP_ID";
        var mysql = "SELECT Emp_ID, FirstName, LastName, EMAIL, Department, Email FROM
Employees";
        if(isdefined("arguments.empName") and trim(arguments.empName) neq ""){
            mysql = mysql & " WHERE " & "firstname = '#arguments.empName#'";
        }
        if(arguments.gridsortcolumn eq ""){
            mysql = mysql & " ORDER BY " & orderBy;
        }
        mysql = mysql & " " & gridsortdirection;
        return QueryConvertForGrid(empQuery.execute(sql=mysql).getResult(), page,
pageSize);
    }
    remote void function editEmployees(gridaction,gridrow,gridchanged)
    {
        switch(gridaction)
        {
            case "I":
            {
                var eFName = gridrow["FIRSTNAME"];
                var eLName = gridrow["LASTNAME"];
                var eDept = gridrow["DEPARTMENT"];
                var eEmail = gridrow["EMAIL"];
                var insertSql = "insert into
Employees(FirstName,LastName,Department,Email) values (" & "'" & eFName & "', '" & eLName &
'", '" & eDept & "', '" & eEmail & "')";
                empQuery.execute(sql=insertSql);
                break;
            }
        }
    }

```

```
    }
    case "U":
    {
        var empId = gridrow["EMP_ID"];
        var changedCol = structkeylist(gridchanged);
        var updateSql = "UPDATE Employees SET " & changedCol & "='" &
gridchanged[changedCol] & "' WHERE emp_id=" & empId;
        empQuery.execute(sql=updateSql);
        break;
    }
    case "D":
    {
        deleteEmployees(gridrow);
    }
}
}
remote void function deleteEmployees(empdata)
{
    var i = 1;
    var emp = {};
    if(isArray(empdata) and not ArrayIsEmpty(empdata)){
        for(emp in empdata){
            if(isStruct(emp) and structkeyexists(emp,"emp_id")){
                empid = emp["emp_id"];
                writelog("deleting " & empid);
                //var deleteSql = "delete from Employees where emp_id=" & empid;
                //empQuery.execute(sql=deleteSql);
            }
        }
    }
}

</cfscript>
</cfcomponent>
```

In this example, setting `multirowselect=true` enables performing of batch operations on grid data, such as deleting multiple records.

In the `deleteemployees` functions, two lines have been commented out to prevent accidental deletion of data (since it is a batch operation). To see deletion, uncomment the code.

The form has a `deleteAllSelectedRows` button that illustrates how records can be deleted externally. That is, without using the delete button built in to the grid. The same approach can be used to perform other batch operations such as moving multiple files to another folder or batch updates.

**Note:** Set the `httpMethod` to `POST` on the `Proxy` object carefully to avoid "request URI too large" errors as shown in the `deleteAllSelectedRows` method in `Employee.cfm`.

## ColdFusion.Map.show

### Description

Shows the map if it is hidden.

### Function syntax

```
ColdFusion.Map.show(Id)
```

### Parameters

- `Id`: Name of the map.

### Example

```
<script>
    function showMap(mapId)
    {
        ColdFusion.Map.show(mapId);
    }

    function hideMap(mapId)
    {
        ColdFusion.Map.hide(mapId);
    }
</script>
<a href="#" id="a1" onclick="return showMap('mainMap')">Show Map</a> | <a href="#" id="a1"
onclick="return hideMap('mainMap')">Hide Map</a>
<cfmap
    zoomlevel = "12"
    name = "mainMap"
    showcentermarker= "true"
    centeraddress = "The Key Learning centre, Oxford, UK"
    title="Venue Address"
    hideborder=false
    collapsible=true
    initShow=false/>
```

## ColdFusion.Map.hide

### Description

If displayed, hides the map.

### Function syntax

```
ColdFusion.Map.hide(Id)
```

### Parameters

- `Id`: Name of the map.

### Example

See example in [ColdFusion.Map.show](#)

## ColdFusion.Map.refresh

### Description

Reloads the map.

### Function syntax

```
ColdFusion.Map.refresh (Id)
```

### Parameters

- `id`: Name of the map.

### Usage

If the map is embedded within spry collapsible panels or divs that are hidden on display, that is the map container is displayed while the actual map is hidden, use this function to force the map to display.

### Example

```
<script type="text/javascript"
src="/CFIDE/scripts/ajax/spry/includes_minified/SpryCollapsiblePanel.js" ></script>
<link type="text/css"
href="/CFIDE/scripts/ajax/spry/widgets/collapsiblepanel/SpryCollapsiblePanel.css"
rel="stylesheet">
<div id="cp" class="CollapsiblePanel" style="width:500px;">
    <div class="CollapsiblePanelTab" tabindex="0">SHOW MAP</div>
    <div class="CollapsiblePanelContent">
        <cfmap
            width="500"
            height="200"
            zoomlevel="12"
            name="mainMap"
            markercolor="333444"
            showscale="false"
            typecontrol="none"
            showcentermarker="true"
            centeraddress="The Key Learning centre, Oxford, UK"
        >
        </cfmap>
    </div>
</div>
<script type="text/javascript">
    var myTabClick = function()
    {
        !cpanel.isOpen() ? cpanel.open() : cpanel.close();
        cpanel.focus();
        ColdFusion.Map.refresh('mainMap');
    }
    var cpanel = new Spry.Widget.CollapsiblePanel("cp", {contentIsOpen:false});
    cpanel.onTabClick = myTabClick;
</script>
```

## ColdFusion.Grid.getTopToolbar

### Description

Gets the top toolbar that can be used to add a control, for example icon or button.

### Function syntax

```
ColdFusion.getTopToolbar(id)
```

### Parameters

- `id`: Name of the grid.

### Example

See example in [ColdFusion.Grid.refreshBottomToolbar](#).

## ColdFusion.Grid.getBottomToolbar

### Description

Gets bottom toolbar that can be used to add a control, for example icon or button.

### Function syntax

```
ColdFusion.Grid.getBottomToolbar(Id)
```

### Parameters

- `Id`: Name of the grid.

### Example

See example in [ColdFusion.Grid.refreshBottomToolbar](#).

## ColdFusion.Grid.showTopToolbar

### Description

Displays the top toolbar that can be used to add a control, for example icon or button.

### Function syntax

```
ColdFusion.Grid.showTopToolbar(Id)
```

### Parameters

- `Id`: Name of the grid.

### Example

See example in [ColdFusion.Grid.refreshBottomToolbar](#).

## ColdFusion.Grid.hideTopToolbar

### Description

Hides the top toolbar that can be used to add a control, for example icon or button.

### Function syntax

```
ColdFusion.Grid.hideTopToolbar(Id)
```

### Parameters

- `Id`: Name of the grid.

### Example

See example in [ColdFusion.Grid.refreshBottomToolbar](#).

## ColdFusion.Grid.showBottomToolbar

### Description

Shows bottom toolbar that can be used to add a control, for example icon or button.

### Function syntax

```
ColdFusion.Grid.showBottomToolbar (Id)
```

### Parameters

- `Id`: Name of the grid.

### Example

See example in [ColdFusion.Grid.refreshBottomToolbar](#).

## ColdFusion.Grid.hideBottomToolbar

### Description

Hides the bottom toolbar that can be used to add a control, for example icon or button.

### Function syntax

```
ColdFusion.Grid.hideBottomToolbar (Id)
```

### Parameters

- `Id`: Name of the grid.

### Example

See example in [ColdFusion.Grid.refreshBottomToolbar](#).

## ColdFusion.Grid.refreshTopToolbar

### Description

Refreshes the top toolbar that can be used to add a control, for example icon or button. This function internally calls the JavaScript function [ColdFusion.Grid.showTopToolbar](#).

### Function syntax

```
ColdFusion.Grid.refreshTopToolbar (Id)
```

### Parameters

- `Id`: Name of the grid.

### Example

See example in [ColdFusion.Grid.refreshBottomToolbar](#).

## ColdFusion.Grid.refreshBottomToolbar

### Description

Refreshes the bottom toolbar that can be used to add a control, for example icon or button. This function internally calls the JavaScript function [ColdFusion.Grid.showBottomToolbar](#).

### Function syntax

`ColdFusion.Grid.refreshBottomToolbar(Id)`

### Parameters

- `Id`: Name of the grid control.

### Example

grid.cfc

```
<cfcomponent>
    <cfscript>
        remote any function
getEmployees(page,pageSize,gridsortcolumn="EMP_ID",gridsortdirection="ASC"){
    var startRow = (page-1)*pageSize;
    var endRow = page*pageSize;

    if(!isdefined("arguments.gridsortcolumn") or
isdefined("arguments.gridsortcolumn") and trim(arguments.gridsortcolumn) eq "")
        gridsortcolumn = "EMP_ID";
    if(!isdefined("arguments.gridsortdirection") or
isdefined("arguments.gridsortdirection") and arguments.gridsortdirection eq "")
        gridsortdirection = "ASC";

# Chapter 6: Script Functions Implemented as CFCs

Script functions are added in ColdFusion 9. They are implemented as ColdFusion Components. These functions extend the usage of the tags `cfmail`, `cfpdf`, `cfquery`, `cfhttp`, `cfstoredproc`, and `cfftftp` to CFScript.

## More Help topics

[“Script functions implemented as CFCs in ColdFusion 9 Update 1”](#) on page 1432

## Accessing the functions

Script functions are available in the following location: `cf_root\CustomTags\com\adobe\coldfusion`.

Ensure that you do not delete the default custom tag mapping listed in the ColdFusion Administrator (Extensions > Custom Tag Paths > Custom tag mappings).

Script functions work if they are either in the default location or web root. If you have the functions in any other location, add a `/com` mapping in the ColdFusion Administrator that points to the new location (for example `C:\com`).

**Note:** *Values of the attributes set in a service action, for example, `mail.send(body="test mail")` are transient in nature. They are not accessible after the action completes. Accessing the attributes using implicit getters results in error whereas any attributes set using either implicit setters or the `init` method call are retained and can be accessed using implicit getters.*

## Function summary

The following table lists the script functions and the equivalent ColdFusion tag.

Function	Equivalent ColdFusion Tag
<code>ftp</code>	<code>cfftftp</code>
<code>http</code>	<code>cfhttp</code>
<code>mail</code>	<code>cfmail</code>
<code>pdf</code>	<code>cfpdf</code>
<code>query</code>	<code>cfquery</code>
<code>storedproc</code>	<code>cfstoredproc</code>

## ftp

### Description

Used to implement File Transfer Protocol (FTP) operations using CFScript.

## Syntax

Mode	Syntax
Creating the service	<pre>new ftp()</pre> <p>or</p> <pre>createObject("component", "ftp")</pre>
Initializing the attributes	<p>Any one of the following:</p> <ul style="list-style-type: none"> <li>• <code>ftpService=new ftp(<b>attribute-value pair</b>)</code></li> <li>• <code>ftpService.setAttributes(<b>attribute-value pair</b>)</code></li> <li>• <code>ftpService.set<b>AttributeName</b>(attribute_value)</code></li> <li>• <code>ftpService.<b>action_method</b>(<b>attribute-value pair</b>)</code></li> </ul>
Executing the service action	<code>ftpService.<b>action_method</b>(<b>attribute-value pair</b>)</code>

## Properties

<code>actionparam</code>	<code>bufferSize</code>	<code>connection</code>	<code>passive</code>
<code>password</code>	<code>port</code>	<code>proxyserver</code>	<code>retrycount</code>
<code>server</code>	<code>stoponerror</code>	<code>timeout</code>	<code>username</code>
<code>fingerprint</code>	<code>key</code>	<code>passphrase</code>	<code>secure</code>
<code>ASCIIExtensionList</code>	<code>directory</code>	<code>existing</code>	<code>failifexists</code>
<code>item</code>	<code>localfile</code>	<code>name</code>	<code>new</code>
<code>remotefile</code>	<code>result</code>	<code>transfermode</code>	<code>allosize</code>

All attributes supported by the tag `cffftp` can be used as attribute-value pairs. For example,

```
<cffftp userName="myUserName">
```

can be used as

```
ftpService.setUserName("myUserName");
```

For details, see the Attributes section for the `cffftp` tag.

## History

ColdFusion 9: Added this function.

## Methods

The following FTP actions are available as methods. All methods have similar arguments and syntax.

<code>open</code>	<code>close</code>	<code>quote</code>	<code>site</code>
<code>allo</code>	<code>acct</code>	<code>changeDir</code>	<code>createDir</code>
<code>listDir</code>	<code>removeDir</code>	<code>getFile</code>	<code>putFile</code>
<code>rename</code>	<code>remove</code>	<code>getCurrentDir</code>	<code>getCurrentUrl</code>
<code>existDir</code>	<code>existsFile</code>	<code>exists</code>	

  

Description	All methods correspond to the FTP actions supported by the tag <code>cffftp</code> . For details of each method, refer to the relevant section for the tag <code>cffftp</code> .
-------------	--

Returns	All methods return a component with the following properties set: <ul style="list-style-type: none"> <li>• <code>prefix</code>: Equivalent to the <code>result</code> attribute or <code>cfftp</code> scope</li> <li>• <code>result</code>: Applicable only for <code>action="listdir"</code></li> </ul>
Syntax	<code>ftpService.<b>methodName</b>(<i>attribute-value pair</i>)</code>
Arguments	All attributes supported by the tag <code>cfftp</code> .

- `setAttributes`

Description	Sets attributes for the <code>ftp</code> function.
Returns	Nothing
Syntax	<code>ftpService.<b>setAttributes</b> (<i>attribute-value pair</i>)</code>
Arguments	All attributes supported by the tag <code>cfftp</code> .

- `getAttributes`

Description	Gets the attributes that were set for the <code>ftp</code> function.
Returns	Returns a struct with all or some attribute values.
Syntax	<code>ftpService.<b>getAttributes</b> (<i>attributelist</i>)</code>
Arguments	A comma-separated list of attributes. If no list is specified, all defined attributes are returned.

- `clear`

Description	Removes all attributes added for the <code>ftp</code> function.
Returns	Nothing
Syntax	<code>ftpService.<b>clear</b>()</code>
Arguments	None

## Usage

This function corresponds to the `cfftp` tag. For details, see the Usage section for the tag `cfftp`.

## Example

```
<cfscript>
    /* Create a new ftp Service*/
    ftpService = new ftp();
    /* Set attributes using implicit setters */
    ftpService.setUsername("myUsername");
    ftpService.setPassword("myPassword");
    ftpService.setServer("myFtpServer");
    ftpService.setStopOnError("true");
    ftpService.setConnection("conn");
    /* Open connection to ftp server */
    WriteOutput("<h4>Open a connection</h4>");
    result = ftpService.open();
    WriteOutput("<p>Did it succeed? " & result.getPrefix().succeeded & "<br></p>");
    /* Get current directory */
    WriteOutput("<h4>Get current directory</h4>");
    result = ftpService.getCurrentDir();
    WriteOutput("<p>Current Directory: " & "" & result.getPrefix().returnValue & "" &
"<br></p>");
    /* List contents of the current directory */
    WriteOutput("<h4>List directory contents</h4>");
    result = ftpService.listdir(directory = "/",name="listDirs");
    displayListing(result.getResult());
    /* Move a file to the ftp server */
    WriteOutput("<h4>Move File to Remote Server</h4>");
    lFile = "C:\temp\artifacts.xml";
    rFile = "artifacts.xml";
    result = ftpService.putFile(transferMode="binary", localfile=lFile, remoteFile=rFile);
    WriteOutput("<p>Did it succeed? " & result.getPrefix().succeeded & "<br></p>");
    /* Close connection to the ftp server */
    WriteOutput("<h4>Close the connection</h4>");
    ftpService.close(connection="conn");
    WriteOutput("<p>Did it succeed? " & result.getPrefix().succeeded & "<br></p>");
</cfscript>
<cffunction name="displayListing" hint="display ftp files">
    <cfargument name="filesToList" required="true">
    <cftable query = "filesToList" HTMLTable = "Yes" colHeaders = "Yes" border="1"
maxrows="10">
        <cfcol header = "<b>Name</b>" text = "#name#">
        <cfcol header = "<b>Path</b>" text = "#path#">
        <cfcol header = "<b>URL</b>" text = "#url#">
        <cfcol header = "<b>Length</b>" text = "#length#">
        <cfcol header = "<b>LastModified</b>"
            text = "#DateFormat(lastmodified)#">
        <cfcol header = "<b>IsDirectory</b>" text = "#isdirectory#">
    </cftable>
</cffunction>
```

# http

## Description

Used in CFScript to generate an HTTP request and handle the response from the server.

## Syntax

Mode	Syntax
Creating the service	<code>new http()</code>  or  <code>createObject ("component", "http")</code>
Initializing the attributes	Any one of the following: <ul style="list-style-type: none"><li>• <code>httpService=new http(<i>attribute-value_pair</i>)</code></li><li>• <code>httpService.setAttributes(<i>attribute-value_pair</i>)</code></li><li>• <code>httpService.setAttributeName(<i>attribute_value</i>)</code></li><li>• <code>httpService.send(<i>attribute-value_pair</i>)</code></li></ul>
Executing the service action	<code>httpService.send(<i>attribute-value_pair</i>)</code>

## Properties

<code>url</code>	<code>charset</code>	<code>clientcert</code>	<code>clientcertpassword</code>
<code>columns</code>	<code>delimiter</code>	<code>file</code>	<code>firstrowasheaders</code>
<code>getasbinary</code>	<code>method</code>	<code>multipart</code>	<code>multiparttype</code>
<code>name</code>	<code>password</code>	<code>path</code>	<code>port</code>
<code>proxyserver</code>	<code>proxyport</code>	<code>proxyuser</code>	<code>proxypassword</code>
<code>redirect</code>	<code>resolveurl</code>	<code>result</code>	<code>textqualifier</code>
<code>throwonerror</code>	<code>timeout</code>	<code>useragent</code>	<code>username</code>

All attributes supported by the tag [cfhttp](#) can be used as attribute-value pairs. For example,

```
<cfhttp name="onerow">
```

can be used as

```
httpService.setName("onerow");
```

For details of the attributes, see the Attributes section for the tag [cfhttp](#).

## See also

[cfhttp](#), [Function summary](#)

## History

ColdFusion 9: Added this function.

## Methods

- `addParam`

Description	Used to add <a href="#">cfhttpparam</a> tags. For example, to specify http POST operations in CFScript. Specifies parameters to build an HTTP request.
Syntax	<code>httpService.addParam(<i>attribute-value pair</i>)</code>
Returns	Nothing
Arguments	All attributes supported by <a href="#">cfhttpparam</a> tag can be used as attribute-value pairs.

- `send`

Description	Used to generate an HTTP request and handle the response from the server.
Returns	A component on which the following methods can be invoked: <ul style="list-style-type: none"> <li><code>getResult()</code> : To access the query object returned by the server if a name attribute is specified.</li> <li><code>getPrefix()</code> : To access the <code>cfhttp</code> scope. This is equivalent to the <code>result</code> attribute of the <code>cfhttp</code> tag.</li> </ul>
Syntax	<code>httpService.send(attribute_value pair)</code>
Arguments	All attributes supported by the <code>cfhttpparam</code> tag.

- `setAttributes`

Description	Sets attributes for the <code>http</code> function.
Returns	Nothing
Syntax	<code>httpService.setAttributes(attribute-value pair)</code>
Arguments	All arguments supported by the <code>cfhttp</code> tag.

- `getAttributes`

Description	Gets attributes that were set for the <code>http</code> function.
Returns	Returns a struct with all or some of the service tag attribute values.
Syntax	<code>httpService.getAttributes(attribute_list)</code>
Arguments	A comma-separated list of attributes. If no list is specified, all defined attributes are returned.

- `clearAttributes`

Description	Removes all attributes added for the <code>http</code> function.
Returns	Nothing
Syntax	<code>httpService.clearAttributes(attribute_list)</code>
Arguments	A comma-separated list of attributes.

- `clearParams`

Description	Removes <code>cfhttpparam</code> tags that were added using the <code>addParam</code> method.
Returns	Nothing
Syntax	<code>httpService.clearParams()</code>
Arguments	None

- `clear`

Description	Removes all attributes and <code>cfhttpparam</code> tags that were added using the <code>addParam</code> method.
Returns	Nothing
Syntax	<code>httpService.clear()</code>

Arguments	None
-----------	------

## Usage

This function corresponds to the `cfhttp` tag. For usage details, see the Usage section for `cfhttp` in the *CFML Reference*.

## Example

```
<!--- Get Video --->
<!---
<cfset videoName = "<video path>\hello.wmv">
<cfset videoFileName = "hello.wmv">
--->
<!--- Set User Account Data --->
<!---
<cfset clientKey = "enter client key from google"/>
<cfset devKey = "ebtdev key from google"/>
--->
<cfscript>
    /* youtube uplaod url */
    youtubeUploadURL = "http://uploads.gdata.youtube.com/feeds/api/users/default/uploads";
    /* video to upload */
    videoName = ExpandPath('./hello.wmv');
    videoFileName = "hello.wmv";
    /* set user account data */
    clientKey = "enter client key from google";
    devKey = "ewnter dev key from google";
    /* create new http service */
    httpService = new http();
    /* set attributes using implicit setters */
    httpService.setMethod("post");
    httpService.setCharset("utf-8");
    httpService.setUrl("https://www.google.com/accounts/ClientLogin");
    /* add httpparams using addParam() */
    httpService.addParam(type="formfield",name="accountType",value="HOSTED_OR_GOOGLE");
    httpService.addParam(type="formfield",name="Email",value="enter gmail id");
    httpService.addParam(type="formfield",name="Passwd",value="enter password");
    httpService.addParam(type="formfield",name="service",value="youtube");
    httpService.addParam(type="formfield",name="source",value="youtubecode");
    /* make the http call to the URL using send() */
    result = httpService.send().getPrefix();
    /* process the filecontent returned */
    content = listtoarray(result.filecontent,chr(10));
    for(i=1;i lte arraylen(content);i++)
    {
        item = content[i];
        authdata[listFirst(item, "=")] = listRest(item, "=");
    }
</cfscript>
<!--- Create ATOM XML and save to a file to be sent with video --->
<cfsavecontent variable="meta">
    <cfoutput>
    <entry xmlns="http://www.w3.org/2005/Atom"
        xmlns:media="http://search.yahoo.com/mrss/"
        xmlns:yt="http://gdata.youtube.com/schemas/2007">
        <media:group>
```

```

        <media:title type="plain">WithoutQuotes</media:title>
        <media:description type="plain">Test Description</media:description>
        <media:category
            scheme="http://gdata.youtube.com/schemas/2007/categories.cat">People
        </media:category>
        <media:keywords>yourvideo</media:keywords>
    </media:group>
</entry>
</cfoutput>
</cfsavecontent>
<cfscript>
    tmpfile = expandPath("./meta.xml");
    FileWrite(tmpfile,trim(meta));
    /* use the httpService created above */
    httpService.setUrl("http://uploads.gdata.youtube.com/feeds/api/users/default/uploads");
    httpService.setTimeout(450);
    httpService.setMultipartType("related");
    /* clear params first */
    httpService.clearParams();
    /* add httpparams using addParam() */
    httpService.addParam(type="header",name="Authorization", value="GoogleLogin
auth=#authdata.auth#");
    httpService.addParam(type="header",name="X-GData-Client",
value="#variables.clientkey#");
    httpService.addParam(type="header",name="X-GData-Key", value="key=#variables.devkey#");
    httpService.addParam(type="header",name="Slug",value="#videoFileName#");

    httpService.addParam(type="file",name="API_XML_Request",file="#tmpfile#",mimetype="applicati
on/atom+xml");
    httpService.addParam(type="file",name="file",file="#videoName#",mimetype="video/*");
    /* make the http call to the URL using send() */
    result = httpService.send().getPrefix();
    if(result.statuscode contains "201")
    {
        WriteOutput("Your video has been successfully uploaded to YouTube");
    }
    else
    {
        WriteOutput("There was a problem uploading the video. Status code returned was " &
result.statuscode);
    }
</cfscript>

```

## mail

### Description

Used to sends an e-mail message, that optionally contains query output, using an SMTP server.

## Syntax

Mode	Syntax
Creating the service	<code>new mail()</code>  or <code>createObject("component", "mail")</code>
Initializing the attributes	Any one of the following: <ul style="list-style-type: none"><li>• <code>mailService=new mail(<i>attribute-value_pair</i>)</code></li><li>• <code>mailService.setAttributes(<i>attribute-value_pair</i>)</code></li><li>• <code>mailService.setAttributeName(<i>attribute_value</i>)</code></li><li>• <code>mailService.send(<i>attribute-value_pair</i>)</code></li></ul>
Executing the service action	<code>mailService.send(<i>attribute-value_pair</i>)</code>

## Properties

<code>from</code>	<code>to</code>	<code>subject</code>	<code>bcc</code>
<code>cc</code>	<code>charset</code>	<code>debug</code>	<code>failto</code>
<code>group</code>	<code>groupcasesensitive</code>	<code>mailerid</code>	<code>maxrows</code>
<code>mimeattach</code>	<code>password</code>	<code>port</code>	<code>priority</code>
<code>query</code>	<code>replyto</code>	<code>server</code>	<code>spoolenable</code>
<code>startrow</code>	<code>timeout</code>	<code>type</code>	<code>username</code>
<code>useSSL</code>	<code>useTLS</code>	<code>wraptext</code>	<code>remove</code>
<code>body</code>			

All attributes supported by the tag `cfmail` can be used as attribute-value pairs. For example,

```
<cfmail from="#form.mailFrom#">
```

can be used as

```
mailerService.setFrom(form.mailFrom);
```

## See also

[cfmail](#), [Function summary](#)

## History

ColdFusion 9: Added this function.

## Methods

- `addParam`

Description	Used to add <code>cfmailparam</code> tags. For example, to attach a file or add a header to an e-mail message.
Syntax	<code>mailerService.addParam(<i>attribute-value_pair</i>)</code>
Returns	Nothing
Arguments	All attributes supported by the <code>cfmailparam</code> tag can be used as attribute-value pairs.

- `addPart`

Description	Used to add <code>cfmailpart</code> tags. For example, one part of a multipart e-mail message.
Syntax	<code>mailService.addPart (attribute-value pair)</code>
Returns	Nothing
Arguments	All attributes supported by the <code>cfmailpart</code> tag can be used as attribute-value pairs.

- `send`

Description	Used to invoke the mail service to send an e-mail message.
Returns	Nothing
Syntax	<code>mailService.send (attribute-value pair)</code>
Arguments	All attributes supported by the <code>cfmail</code> tag.

- `setAttributes`

Description	Sets attributes for the <code>mail</code> function.
Returns	Nothing
Syntax	<code>mailService.setAttributes (attribute-value pair)</code>
Arguments	All attributes supported by the <code>cfmail</code> tag.

- `getAttributes`

Description	Gets attributes that were set for the <code>mail</code> function.
Returns	Returns a struct with all or some of the attribute values.
Syntax	<code>mailService.getAttributes (attributelist)</code>
Arguments	A comma-separated list of attributes. If no list is specified, all defined attributes are returned.

- `clearAttributes`

Description	Removes all attributes added for the <code>mail</code> function.
Returns	Nothing
Syntax	<code>mailService.clearAttributes (attribute_list)</code>
Arguments	A comma-separated list of attributes.

- `clearParams`

Description	Removes <code>cfmailparam</code> tags that were added using the <code>addParam</code> method.
Returns	Nothing
Syntax	<code>mailService.clearParams ()</code>
Arguments	None

- `clearParts`

Description	Removes <code>cfmailpart</code> tags that were added using the <code>addPart</code> method.
-------------	---

Returns	Nothing
Syntax	<code>mailService.clearProcResults()</code>
Arguments	None

- `clear`

Description	Removes all attributes, <a href="#">cfmailparam</a> tags, and <a href="#">cfmailpart</a> tags that were added using the methods <code>addParam</code> and <code>addPart</code> .
Returns	Nothing
Syntax	<code>mailService.clear()</code>
Arguments	None

## Usage

This function corresponds to the tag `cfmail`. For usage details, see the Usage section for [cfmail](#).

## Example

```
<h3>Sending mail in cfscript</h3>
<cfscript>
    /* create mailer service */
    mailerService = new mail();
    if(IsDefined("form.mailto"))
    {
        if(form.mailto is not "" AND form.mailfrom is not "" AND form.Subject is not "" and
form.attachment is not "")
        {
            savecontent variable="mailBody"{
                WriteOutput("This message was sent by an automatic mailer built with cfmail:= = = =
= = = = = & "<br><br>" & form.body);
            }
            /* set mail attributes using implicit setters provided */
            mailerService.setTo(form.mailto);
            mailerService.setFrom(form.mailFrom);
            mailerService.setSubject(form.subject);
            mailerService.setType("html");
            /* add mailparams */

            mailerService.addParam(file=expandpath(form.attachment),type="text/plain",remove=false);
            /* send mail using send(). Attribute values specified in an end action like "send" will
not persist after the action is performed */
            mailerService.send(body=mailBody);
            writeoutput("<h3>Thank you</h3>" & "<p>Thank you, " & mailfrom & "<br>" & "Your
message, " & subject & ", has been sent to " & mailto & "</p>");
        }
    }
</cfscript>
<p>
<form action = "mail1.cfm" method="POST">
    <table>
    <tr>
    <td>TO</td>
    <td><input type = "Text" name = "MailTo"></td>
    </tr>
```

pdf

Provides services to manipulate existing PDF documents in CFScript.

Mode	Syntax
Creating the service	<pre>new pdf()</pre> <p>or</p> <pre>createObject("component", "pdf")</pre>
Initializing the attributes	<p>Any one of the following:</p> <ul style="list-style-type: none"> <li>• <code>pdfService=new pdf(<i>attribute-value pair</i>)</code></li> <li>• <code>pdfService.setAttributes(<i>attribute-value pair</i>)</code></li> <li>• <code>pdfService.setAttributeName(<i>attribute_value</i>)</code></li> <li>• <code>pdfService.action_method(<i>attribute-value pair</i>)</code></li> </ul>
Executing the service action	<code>pdfService.action_method(<i>attribute-value pair</i>)</code>

`addQuads`                  `algo`                  `align`                  `ascending`

bottomMargin	compressTiffs	copyFrom	ddxfile
destination	directory	encodeAll	encrypt
flatten	foreground	format	height
hires	honourSpaces	hScale	image
imagePrefix	info	inputFiles	isBase64
jpgDpi	keepBookmark	leftMargin	maxBreadth
maxLength	maxScale	name	newOwnerPassword
newUserPassword	noAttachments	noBookmarks	noComments
noJavascrpts	noLinks	noMetadata	noThumbnails
numberFormat	opacity	order	outputFiles
overridePage	overwrite	package	pages
password	permissions	position	resolution
rightMargin	rotation	saveOption	scale
showOnPrint	source	stopOnError	text
topMargin	transparent	type	useStructure
version	vscale	width	

All attributes supported by the tag `cfpdf` can be used as attribute-value pairs. For example,

```
<cfpdf action="getInfo" source="myBook.pdf" name="PDFInfo">
```

can be used as

```
pdfInfo = pdfService.getPdfInfo(source="myBook.pdf", name="pdfinfo");
```

For details, see the Attributes section for the `cfpdf` tag.

## Methods

- `addParam`

Description	Used in CFScript to add <code>cfpdfparam</code> tags. Applicable only to <code>action="merge"</code> .
Returns	Nothing
Syntax	<code>pdfService.addParam(attribute-value pair)</code>
Arguments	All attributes supported by the <code>cfpdfparam</code> tag can be used as attribute-value pairs.

- The following PDF actions are available as methods. All these methods have similar arguments and syntax.

<code>addWatermark</code>	<code>removeWatermark</code>	<code>deletePages</code>	<code>getPDFInfo</code>
<code>setPDFInfo</code>	<code>merge</code>	<code>processDDX</code>	<code>protect</code>
<code>read</code>	<code>write</code>	<code>thumbnail</code>	<code>transform</code>
<code>optimize</code>	<code>extractImage</code>	<code>extractText</code>	<code>addHeader</code>
<code>addFooter</code>	<code>removeHeaderFooter</code>		

**Note:** In the list, `setPDFInfo` and `getPDFInfo` do not have identical actions in `cfpdf`. `cfpdf action="setinfo"` and `cfpdf action="getinfo"` represent them respectively.

Description	All methods correspond to the PDF actions specified for the tag <code>cfpdf</code> . For details of each method, refer to the corresponding section for <code>cfpdf</code> .
-------------	--

Returns	<p>Depends on the action. If the <code>name</code> attribute is specified, the result of the pdf operation is returned. Else, an empty string.</p> <p>For example, the following code returns a structure containing the pdf information for "book.pdf":</p> <pre>pdfinfo = pdfService.getPdfInfo(source="book.pdf", name="var")</pre> <p>PDF manipulation is done using the <code>cfpdf</code> tag. This is why, you must specify the <code>name</code> attribute.</p> <p>Accessing "var" directly does not work since "var" does not exist in the page variables scope.</p>
Syntax	<code>serviceName.methodName(attribute-value pair)</code>
Arguments	All attributes supported by the <code>cfpdf</code> tag for a given action are supported.

- `setAttributes`

Description	Sets attributes for the pdf function.
Returns	Nothing
Syntax	<code>pdfService.setAttributes(attribute-value pair)</code>
Arguments	All attributes supported by the <code>cfpdf</code> tag.

- `getAttributes`

Description	Gets the attributes that were set for the pdf function.
Returns	Returns a struct with all or some of the attribute values.
Syntax	<code>pdfService.getAttributes(attributelist)</code>
Arguments	A comma-separated list of attributes. If no list is specified, all defined attributes are returned.

- `clearAttributes`

Description	Removes all attributes added for the pdf function.
Returns	Nothing
Syntax	<code>pdfService.clearAttributes(attribute_list)</code>
Arguments	A comma-separated list of attributes that must be removed.

- `clearParams`

Description	Removes params that were added using <code>addParam</code> method.
Returns	Nothing
Syntax	<code>pdfService.clearParams()</code>
Arguments	None

- `clear`

Description	Removes all attributes and params added using the <code>addParam</code> method.
Returns	Nothing

Syntax	<code>pdfService.clear()</code>
Arguments	None

### History

ColdFusion 9: Added this function.

### Usage

This function corresponds to the `cfpdf` tag. For usage details, refer to the Usage section for [cfpdf](#).

### Example

```
<h3>PDF Thumbnail</h3>
<cfscript>
    // Create a variable for the name of the PDF document.
    mypdf = "book";
    thumbnailsDirectory = ExpandPath(".") & "\" & "#mypdf#_thumbnails";
    //create new PDF service
    pdfService = new pdf();
    //set attributes using implicit setters
    pdfService.setSource(expandpath('./#mypdf#.pdf'));
    //Use the getPdfInfo action to retrieve the total page count for the PDF document.
    PDFInfo = pdfService.getPdfInfo(name="pdfinfo");
    pageCount = PDFInfo.TotalPages;
    WriteOutput("pageCount=" & pageCount);
    //Generate a thumbnail image for each page in the PDF source document,
    //create a directory (if it does not exist) in the web root that is
    //a concatenation of the PDF source name and the word "thumbnails", and
    //save the thumbnail images in that directory.
    pdfService.thumbnail(destination=thumbnailsDirectory, scale=60, overwrite=true);
    //Loop through the images in the thumbnail directory and generate a link
    //from each image to the corresponding page in the PDF document.
    for(i="1";i lte pageCount;i++)
    {
        //Click the thumbnail image to navigate to the page in the PDF document.
        WriteOutput("<a href='#mypdf#.pdf##page=#i#' target='_blank'><img
src='#mypdf#_thumbnails/#mypdf#_page_#i#.jpg'></a>");
    }
</cfscript>
```

## query

### Description

Used to execute a query passing SQL statements to a data source using CFScript.

## Syntax

Mode	Syntax
Creating the service	<pre>new query()</pre> <p>or</p> <pre>createObject("component", "query")</pre>
Initializing the attributes	<p>Any one of the following:</p> <ul style="list-style-type: none"> <li><code>queryService=new query(<b>attribute-value_pair</b>)</code></li> <li><code>queryService.setAttributes(<b>attribute-value_pair</b>)</code></li> <li><code>queryService.set<b>AttributeName</b>(<b>attribute_value</b>)</code></li> <li><code>queryService.execute(<b>attribute-value_pair</b>)</code></li> </ul>
Executing the service action	<code>queryService.execute(<b>attribute-value_pair</b>)</code>

## Properties

name	blockfactor	cachedafter	cachedwithin
dataSource	dbtype	debug	maxRows
password	result	timeout	username
sql			

All attributes supported by the tag `cfquery` can be used as attribute-value pairs. For example,

```
<cfquery Name="myName"> </cfquery>
```

can be used as

```
queryService.setName("myName");
```

## See also

[cfquery](#), [Function summary](#)

## History

ColdFusion 9: Added this function.

## Methods

- `addParam`

Description	<p>Used in CFScript to add <a href="#">cfqueryparam</a> tags to:</p> <ul style="list-style-type: none"> <li>Verify the data type of a query parameter</li> <li>For DBMSs that support bind variables, to enable ColdFusion to use bind variables in the SQL statement</li> </ul>
Syntax	<code><b>serviceName.addParam(attribute-value_pair)</b></code>
Returns	Nothing
Arguments	All attributes supported by <a href="#">cfqueryparam</a> tag can be used as attribute-value pairs.

- `execute`

Description	Used to execute SQL statements.
-------------	---------------------------------

Returns	A component with the following properties set: <ul style="list-style-type: none"> <li>Result: For SQL queries that return a result set, for example, a "SELECT" SQL query.</li> <li>Prefix: Equivalent to the <code>result</code> attribute for the <code>cfquery</code> tag.</li> </ul>
Syntax	<code>queryService.execute(attribute-value pair)</code>
Arguments	All attributes supported by the <code>cfquery</code> tag.

- `setAttributes`

Description	Sets attributes for the <code>query</code> function.
Returns	Nothing
Syntax	<code>queryService.setAttributes(attribute-value pair)</code>
Arguments	All attributes supported by the <code>cfquery</code> tag.

- `getAttributes`

Description	Gets attributes that were set for the <code>query</code> function.
Returns	Returns a struct with all or some of the attribute values.
Syntax	<code>queryService.getAttributes(attributelist)</code>
Arguments	A comma-separated list of attributes. If no list is specified, all defined attributes are returned.

- `clearAttributes`

Description	Removes all attributes added for the <code>query</code> function.
Returns	Nothing
Syntax	<code>queryService.clearAttributes(attribute_list)</code>
Arguments	A comma-separated list of attributes.

- `clearParams`

Description	Removes <code>queryparams</code> that were added using the <code>addParam</code> method.
Returns	Nothing
Syntax	<code>queryService.clearParams()</code>
Arguments	None

- `clear`

Description	Removes all attributes and <code>queryparams</code> that were added using the <code>addParam</code> method.
Returns	Nothing
Syntax	<code>queryService.clear()</code>
Arguments	None

## Usage

This function corresponds to the `cfquery` tag. For usage information, see Usage details for `cfquery`.

## Example

```
<cfscript>
    /*
        This example shows how to create a query service in cfscript, set/get attributes using
        implicit setters/getters, and also
        how to execute the query and access the resultset
    */
    param MaxRows="10";
    param StartRow="1";
    /*
        Query database for information if cached database information has
        not been updated in the last six hours; otherwise, use cached data.
    */
    /* create a query service */
    queryService = new query();
    /* set properties using implicit setters */
    queryService.setDatasource("cfdocexamples");
    queryService.setName("GetParks");
    queryService.setCachedwithin(CreateTimeSpan(0, 6, 0, 0));
    /* Add sql queryparams using named and positional notation */
    queryService.addParam(name="state",value="MD",cfsqltype="cf_sql_varchar");
    queryService.addParam(value="National Capital Region",cfsqltype="cf_sql_varchar");
    /* invoke execute() on the query object to execute the query and return a component with
    properties result and prefix (which can be accessed as implicit getters) */
    result = queryService.execute(sql="SELECT PARKNAME, REGION, STATE FROM Parks WHERE STATE
    = :state and REGION = ? ORDER BY ParkName, State ");
    GetParks = result.getResult();
    /* getPrefix() returns information like recordcount,sql etc (typically whatever one gets
    if one uses the result attribute of the cfquery tag */
    metaInfo = result.getPrefix();
</cfscript>
<cfoutput>
<h4>Found #metaInfo.recordcount# records for '#metaInfo.sqlparameters[2]#' in the state
'#metaInfo.sqlparameters[1]#' </h4>
</cfoutput>
<!-- Build HTML table to display query. ----->
<table cellpadding="1" cellspacing="1">
    <tr>
        <td bgcolor="f0f0f0">
            &nbsp;
        </td>
        <td bgcolor="f0f0f0">
            <b><i>Park Name</i></b>
        </td>
        <td bgcolor="f0f0f0">
            <b><i>Region</i></b>
        </td>
        <td bgcolor="f0f0f0">
            <b><i>State</i></b>
        </td>
    </tr>
    <!-- Output the query and define the startrow and maxrows parameters.
    Use the query variable CurrentCount to keep track of the row you are displaying. ----->
    <cfoutput query="GetParks" startrow="#StartRow#" maxrows="#MaxRows#">
        <tr>
            <td valign="top" bgcolor="ffffed">
```

```

        <b>#GetParks.CurrentRow#</b>
    </td>
    <td valign="top">
        <font size="-1">#ParkName#</font>
    </td>
    <td valign="top">
        <font size="-1">#Region#</font>
    </td>
    <td valign="top">
        <font size="-1">#State#</font>
    </td>
</tr>
</cfoutput>
<!-- If the total number of records is less than or equal to the total number of rows,
then offer a link to the same page, with the startrow value incremented by maxrows
(in the case of this example, incremented by 10). ----->
<tr>
    <td colspan="4">
        <cfif (StartRow + MaxRows) LTE GetParks.RecordCount>
            <cfoutput><a href="#CGI.SCRIPT_NAME#?startrow=#Evaluate(StartRow + MaxRows)#">
                See next #MaxRows# rows</a></cfoutput>
        </cfif>
    </td>
</tr>
```

# storedproc

## Description

Used to execute a stored procedure in a server database using CFScript. It specifies database connection information and identifies the stored procedure.

## Syntax

Mode	Syntax
Creating the service	new storedProc()  or  createObject("component", "storedproc")
Initializing the attributes	Any one of the following: <ul style="list-style-type: none"><li>• storedProcService=new storedproc(<b>attribute-value_pair</b>)</li><li>• storedprocService.setAttributes(<b>attribute-value_pair</b>)</li><li>• storedProcService.set<b>AttributeName</b>(<b>attribute_value</b>)</li><li>• storedProcService.execute(<b>attribute-value_pair</b>)</li></ul>
Executing the service action	storedProcService.execute( <b>attribute-value_pair</b> )

## Properties

datasource	procedure	debug	cachedafter
cachedwithin	blockfactor	password	result

```
returncode          username
```

All attributes supported by the tag `cfstoredproc` are supported as attribute-value pairs. For example,

```
<cfstoredproc procedure= "sp_proc">
```

can be used as

```
spService.setProcedure("sp_proc");
```

For details of the `cfstoredproc` tag attributes, see the Attributes section for [cfstoredproc](#).

### See also

[cfstoredproc](#), [Function summary](#)

### History

ColdFusion 9: Added this function.

### Methods

- `addParam`

Description	Used to add <a href="#">cfprocparam</a> tags.
Syntax	<code>storedprocService.addParam(attribute-value pair)</code>
Returns	Nothing
Arguments	All attributes supported by <a href="#">cfprocparam</a> tag can be used as attribute-value pairs.

- `addProcResult`

Description	Used to add <a href="#">cfprocresult</a> tags to associate a query object with a result set returned by a stored procedure.
Syntax	<code>storedprocService.addProcResult(attribute-value pair)</code>
Returns	Nothing
Arguments	All attributes supported by the <a href="#">cfprocresult</a> tag can be used as attribute-value pairs.

- `execute`

Description	Used to execute a stored procedure.
Returns	A component on which the following methods can be invoked: <ul style="list-style-type: none"><li>• <code>getProcResultSets()</code>: To access result sets returned by the procedure.</li><li>• <code>getProcOutVariables()</code>: To access OUT or INOUT variables returned by the procedure.</li></ul>
Syntax	<code>storedprocService.execute(attribute-value pair)</code>
Arguments	All attributes supported by the <a href="#">cfstoredproc</a> tag.

- `setAttributes`

Description	Sets attributes for the <code>storedproc</code> function.
Returns	Nothing

Syntax	<code>storedProcService.setAttributes (attribute-value pair)</code>
Arguments	All attributes supported by the <code>cfstoredproc</code> tag.

- `getAttributes`

Description	Gets attributes that were set for the <code>storedproc</code> function.
Returns	Returns a struct with all or some of the attribute values.
Syntax	<code>storedProcService.getAttributes (attributelist)</code>
Arguments	A comma-separated list of attributes. If no list is specified, all defined attributes are returned.

- `clearAttributes`

Description	Removes all attributes added for the <code>storedProc</code> function.
Returns	Nothing
Syntax	<code>storedProcService.clearAttributes (attribute_list)</code>
Arguments	A comma-separated list of attributes.

- `clearParams`

Description	Removes <code>cfprocparam</code> tags added using the <code>addParam</code> method.
Returns	Nothing
Syntax	<code>storedProcService.clearParams ()</code>
Arguments	None

- `clearProcResults`

Description	Removes <code>cfprocresult</code> tags added using the <code>addProcResults</code> method.
Returns	Nothing
Syntax	<code>storedProcService.clearProcResults ()</code>
Arguments	None

- `clear`

Description	Removes all attributes and params that were added using the methods <code>addProcResults</code> and <code>addParam</code> .
Returns	Nothing
Syntax	<code>storedProcService.clear ()</code>
Arguments	None

## Usage

This function corresponds to the `cfstoredproc` tag. For usage details, refer to the Usage section for `cfstoredproc`.

### Example

```
<cfscript>
//If submitting a new book, insert the record and display confirmation
if(isDefined("form.title"))
{
    //create a new storedproc service
    spService = new storedproc();
    //set attributes using implicit setters
    spService.setDatasource("books");
    spService.setProcedure("Insert_Book");
    //add procparams using addParam
    spService.addParam(cfsqltype="cf_sql_varchar", type="in",value=form.title);
    spService.addParam(cfsqltype="cf_sql_numeric",type="in",value=form.price);
    spService.addParam(cfsqltype="cf_sql_date", type="in",value=form.publishDate);
    spService.addParam(cfsqltype="cf_sql_numeric",type="out",variable="bookId");
    //add procresults using addProcResult
    spService.addProcResult(name="rs1",resultset=1);
    //execute the stored procedure
    result = spService.execute();
    //getprocOutVariables() returns any OUT or INOUT variables added using addParams()
    bookId = result.getprocOutVariables().bookId;
    //getProcResultSets() returns resultsets added using addProcresult()
    listOfBooks = result.getProcResultSets().rs1;
    WriteOutput("<h3>List of Books</h3>");
    writeDump(listOfBooks);
    //output data
    WriteOutput("<h3>" & "" & form.title & "" & " inserted into database. The ID is " & bookId
    & ".</h3>");
}
</cfscript>
<cfform action="#CGI.SCRIPT_NAME#" method="post">
    <h3>Insert a new book</h3>
    <table>
        <tr>
            <td>Title:</td>
            <td><cfinput type="text" size="20" required="yes" name="title"/></td>
        </tr>
        <tr>
            <td>Price:</td>
            <td><cfinput type="text" size="20" required="yes" name="price" validate="float" /></td>
        </tr>
        <tr>
            <td>Publish Date:</td>
            <td>
                <cfinput type="datefield" name="publishdate" mask="mm/dd/yyyy" size="20" ></td>
            </tr>
        </table>
        <input type="submit" value="Insert Book"/>
    </cfform>
```

# Script functions implemented as CFCs in ColdFusion 9 Update 1

## Function summary

The following table lists the script functions and the equivalent ColdFusion tag.

Function	Equivalent ColdFusion Tag
<a href="#">dbinfo</a>	<code>cfdbinfo</code>
<a href="#">imap</a>	<code>cfimap</code>
<a href="#">pop</a>	<code>cfpop</code>
<a href="#">ldap</a>	<code>cfldap</code>
<a href="#">feed</a>	<code>cffeed</code>

## dbinfo

### Description

Used in CFScript to retrieve information about a data source such as database details, tables, queries, procedures, foreign keys, indexes, and version information about the database, driver, and JDBC.

### Syntax

Mode	Syntax
Creating the service	<code>new dbinfo();</code>  <code>or</code> <code>createObject("component", "dbinfo");</code>
Executing the service action	<code>dbinfoService.action_method(attribute-value_pair);</code>
Initializing the attributes	See <a href="#">Initializing the attributes</a> .
Getting the CFC properties	See <a href="#">Getting the CFC Properties</a> .
Working with the data returned	<code>data=dbinfoService.action_method(attribute-value_pair);</code>  <code>writedump(data);</code>

### Properties

<code>datasource</code>	<code>dbname</code>	<code>name</code>	<code>password</code>
<code>pattern</code>	<code>table</code>	<code>username</code>	

All attributes supported by the tag `cfdbinfo` can be used as attribute-value pairs. For example,

```
<cfdbinfo username="myUserName">
```

can be used as

```
dbinfoService.setUserName("myUserName");
```

For details, see the Attributes section for the `cfdbinfo` tag.

## See also

[Function summary](#)

## History

ColdFusion 9.0.1: Added this function.

## Methods

The following dbinfo types are available as methods. All methods have similar arguments and syntax.

dbnames	tables	columns	version
procedures	foriegnkeys	index	
Description	All methods correspond to the type of information supported by the tag <code>cfdbinfo</code> . For details of each method, see the relevant section for the tag <code>cfdbinfo</code> in <i>ColdFusion 9 CFML Reference</i> .		
Returns	All methods return a query object.		
Syntax	<code>dbinfoService.<b>methodName</b>(<i>attribute-value pair</i>);</code>		
Arguments	All attributes supported by the tag <code>cfdbinfo</code> .		

- `setAttributes`, `getAttributes`, `clearAttributes`, `clear`, `setProperties`, `getProperties`, `clearProperties`, and `clearProperties`. For details, see [Methods common to all functions](#).

## Usage

This function corresponds to the tag `cfdbinfo`. For details, see the Usage section for the tag `cfdbinfo`.

## Example

```
<cfscript>

    d = new dbinfo(datasource=" cfartgallery ").dbnames(datasource="ajax");
    writedump(d);
    d = new dbinfo(datasource=" ajax").dbnames();
    writedump(d);
</cfscript>
```

# imap

## Description

Used in CFScript to query an IMAP server to retrieve and manage mails within multiple folders.

## Syntax

Mode	Syntax
Creating the service	<code>new imap();</code>  or <code>createObject("component", "imap");</code>
Initializing the attributes	See <a href="#">Initializing the attributes</a> .

Mode	Syntax
Executing the service action	<code>imapService.methodName(<i>attribute-value pair</i>)</code>
Getting the CFC properties	See <a href="#">Getting the CFC Properties</a> .
Working with returned data	<code>imapResult=imapService.<i>action_method</i>(<i>attribute-value pair</i>);</code>

## Properties

attachmentpath	connection	folder	generateuniquefilenames
maxrows	messagenumber	name	newfolder
password	port	recurse	secure
server	startrow	stoponerror	timeout
uid	username		

All attributes supported by the tag `cfimap` can be used as attribute-value pairs. For example,

```
<cfimap action="open" connection = "myconnection">
```

can be used as

```
imapService = new
imap(server="myimapserver",username="myusername",password="mypassword",port="myport",secure=
"yes");
imapService.open();
```

**Note:** If connection properties such as server, username, password, port, and secure are specified either during initialization or when open method is called, a connection is created implicitly. Therefore, you need not specify the properties for further actions. If sandbox security is turned on, the directory referred to by the property `attachmentPath` must be given the required permission. By default, the temp directory is used.

For details of the attributes, see the Attributes section for the tag `cfimap`.

## See also

[Function summary](#)

## History

ColdFusion 9.0.1: Added this function.

## Methods

The following imap actions are available as methods. All methods have similar arguments and syntax.

getAll	delete	open	close
markRead	createFolder	deleteFolder	renameFolder
listAllFolders	moveMail	getHeaderOnly	

Description	All methods correspond to the type of information supported by the tag <code>cfimap</code> . For details of each method, see the relevant section of <code>cfimap</code> in the <i>ColdFusion 9 CFML Reference</i> .
Returns	A query object for methods <code>getAll</code> , <code>getHeaderOnly</code> , and <code>listAllFolders</code> . Else, nothing.
Syntax	<code>imapService.methodName(<i>attribute-value pair</i>);</code>
Arguments	All attributes supported by the tag <code>cfimap</code> .

- `setAttributes`, `getAttributes`, `clearAttributes`, `clear`, `setProperties`, `getProperties`, and `clearProperties`. For details, see [Methods common to all functions](#).

### Usage

This function corresponds to the tag `cfimap`. See the Usage section for `cfimap` in the *ColdFusion 9 CFML Reference* for details.

### Example

```
<cfscript>

    m = new imap();
    m.setAttributes(server="#REQUEST.server#",username="#REQUEST.username#",
                    password="#REQUEST.password#",secure="#REQUEST.secure#",

connection="#REQUEST.connectionname#",stoponerror="#REQUEST.stoponerror#");
    m.open();
    master = m.getAll(connection = "#REQUEST.connectionname#",name = "queryname", stoponerror
= "#REQUEST.stoponerror#" );
    writedump(master);

</cfscript>
```

## pop

### Description

Used in CFScript to retrieve or delete e-mail messages from a POP mail server.

### Syntax

Mode	Syntax
Creating the service	<code>new pop();</code>  or  <code>createObject("component", "pop");</code>
Initializing the attributes	See <a href="#">Initializing the attributes</a> .
Executing the service action	<code>popService.action_method(attribute-value_pair);</code>
Getting the CFC properties	See <a href="#">Getting the CFC Properties</a> .
Working with data returned	<code>popresult = popService.action_method (attribute-value pair);</code> where <code>popresult</code> is a query object if the <code>action_method</code> is <code>getAll</code> or <code>getHeaderOnly</code> .  For any other method, nothing is returned.

### Properties

<code>server</code>		<code>attachmentPath</code>	<code>debug</code>
<code>generateUniqueFileNames</code>	<code>maxRows</code>	<code>messageNumber</code>	<code>name</code>
<code>password</code>	<code>port</code>	<code>startRow</code>	<code>timeout</code>
<code>uid</code>	<code>username</code>		

All attributes supported by the tag `cfpop` can be used as attribute-value pairs. For example,

```
<cfpop server = "#form.popserver#" action = "getHeaderOnly" name = "GetHeaders">
```

can be used as

```
popHeaders = popService.getHeaderOnly(server="#form.popserver#");
```

**Note:** *name is a required attribute in `cfpop`, but not in `CFScript`.*

## See also

[Function summary](#)

## History

ColdFusion 9.0.1: Added this function.

## Methods

The following pop actions are available as methods. All methods have similar arguments and syntax.

getHeaderOnly	getAll	delete
Description		
All methods correspond to the type of information supported by the tag <code>cfpop</code> . For details of each method, see the relevant section of <code>cfpop</code> in the <i>ColdFusion 9 CFML Reference</i> .		
Returns		
All methods except <code>delete</code> returns a query object.		
Syntax		
<code>popService.<i>methodName</i>(<i>attribute-value pair</i>)</code>		
Arguments		
All attributes supported by the tag <code>cfpop</code> .		

- `setAttributes`, `getAttributes`, `clearAttributes`, `clear`, `setProperties`, `getProperties`, and `clearProperties`. For details, see [Methods common to all functions](#).

## Usage

This function corresponds to the tag `cfpop`. For usage details, see the Usage section for `cfpop`.

## Example

```
<cfscript>

    p = createObject("component", "pop");
    p.setAttributes(server="#popServer#", username="failoveruser", password="#popPassword#");
    r = p.GetAll(name="results", maxRows = "2");

    writeoutput("getAll Passed<br>");

    r = p.GetAll(messageNumber = "2");
    writeoutput("#r.FROM# & "<br>");

    r= p.GETHEADERONLY(messageNumber = "1");
    writeoutput("#r.subject# & "<br>");

</cfscript>
```

## Ldap

### Description

Used in CFScript to provide an interface to a Lightweight Directory Access Protocol (LDAP) directory server, such as the Netscape Directory Server.

### Syntax

Mode	Syntax
Creating the service	<code>new ldap();</code>  <code>or</code> <code>createObject("component", "ldap");</code>
Initializing the attributes	See <a href="#">Initializing the attributes</a> .
Executing the service action	<code>ldapService.action_method(attribute-value pair);</code>
Getting the CFC properties	See <a href="#">Getting the CFC Properties</a> .
Working with data	<code>ldapresult = ldapService.query(attribute-value pair).</code> For other methods, nothing is returned.

### Properties

<code>dn</code>	<code>server</code>	<code>attributes</code>	<code>delimiter</code>
<code>name</code>	<code>filter</code>	<code>maxRows</code>	<code>modifyType</code>
<code>referral</code>	<code>password</code>	<code>port</code>	<code>rebind</code>
<code>separator</code>	<code>returnAsBinary</code>	<code>scope</code>	<code>secure</code>
<code>startRow</code>	<code>sort</code>	<code>sortcontrol</code>	<code>start</code>
	<code>timeout</code>	<code>userName</code>	

All attributes supported by the tag `cfldap` can be used as attribute-value pairs. For example,

```
<cfldap action="add" server="ldap.uconn.edu">
```

can be used as

```
ldapService.add(server="ldap.uconn.edu");
```

For details, see the Attributes section for the tag `cfldap`.

### Methods

The following ldap actions are available as methods. All methods have similar arguments and syntax.

<code>query</code>	<code>add</code>	<code>modify</code>	<code>modifyDn</code>
<code>delete</code>			

Description	All methods correspond to the actions supported by the tag <code>cfldap</code> . For details of each method, see the relevant section of <code>cfldap</code> in the <i>ColdFusion 9 CFML Reference</i> .
Returns	If method is <code>query</code> , returns a query object. Else, none.
Syntax	<code>ldapService.methodName(attribute-value pair)</code>
Arguments	All attributes supported by the tag <code>cfldap</code> .

- `setAttributes`. For details, see [Methods common to all functions](#)

- `getAttributes`, `clearAttributes`, `clear`, `setProperties`, `getProperties`, and `clearProperties`. For details, see [Methods common to all functions](#).
- `setLdapAttributes`

Description	Sets the property attributes.
Returns	Nothing
Syntax	<code>ldapService.<b>setLdapAttributes</b>(attribute-value);</code>
Arguments	A string that contains the value of the property attributes.

- `getLdapAttributes`

Description	Gets the property attributes.
Returns	A string that contains the value of the property attributes.
Syntax	<code>myattributes = ldapService.<b>getLdapAttributes</b>();</code>

#### See also

[Function summary](#)

#### History

ColdFusion 9.0.1: Added this function.

#### Usage

This function corresponds to the tag `cfldap`. For usage details, see the Usage section for `cfldap`.

## Example

```
<cfscript>

    l = new ldap();
    l.setLdapAttributes("objectclass=top, person, organizationalPerson, inetOrgPerson;cn=Joe
    Smith; sn=Smith; mail=spenella@allaire.com; telephonenumber=(617) 761 - 2128");
    l.setUsername("uid=admin,ou=system");
    l.setPassword("administrator");
    l.setPort(port);
    l.setServer(ldapserver);

    l.setdn("ou=People+o=aribus.com,dc=example,dc=com");

    l.add();-

    l.clearAttributes();result = l.query(name="apache",
        attributes="dn,cn,o,ou,c,mail,telephonenumber",
        start="dc=example,dc=com",
        scope="SUBTREE",
        filter="(&(cn=Joe Smith)(ou=people))");

    writeoutput("<b>Adding and Querying a LDAP entry : </b>" & "CN = " & result.CN & " DN = "
    & result.DN & "<br> ");
    l.clearAttributes();
    l.delete(
        DN="ou=People+o=aribus.com,dc=example,dc=com",
        );

</cfscript>
```

## feed

### Description

Used in CFScript to read or create an RSS or Atom syndication feed. This service reads RSS versions 0.90, 0.91, 0.92, 0.93, 0.94, 1.0, and 2.0, and Atom 0.3 or 1.0. It can create RSS 2.0 or Atom 1.0 feeds.

### Syntax

Mode	Syntax
Creating the service	<code>new feed()</code>  or <code>createObject("component" "feed")</code>
Initializing the attributes	See <a href="#">Initializing the attributes</a> .
Executing the service action	<code>feedService.action_method(attribute-value_pair)</code>
Getting the CFC properties	See <a href="#">Getting the CFC Properties</a> .
Working with the data returned	<ul style="list-style-type: none"><li><code>feedresult = feedService.read(attribute-value_pair)</code> where <code>feedresult</code> is a struct with the keys <code>name</code>, <code>query</code>, <code>properties</code>, and <code>xmlvar</code>.</li><li><code>feedresult = feedService.create(attribute-value_pair)</code> where <code>feedresult</code> is a string that contains the <code>xmlvar</code>.</li></ul>

## Properties

columnMap	enclosureDir	escapeChar	ignoreEnclosureError
name (optional in CFScript)	outputFile	overwrite	overwriteEnclosure
properties (optional in CFScript)	proxyPassword	proxyPort	proxyServer
proxyUser	query (optional in CFScript)	source	timeout
useragent	xmlvar (optional in CFScript)		

All attributes supported by the tag `cffeed` can be used as attribute-value pairs. For example,

```
<cffeed action="read" source="http://googleblog.blogspot.com/atom.xml"
query="feedQuery" properties="feedMetadata" >
```

can be used as

```
feedservice.read(source="http://googleblog.blogspot.com/atom.xml",
query="feedQuery", properties="feedMetadata");
```

[Function summary](#)

## History

ColdFusion 9.0.1: Added this function.

## Methods

- `create`

Description	Creates an RSS 2.0 or Atom 1.0 feed XML document and saves it in a variable, writes it to a file, or both.
Returns	String representing the xmlvar
Syntax	<code>feedservice.create (<b>attribute-value pair</b>);</code>
Arguments	All attributes supported by the tag <code>cffeed</code> .

- `read`

Description	Parses an RSS or Atom feed from a URL or an XML file and saves it in a structure or query. You can also get feed metadata in a separate structure.
Returns	Struct with the following keys: <ul style="list-style-type: none"><li>• <code>name</code></li><li>• <code>query</code></li><li>• <code>properties</code></li><li>• <code>xmlvar</code></li></ul>
Syntax	<code>feedservice.read (<b>attribute-value pair</b>);</code>
Arguments	All attributes supported by the tag <code>cffeed</code> .

- `setAttributes`, `getAttributes`, `clearAttributes`, `clear`, `setProperties`, `getProperties`, and `clearProperties`. For details, see [Methods common to all functions](#).
- `getFeedProperties`

Description	Returns the value of the property <code>properties</code> .
Returns	Struct or error (if property is not set)
Syntax	<code>feedService.getFeedProeprties()</code>
Arguments	None

- `setFeedProperties`

Description	Sets the value of the property <code>properties</code> .
Returns	Nothing
Syntax	<code>feedService.setFeedProperties()</code>
Arguments	<code>properties</code> struct

## Usage

This service corresponds to the tag `cffeed`. For usage, see Usage section for `cffeed`.

## Example

```
<cfscript>
    f = new feed();
    r = f.read(source=feedpath);

    writeoutput("Name : " & r.name.title & "<br>");
    writeoutput("Properties : " & r.properties.version & "<br>");
    writeoutput("Query : " & r.query.recordcount & "<br>");
    writeoutput("XMLVar : " & r.xmlvar.length() & "<br>");
</cfscript>
```

## Methods common to all functions

The following methods are common to all script functions:

- `setAttributes`

Description	Sets attributes for the function.
Returns	Nothing
Syntax	<code><i>service_name</i>.setAttributes (<i>attribute-value pair</i>)</code> ;
Arguments	All attributes supported by the equivalent tag.

- `getAttributes`

Description	Gets the attributes set for the function.
Returns	Returns a struct with all or some attribute values.
Syntax	<code><i>service_name</i>.getAttributes (<i>attributelist</i>)</code> ;
Arguments	A comma-separated list of attributes. If no list is specified, all defined attributes are returned.

- `clearAttributes`

Description	Removes all attributes added for the function.
Returns	Nothing
Syntax	<code>service_name.clearAttributes(attribute_list);</code>
Arguments	A comma-separated list of attributes.

- `clear`

Description	Removes all attributes added for the function.
Returns	Nothing
Syntax	<code>service_name.clear();</code>
Arguments	None

- `clearProperties`

Description	Removes all properties added for the function.
Returns	Nothing
Syntax	<code>service_name.clearProperties(attribute_list);</code>
Arguments	If nothing is specified, all properties are cleared.

- `setProperties`

Description	Sets properties for the function.
Returns	Nothing
Syntax	<code>service_name.setproperties (attribute-value pair);</code>
Arguments	All attributes supported by the equivalent tag.

- `getProperties`

Description	Gets the properties set for the function.
Returns	Returns a struct with all or some attribute values.
Syntax	<code>service_name.getProperties (attributelist);</code>
Arguments	A comma-separated list of attributes. If no list is specified, all defined attributes are returned.

## Initializing the attributes

You can initialize the attributes using one of the following ways:

- `service_name=new dbinfo(attribute-value pair)`
- `service_name=new dbinfo().init(attribute-value pair)`
- `service_name.setAttributes(attribute-value pair)`
- `service_name.setAttributeName(attribute_value)`
- `service_name.action_method(attribute-value_pair)`

- `service_name.setProperty (attribute_value)`

## Getting the CFC Properties

Get the CFC properties using one of the following ways:

- `service_name.getAttributeName (attributelist)`
- `service_name.getProperties (attributelist)`
- `service_name.getAttributes (attributelist)`

# Chapter 7: ColdFusion Flash Form Style Reference

You can specify styles in ColdFusion forms tags when you display the form or form element in Flash format.

**Note:** The column labeled **Inh** indicates whether a style is inherited by child controls, such as the form controls in a `vbox`.

## Styles valid for all controls

The following styles are valid for all ColdFusion Flash format form tags except for `cfformitem` tags with the following `type` attributes, which do not take `style` attributes:

- `html`
- `space`

These styles do not cause errors when used in all other tags. However, many styles do not have any effect when used in some tags.

Style	Inh	Description
<code>backgroundAlpha</code>	N	Alpha (transparency) level of the SWF file or image defined by <code>backgroundImage</code> . Valid values range from 0 (transparent) to 100 (opaque). The default value is 100.
<code>backgroundColor</code>	Y	Format: color; background color of the control. Has no effect if specified in a <code>cfform</code> control tag, which uses the <code>background-color</code> style to control the color. Also ignored by <code>cfinput</code> tags of type <code>button</code> , <code>img</code> , <code>submit</code> , <code>radio</code> , and <code>checkbox</code> , because they are filled with the button face or other graphics.
<code>backgroundDisabledColor</code>	Y	Format: color; background color of components when disabled. The default value is <code>##EFFFFFF</code> (light gray).
<code>backgroundSize</code>	N	Scales the image specified by <code>backgroundImage</code> to different percentage sizes. By default, the value is <code>auto</code> , which maintains the original size of the image. A value of 100% stretches the image to fit the entire screen. Include the percent sign with the value.
<code>barColor</code>	Y	Format: color; color of the outer bar.
<code>borderCapColor</code>	Y	Format: color; outside left and outside right color for skins.
<code>borderColor</code>	Y	Format: color; black section of a three-dimensional border or the color section of a two-dimensional border.
<code>borderSides</code>	N	Bounding box sides. Only used when <code>borderStyle="solid"</code> . Space-delimited string containing the sides of the border to show. Order is not important. The default value is "left top right bottom".
<code>borderStyle</code>	Y	Bounding box style. The possible values are: <ul style="list-style-type: none"> <li>• <code>inset</code> (default)</li> <li>• <code>none</code></li> <li>• <code>outset</code></li> <li>• <code>solid</code></li> </ul>
<code>borderThickness</code>	N	Bounding box thickness. Only used when <code>borderStyle="solid"</code> . The default value is 1.

Style	Inh	Description
color	Y	Format: color; text color of a component's label.
cornerRadius	N	Radius of component corners. The default value is 0.
disabledColor	Y	Format: color; color of the component if it is disabled.
dropShadow	N	Format: Boolean; controls the visibility of the component's drop shadow. The default value is false. This style must be used with <code>borderStyle="solid"</code> . For drop shadows to appear on containers, set <code>backgroundColor</code> or <code>backgroundImage</code> . Otherwise, since the default background of a container is transparent, the shadow appears behind the container.
errorColor	Y	Format: color; color of the error text.
fillColors	N	Format: color; colors used to tint the background of the control. Pass the same color for both values for "flat" looking control. The default value is <code>##E6EEEE,##FFFFFF</code> .
fontFamily	Y	Comma-separated list of fonts to use, in descending order of desirability. You can use any font family name. If you specify a generic font name, it is converted to an appropriate device font. Flash can only use fonts that are installed on the client system.
fontSize	Y	Format: length; size of the text.
fontStyle	Y	Determines whether the text is italic. Recognized values are <code>normal</code> and <code>italic</code> . The default value is <code>normal</code> .
fontWeight	Y	Determines whether the text is bold. Recognized values are <code>normal</code> and <code>bold</code> . The default value is <code>normal</code> .
highlightColor	Y	Format: color; color of the control when it is in focus.
horizontalGap	N	Format: length; number of pixels between children in the horizontal direction.
leading	N	Additional vertical space between lines of text. The default value is no leading.
marginLeft	N	Format: length; number of pixels between the container's left border and its content area.
marginRight	N	Format: length; number of pixels between the container's right border and its content area.
scrollTrackColor	Y	Format: color; scroll track for a scroll bar. The default value is <code>##EFEFEF</code> (light gray).
selectedFillColors	N	Format: colors; two colors used to tint the background of the control when in its selected state. Pass the same color for both values for "flat" looking control. The default value is undefined, which means the colors are derived from <code>themeColor</code> .
textAlign	Y	Aligns text in a container. Recognized values are <code>left</code> , <code>right</code> , and <code>center</code> . The default value is <code>right</code> .
textDecoration	N	Determines whether the text is underlined or not. Recognized values are <code>none</code> and <code>underline</code> . The default value is <code>none</code> .
textIndent	Y	Format: length; offset of first line of text from the left side of the container. The default value is 0.
themeColor	Y	Format: color; background color of a component. The possible values are: <ul style="list-style-type: none"> <li>• <code>haloGreen</code></li> <li>• <code>haloBlue</code></li> <li>• <code>haloOrange</code></li> <li>• <code>haloSilver</code></li> </ul>
verticalGap	N	Format: length; number of pixels between children in the vertical direction.

## Styles for cfform

The following styles apply to the `cfform` tag:

Style	Inh	Description
<code>background-color</code>		Format: color; background color of the form.
<code>indicatorGap</code>	Y	Format: length; number of pixels between the label and child components. The default value is 14.
<code>labelWidth</code>	Y	Format: length; width of the form labels. The default value is the length of the longest label in the form.
<code>marginBottom</code>	N	Format: length; number of pixels between the container's bottom border and its content area. The default value is 16.
<code>marginTop</code>	N	Format: length; number of pixels between the container's top border and its content area. The default value is 16.
<code>verticalGap</code>	N	Format: length; number of pixels between children in the vertical direction. The default value is 8.

## Styles for cfformgroup with horizontal or vertical type attributes

The following styles apply to the `cfformgroup` tag with `type` attributes `horizontal` or `vertical`:

Style	Inh	Description
<code>horizontalAlign</code>	N	Horizontal alignment of children. Possible values are left, center, and right. The default value is left.
<code>horizontalGap</code>	N	Format: length; number of pixels between children in the horizontal direction. The default value is 6.
<code>indicatorGap</code>	Y	Format: length; number of pixels between the label and child components. The default value is 14.
<code>labelWidth</code>	Y	Format: length; width of the form labels. The default value is the length of the longest label in the form.
<code>marginBottom</code>	N	Format: length; number of pixels between the container's bottom border and its content area. The default value is 0.
<code>marginTop</code>	N	Format: length; number of pixels between the container's top border and its content area. The default value is 0.
<code>verticalGap</code>	N	Format: length; number of pixels between children in the vertical direction. The default value is 6.

## Styles for box-style cfformgroup elements

The following styles apply to the `cfformgroup` tag with the following `type` attributes. Some types have additional attributes, which are listed in the following sections.

- `hbox`
- `vbox`
- `hdividedbox`
- `vdividedbox`
- `panel`

- `tile`
- `page`

Style	Inh	Description
<code>horizontalAlign</code>	N	Horizontal alignment of children in the container. The default value is <code>left</code> . Possible values are <code>left</code> , <code>center</code> , and <code>right</code> .
<code>horizontalGap</code>	N	Format: length; number of pixels between children in the horizontal direction. The default value is 8 (6 for a tile container).
<code>marginBottom</code>	N	Format: length; number of pixels between the container's bottom border and its content area. The default value is 0.
<code>marginTop</code>	N	Format: length; number of pixels between the container's top border and its content area. The default value is 0.
<code>verticalAlign</code>	N	Vertical alignment of children in the container. The default value is <code>top</code> . Possible values are <code>top</code> , <code>middle</code> , and <code>bottom</code> .
<code>verticalGap</code>	N	Format: length; number of pixels between children in the vertical direction. The default value is 8 (6 for a tile container).

#### Styles specific to `cfformgroup` with `hdividedbox` or `vdividedbox` type attributes

The following additional styles apply to the `cfformgroup` tag with `type="hdividedbox"`, or `type="vdividedbox"`:

Style	Inh	Description
<code>dividerAffordance</code>	N	Format: length; width ( <code>hdividedbox</code> ) or height ( <code>vdividedbox</code> ) in pixels of the area of the divider that the user can select with the mouse pointer. The default value is 6.
<code>dividerColor</code>	Y	Format: color; color of the dividers in their up state. The default value is <code>##AAAAAA</code> .
<code>dividerThickness</code>	N	Format: length; thickness in pixels of the dividers. The default value is 4.

#### Styles specific to `cfformgroup` with `panel` type attribute

The following additional styles apply to the `cfformgroup` tag with `type="panel"`:

Style	Inh	Description
<code>cornerRadius</code>	N	Format: length; radius of corners of the window frame. The default value is 8.
<code>dropShadow</code>	N	Boolean value specifying whether the panel has a drop shadow. The default value is <code>true</code> .
<code>footerColors</code>	Y	Format: color; comma-delimited list of two colors used to draw the footer ( <code>ControlBar</code> ) background. The first color is the top color. The second color is the bottom color. The default value is <code>##F4F5F7, ##E1E5EB</code> .
<code>headerColors</code>	Y	Format: color; comma-delimited list of two colors used to draw the header. The first color is the top color. The second color is the bottom color. The default value is <code>##E1E5EB, ##F4F5F7</code> .
<code>headerHeight</code>	N	Format: length; height of the header. The default value is 28.
<code>panelBorderStyle</code>	N	Border style for the bottom two corners of the container. The top two corners are always round. Possible values are <code>default</code> , which configures the container to have square corners, and <code>roundCorners</code> , which defines rounded corners. To configure the top corners to be square, set <code>cornerRadius</code> to 0. The default value is <code>default</code> .
<code>shadowDirection</code>	N	Direction of drop shadow. Possible values are <code>"left"</code> , <code>"center"</code> , and <code>"right"</code> . The default value is <code>"center"</code> .
<code>shadowDistance</code>	N	Distance of drop shadow. Negative values move shadow above the panel. The default value is 2.

## Styles for cfformgroup with accordion type attribute

The following styles apply to the `cfformgroup` tag with `type="accordion"`:

Style	Inh	Description
<code>headerHeight</code>	N	Format: length; height of the accordion container buttons, in pixels. The default value is 22.
<code>marginBottom</code>	N	Format: length; number of pixels between the container's bottom border and its content area. The default value is -1.
<code>marginTop</code>	N	Format: length; number of pixels between the container's top border and its content area. The default value is -1.
<code>openDuration</code>	N	Format: time; duration, in milliseconds, of the transition from one child panel to another. The default value is 250.
<code>verticalGap</code>	N	Format: length; number of pixels between children in the vertical direction. The default value is -1.

## Styles for cfformgroup with tabnavigator type attribute

The following styles apply to the `cfformgroup` tag with the `type="tabnavigator"`:

Style	Inh	Description
<code>horizontalAlign</code>	N	Horizontal alignment of children. The default value is left. Possible values are left, center, and right. Because the preferred width of each tab in the tab navigator container is the size of the label text, use the <code>tabWidth</code> style to increase the width of the tab to a size larger than its preferred width to see different alignments.
<code>horizontalGap</code>	N	Format: length; number of pixels between children in the horizontal direction. The default value is 6.
<code>tabHeight</code>	N	Format: length; default tab height, in pixels. The default value is 22.
<code>tabWidth</code>	N	Format: length; width of the tabs, in pixels. If undefined, the default tab widths are automatically calculated from the label text. If the width of the container is smaller than the width of the label text, the labels are truncated. If a tab label is truncated, Flash displays a tooltip with the full label text when a user moves the mouse pointer over the tab. If you specify an explicit tab width, labels do not automatically shrink to fit if they do not fit in the available space.

## Styles for cfformitem with hrule or vrule type attributes

The following styles apply to the `formitem` tag with `type="hrule"` or `type="vrule"`:

Style	Inh	Description
color	Y	<p>Format: color; color of the line. according to the following rules:</p> <ul style="list-style-type: none"> <li>• If <code>strokeWidth</code> is 1, the color of the entire line.</li> <li>• If <code>strokeWidth</code> is 2 (default), the color of the top line.</li> <li>• If <code>strokeWidth</code> is greater than 2, the color of the top and left edges of the rectangle.</li> </ul> <p>The default value is <code>##C4CCCC</code>.</p>
shadowColor	Y	<p>Format: color; shadow color of the line, as follows:</p> <ul style="list-style-type: none"> <li>• If <code>strokeWidth</code> is 1, does nothing.</li> <li>• If <code>strokeWidth</code> is 2 (default), the color of the bottom line.</li> <li>• If <code>strokeWidth</code> is greater than 2, the color of the bottom and right edges of the rectangle.</li> </ul> <p>The default value is <code>##D4D0C8</code>.</p>
strokeWidth	Y	<p>Thickness of the rule in pixels, as follows:</p> <ul style="list-style-type: none"> <li>• If <code>strokeWidth</code> is 1, the rule is a 1-pixel-wide line.</li> <li>• If <code>strokeWidth</code> is 2 (default), the rule is two adjacent 1-pixel-wide horizontal lines.</li> <li>• If <code>strokeWidth</code> is greater than 2, the rule is a hollow rectangle with 1-pixel-wide edges.</li> </ul> <p>The default value is 2.</p>

## Styles for `cfinput` with radio, checkbox, button, image, or submit type attributes

The following styles apply `cfinput` tags with the following `type` attribute values:

- `button`
- `checkbox`
- `image`
- `radio`
- `submit`

In some cases, a style applies only to the subset of these input types, as specified in the description.

Style	Inh	Description
borderThickness	N	Thickness of border "ring". A value of 0 means no border. Any value greater than 2 creates a glowing "ring" around the button. The default value is 3.
cornerRadius	N	Radius of corners. The default value is 5.
horizontalGap	N	Gap between the label and the image in an <code>img</code> input when <code>labelPlacement</code> = "left" or "right". The default value is 2.
repeatDelay	N	Format: time; number of milliseconds to wait after the first <code>buttonDown</code> event before repeating <code>buttonDown</code> events at the <code>repeatInterval</code> . The default value is 500.

Style	Inh	Description
repeatInterval	N	Format: time; number of milliseconds between buttonDown events if you press and hold a button. The default value is 35.
symbolBackgroundColor	Y	Format: color; background color of check boxes and radio buttons. The default value is #FFFFFF (white).
symbolBackgroundDisabledColor	Y	Format: color; background color of check boxes and radio buttons when disabled. The default value is #EEEEEE (light gray).
symbolBackgroundPressedColor	Y	Format: color; background color of check boxes and radio buttons when pressed. The default value is #FFFFFF (white).
symbolColor	Y	Format: color; the check mark of a check box or the dot of a radio button. The default value is #000000 (black).
symbolDisabledColor	Y	Format: color; check mark or radio button dot color if the control is disabled. The default value is #848384 (dark gray).
texRollOverColor	Y	Format: color; text color of the label as you move the mouse pointer over the control. The default value is #2B333C.
textSelectColor	Y	Format: color; text color of the label as you select the control. The default value is #000000.
verticalGap	N	Gap between the label and the image in an img input when labelPlacement = "top" or "bottom". The default value is 2.

## Styles for cftextarea tag and cfinput with text, password, or hidden type attributes

The following style applies to the following tags and tag-attribute combinations:

- textarea
- cfinput type="hidden"
- cfinput type="password"
- cfinput type="text"

Style	Inh	Description
disabledColor	Y	Format: color; disabled color of the Text Area.

## Styles for cfselect with size attribute value of 1

The following styles apply to the cfselect tag when the size attribute is 1; that is, if the control displays one option at a time, with a drop-down list (also known as a combobox):

Style	Inh	Description
alternatingRowColors	Y	Format: comma delimited list of colors for rows in an alternating pattern. Value can be a list of two or more colors. Use only if you do not specify a backgroundColor style.
closeDuration	N	Time to close the drop-down list, in milliseconds. The default value is 250.

Style	Inh	Description
openDuration	N	Time to close the drop-down list, in milliseconds. The default value is 250.
rollOverColor	Y	Format: color; color of the background when the user rolls over an item. The default value is ##0EFFD6.
selectionColor	Y	Format: color; color of the background when the user selects an item. The default value is ##0DFFC1.

## Styles for cfselect with size attribute value greater than 1

The following styles apply to the `cfselect` tag when the `size` attribute is greater than 1; that is, if the control is a list box that displays two or more options at a time:

Style	Inh	Description
alternatingRowColors	Y	Type: comma-delimited list of colors for rows in an alternating pattern. Value can be a list of two or more colors.
marginBottom	N	Format: length; number of pixels between the bottom of the row and the bottom of the text in the row. The default value is 0.
marginTop	N	Format: length; number of pixels between the top of the row and the top of the text in the row. The default value is 0.
rollOverColor	Y	Format: color; color of the background when the user moves the mouse pointer over the link. The default value is ##0EFFD6.
selectionColor	Y	Format: color; color of the background when the user selects the link. The default value is ##0DFFC1.
selectionDuration	N	The duration of the selection animation, in milliseconds. The default value is 250. Set to 0 to disable animation.
textRollOverColor	Y	Format: color; text color when the user moves the mouse pointer over the selection. The default value is ##02B33C.
textSelectedColor	Y	Format: color; text color when selected. The default value is ##005F33.

## Styles for cfcalendar tag and cfinput with dateField type attribute

The following styles apply to the `cfcalendar` tag and `dateField` type of the `cfinput` tag:

Style	Inh	Description
headerColors	Y	Format: color; colors of the band at the top of the <code>DateChooser</code> control. Specify two values, separated by a comma. For a solid band, use the same color for both values. The default value is ##E6EEEE,##FFFFFF.
rollOverColor	Y	Format: color; color of the background when the user moves the mouse pointer over the <code>dateField</code> . The default value is ##E3FFD6.
selectionColor	Y	Format: color; color of the background when the user selects the <code>dateField</code> . The default value is ##CDFFC1.
todayColor	Y	Format: color; color of today's date. The default value is ##2B333C.

## Styles for the cfgrid tag

The following styles apply to the `cfgrid` tag:

Style	Inh	Description
<code>horizontalAlign</code>	N	Horizontal alignment of children in the container. The default value is <code>left</code> . Possible values are <code>left</code> , <code>center</code> , and <code>right</code> .
<code>horizontalGap</code>	N	Number of pixels between children in the horizontal direction. The default value is 8.
<code>marginBottom</code>	N	Number of pixels between the container's bottom border and its content area. The default value is 0.
<code>marginTop</code>	N	Number of pixels between the container's top border and its content area. The default value is 0.
<code>verticalAlign</code>	N	Vertical alignment of children in the container. The default value is <code>top</code> . Possible values are <code>top</code> , <code>middle</code> , and <code>bottom</code> .
<code>verticalGap</code>	N	Number of pixels between children in the vertical direction. The default value is 8.

## Styles for the cftree tag

The following styles apply to the `cftree` tag:

Style	Inh	Description
<code>alternatingRowColors</code>	Y	Type: Array; colors for rows in an alternating pattern. Value can be an Array of two or more colors.
<code>depthColors</code>	Y	Type: Array; array of colors used in the Tree control, in descending order.
<code>indentation</code>	N	Indentation for each tree level, in pixels. The default value is 8.
<code>openDuration</code>	N	Format: time; length of an open or close transition, in milliseconds. The default value is 250.
<code>rollOverColor</code>	Y	Format: color; color of the background when the user moves the mouse pointer over the link. The default value is <code>##E3FFD6</code> .
<code>selectionColor</code>	Y	Format: color; color of the background when the user selects the link. The default value is <code>##CDFFC1</code> .
<code>selectionDuration</code>	N	The duration of the selection animation, in milliseconds. The default value is 250. Set to 0 to disable animation.
<code>textRollOverColor</code>	Y	Format: color; color of the text when the user moves the mouse pointer over the entry. The default value is <code>##02B33C</code> .
<code>textSelectedColor</code>	Y	Format: color; color of the text when the user selects the entry. The default value is <code>##005F33</code> .

# Chapter 8: Application.CFC Reference

You implement methods in `Application.cfc` to handle ColdFusion application events and set variables in the CFC to configure application characteristics.

## Application variables

The `Application.cfc` scope contains several built-in variables, which correspond to the attributes that you set in the `cfapplication` tag. You set the values of these variables in the CFC initialization code, before you define the CFC methods. You can access the variables in any method.

**Note:** Although `Windows` is case-insensitive, you must always start the `Application.cfc` filename with an uppercase `A`. Both `application.cfc` and `Application.cfc` are reserved words.

**Note:** If your application has an `Application.cfc`, and an `Application.cfm` or `onRequestend.cfm` page, ColdFusion ignores the CFM pages.

The following table briefly describes the variables that you can set to control the application behavior. For more details, see the [cfapplication](#) tag.

Variable	Default	Description
<code>name</code>	no name	The application name. If you do not set this variable, or set it to the empty string, your CFC applies to the unnamed application scope, which is the ColdFusion J2EE servlet context. For more information on unnamed scopes see <i>Integrating JSP and servlets in a ColdFusion application</i> in the <i>Developing ColdFusion Applications</i> .
<code>applicationTimeout</code>	Administrator value	Life span, as a real number of days, of the application, including all Application scope variables. Use the CFML <code>CreateTimeSpan</code> function to generate this variable's value.
<code>clientManagement</code>	Administrator value	Whether the application supports Client scope variables.
<code>clientStorage</code>	Administrator value	Where Client variables are stored; can be cookie, registry, or the name of a data source.
<code>customtagpaths</code>	Administrator value	Contains ColdFusion custom tag paths. It is a comma delimited list with absolute path.  To use this variable, select the Enable Per App Settings option in the Administrator Server > Settings page.  The settings that you define here take precedence over the custom tag paths defined in the Administrator Server Settings > Mappings page for the current application.
<code>googleMapKey</code>		The Google Maps API key required to embed Google Maps in your web pages.
<code>datasource</code>		Name of the data source from which the query retrieves data.
<code>loginStorage</code>	cookie	Whether to store login information in the Cookie scope or the Session scope.
<code>mappings</code>	Administrator value	A structure that contains ColdFusion mappings. Each element in the structure consists of a key and a value. The logical path is the key and the absolute path is the value.  To use this variable, select the Enable Per App Settings option in the Administrator Server Settings > Settings page.  The mappings that you define here take precedence over the mappings defined in the Administrator Server Settings > Mappings page for the current application.
<code>serverSideFormValidation</code>	yes	Whether to enable validation on cfform fields when the form is submitted.

Variable	Default	Description
sessionManagement	no	Whether the application supports Session scope variables.
sessionTimeout	Administrator value	Life span, as a real number of days, of the user session, including all Session variables. Use the CFML <code>CreateTimeSpan</code> function to generate this variable's value.
setClientCookies	True	Whether to send CFID and CFTOKEN cookies to the client browser.
setDomainCookies	False	Whether to set CFID and CFTOKEN cookies for a domain (not just a host).
scriptProtect	Administrator value	Whether to protect variables from cross-site scripting attacks.
secureJSON	Administrator value	<p>A Boolean value that specifies whether to add a security prefix in front of the value that a ColdFusion function returns in JSON-format in response to a remote call.</p> <p>The default value is the value of the Prefix serialized JSON setting in the Administrator Server Settings &gt; Settings page (which defaults to <code>false</code>). You can override this value in the <code>cffunction</code> tag.</p> <p>For more information see Improving security in the <i>Developing ColdFusion Applications</i>.</p>
secureJSONPrefix	Administrator value	<p>The security prefix to put in front of the value that a ColdFusion function returns in JSON-format in response to a remote call if the <code>secureJSON</code> setting is <code>true</code>.</p> <p>The default value is the value of the Prefix serialized JSON setting in the Administrator Server Settings &gt; Settings page (which defaults to <code>//</code>, the JavaScript comment character).</p> <p>For more information see Improving security in the <i>Developing ColdFusion Applications</i>.</p>
welcomeFileList		<p>A comma-delimited list of names of files. Tells ColdFusion not to call the <code>onMissingTemplate</code> method if the files are not found. Use this variable to prevent ColdFusion from invoking the <code>onMissingTemplate</code> handler if all of the following items are true:</p> <ul style="list-style-type: none"> <li>Your web server (for example, <code>web.xml</code> file) has a welcome file list with CFML pages such as <code>index.cfm</code> that it tries to run if a URL specifies a path ending in a directory.</li> <li>The web server sends a request for CFML pages the welcome list to ColdFusion without first determining if the page exists.</li> <li>You want to support directory browsing in directories that do not have any of the files on the welcome file list.</li> </ul> <p>You specify this variable only if the <code>Application.cfc</code> file also specifies an <code>onMissingTemplate</code> handler. It must have the same list of files as your <code>web.xml</code> welcome file list.</p> <p><b>Note:</b> You do not need to use the <code>welcomeFileList</code> variable with most "pure" web servers, such as Apache. The <code>welcomeFileList</code> variable has to be used with most integrated web and application servers, such as the integrated ColdFusion/JRun web server.</p>
smtpServersettings		A struct that contains the following values: <code>server</code> , <code>username</code> , and <code>password</code> . If no value is specified, takes the value in the administrator.
timeout		<p>The lifespan.</p> <p>Timeout set using <code>&lt;cfsetting requesttimeout=""&gt;</code> overrides the timeout in the <code>Application.cfc</code> using <code>this.timeout=""</code>.</p>
debuggingIPAddresses		A list of ip addresses that need debugging.
enablerobustexception		Overrides the default administrator settings. It does not report compile-time exceptions.

## Enhancements in ColdFusion 9.0.1

Application.cfc lets you specify data source authentication details for the data source. The data source settings can now be a string or a struct. When string, it is considered to be the data source name and authentication information is taken from the data source defined in the ColdFusion Administrator.

You can specify the authentication information using a struct value for data source. The following are the key names:

- `name`: data source name
- `username`: Username for the data source
- `password`: Password for the data source

### Example

```
<this.datasource={name='cfartgallery', username="user", password="passwd"}>
```

or

```
<this.datasource="cfartgallery">
```

**Note:** The same convention is used for ORM default data source where you can specify the data source authentication information in the `ormsettings`.

The following application-specific attributes have been added for Amazon S3 integration:

- `accessKeyId`: ID for Amazon S3 account.
- `awsSecretKey`: Secret key for S3 account.
- `defaultLocation`: The default location of Amazon S3 bucket creation. A bucket on S3 storage can be in one of the following regions: US, EU, or US-WEST.

The `defaultLocation` provided in the `Application.cfc` defines the default location for the bucket that you create. The default value is US.

### Example

```
<cfscript>
this.s3.accessKeyId = "key_ID";
this.s3.awsSecretKey = "secret_key";
this.s3.defaultLocation="location";
</cfscript>
```

## Method summary

The following table briefly describes the application event methods that you can implement in `Application.CFC`:

Method name	Method runs when
<code>onApplicationEnd</code>	The application ends: the application times out, or the server is stopped
<code>onApplicationStart</code>	The application first starts: the first request for a page is processed or the first CFC method is invoked by an event gateway instance, or a web services or Flash Remoting CFC.
<code>onCFCRequest</code>	HTTP or AMF calls are made to an application.
<code>onError</code>	An exception that is not caught by a try/catch block occurs.
<code>onMissingTemplate</code>	ColdFusion received a request for a non-existent page.

Method name	Method runs when
<a href="#">onRequest</a>	The <code>onRequestStart</code> method finishes. (This method can filter request contents.)
<a href="#">onRequestEnd</a>	All pages in the request have been processed:
<a href="#">onRequestStart</a>	A request starts
<a href="#">onSessionEnd</a>	A session ends
<a href="#">onSessionStart</a>	A session starts
<a href="#">onServerStart</a>	A ColdFusion server starts

All parameters to these methods are positional. You can use any names for these parameters.

When a request executes, ColdFusion runs the CFC methods in the following order:

- 1 `onApplicationStart` (if not run before for this application)
- 2 `onSessionStart` (if not run before for this session)
- 3 `onRequestStart`
- 4 `onRequest/onCFCRequest`
- 5 `onRequestEnd`

The `onApplicationEnd`, `onSessionEnd`, and `onError` CFCs are triggered by specific events.

## onApplicationEnd

### Description

Runs when an application times out or the server is shutting down.

### Syntax

```
<cffunction name="onApplicationEnd" returnType="void">
    <cfargument name="ApplicationScope" required=true/>
    ...
</cffunction>
```

### See also

[onApplicationStart](#), [Method summary](#), Managing the application with `Application.cfc` in the *Developing ColdFusion Applications*

### Parameters

ColdFusion passes the following parameters to the method:

Parameters	Description
<code>ApplicationScope</code>	The application scope.

### Returns

This method does not return a value; do not use the `cfreturn` tag.

### Usage

Use this method for any clean-up activities that your application requires when it shuts down, such as saving data in memory to a database, or to log the application end to a file. You cannot use this method to display data on a user page, because it is not associated with a request. The application ends, even if this method throws an exception.

If you call this method explicitly, ColdFusion does not end the application; it does execute the method code, but does not lock the Application scope while the method executes.

Use the *ApplicationScope* parameter to access the application scope; you cannot reference the scope directly; for example, use `Arguments.ApplicationScope.myVariable`, not `Application.myVariable`. This method can access the Server scope directly, but it does not have access to Session or Request scopes.

**Note:** *The application times out only if it is inactive for the time-out period. Sessions do not end, and the `onSessionEnd` method is not called when an application ends. For more information, see [onSessionEnd](#).*

### Example

```
<cffunction name="onApplicationEnd">
    <cfargument name="ApplicationScope" required=true/>
    <cflog file="#This.Name#" type="Information"
        text="Application #Arguments.ApplicationScope.applicationname# Ended" >
</cffunction>
```

## onApplicationStart

### Description

Runs when ColdFusion receives the first request for a page in the application.

### Syntax

```
<cffunction name="onApplicationStart" returnType="boolean">
    ...
    <cfreturn Boolean>
</cffunction>
```

### See also

[onApplicationEnd](#), [Method summary](#), Managing the application with Application.cfc in the *Developing ColdFusion Applications*

### Returns

A Boolean value: True if the application startup code ran successfully; False, otherwise. You do not need to explicitly return a True value if you omit the `cffunction` tag `returntype` attribute.

### Usage

Use this method for application initialization code; for example, use it to set Application scope variables, to determine whether a required data source or other resource is available, or to log the application start. You do not have to lock the Application scope if you set Application variables in this method, and you can reference Application scope variables as you normally do; for example, as `Application.myVariable`.

This method can access the requested page's Variables scope only if the Application.cfc file includes an `onRequest` method that calls the page.

If you call this method explicitly, ColdFusion does not start the application; it does execute the method code, but does not lock the Application scope while the method executes.

If this method throws an uncaught exception or returns False, the application does not start and ColdFusion does not process any pages in the application. In this case, ColdFusion runs the `onApplicationStart` method the next time a user requests a page in the application.

### Example

The following example tests for the availability of a database. If the database is not available it reports and logs the error, and does not start the application; if it is available, the method initializes two Application scope variables.

```
<cffunction name="onApplicationStart">
    <cftry>
        <!--- Test whether the DB is accessible by selecting some data. --->
        <cfquery name="testDB" dataSource="cfdocexamples" maxrows="2">
            SELECT Emp_ID FROM employee
        </cfquery>
        <!--- If you get a database error, report an error to the user, log the
            error information, and do not start the application. --->
        <cfcatch type="database">
            <cfoutput>
                This application encountered an error<br>
                Please contact support.
            </cfoutput>
            <cflog file="#This.Name#" type="error"
                text="cfdocexamples DB not available. message: #cfcatch.message#
                Detail: #cfcatch.detail# Native Error: #cfcatch.NativeErrorCode#" >
            <cfreturn False>
        </cfcatch>
    </cftry>
    <cflog file="#This.Name#" type="Information" text="Application Started">
    <!--- You do not have to lock code in the onApplicationStart method that sets
        Application scope variables. --->
    <cfscript>
        Application.availableResources=0;
        Application.counter1=1;
    </cfscript>
    <cfreturn True>
</cffunction>
```

## onCFCRequest

### Description

Intercepts any HTTP or AMF calls to an application based on CFC request.

### Syntax

```
<cffunction name="onCFCRequest" returnType="void">
    <cfargument type="string" name="cfcname">
    <cfargument type="string" name="method">
    <cfargument type="struct" name="args">
</cffunction>
```

### See also

[Method summary](#), Handling errors in Application.cfc in the *Developing ColdFusion Applications*

### Parameters

ColdFusion passes the following parameters to the method:

Parameter	Description
cfcname	Fully qualified dotted path to the CFC.
method	The name of the method invoked.
args	The arguments (struct) with which the method is invoked.

### Usage

Whereas `onRequest` handles only requests made to ColdFusion templates, this function controls Ajax, Web Service, and Flash Remoting requests.

### Example

Create a folder `onCFCRequest` in your web root. Place `test.cfc` and `Application.cfm` in this directory and make an HTTP call to the CFC using the following URL:

`http://localhost:8500/onCFCRequest/test.cfc?method=foo&arg1=1&arg2=2&arg3=3`

When you run the URL, the method `onCFCRequest` is called and the function name `foo` is passed along with the arguments `arg1`, `arg2`, and `arg3`.

You can then invoke the `test.cfc` as shown in the following example:

```
<!--- Application.cfc --->
<cfcomponent>
    <cfset this.name = "oncfcrequest">
    <cffunction name="onCFCRequest">
        <cfargument type="string" name="cfcname" required=true>
        <cfargument type="string" name="method" required=true>
        <cfargument type="struct" name="args" required=true>
        <cflog text="oncfcrequest()">
        <cfdump var="#arguments#" output="console" format="text">
        <cfinvoke
            component = "oncfcrequest.test"
            method = "foo"
            returnVariable = "result"
            argumentCollection = "#arguments.args#">
        <cfdump var="#result#" output="console" format="text">
    </cffunction>
    <cffunction name="onRequest" output="yes" access="remote">
        <cfargument type="string" name="targetpage">
        <cflog text="onRequest()">
    </cffunction>
</cfcomponent>
<!--- test.cfc --->
<cfcomponent>
    <cffunction name="foo">
        <cfargument name="arg1" type="string" >
        <cfargument name="arg2" type="string" >
        <cfargument name="arg3" type="string" >
        <cfreturn arguments>
    </cffunction>
</cfcomponent>
```

## onError

### Description

Runs when an uncaught exception occurs in the application.

### Syntax

```
<cffunction name="onError" returnType="void">
    <cfargument name="Exception" required=true/>
    <cfargument name="EventName" type="String" required=true/>
    ...
</cffunction>
```

### See also

[Method summary](#), Handling errors in Application.cfc in the *Developing ColdFusion Applications*

### Parameters

ColdFusion passes the following parameters to the method:

Parameter	Description
Exception	The ColdFusion Exception object. For information on the structure of this object, see the description of the <code>cfcatch</code> variable in the <code>cfcatch</code> description.
EventName	The name of the event handler that generated the exception. If the error occurs during request processing and you do not implement an <code>onRequest</code> method, <code>EventName</code> is the empty string.

### Returns

This method does not return a value; do not use the `cfreturn` tag.

### Usage

Use this method to handle errors in an application-specific manner. This method overrides any error handlers that you set in the ColdFusion Administrator or in `cferror` tags. It does not override try/catch blocks.

Whether the `onError` method can display output depends on where the error takes place, as follows:

- The `onError` method can display a message to the user if an error occurs during an `onApplicationStart`, `onSessionStart`, `onRequestStart`, `onRequest`, or `onRequestEnd` event method, or while processing a request.
- The `onError` method cannot display output to the user if the error occurs during an `onApplicationEnd` or `onSessionEnd` event method, because there is no available page context; however, it can log an error message.

If the `onError` event handler is triggered by a scope-specific event method, such as `onSessionStart`, the error prevents further processing at the level of that scope and any lower scopes. An `onError` event triggered by an `onSessionStart` method, for example, prevents further processing in the session, but not in the application.

If an exception occurs while processing the `onError` method, or if the `onError` method uses a `cfthrow` tag, the ColdFusion standard error handling mechanisms handle the exception. These mechanisms include: any error handlers specified by `cferror` tags in the `Application.cfc` initialization code, the site-wide error handler specified in the ColdFusion Administrator, and ColdFusion default error page. Therefore, you can use the `onError` method as a filter to handle selected errors, and use other ColdFusion error-handling techniques for the remaining errors.

### Example

```
<cffunction name="onError">
    <cfargument name="Exception" required=true/>
    <cfargument type="String" name="EventName" required=true/>
    <!--- Log all errors. --->
    <cflog file="#This.Name#" type="error"
        text="Event Name: #Arguments.Eventname#" >
    <cflog file="#This.Name#" type="error"
        text="Message: #Arguments.Exception.message#">
    <cflog file="#This.Name#" type="error"
        text="Root Cause Message: #Arguments.Exception.rootcause.message#">
    <!--- Display an error message if there is a page context. --->
    <cfif NOT (Arguments.EventName IS "onSessionEnd") OR
        (Arguments.EventName IS "onApplicationEnd")>
        <cfoutput>
            <h2>An unexpected error occurred.</h2>
            <p>Please provide the following information to technical support:</p>
            <p>Error Event: #Arguments.EventName#</p>
            <p>Error details:<br>
            <cfdump var=#Arguments.Exception#></p>
        </cfoutput>
    </cfif>
</cffunction>
```

# onMissingTemplate

## Description

Runs when a request specifies a non-existent CFML page.

## Syntax

```
<cffunction name="onMissingTemplate" returnType="boolean">
    <cfargument type="string" name="targetPage" required=true/>
    ...
    <cfreturn BooleanValue />
</cffunction>
```

## See also

[Method summary](#), Handling errors in Application.cfc in the *Developing ColdFusion Applications*

## Parameters

ColdFusion passes the following parameters to the method:

Parameter	Description
targetPage	The path from the web root to the requested CFML page.

## Returns

A Boolean value. `True` or no return value specifies that the event has been processed. `False` specifies that the event was not processed.

## Usage

ColdFusion invokes this method when it encounters a file not found condition, that is, when a URL specifies a CFML page that does not exist.

The `onMissingTemplate` function must return `true` to indicate that the event has been processed, or return `false` to indicate that the event has not been processed. If the function does not return a value, it is assumed to be `true`. If the function returns `false`, ColdFusion invokes the standard error handler. If an error occurs within the `onMissingTemplate` function, the error handler is not invoked. Therefore, you must use `try/catch` blocks in your missing template handler and, if the catch block cannot handle the error, it must set the function return value to `false` so the standard error handler can report the error.

If the `onMissingTemplate` function is invoked, the `onApplicationStart` and `onSessionStart` event handlers are first invoked, if appropriate, but the `onRequestStart`, `onRequest` and `onRequestEnd` handlers are not invoked, and processing of the request terminates when the `onMissingTemplate` handler returns.

All standard scopes, including the Application, Session, and Client scopes, are available in the `onMissingTemplate` function, if they are enabled.

To include the contents of a page in the `onMissingTemplate` function, use the `cfinclude` tag. Do not any other method to include or redirect other page content, including tags and functions such as `cflocation`, `GetPageContext().forward()`, and `GetPageContext().include()`.

Use the `This.welcomeFileList` variable to keep this function from executing if all of the following are true:

- Your web server uses a welcome file list with one or more CFML files (such as `index.cfm`), that it tries to access when a user enters a URL that ends with a directory name

- The web server sends a request for a CFML page on the welcome list to ColdFusion without first determining if the page exists.
- You want to allow users to browse web directories that do not have any files on the list.

For more information, see `welcomeFileList` in [Application variables](#).

### Example

```
<!--- The web.xml welcome-file-list includes index.cfm.
      To allow web browsing, specify index.cfm in This.welcomeFileList. --->
<cfset This.welcomeFileList="index.cfm">

<cffunction name="onMissingTemplate">
    <cfargument name="targetPage" type="string" required=true/>
    <!--- Use a try block to catch errors. --->
    <cftry>
        <!--- Log all errors. --->
        <cflog type="error" text="Missing template: #Arguments.targetPage#">
        <!--- Display an error message. --->
        <cfoutput>
            <h3>#Arguments.targetPage# could not be found.</h3>
            <p>You requested a non-existent ColdFusion page.<br />
                Please check the URL.</p>
        </cfoutput>
        <cfreturn true />
        <!--- If an error occurs, return false and the default error
              handler will run. --->
        <cfcatch>
            <cfreturn false />
        </cfcatch>
    </cftry>
</cffunction>
```

## onRequest

### Description

Runs when a request starts, after the [onRequestStart](#) event handler. If you implement this method, it **must** explicitly call the requested page to process it.

### Syntax

```
<cffunction name="onRequest" returnType="void">
    <cfargument name="targetPage" type="String" required=true/>
    ...
    <cfinclude template="#Arguments.targetPage#">
    ...
</cffunction>
```

### See also

[onRequestStart](#), [onRequestEnd](#), [Method summary](#), Managing requests in `Application.cfc` in the *Developing ColdFusion Applications*

## Parameters

ColdFusion passes the following parameters to the method:

Parameter	Description
targetPage	Path from the web root to the requested page.

## Returns

This method does not return a value; do not use the `cfreturn` tag.

## Usage

This event handler provides an optional request filter mechanism for CFML page requests (that is, .cfm pages requested using a browser). Use it to intercept requests to target pages and override the default behavior of running the requested pages. The following rules specify where and how you use the `onRequest` method.

- Implement this method only if the following are true:
  - The directory, and any subdirectories affected by this `Application.cfc` contain CFM files. The affected directory and subdirectories do not contain any CFC files that are intended to be accessed as web services, AJAX bind, using Flash Remoting, or using an event gateway.
  - You want to intercept the request and process it in a special way.
- If you do not implement this method, ColdFusion automatically calls the target page (or the CFC for a web service, Flash Remoting, or event gateway event).
- If you implement this method, it **must** explicitly call the target page, normally by using a `cfinclude` tag.
- Do **not** implement the `onRequest` method in any `Application.cfc` file that affects .cfm files that implement web services, process Flash Remoting or event gateway requests; ColdFusion does not execute the requests if you implement this method.
- Code in this method that precedes the call to the target page can perform the same functions as the `onRequestStart` method, and shares the Variables scope with the target page.
- Code in this method that follows the call to the target page can perform the same functions as the `onRequestEnd` method, and shares the Variables scope with the target page.
- If you implement this method, you can also implement the `onRequestStart` and `onRequestEnd` methods.

You can use this method to do preprocessing that is required for all requests. Typical uses include filtering and modifying request page contents (such as removing extraneous white space), or creating a switching mechanism that determines the exact page to display based on available parameters.

## Example

```
<cffunction name="onRequest">
    <cfargument name="targetPage" type="String" required=true/>
    <cfset var content="">
    <cfsavecontent variable="content">
        <cfinclude template="#Arguments.targetPage#">
    </cfsavecontent>
    <cfoutput>
        #replace(content, "report", "MyCompany Quarterly Report", "all")#
    </cfoutput>
</cffunction>
```

# onRequestEnd

## Description

Runs at the end of a request, after all other CFML code.

## Syntax

```
<cffunction name="onRequestEnd" returnType="void">
    <cfargument type="String" name="targetPage" required=true/>
    ...
</cffunction>
```

## See also

[onRequestStart](#), [onRequest](#), [Method summary](#), Managing requests in Application.cfc in the *Developing ColdFusion Applications*

## Parameters

ColdFusion passes the following parameters to the method:

Parameter	Description
targetPage	Path from the web root to the requested page.

## Returns

This method does not return a value; do not use the `cfreturn` tag.

## Usage

This method has the same purpose as the `onRequestEnd.cfm` page. (You cannot use an `onRequestEnd.cfm` page if you have an `Application.cfc` file for your application.) This method runs before the request terminates; therefore, it can access the page context, and can generate output.

This method can be useful for gathering performance metrics, or for displaying dynamic footer information.

This method can access the requested page's Variables scope only if the `Application.cfc` file includes an `onRequest` method that calls the page. You can use Request scope variables to share data with the requested page, even if the `Application.cfc` file does not have an `onRequest` method.

If you call this method explicitly, ColdFusion does not end the request, but does execute the method code.

## Example

The following example displays one of two footer pages depending on whether the user has logged in:

The `onRequestEnd` method in `Application.cfc` contains the following code:

```
<cffunction name="onRequestEnd">
    <cfargument type="String" name="targetPage" required=true/>
    <cfset theAuthuser=getauthuser()>
    <cfif theAuthUser NEQ "">
        <cfinclude template="authuserfooter.cfm">
    <cfelse>
        <cfinclude template="noauthuserfooter.cfm">
    </cfif>
</cffunction>
```

A simple authuserfooter.cfm page consists of the following code:

```
<cfoutput>
    <h3>Thank you for shopping at our store, #theAuthUser#!</h3>
</cfoutput>
```

A simple noauthuserfooter.cfm page consists of the following code:

```
<cfoutput>
    <h3>Remember, only registered users get all our benefits!</h3>
</cfoutput>
```

To test this example, implement code for logging in a user, or try the example with and without the following line in the onRequestStart Application.cfc method:

```
<cfloginuser name="Robert Smith" password="secret" roles="customer">
```

## onRequestStart

### Description

Runs when a request starts.

### Syntax

```
<cffunction name="onRequestStart" returnType="boolean">
    <cfargument type="String" name="targetPage" required=true/>
    ...
    <cfreturn Boolean>
</cffunction>
```

### See also

[onRequest](#), [onRequestEnd](#), [Method summary](#), Managing requests in Application.cfc in the *Developing ColdFusion Applications*

### Parameters

ColdFusion passes the following parameters to the method:

Parameters	Description
targetPage	Path from the web root to the requested page.

### Returns

A Boolean value. Return False to prevent ColdFusion from processing the request. You do not need to explicitly return a True value if you omit the cffunction tag returnType attribute.

### Usage

This method runs at the beginning of the request. It is useful for user authorization (login handling), and for request-specific variable initialization, such as gathering performance statistics.

If this method throws an exception (for example, if it uses the cfthrow tag), ColdFusion handles the error and does not process the request further.

If you call this method explicitly, ColdFusion does not start a request, but does execute the method code.

This method can access the requested page's Variables scope only if the Application.cfc file includes an `onRequest` method that calls the page. You can use Request scope variables to share data with the requested page even if Application.cfc does not have an `onRequest` method.

### Example

This example uses the authentication code generated by the ColdFusion Dreamweaver Login wizard to ensure that the user is logged in. For Beta 2, the wizard generates code that is appropriate for Application.cfm only. To use this code with the Application.CFC, delete the generated Application.CFM

```
<cffunction name="onRequestStart">
    <cfargument name="requestname" required=true/>
    <!--- Authentication code, generated by the Dreamweaver Login wizard.
    <cfinclude template="mm_wizard_application_include.cfm">
    <!--- Regular maintenance is done late at night. During those hours, tell
        people to come back later, and do not process the request further. --->
    <cfscript>
        if ((Hour(now()) gt 1) and (Hour(now()) lt 3)) {
            WriteOutput("The system is undergoing periodic maintenance.
                Please return after 3:00 AM Eastern time.");
            return false;
        } else {
            this.start=now();
            return true;
        }
    </cfscript>
</cffunction>
```

## onSessionEnd

### Description

Runs when a session ends.

### Syntax

```
<cffunction name="onSessionEnd" returnType="void">
    <cfargument name="SessionScope" required=True/>
    <cfargument name="ApplicationScope" required=False/>
    ...
</cffunction>
```

### See also

[onSessionStart](#), [Method summary](#), Managing sessions in Application.cfc in the *Developing ColdFusion Applications*

### Parameters

ColdFusion passes the following parameters to the method:

Parameter	Description
SessionScope	The Session scope
ApplicationScope	The Application scope

### Returns

This method does not return a value; do not use the `cfreturn` tag.

### Usage

Use this method for any clean-up activities when the session ends. A session ends when the session is inactive for the session time-out period. You can, for example, save session-related data, such as shopping cart contents or whether the user has not completed an order, in a database, or do any other required processing based on the user's status. You might also want to log the end of the session, or other session-related information, to a file for diagnostic use.

If you call this method explicitly, ColdFusion does not end the session; it does execute the method code, but does not lock the Session.

You cannot use this method to display data on a user page, because it is not associated with a request.

You can access shared scope variables as follows:

- Use the *SessionScope* parameter to access the Session scope. You cannot reference the Session scope directly; for example, use `Arguments.SessionScope.myVariable`, not `Session.myVariable`.
- You must use the *ApplicationScope* parameter to access the Application scope. You cannot reference the Application scope directly; for example, use `Arguments.ApplicationScope.myVariable`, not `Application.myVariable`. Use a named lock when you reference variables in the Application scope, as shown in the example.
- You can access the Server scope directly; for example, `Server.myVariable`.
- You cannot access the Request scope.

Sessions do not end, and the `onSessionEnd` method is not called when an application ends. The `onSessionEnd` does not execute if there is no active application, however.

### Example

The following method decrements an Application scope session count variable and logs the session length.

```
<cffunction name="onSessionEnd">
    <cfargument name = "SessionScope" required=true/>
    <cfargument name = "AppScope" required=true/>
    <cfset var sessionLength = TimeFormat(Now() - SessionScope.started,
        "H:mm:ss")>
    <cflock name="AppLock" timeout="5" type="Exclusive">
        <cfset Arguments.AppScope.sessions = Arguments.AppScope.sessions - 1>
    </cflock>
    <cflog file="#This.Name#" type="Information"
        text="Session #Arguments.SessionScope.sessionid# ended. Length: #sessionLength#
Active sessions: #Arguments.AppScope.sessions#">
</cffunction>
```

## onSessionStart

### Description

Runs when a session starts.

### Syntax

```
<cffunction name="onSessionStart" returnType="void">
    ...
</cffunction>
```

### See also

[onSessionEnd](#), [Method summary](#), Managing sessions in Application.cfc in the *Developing ColdFusion Applications*

### Returns

This method does not return a value; do not use the `cfreturn` tag.

### Usage

This method is useful for initializing Session scope data, such as a shopping cart, or setting session-specific Application scope variables, such as for tracking the number of active sessions. You need not lock the Session scope to set its variables using this method.

If you call this method explicitly, ColdFusion does not start a session; it does execute the method code, but does not lock the Session scope.

This method can access the requested page's Variables scope only if the Application.cfc file includes an `onRequest` method that calls the page.

### Example

The following `onSessionStart` example initializes some Session scope variables and increments an Application scope counter of active sessions.

```
<cffunction name="onSessionStart">
    <cfscript>
        Session.started = now();
        Session.shoppingCart = StructNew();
        Session.shoppingCart.items = 0;
    </cfscript>
    <cflock scope="Application" timeout="5" type="Exclusive">
        <cfset Application.sessions = Application.sessions + 1>
    </cflock>
</cffunction>
```

## onServerStart

ColdFusion now supports a CFC with an `onServerStart` method that runs only when the server starts. The `onServerStart` method takes no parameters, and is the only function in the CFC. The function is useful for application-independent tasks, such as instantiating the applications, configuring logging, or setting up the scheduler.

By default, ColdFusion looks for the `onServerStart` method in `cf_webroot/Server.cfc`. To specify a different filepath:

- 1 Launch ColdFusion Administrator.
- 2 Click ColdFusion Administrator Server Settings > Settings.
- 3 Specify the absolute filepath under the web root on the Settings page such as `c:\Server.cfc`. Alternatively, you can use a dot-delimited path under the web root, such as `a.b.Server`.

**Note:** If you use an absolute path, the filename must end with `.cfc`. If you use a relative path or dotted path, do not end the name with the `.cfc` suffix.

You select an option on the Settings page to enable and disable the `onServerStart` method. By default, the method is disabled.

You can also specify a timeout limit (in seconds) for the `onServerStart` method. The timeout limit determines the duration for which the method would be allowed to run during server start up. This setting can be specified in `server.cfc`.

The `onServerStart` method can use most CFML features, but not any features that require full server start. For example, the method cannot use a `cfhttp` tag with a URL that specifies a location on the same server. You also cannot use Application or Request scope variables in the method.

By default, all errors, including any `serverCFC` errors, are logged in `<ColdFusion_home>/WEB-INF/cfusion/logs` directory for standalone and `<appserver_root>/logs` directory for J2EE configurations.

You can also specify a different location for logging by configuring the log directory setting in ColdFusion Administrator > Debugging and Logging > Logging Settings.

The `server.log` file contains server startup information. So, any `server.CFC` startup errors are logged in it, but for details about the error, you have to see the `exception.log` file. In addition, server startup information is logged in `{appserver_root}/logs` directory.

For WebSphere, it is logged in the `SystemOut.log` file, and for JRun, it is logged in `cfusion-out.log` file.

# Chapter 9: ColdFusion Event Gateway Reference

Java interfaces are available for building ColdFusion custom CFXs in Java.

**Note:** The following CFML functions also apply to gateway application development: [GetGatewayHelper](#), [SendGatewayMessage](#).

## Gateway development interfaces and classes

The ColdFusion event gateway system is defined in the `coldfusion.eventgateway` package. Gateway developers implement two interfaces and use several classes, as follows:

### More Help topics

[“Gateway interface”](#) on page 1471

[“GatewayHelper interface”](#) on page 1481

[“GatewayServices class”](#) on page 1481

[“CFEvent class”](#) on page 1485

[“Logger class”](#) on page 1498

## Gateway interface

`coldfusion.eventgateway.Gateway`

Interface for implementing ColdFusion event gateways.

A class that implements this interface defines a ColdFusion event gateway type that you can use in ColdFusion applications. The class must implement the following methods:

Signature	Description
<code>GatewayName([String id[, String configFile]])</code>	The gateway constructor.
<code>String getGatewayID()</code>	Returns the gateway ID.
<code>GatewayHelper getHelper()</code>	Returns an instance of the <code>GatewayHelper</code> class for this gateway type. instance, or null if the gateway does not have a <code>GatewayHelper</code> class.
<code>int getStatus()</code>	Gets the event gateway status.
<code>String outgoingMessage(coldfusion.eventgateway.CFEvent cfmessage)</code>	Handles a message sent by ColdFusion and processes it to send to a message receiver.
<code>void restart()</code>	Restarts a running event gateway.

Signature	Description
void <a href="#">setCFCListeners</a> (String[] listeners)	Identifies the CFCs that listen for incoming messages from the event gateway.
void <a href="#">setGatewayID</a> (String id)	Sets the gateway ID that uniquely identifies the Gateway instance.
void <a href="#">start</a> ()	Starts the event gateway.
void <a href="#">stop</a> ()	Stops the event gateway.

## Constructor

### Description

Instantiates a gateway.

### Category

Event Gateway Development

### Syntax

```
public void gatewayName()  
public void gatewayName(String id)  
public void gatewayName(String id, String configFile)
```

### See also

[setGatewayID](#), `Class` constructor in the *Developing ColdFusion Applications*.

### Parameters

Parameter	Description
id	The identifier for the gateway instance
configFile	The absolute path to the gateway configuration file.

### Usage

If your gateway requires a configuration file, use the constructor with two parameters. Otherwise, you can use either the default constructor or the single parameter version; ColdFusion always uses the `setGatewayID` method to set the ID.

### Example

The following example shows the two argument constructor implemented in the ColdFusion `SocketGateway` class:

```
public SocketGateway(String id, String configpath) {
    propsFilePath=configpath;
    try {
        FileInputStream propsFile = new FileInputStream(propsFilePath);
        properties.load(propsFile);
        propsFile.close();
        this.loadProperties();
    }
    catch (FileNotFoundException f) {
        // do nothing. use default value for port.
    }
    catch (IOException e) {
        e.printStackTrace();
    }
    gatewayID = id;
    gatewayService = GatewayServices.getGatewayServices();
}
```

## getGatewayID

### Description

Returns the gateway ID that identifies the Gateway instance.

### Category

Event Gateway Development

### Syntax

```
public String getGatewayID()
```

### See also

[setGatewayID](#), Providing Gateway class service and information routines in the *Developing ColdFusion Applications*.

### Usage

This method returns a string value that is set by the `setGatewayID` method.

### Example

The following example is the ColdFusion SocketGateway class `getGatewayID` method:

```
public String getGatewayID()
{
    return gatewayID;
}
```

## getHelper

### Description

Returns an instance of the `gatewayHelper` class, if any for the gateway type.

### Category

Event Gateway Development

### Syntax

```
public GatewayHelper getHelper()
```

### See also

[GatewayHelper interface](#); Providing Gateway class service and information routines in the *Developing ColdFusion Applications*.

### Returns

A coldfusion.eventgateway.GatewayHelper class instance, or null if the gateway does not have a GatewayHelper class.

### Usage

ColdFusion calls this method when a ColdFusion application calls the CFML `GetGatewayHelper` function. The application then uses the gatewayHelper object methods to call gateway-specific utility methods, such as instant message buddy management methods.

### Example

The following example is the ColdFusion SocketGateway class `getHelper` method:

```
public GatewayHelper getHelper()
{
    // SocketHelper class implements the GatewayHelper interface
    return new SocketHelper();
}
```

## getStatus

### Description

Returns the gateway status.

### Category

Event Gateway Development

### Syntax

```
public int getStatus()
```

### See also

Providing Gateway class service and information routines in the *Developing ColdFusion Applications*

### Returns

An integer status value. The Gateway interface defines the following status constants:

- STARTING
- RUNNING
- STOPPING

- STOPPED
- FAILED

### Example

The following example is the ColdFusion SocketGateway class `getStatus` method:

```
public int getStatus()  
{  
    return status;  
}
```

## outgoingMessage

### Description

Sends a message from ColdFusion to a message receiver.

### Category

Event Gateway Development

### Syntax

```
public String outgoingMessage(coldfusion.eventgateway.CFEvent message)
```

### See also

Responding to a ColdFusion function or listener CFC in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
message	A coldfusion.eventgateway.CFEvent instance containing the message to be sent.

### Returns

A gateway-specific string, such as a message ID or a status indicator.

### Usage

This method handles a message sent by ColdFusion and processes it as needed by the gateway type to send a message to the (usually external) message receiver. ColdFusion calls this method when the listener method of a listener CFC returns a message or when a ColdFusion application calls the `SendGatewayMessage` function. ColdFusion passes the String returned by this method back as the return value of a CFML `SendGatewayMessage` function.

### Example

The following example is the ColdFusion SocketGateway class `outgoingMessage` method:

```
public String outgoingMessage(coldfusion.eventgateway.CFEvent cfmsg)
{
    String retcode="ok";
    // Get the table of data returned from the event handler
    Map data = cfmsg.getData();
    String message = (String) data.get("MESSAGE");
    // find the right socket to write to from the socketRegistry hashtable
    if (cfmsg.getOriginatorID() != null && message != null)
    {
        SocketServerThread st =
            ((SocketServerThread) socketRegistry.get(cfmsg.getOriginatorID()));
        if(st != null)
            st.writeOutput(message);
        else
        {
            log.error("Cannot send outgoing message. OriginatorID '" +
                cfmsg.getOriginatorID() + "' is not a valid socket id.");
            retcode="failed";
        }
    }
    else if (data.get("OriginatorID") != null && message != null)
    {
        SocketServerThread st =
            ((SocketServerThread) socketRegistry.get(data.get("OriginatorID")));
        if(st != null)
            st.writeOutput(message);
        else
        {
            log.error("Cannot send outgoing message. OriginatorID '" +
                data.get("OriginatorID") + "' is not a valid socket id.");
            retcode="failed";
        }
    }
    else
    {
        log.error("Cannot send outgoing message. OriginatorID/MESSAGE is not
            available.");
        retcode="failed";
    }
    return retcode;
}
```

## restart

### Description

Stops a gateway if it is running and starts it up.

### Category

Event Gateway Development

### Syntax

```
public void restart()
```

### See also

[start](#), [stop](#)

### Usage

In most cases, you implement this method as a call to the stop method followed by a start method, but you may be able to optimize the restart method based on the type of gateway.

### Example

The following example is the ColdFusion SocketGateway class `restart` method:

```
public void restart()
{
    stop();
    start();
}
```

## setCFCListeners

### Description

Sets the array of listener CFCs that the gateway sends messages to.

### Category

Event Gateway Development

### Syntax

```
public void setCFCListeners(String[] listeners)
```

### See also

[Constructor](#), [getGatewayID](#), [setCFPath](#), Providing Gateway class service and information routines in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
<code>listeners</code>	Array of absolute file paths to CFCs to which the gateway forwards messages when it gets events.

### Usage

When ColdFusion starts a gateway instance, it calls this method with the names in the instance's listener list in the ColdFusion Administrator. ColdFusion can also call this method if the ColdFusion Administrator listener list changes while the gateway is running.

### Example

The following example is the ColdFusion SocketGateway class `setCFCListeners` method:

```
public void setCFCListeners(String[] listeners)
{
    ArrayList aListeners = new ArrayList();
    for(int i = 0; i<listeners.length; i++)
    {
        aListeners.add(listeners[i]);
    }
    // Try not to pull the rug out from underneath a running message
    synchronized (cfcListeners)
    {
        cfcListeners = aListeners;
    }
}
```

## setGatewayID

### Description

Sets the gateway ID that uniquely identifies the Gateway instance.

### Category

Event Gateway Development

### Syntax

```
public void setGatewayID(String id)
```

### See also

[Constructor](#), [getGatewayID](#), Providing Gateway class service and information routines in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
id	The identifier for this gateway instance.

### Usage

This method sets a string value that is returned by the `getGatewayID` method. ColdFusion calls this method to set the gateway ID with the value specified in the gateway instance configuration in the ColdFusion Administrator before it starts the event gateway, even if the Gateway constructor also sets the ID.

### Example

The following example is the ColdFusion `SocketGateway` class `setGatewayID` method:

```
public void setGatewayID(String id)
{
    gatewayID = id;
}
```

# start

## Description

starts a gateway running.

## Category

Event Gateway Development

## Syntax

```
public void start()
```

## See also

[restart](#), [stop](#), Starting, stopping, and restarting the event gateway in the *Developing ColdFusion Applications*

## Usage

Start a gateway by performing any required initialization. This method starts any listener thread or threads that monitor the gateway's event source. The ColdFusion Administrator calls this function when it starts a gateway instance.

This method should update the status information that is returned by the `getStatus` method to indicate when the gateway is starting and when the gateway is running.

The ColdFusion Administrator Gateway Types page lets you specify a time-out for the gateway startup, and whether to kill the gateway on startup time-out. If you enable the kill option and the `start` method does not return in the time-out period, ColdFusion kills the thread that called this function.

## Example

The following example is the ColdFusion SocketGateway class `restart` method:

```
public void start()
{
    status = STARTING;
    listening=true;
    // Start up event generator thread
    Runnable r = new Runnable()
    {
        public void run()
        {
            socketServer();
        }
    };
    Thread t = new Thread(r);
    t.start();
    status = RUNNING;
}
```

# stop

## Description

Stops a gateway if it is running.

## Category

Event Gateway Development

## Syntax

```
public void stop()
```

## See also

[restart](#), [start](#), [Starting](#), [stopping](#), and [restarting the event gateway in the \*Developing ColdFusion Applications\*](#)

## Usage

Stops a gateway by performing any required clean-up operations. This method stops any listener thread or threads that monitor the gateway's event source and releases any other resources. The ColdFusion Administrator calls this function when it stops a gateway instance.

This method should update the status information that is returned by the `getStatus` method to indicate when the gateway is stopping and when the gateway is stopped.

## Example

The following example is the ColdFusion SocketGateway class `stop` method:

```
public void stop()
{
    status = STOPPING;
    listening=false;
    Enumeration e = socketRegistry.elements();
    while (e.hasMoreElements()) {
        try
        {
            ((SocketServerThread)e.nextElement()).socket.close();
        }
        catch (IOException e1) {
            e1.printStackTrace();
        }
    }
    if (serverSocket != null) {
        try
        {
            serverSocket.close();
        }
        catch (IOException e1) {
        }
        serverSocket = null;
    }
    status = STOPPED;
}
```

## GatewayHelper interface

`coldfusion.eventgateway.GatewayHelper`

ColdFusion includes a `coldfusion.eventgateway.GatewayHelper` Java marker interface, with no methods. Implement this interface to define a class that provides gateway-specific utility methods to the ColdFusion application or listener CFC. For example, an instant messaging event gateway might use a helper class to provide buddy list management methods to the application. The Gateway class must implement a `getHelper` method that returns the helper class, or null if you do not implement the interface.

For information on GatewayHelper classes, see GatewayHelper class.

## GatewayServices class

`coldfusion.eventgateway.GatewayServices`

The Gateway class uses the `coldfusion.eventgateway.GatewayServices` class to interact with the ColdFusion event gateway services. This class has the following methods:

Signature	Description
<code>GatewayServices getGatewayServices()</code>	Static method that returns the GatewayServices object.
<code>boolean addEvent(CFEvent msg)</code>	Sends a <code>CFEvent</code> instance to ColdFusion for dispatching to a listener CFC.
<code>coldfusion.eventgateway.Logger getLogger([String logfile])</code>	Returns a ColdFusion logger object that the event gateway can use to log information in a file.
<code>int getMaxQueueSize()</code>	Returns the maximum size of the ColdFusion event queue, as set in the ColdFusion Administrator.
<code>int getMaxQueueSize()</code>	Returns the current size of the ColdFusion event queue that handles all messages for all gateways.

## getGatewayServices

### Description

Static method that returns the GatewayServices object. Gateway code can call this method at any time, if necessary.

### Category

Event Gateway Development

### Syntax

```
GatewayServices getGatewayServices()
```

### See also

GatewayServices class in the *Developing ColdFusion Applications*

### Returns

The GatewayServices object.

### Usage

Gateway constructors can call this method to get a convenient reference to the GatewayServices class and its methods.

### Example

The following Socket gateway constructor code sets the GatewayServices variable:

```
public SocketGateway(String id)
{
    gatewayID = id;
    gatewayService = GatewayServices.getGatewayServices();
}
```

Calls to GatewayServices methods, such as the following, use the returned value.

```
boolean sent = gatewayService.addEvent(event);
```

## addEvent

### Description

Sends a CFEvent instance to ColdFusion for dispatching to a listener CFC.

### Category

Event Gateway Development

### Syntax

```
boolean addEvent(CFEvent msg)
```

### See also

[getMaxQueueSize](#), [getMaxQueueSize](#), Responding to incoming messages in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
msg	The CFEvent object containing the message to be queued for delivery to the listener CFC.

### Returns

True if the event was added to the gateway services queue for delivery, false, otherwise. Therefore, a true response does not indicate that the message was delivered.

### Usage

The event gateway must use this method to send incoming messages to the application for processing.

### Example

The following example from the ColdFusion SocketGateway code sends an event to all listener CFCs:

```
for (int i = 0; i < listeners.length; i++) {
    String path = listeners[i];
    CFEvent event = new CFEvent(gatewayID);
    Hashtable mydata = new Hashtable();
    mydata.put("MESSAGE", theInput);
    event.setData(mydata);
    event.setGatewayType("SocketGateway");
    event.setOriginatorID(theKey);
    event.setCfcMethod(cfcEntryPoint);
    event.setCfcTimeOut(10);
    if (path != null)
        event.setCfcPath(path);
    boolean sent = gatewayService.addEvent(event);
    if (!sent)
        log.error("SocketGateway(" + gatewayID + ") Unable to put message on
            event queue. Message not sent from " + gatewayID + ", thread " +
            theKey + ".Message was " + theInput);
}
```

## getLogger

### Description

Returns a ColdFusion Logger object that the event gateway can use to log information in a file.

### Category

Event Gateway Development

### Syntax

```
coldfusion.eventgateway.Logger getLogger([String logfile])
```

### See also

[Logger class](#), Logging events and using log files in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
logfile	The name, without an extension, of a log file in the ColdFusion logs directory. ColdFusion automatically appends a .log extension to the name. If the file does not exist, ColdFusion creates it when it logs the first message. By default, ColdFusion logs to the eventgateway.log file.

### Returns

A ColdFusion logger object

### Usage

The Logger class has five methods: [debug](#), [info](#), [warn](#), [error](#), and [fatal](#), that correspond to the severity level that is set in the log message. Each method takes a message string, a Throwable class object, or both.

If you pass a Throwable object to these methods, ColdFusion writes the exception information in the exceptions.log file.

### Example

The ColdFusion example DirectoryWatcherGateway includes the following line in the constructor to get a logger object:

```
// We create our own log file, which will be named "watcher.log"
logger = gatewayService.getLogger("watcher");
```

The following code, from the start of the routine that loads information from the configuration file, uses this object to log the initialization.

```
// Load the properties file to get our settings
protected void loadconfig() throws ServiceRuntimeException
{
    // load config
    logger.info("DirectoryWatcher (" + gatewayID + ") Initializing
        DirectoryWatcher gateway with configuration file " + config);
    .
    .
    .
}
```

## getMaxQueueSize

### Description

Returns the maximum size of the ColdFusion event queue, as set in the ColdFusion Administrator.

### Category

Event Gateway Development

### Syntax

```
int getMaxQueueSize()
```

### See also

[addEvent](#), [getQueueSize](#)

### Returns

The integer maximum number of messages that the gateway services queue can hold.

### Usage

If the queue length reaches this value, the `addEvent` method does not add its message to the processing queue. You can use this method and the `getQueueSize` method to control the rate of event queuing and to help diagnose any throughput problems in your gateways.

### Example

The following example logs the queue size, maximum queue size, and other information if a `gatewayService.addEvent` method fails to queue a message for delivery to a listener CFC. (It uses an internal method to construct the error message string.)

```
boolean sent = gatewayService.addEvent(cfmsg);
if (!sent)
{
    logger.error(RB.getString(this, "IMGateway.cantAddToQueue",
        gatewayType, gatewayID, ((path != null) ? path : "default"),
        Integer.toString(gatewayService.getQueueSize()),
        Integer.toString(gatewayService.getMaxQueueSize())));
}
```

## getQueueSize

### Description

Returns the current size of the ColdFusion event queue that handles all messages for all gateways.

### Category

Event Gateway Development

### Syntax

```
int getQueueSize()
```

### See also

[addEvent](#), [getMaxQueueSize](#)

### Returns

The integer number of messages in the gateway message queue that are waiting to be delivered to CFCs.

### Usage

You can use this method and the `getMaxQueueSize` method to control the rate of event queuing and to help diagnose any throughput problems in your gateways.

### Example

The following example logs the queue size, maximum queue size, and other information if a `gatewayService.addEvent` method fails to queue a message for delivery to a listener CFC. (It uses an internal method to construct the error message string.)

```
boolean sent = gatewayService.addEvent(cfmsg);
if (!sent)
{
    logger.error(RB.getString(this, "IMGateway.cantAddToQueue",
        gatewayType, gatewayID, ((path != null) ? path : "default"),
        Integer.toString(gatewayService.getQueueSize()),
        Integer.toString(gatewayService.getMaxQueueSize())));
}
```

## CFEvent class

`coldfusion.gateway.CFEvent`

The Gateway class sends and receives `CFEvent` instances to communicate with the ColdFusion listener CFC or application. The `CFEvent` instances correspond to [CFML CFEvent structure](#) that ColdFusion application listener CFC methods receive and contain the message structures that ColdFusion application code sends to the gateway.

- The Gateway notifies ColdFusion of a message by sending a `CFEvent` instance in `GatewayServices.addEvent` method.
- The Gateway receives a `CFEvent` instance when ColdFusion calls the gateway's `outgoingMessage` method.

The `CFEvent` Class extends the `java.util.Hashtable` class and has the following methods:

Methods	Description
<code>CFEvent</code> (String <i>gatewayID</i> )	<code>CFEvent</code> constructor.
String <code>getGatewayID()</code>	Returns the gateway ID (set in the <code>CFEvent</code> constructor).
void <code>setCFCMethod</code> (String <i>method</i> ) String <code>getCFCMethod()</code>	Sets or gets the name of the CFC method that receives an incoming message.
void <code>setCFCPath</code> (String <i>path</i> ) String <code>getCFCPath()</code>	Sets or gets the path to the application listener CFC that processes the event.
void <code>setCFCTimeout</code> (String <i>seconds</i> ) String <code>getCFCTimeout()</code>	Sets or gets the time-out, in seconds, for the listener CFC to process the event request.
void <code>setData</code> (Map <i>data</i> ) Map <code>getData()</code>	Sets or gets the event data structure, which contains the message contents and any other gateway-specific information.
void <code>setGatewayType</code> (String <i>type</i> ) String <code>getGatewayType()</code>	Sets or gets the event gateway type identifier, such as SMS.
void <code>setOriginatorID</code> (String <i>id</i> ) String <code>getOriginatorID()</code>	Sets or gets the gateway- or protocol-specific Identity of the originator of a message.

## CFEvent

### Description

`CFEvent` constructor.

### Category

Event Gateway Development

### Syntax

```
CFEvent (String gatewayID)
```

### See also

`getGatewayID`, [CFML CFEvent structure](#), `CFEvent` class in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
gatewayID	The ID of the gateway. This parameter indicates the source of the message and must be the value that is passed in the Gateway constructor or set using the Gateway <code>setGatewayID</code> method. The SMS gateway ID must be 21 characters or fewer.

### Usage

This method creates a container for an event gateway message that you send to ColdFusion gateway services in a `gatewayServices.addEvent` method for delivery to a CFC listener method.

### Example

The following example, based on code for the ColdFusion asynchronous CFML gateway, sends a message to that the gateway has received to a CFC:

```
public String outgoingMessage(coldfusion.eventgateway.CFEvent cfmsg)
{
    // Get the data
    Map data = cfmsg.getData();
    boolean status = true;
    if (data != null)
    {
        // create an event
        CFEvent event = new coldfusion.eventgateway.CFEvent(gatewayID);
        //set the event field values
        event.setGatewayType("CFMLGateway");
        event.setOriginatorID("CFMLGateway");
        event.setData(data);
        // send it to the event service
        status = gatewayService.addEvent(event);
    }
    return new Boolean(status).ToString();
}
```

## getCFCMethod

### Description

Gets the name of the CFC method that processes the message.

### Category

Event Gateway Development

### Syntax

```
String getCFCMethod()
```

### See also

[getCFCPath](#), [getCFCTimeout](#), [setCFCMethod](#), [CFML CFEvent structure](#), CFEvent class in the *Developing ColdFusion Applications*

### Returns

For incoming messages, the name of the method that gateway services call in the listener CFC, as set by the [setCFCMethod](#) method. If [setCFCMethod](#) has not been called, returns null, and not [onIncomingMessage](#), which ColdFusion gateway services uses by default. Outgoing messages that are returned by a CFC in response to an incoming message also have the CFC method name in this field if the gateway set the field on the incoming message.

### Usage

Most event gateways do not need to use this method. This method could be useful if a gateway sends messages to multiple CFC Methods and must determine which method is responding.

## getCFCPath

### Description

Gets the path to the listener CFC that processes this message.

### Category

Event Gateway Development

### Syntax

```
String getCFCPath()
```

### See also

[getCFCMethod](#), [getCFCTimeout](#), [setCFCPath](#), [CFML CFEvent structure](#), CFEvent class in the *Developing ColdFusion Applications*

### Returns

An absolute path to the application listener CFC that processes the event, as set by the [setCFCPath](#) method. If the [setCFCPath](#) method has not been called, returns null, not the path specified in the ColdFusion Administrator and used by default by gateway services. Outgoing messages that are returned by a CFC in response to an incoming message also have the CFC method name in this field if the gateway set the field on the incoming message.

### Usage

Most event gateways do not need to use this method. This method could be useful if a gateway sends messages to multiple CFCs and must determine which CFC is responding.

## getCFCTimeout

### Description

Gets the time-out, in seconds, for the listener CFC to process the event request.

### Category

Event Gateway Development

### Syntax

```
String getCFCTimeout()
```

### See also

[getCFCMethod](#), [getCFCPath](#), [setCFCTimeout](#), [CFML CFEvent structure](#), CFEvent class in the *Developing ColdFusion Applications*

### Returns

The listener CFC time-out, in seconds, as set by the [setCFCTimeout](#) method, or null.

### Usage

Most gateways do not need to use this function.

When ColdFusion calls a listener CFC method to process the event, and the CFC does not process the event in the specified time-out period, ColdFusion terminates the request and logs an error in application.log file. By default ColdFusion uses the Timeout Request value set on the Server Settings page in the ColdFusion Administrator.

## getData

### Description

Returns the data Map that contains the message contents and other gateway-specific information.

### Category

Event Gateway Development

### Syntax

```
Map getData()
```

### See also

[setData](#), [CFML CFEvent structure](#), CFEvent class in the *Developing ColdFusion Applications*

### Returns

The event data structure, or null. This structure includes the message contents being passed by the gateway and any other gateway-specific information.

### Usage

The contents of the data Map depends on the event gateway type. Typical fields include the message contents, originator ID, destination ID, and if a gateway (such as the ColdFusion SMS gateway) supports multiple commands, the command.

**Note:** The returned Map object has case-insensitive keys.

### Example

The following outgoingMessage method from the SocketGateway example gateway gets the message contents from the CFEvent data field of an outgoing message. If the CFEvent object does not include an OriginatorID field, it also tries to get the originator ID from the data field.

```
public String outgoingMessage(coldfusion.eventgateway.CFEvent cfmsg)
{
    String retcode="ok";
    // Get the table of data returned from the event handler
    Map data = cfmsg.getData();
    String message = (String) data.get("MESSAGE");
    // find the right socket to write to from the socketRegistry hashtable
    if (cfmsg.getOriginatorID() != null)
        ((SocketServerThread)socketRegistry.get(cfmsg.getOriginatorID())).
            writeOutput(message);
    else if (data.get("OriginatorID") != null)
        ((SocketServerThread)socketRegistry.get(data.get("OriginatorID"))).
            writeOutput(message);
    else {
        System.out.println("cannot send outgoing message. OriginatorID is not
            available.");
        retcode="failed";
    }
    return retcode;
}
```

## getGatewayID

### Description

Returns the gateway ID field of the CFEvent object.

### Category

Event Gateway Development

### Syntax

```
String getGatewayID(CFEvent event)
```

### See also

[CFEvent](#), [CFML CFEvent structure](#), CFEvent class in the *Developing ColdFusion Applications*

### Returns

The gateway ID of the CFEvent object, or null.

### Usage

Most gateways do not need to use this method. The gateway ID is set in the CFEvent constructor and normally corresponds to the gateway that is handling the event.

## getGatewayType

### Description

Returns the gateway type field of the CFEvent object.

### Category

Event Gateway Development

### Syntax

```
String getGatewayType()
```

### See also

[setGatewayType](#), [CFML CFEvent structure](#), `CFEvent` class in the *Developing ColdFusion Applications*

### Returns

The gateway type of the `CFEvent` object, or null.

### Usage

Most gateways do not need to use this method.

## getOriginatorID

### Description

Identifies the originator of an incoming message. Some gateway types also use this field for the destination of an outgoing message.

### Category

Event Gateway Development

### Syntax

```
String getOriginatorID()
```

### See also

[setOriginatorID](#), [CFML CFEvent structure](#), `CFEvent` class in the *Developing ColdFusion Applications*

### Returns

The protocol-specific identifier of the message originator, or null.

### Example

The `outgoingMessage` method of the `SocketGateway` example gateway uses the `getOriginatorID` method to determine the destination of an outgoing message. This way, a listener CFC that sends a response back to the originator does not have to explicitly set a destination in the return variable. If the field is empty, (as it is in messages sent by the `CFML SendGatewayMessage` function) the gateway tries to get the destination from the `CFEvent` data field.

```
public String outgoingMessage(coldfusion.eventgateway.CFEvent cfmsg)
{
    String retcode="ok";
    // Get the table of data returned from the event handler
    Map data = cfmsg.getData();
    String message = (String) data.get("MESSAGE");
    // find the right socket to write to from the socketRegistry hashtable
    if (cfmsg.getOriginatorID() != null)
        ((SocketServerThread)socketRegistry.get(cfmsg.getOriginatorID())).
            writeOutput(message);
    else if (data.get("OriginatorID") != null)
        ((SocketServerThread)socketRegistry.get(data.get("OriginatorID"))).
            writeOutput(message);
    else
    {
        System.out.println("cannot send outgoing message. OriginatorID is not
            available.");
        retcode="failed";
    }
    return retcode;
}
```

## setCFCMethod

### Description

Sets the name of the CFC method that processes an incoming message.

### Category

Event Gateway Development

### Syntax

```
void setCFCMethod(String method)
```

### See also

[getCFCMethod](#), [setCFCPath](#), [setCFCTimeout](#), “[CFML CFEvent structure](#)” on page 1503, CFEvent class in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
method	The method in the listener CFC that ColdFusion calls to process this event. If you do not use this method in your gateway, ColdFusion invokes the <code>onIncomingMessage</code> method.

### Usage

Gateways that use a single CFC listener method do not need to use this method if the listener CFC method is named `onIncomingMessage`. For the sake of consistency, Adobe recommends that any event gateway with a single listener not override this default.

A gateway, such as the ColdFusion XMPP gateway, that uses different listener methods for different message types uses this method to identify the destination method.

### Example

The following example code comes from the ColdFusion XMPP gateway incoming message handler. It creates a CFEvent object and sets the method that handles tests based on the message type.

```
CFEvent cfmsg = new CFEvent(gatewayID);
cfmsg.setOriginatorID(sender);
cfmsg.setGatewayType(gatewayType);
if(messageType == IMessage.IM)
{
    // default for normal messages
    cfmsg.setCfcMethod(onIncomingMessageFunction);
}
//if the message is an authorization request
else if(messageType == IMessage.AUTH_REQUEST)
{
    cfmsg.setCfcMethod(onAddBuddyRequestFunction);
    message = "Requesting authorization to add '" + recipient + "' to '"
+ sender + "' buddy list and view '" + recipient + "' presence.";
} // Code snipped here for brevity.
```

## setCFCPath

### Description

Specifies the listener CFC that processes this event.

### Category

Event Gateway Development

### Syntax

```
void setCFCPath(String path)
```

### See also

[getCFCPath](#), [setCFCMethod](#), [setCFCTimeout](#), CFEvent class in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
path	An absolute path to the application listener CFC that processes the event. If you do not call this method in your gateway, ColdFusion uses the first path configured for the event gateway instance on the Event Gateways page in the ColdFusion Administrator.

### Usage

By default, ColdFusion delivers messages to the CFC in the first path configured for the event gateway instance on the Event Gateways page in the ColdFusion Administrator.

If your application supports multiple listener CFCs, use this method to set each listener CFC and then call the `gatewayService.addEvent` method to send the event to the CFC.

### Example

The following example code is based on the Socket gateway processInput method that takes input from the socket and sends it to the CFC listener methods. The listeners variable contains an array of listener CFCs and is set by the gateway's [setCFCListeners](#) method, which ColdFusion calls when it starts the gateway.

```
for (int i = 0; i < listeners.length; i++)
{
    String path = listeners[i];
    CFEvent event = new CFEvent(gatewayID);
    Hashtable mydata = new Hashtable();
    mydata.put("MESSAGE", theInput);
    event.setData(mydata);
    event.setGatewayType("SocketGateway");
    event.setOriginatorID(theKey);
    event.setCFCMethod(cfcEntryPoint);
    event.setCFCTimeout(10);
    if (path != null)
        event.setCFCPATH(path);boolean sent = gatewayService.addEvent(event);
}
```

## setCFCTimeout

### Description

Sets the time-out, in seconds, during which the listener CFC must process the event request and return before ColdFusion gateway services terminates the request.

### Category

Event Gateway Development

### Syntax

```
void setCFCTimeout(String timeout)
```

### See also

[getCFCTimeout](#), [setCFCMethod](#), [setCFCPATH](#), CFEvent class in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
timeout	The CFC time-out period, in seconds.

### Usage

When ColdFusion calls a listener CFC method to process the event, and the CFC does not return in the specified time-out period, ColdFusion terminates the request and logs an error in the application.log file.

If you do not use this method, ColdFusion uses the Timeout Request value set on the Server Settings page in the ColdFusion Administrator.

Use this method if your messages require a longer or shorter time-out period than standard ColdFusion HTML requests.

### Example

The following example code is based on the Socket gateway processInput method that takes input from the socket and sends it to the CFC listener methods. It sets the CFC time-out to 10 seconds.

```
for (int i = 0; i < listeners.length; i++)
{
    String path = listeners[i];
    CFEvent event = new CFEvent(gatewayID);
    Hashtable mydata = new Hashtable();
    mydata.put("MESSAGE", theInput);
    event.setData(mydata);
    event.setGatewayType("SocketGateway");
    event.setOriginatorID(theKey);
    event.setCfcMethod(cfcEntryPoint);
    event.setCfcTimeOut(10);
    if (path != null)
        event.setCfcPath(path);
    boolean sent = gatewayService.addEvent(event);
}
```

## setData

### Description

Adds the gateway-specific data, including any message contents, as a Java Map to the CFEvent object

### Category

Event Gateway Development

### Syntax

```
void setData(Map data)
```

### See also

[getData](#), [CFML CFEvent structure](#), CFEvent class in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
data	The incoming message and any additional gateway-specific event data.

### Usage

The number of fields and their contents depend on the event gateway type. The Map keys must be strings.

Because ColdFusion is not case sensitive, it converts the Map passed in the `setData` method to a case insensitive Map. As a result, do not create entries in the data with names that differ only in case.

### Example

The following code shows the routine from the example JMS gateway that handles incoming messages. It puts the JMS message ID and contents in a data HashMap, and uses it in the `setData` method:

```
public void handleMessage(String msg, String topicName, String msgID) {
    coldfusion.eventgateway.Logger log = getGatewayServices().getLogger();
    Map data = new HashMap();
    CFEvent cfMsg = new CFEvent(getGatewayID());
    data.put("msg", msg);
    data.put("id", msgID);
    cfMsg.setData(data);
    cfMsg.setOriginatorID(topicName);
    cfMsg.setGatewayType("JMS");
    if (sendMessage(cfMsg)) {
        log.info("Added message '" + msgID + "' to queue.");
    } else {
        log.error("Failed to add message '" + msgID + "' to queue.");
    }
}
```

## setGatewayType

### Description

Identifies the type of event gateway.

### Category

Event Gateway Development

### Syntax

```
void setGatewayType(String gatewayType)
```

### See also

[getGatewayType](#), [CFML CFEvent structure](#), CFEvent class in *Developing ColdFusion Applications*

### Parameters

Parameter	Description
gatewayType	A gateway type identifier.

### Usage

For the sake of consistency, use the same name in this method and in the Type Name field when you add the event gateway type in the ColdFusion Administrator. Gateway application CFCs that handle multiple gateway types, such as those in an instant messaging application that handles multiple instant messaging providers, could use this field to determine the protocol type and any gateway type-specific actions.

### Example

The following code shows the routine from the example JMS gateway that handles incoming messages. It sets the gateway type to JMS:

```
public void handleMessage(String msg, String topicName, String msgID) {
    coldfusion.eventgateway.Logger log = getGatewayServices().getLogger();
    Map data = new HashMap();
    CFEvent cfMsg = new CFEvent(getGatewayID());
    data.put("msg", msg);
    data.put("id", msgID);
    cfMsg.setData(data);
    cfMsg.setOriginatorID(topicName);
    cfMsg.setGatewayType("JMS");
    if (sendMessage(cfMsg)) {
        log.info("Added message '" + msgID + "' to queue.");
    } else {
        log.error("Failed to add message '" + msgID + "' to queue.");
    }
}
```

## setOriginatorID

### Description

Identifies the originator of an incoming message.

### Category

Event Gateway Development

### Syntax

```
void setOriginatorID(String originatorID)
```

### See also

[getOriginatorID](#), [CFML CFEvent structure](#), CFEvent class in *Developing ColdFusion Applications*

### Parameters

Parameter	Description
originatorID	The gateway or protocol-specific ID of the message originator.

### Example

The following code shows the routine from the example JMS gateway that handles incoming messages. It sets the originator ID to the name of the JMS topic that the gateway handles:

```
public void handleMessage(String msg, String topicName, String msgID) {
    coldfusion.eventgateway.Logger log = getGatewayServices().getLogger();
    Map data = new HashMap();
    CFEvent cfMsg = new CFEvent(getGatewayID());
    data.put("msg", msg);
    data.put("id", msgID);
    cfMsg.setData(data);
    cfMsg.setOriginatorID(topicName);
    cfMsg.setGatewayType("JMS");
    if (sendMessage(cfMsg)) {
        log.info("Added message '" + msgID + "' to queue.");
    } else {
        log.error("Failed to add message '" + msgID + "' to queue.");
    }
}
```

## Logger class

`coldfusion.eventgateway.Logger`

**Note:** This class is in the `coldfusion.log` package, not the `coldfusion.eventgateway` package, which contains all other event gateway-related interfaces and classes.

The Logger class logs messages to a file in the ColdFusion logs directory. (You set this directory on the ColdFusion Administrator Logging Settings page.) The `coldfusion.eventgateway.GatewayServices.getLogger()` method returns an instance of the Logger class. The Logger class has the following methods:

Signature	Description
<code>debug</code>	Writes a debugging message to the log file.
<code>error</code>	Writes an error message to the log file.
<code>fatal</code>	Writes a fatal error to the log file.
<code>info</code>	Writes an informational message to the log file.
<code>warn</code>	Writes a warning message to the log file.

## debug

### Description

Writes a log entry with a debugging severity to the ColdFusion logger. The entry includes the severity, thread ID, date, time, and a text message.

### Category

Event Gateway Development

### Syntax

```
debug(String message)
debug(Throwable th)
debug(String message, Throwable th)
```

### See also

[error](#), [fatal](#), [info](#), [warn](#), [getLogger](#), Logging events and using log files in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
message	The message to include in the log entry.
th	A throwable object, normally an exception. ColdFusion logs the exception information in the exception.log file in the ColdFusion logs directory.

### Usage

Use this method to send a debugging message to the ColdFusion logging subsystem.

By default, ColdFusion does **not** write debugging messages to the log file. To have debug messages appear in the log file, change the priority entry in *cf\_root\lib\neo-logging.xml* (in the server configuration) or *cf\_root\WEB-INF\cfusion\lib\neo-logging.xml* (in the J2EE configuration). Change the following entry:

```
<var name='priority'>
  <string>information</string>
</var>
```

to the following:

```
<var name='priority'>
  <string>debug</string>
</var>
```

With debug priority, ColdFusion writes messages with a severity of “debug” to the log file specified in the `getLogger` method that returned the Logger instance (or the default log file).

### Example

The ColdFusion instant messaging gateways use the following line to log information about incoming administrative messages or errors only when debugging priority is on.

```
// code to process incoming administrative messages or errors
logger.debug(gatewayType + "Gateway (" + gatewayID + ") admin message: " +
    msg.getMessage());
```

## error

### Description

Writes a log entry with an error severity to the ColdFusion logger. The entry includes the severity, thread ID, date, time, and a text message.

### Category

Event Gateway Development

### Syntax

```
error(String message)
error(Throwable th)
error(String message, Throwable th)
```

### See also

[debug](#), [fatal](#), [info](#), [warn](#), [getLogger](#), Logging events and using log files in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
message	The message to include in the log entry.
th	A throwable object, normally an exception. ColdFusion logs the exception information in the exception.log file in the ColdFusion logs directory.

### Usage

Use this method to send an error message to the ColdFusion logging subsystem. ColdFusion writes messages with a severity of “error” to the log file specified in the `getLogger` method that returned the `Logger` instance (or the default log file).

### Example

The ColdFusion example `SocketGateway` class includes the following code in the `outgoingMessage` method. It writes an error message if the message’s originator ID does not correspond to an open socket.

```
SocketServerThread st =
    ((SocketServerThread) socketRegistry.get (cfmsg.getOriginatorID() ) );
if (st != null)
    st.writeOutput (message) ;
else {
    log.error("Cannot send outgoing message. OriginatorID '" +
        cfmsg.getOriginatorID() + "' is not a valid socket id.");
    retcode="failed";
}
```

## fatal

### Description

Writes a log entry with a fatal severity to the ColdFusion logger. The entry includes the severity, thread ID, date, time, and a text message.

### Category

Event Gateway Development

### Syntax

```
fatal(String message)
fatal(Throwable th)
fatal(String message, Throwable th)
```

### See also

[debug](#), [error](#), [info](#), [warn](#), [getLogger](#), Logging events and using log files in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
message	The message to include in the log entry.
th	A throwable object, normally an exception. ColdFusion logs the exception information in the exception.log file in the ColdFusion logs directory.

### Usage

Use this method to send a fatal error message to the ColdFusion logging subsystem. ColdFusion writes message with a severity of “fatal” to the log file specified in the `getLogger` method that returned the Logger instance (or the default log file).

## info

### Description

Writes a log entry with an information severity to the ColdFusion logger. The entry includes the severity, thread ID, date, time, and a text message.

### Category

Event Gateway Development

### Syntax

```
info(String message)
info(Throwable th)
info(String message, Throwable th)
```

### See also

[debug](#), [error](#), [fatal](#), [warn](#), [getLogger](#), Logging events and using log files in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
message	The message to include in the log entry.
th	A throwable object, normally an exception. ColdFusion logs the exception information in the exception.log file in the ColdFusion logs directory. Not normally used with this method.

### Usage

Use this method to send an informational message to the ColdFusion logging subsystem. ColdFusion writes messages with a severity of “information” to the log file specified in the `getLogger` method that returned the Logger instance (or the default log file).

ColdFusion normally logs all information severity messages. So do not use this severity for debugging messages or for events that happen frequently.

### Example

The ColdFusion example DirectoryWatcherGateway class includes the following line at the top of its `loadconfig` method that loads the gateway’s configuration file. It writes a message including the gateway ID and configuration file.

```
logger.info("DirectoryWatcher (" + gatewayID + ") Initializing  
DirectoryWatcher gateway with configuration file " + config);
```

## warn

### Description

Writes a log entry with a warning severity to the ColdFusion logger. The entry includes the severity, thread ID, date, time, and a text message.

### Category

Event Gateway Development

### Syntax

```
warn(String message)  
warn(Throwable th)  
warn(String message, Throwable th)
```

### See also

[debug](#), [error](#), [fatal](#), [info](#), [getLogger](#), Logging events and using log files in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
message	The message to include in the log entry.
th	A throwable object, normally an exception. ColdFusion logs the exception information in the exception.log file in the ColdFusion logs directory.

### Usage

Use this method to send a warning message to the ColdFusion logging subsystem. ColdFusion writes messages with a severity of “warning” to the log file specified in the `getLogger` method that returned the `Logger` instance (or the default log file).

### Example

The ColdFusion example `SocketWatcherGateway` class includes the following code in its constructor to load a configuration file. If it cannot load the file, it converts the exception information to a string and logs a warning that includes the gateway ID, and the exception information. It also passes the exception to the `warn` method

```
propsFilePath=configpath;  
try {  
    FileInputStream propsFile = new FileInputStream(propsFilePath);  
    properties.load(propsFile);  
    propsFile.close();  
    this.loadProperties();  
}  
catch (IOException e) {  
    // do nothing. use default value for port.  
    log.warn("SocketGateway(" + gatewayID + ") Unable to read configuration file  
        " + propsFilePath + ": " + e.ToString() + ".Using default port.", e);  
}
```

## CFML CFEvent structure

The CFML listener CFC methods receive messages in the form of a CFEvent structure that corresponds to the [CFEvent class](#) that gateway developers use. This structure has the following fields. Some of the fields might not be used by all gateways. All fields contain text or numeric values except the Data field, which contains a structure.

Field	Description
GatewayID	The event gateway that sent the event or will handle the outgoing message. The value is the ID of an event gateway instance configured on the ColdFusion Administrator Gateways page. If the application calls the <a href="#">SendGatewayMessage</a> function to respond to the event gateway, it uses this ID as the function's first parameter.
Data	A structure containing the event data, including the message. The Data structure contents depend on the event gateway type. This field corresponds to the <a href="#">SendGatewayMessage</a> function's second parameter.
OriginatorID	The originator of the message. The value depends on the protocol or event gateway type. Some event gateways might require this value in response messages to identify the destination of the response. Identifies the sender of the message.
GatewayType	The type of event gateway, such as SMS. An application that can process messages from multiple event gateway types can use this field. This value is the gateway type name that is specified by the event Gateway class. It is not necessarily the same as the gateway type name in the ColdFusion Administrator.
CFCPath	The location of the listener CFC. The listener CFC does not need to use this field.
CFCMethod	The listener method that ColdFusion invokes to process the event. The listener CFC does not need to use this field.
CFCTimeout	The time-out, in seconds, for the listener CFC to process the event request. The listener CFC does not need to use this field.

## IM gateway methods and commands

The XMPP and IBM Sametime gateways implement CFC methods to receive messages, use the gatewayHelper object methods to manage the gateway, and use outgoing message commands to send messages. The following sections describe these methods and commands:

### More Help topics

[“IM Gateway CFC incoming message methods”](#) on page 1503

[“IM gateway message sending commands”](#) on page 1511

[“IM Gateway GatewayHelper class methods”](#) on page 1512

## IM Gateway CFC incoming message methods

You write the following CFC methods to handle incoming messages from an XMPP or Lotus Sametime instant messaging gateway.

**Note:** The method names assume a default gateway configuration. ColdFusion lets you change the method names and disable event types in the gateway configuration file.

Method	Message type
<a href="#">onAddBuddyRequest</a>	Requests from other IM users to add the gateway ID as their buddy
<a href="#">onAddBuddyResponse</a>	Responses from others to requests from your gateway to add them to your buddy lists. Also used by buddies to ask to be removed from your list.
<a href="#">onBuddyStatus</a>	Online status information messages
<a href="#">onIMServerMessage</a>	Error and administrative messages from the IM server
<a href="#">onIncomingMessage</a>	Instant messages

## onAddBuddyRequest

### Description

Handles incoming requests for users to add the gateway user name as one of their buddies.

### Syntax

```
onAddBuddyRequest (CFEvent)
```

### See also

[onIncomingMessage](#), [onAddBuddyResponse](#), [onBuddyStatus](#), [onIMServerMessage](#)

### Parameters

The method must take one parameter, a CFEvent structure with the following fields:

Field	Description
gatewayType	Gateway type, either XMPP or SAMETIME
gatewayID	The ID of the gateway instance, as configured in ColdFusion Administrator
originatorID	The IM ID of the message originator
cfcMethod	This CFC method; by default, onAddBuddyRequest.
data.MESSAGE	The message that was sent with the request
data.SENDER	The sender's ID; identical to the originatorID field value
data.RECIPIENT	The recipient's ID, as specified in the gateway's configuration file
data.TIMESTAMP	The date and time when the message was sent

### Returns

The function can optionally return a value to send a response message. The return structure must contain the following fields:

Field	Description
command	One of the following: <ul style="list-style-type: none"> <li>• <b>accept</b> Accept the request to add you as a buddy. ColdFusion adds the user to the permit list of users that can get status information.</li> <li>• <b>decline</b> Deny request to add you as a buddy. ColdFusion adds the user to the deny list of users that can get status information.</li> <li>• <b>noact</b> Take no action. ColdFusion does not respond to the requestor.</li> </ul>
buddyID	ID to which to send the message. Normally, the value of the CFEvent.data.SENDER field. Not used with the <b>noact</b> command.
reason	A text message describing the reason for the action. Not used with the <b>noact</b> command.

### Example

The following example searches for the requested buddy's name in a data source and, if it finds a unique entry, adds the buddy and updates the buddy's status information in an Application scope `buddyStatus` structure. If it doesn't find the name, it declines the buddy. If there are multiple entries for the buddy name in the database, it tells the gateway not to respond. It logs all actions.

```
<cffunction name="onAddBuddyRequest">
    <cfargument name="CFEvent" type="struct" required="YES">
    <cfquery name="buddysearch" datasource="cfdocexamples">
        SELECT IM_ID
        FROM Employees
        WHERE IM_ID = '#CFEvent.Data.SENDER#'
    </cfquery>
    <cflock scope="APPLICATION" timeout="10" type="EXCLUSIVE">
        <cfscript>
            // If the name is in the DB once, accept; if it is missing, decline.
            // If it is in the DB multiple times, take no action.
            if (buddysearch.RecordCount IS 0) {
                action="decline";
                reason="Invalid ID";
            }
            else if (buddysearch.RecordCount IS 1) {
                action="accept";
                reason="Valid ID";
                //Add the buddy to the buddy status structure only if accepted.
                if (NOT StructKeyExists(Application,
                    "buddyStatus")) {
                    Application.buddyStatus=StructNew();
                }
                if (NOT StructKeyExists(Application.buddyStatus,
                    CFEvent.Data.SENDER)) {
                    Application.buddyStatus[#CFEvent.Data.SENDER#]=StructNew();
                }
                Application.buddyStatus[#CFEvent.Data.SENDER#].status=
                    "Accepted Buddy Request";
                Application.buddyStatus[#CFEvent.Data.SENDER#].timeStamp=
```

```
        CFEvent.Data.TIMESTAMP;  
        Application.buddyStatus[#CFEvent.Data.SENDER#].message=  
            CFEvent.Data.MESSAGE;  
    }  
    else {  
        action="noact";  
    }  
    </cfscript>  
</cflock>  
<!-- Log the request and decision information. --->  
<cflog file="#CFEvent.GatewayID#Status"  
    text="onAddBuddyRequest; SENDER: #CFEvent.Data.SENDER# MESSAGE:  
#CFEvent.Data.MESSAGE# TIMESTAMP: #CFEvent.Data.TIMESTAMP# ACTION: #action#">  
    <!-- Return the action decision. --->  
    <cfset retValue = structNew()>  
    <cfset retValue.command = action>  
    <cfset retValue.BuddyID = CFEvent.Data.SENDER>  
    <cfset retValue.Reason = reason>  
    <cfreturn retValue>  
</cffunction>
```

## onAddBuddyResponse

### Description

Handles incoming responses from other users to requests from the gateway to be added to their buddy lists. Also receives requests from buddies to have you remove them from your buddy list.

### Syntax

onAddBuddyResponse (CFEvent)

### See also

[onIncomingMessage](#), [onAddBuddyRequest](#), [onBuddyStatus](#), [onIMServerMessage](#)

### Parameters

The method must take one parameter, a CFEvent structure with the following fields:

Field	Description
gatewayType	Gateway type, either XMPP or SAMETIME.
gatewayID	The ID of the gateway instance, as configured in ColdFusion Administrator.
originatorID	The IM ID of the message originator.
cfcMethod	This CFC method; by default, onAddBuddyResponse.
data.MESSAGE	One of the following: <ul style="list-style-type: none"><li>accept The request was accepted.</li><li>decline The request was declined, or the buddy is asking you to remove them from your list.</li></ul>

Field	Description
data.SENDER	The sender's ID; identical to the originatorID.
data.RECIPIENT	The recipient's ID, as specified in the gateway's configuration file.
data.TIMESTAMP	The date and time when the message was sent.

### Returns

The function does not return a value.

### Example

The following example adds the buddy's status to the Application scope buddyStatus structure if the message sender accepted an add buddy request. It logs all responses.

```
<cffunction name="onAddBuddyResponse">
    <cfargument name="CFEvent" type="struct" required="YES">
    <cflock scope="APPLICATION" timeout="10" type="EXCLUSIVE">
        <cfscript>
            //Do the following only if the buddy accepted the request.
            if (NOT StructKeyExists(Application, "buddyStatus")) {
                Application.buddyStatus=StructNew();
            }
            if (#CFEVENT.Data.MESSAGE# IS "accept") {
                //Create a new entry in the buddyStatus record for the buddy.
                if (NOT StructKeyExists(Application.buddyStatus,
                    CFEvent.Data.SENDER)) {
                    Application.buddyStatus[#CFEvent.Data.SENDER#]=StructNew();
                }
                //Set the buddy status information to indicate buddy was added.
                Application.buddyStatus[#CFEvent.Data.SENDER#].status=
                    "Buddy accepted us";
                Application.buddyStatus[#CFEvent.Data.SENDER#].timeStamp=
                    CFEvent.Data.TIMESTAMP;
                Application.buddyStatus[#CFEvent.Data.SENDER#].message=
                    CFEvent.Data.MESSAGE;
            }
        </cfscript>
    </cflock>
    <!--- Log the information for all responses. --->
    <cflog file="#CFEvent.GatewayID#Status"
        text="onAddBuddyResponse; BUDDY: #CFEvent.Data.SENDER# RESPONSE:
#CFEvent.Data.MESSAGE# TIMESTAMP: #CFEvent.Data.TIMESTAMP#">
</cffunction>
```

## onBuddyStatus

### Description

Handles incoming messages indicating online status (presence) changes of users on the gateway's buddy list.

### Syntax

onBuddyStatus(CFEvent)

## See also

[onIncomingMessage](#), [onAddBuddyRequest](#), [onAddBuddyResponse](#), [onIMServerMessage](#)

## Parameters

The method must take one parameter, a CFEvent structure with the following fields:

Field	Description
gatewayType	Gateway type, either XMPP or SAMETIME.
gatewayID	The ID of the Gateway instance, as configured in ColdFusion Administrator.
originatorID	The IM ID (buddy name) of the message originator.
cfcMethod	This CFC method; by default, onIMServerMessage.
data.BUDDYNAME	The sender's buddy name, or ID; identical to the originatorID.
data.BUDDYNICKNAME	The buddy's display name or nickname.
data.BUDDYSTATUS	<p>The buddy's status; one of the following:</p> <ul style="list-style-type: none"> <li>• ONLINE</li> <li>• OFFLINE</li> <li>• AWAY</li> <li>• DO NOT DISTURB</li> <li>• NOT AVAILABLE</li> <li>• FREE TO CHAT</li> <li>• IDLE</li> </ul> <p><b>XMPP only</b></p> <ul style="list-style-type: none"> <li>• NOT AVAILABLE</li> <li>• FREE TO CHAT</li> <li>• IDLE</li> </ul> <p><b>Sametime only</b></p> <ul style="list-style-type: none"> <li>• IDLE</li> </ul> <p>Use the <code>IMGatewayHelper.getCustomAwayMessage</code> method to get any custom message that the buddy sent when changing status.</p>
data.BUDDYGROUP	The group that the buddy belongs to.
data.RECIPIENT	The recipient's ID, as specified in the gateway's configuration file.
data.TIMESTAMP	The date and time when the message was sent.

**Note:** You configure the buddy's nickname and group when you use the `gatewayHelper` object `addBuddy` method to add a buddy.

## Returns

The function does not return a value.

## Example

The following example keeps an Application scope structure up-to-date with a buddy's status. It also uses the gatewayhelper object getBuddyStatus method to get the buddy's custom away message, if any.

```
<cffunction name="onBuddyStatus">
    <cfargument name="CFEvent" type="struct" required="YES">
    <!--- Get the gatewayhelper object and to get the info for this buddy. --->
    <!--- This is used to get the buddy's custom away message. --->
    <cfset helper = getGatewayHelper("MYIM")>
    <cfset mybuddyinfo=helper.getBuddyInfo(CFEvent.Data.BUDDYNAME)>

    <cflog file="#CFEvent.GatewayID#Status" type="Information"
        text="in OnbuddyStatus, sender is #CFEvent.OriginatorID#">
    <cflock scope="APPLICATION" timeout="10" type="EXCLUSIVE">
        <cfscript>
            // Create the status structures if they don't exist.
            if (NOT StructKeyExists(Application, "buddyStatus")) {
                Application.buddyStatus=StructNew();
            }
            if (NOT StructKeyExists(Application.buddyStatus,
                CFEvent.Data.BUDDYNAME)) {
                Application.buddyStatus[#CFEvent.Data.BUDDYNAME#]=StructNew();
            }
            // Save the buddy status, timestamp, and custom away message
            Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].status=
                CFEvent.Data.BUDDYSTATUS;
            Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].timeStamp=
                CFEvent.Data.TIMESTAMP;
            // The following assumes that the buddy is in only one group.
            Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].customAway=
                mybuddyinfo[1].BUDDYCUSTOMAWAYMESSAGE;
        </cfscript>
    </cflock>
    <!--- log the info, for debugging purposes only --->
    <cfset temp=Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].status>
    <cflog file="#CFEvent.GatewayID#Status" type="Information" text=
        "Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].status is #temp#">
    <cfset temp=Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].timeStamp>
    <cflog file="#CFEvent.GatewayID#Status" type="Information" text=
        "Application.buddyStatus[#CFEvent.Data.BUDDYNAME#].timestamp is #temp#">
    <cflog file="#CFEvent.GatewayID#Status" type="Information" text=
        "Buddy Custom Away Message is mybuddyinfo[1].BUDDYCUSTOMAWAYMESSAGE#">
    </cflock>
</cffunction>
```

## onIMServerMessage

### Description

Handles incoming error and status messages from the IM server.

### Syntax

```
onIMServerMessage (CFEvent)
```

### See also

[onIncomingMessage](#), [onAddBuddyRequest](#), [onAddBuddyResponse](#), [onBuddyStatus](#)

### Parameters

This method must take one parameter, a CFEvent structure with the following fields:

Field	Description
gatewayType	Gateway type, either XMPP or SAMETIME
gatewayID	The ID of the gateway instance, as configured in ColdFusion Administrator
originatorID	The IM ID (buddy name) of the message originator
cfcMethod	This CFC method; by default, onIMServerMessage
data.MESSAGE	The message sent by the server
data.SENDER	The sender's ID; identical to the originatorID
data.RECIPIENT	The recipient's ID, as specified in the gateway's configuration file
data.TIMESTAMP	The date and time when the message was sent

### Example

The following example logs the sender, message, and a timestamp when an IM server sends an error or status message:

```
<cffunction name="onIMServerMessage">
    <!-- This function just logs the message. -->
    <cfargument name="CFEvent" type="struct" required="YES">
    <cflog file="#CFEvent.GatewayID#Status"
        text="onIMServerMessage; SENDER: #CFEvent.OriginatorID#MESSAGE:
#CFEvent.Data.MESSAGE# TIMESTAMP: #CFEvent.Data.TIMESTAMP#">
</cffunction>
```

## onIncomingMessage

### Description

Handles incoming instant messages from other users. Optionally returns a response to the message sender.

### Syntax

```
onIncomingMessage (CFEvent)
```

### See also

[onAddBuddyRequest](#), [onAddBuddyResponse](#), [onBuddyStatus](#), [onIMServerMessage](#), Handling incoming messages in the *Developing ColdFusion Applications*

### Parameters

The method must take one parameter, a CFEvent structure with the following fields:

Field	Description
gatewayType	Gateway type, either XMPP or SAMETIME.
gatewayID	The ID of the Gateway instance as configured in ColdFusion Administrator.
originatorID	The IM ID of the message originator.
cfcMethod	This CFC method; by default, onIncomingMessage.
data.MESSAGE	The message that was received.
data.SENDER	The sender's ID; identical to the originatorID
data.RECIPIENT	The recipient's ID, as specified in the gateway's configuration file
data.TIMESTAMP	The date and time when the message was sent

### Returns

The function can optionally return a value to send a response message. The return structure must contain the following fields:

Field	Description
command	Normally omitted. You can also specify submit.
buddyID	ID to which to send the message. Normally, the value of the input parameter's Data.SENDER field.
message	The message contents.

### Example

The following example shows a simple onIncomingMessage method that echoes a message back to the sender.

```
<cffunction name="onIncomingMessage">
    <cfargument name="CFEvent" type="struct" required="YES">
    <cfset input_mesg = CFEvent.data.MESSAGE>
    <cfset retValue = structNew()>
    <cfset retValue.command = "submit">
    <cfset retValue.buddyID = CFEvent.originatorID>
    <cfset retValue.message = "Message Received:" & input_mesg>
    <cfreturn retValue>
</cffunction>
```

## IM gateway message sending commands

You use the SendGatewayMessage CFML function or the return value of a CFC listener method to send outgoing messages. The ColdFusion IM gateway accepts the following outgoing message commands:

Command	Description
submit	(Default) Sends a normal message to another IM user.

Command	Description
accept	Accepts an add buddy request. Adds the buddy to the list of IDs that get your presence information and sends an acceptance message to the buddy ID.
decline	Declines an add buddy request and sends a rejection message to the buddy ID.
noact	Tells the gateway to take no action. The gateway logs a message that indicates that it took no action, and contains the gateway type, gateway ID, and buddy ID.

The message structure that you return in the gateway listener CFC function or use as the second parameter in the CFML `SendGatewayMessage` function can have the following fields. The table lists the fields and the commands in which they are used, and describes the field's use.

Field	Commands	Description
buddyID	All	The destination user ID
command	All	The command; defaults to submit if omitted
message	submit	A text message to send to the destination user
reason	accept, decline	A text description of the reason for the action or other message to send to the add buddy requestor

In typical use, a ColdFusion application uses the accept, decline, and noact commands in the return value of the `onAddBuddyRequest` method, and uses the submit command (or no command, because submit is the default command) in `SendGatewayMessage` CFML functions and the return value of the `onIncomingMessage` CFC method.

## IM Gateway GatewayHelper class methods

The GatewayHelper class returned by the CFML `GetGatewayHelper` function includes the following methods:

<a href="#">addBuddy</a>	<a href="#">getDenyList</a>	<a href="#">getStatusAsString</a>	<a href="#">removeDeny</a>
<a href="#">addDeny</a>	<a href="#">getName</a>	<a href="#">getStatusTimeStamp</a>	<a href="#">removePermit</a>
<a href="#">addPermit</a>	<a href="#">getNickName</a>	<a href="#">isOnline</a>	<a href="#">setNickName</a>
<a href="#">getBuddyInfo</a>	<a href="#">getPermitList</a>	<a href="#">numberOfMessagesReceived</a>	<a href="#">setPermitMode</a>
<a href="#">getBuddyList</a>	<a href="#">getPermitMode</a>	<a href="#">numberOfMessagesSent</a>	<a href="#">setStatus</a>
<a href="#">getCustomAwayMessage</a>	<a href="#">getProtocolName</a>	<a href="#">removeBuddy</a>	

## addBuddy

### Description

Adds a buddy to the buddy list for the gateway user ID and asks to have the IM server send messages with the buddy's online presence state to the gateway.

### Syntax

```
Boolean = addBuddy(name, nickname, group)
```

### See also

[getBuddyInfo](#), [getBuddyList](#), [removeBuddy](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
name	The unique instant messaging user name for the person about whom you want to receive periodic status messages.
nickname	The nickname that the application can use to refer to the user.
group	The name of the group you wish to add the user to in your Buddy List. If the group specified does not exist, it will be created. If the group parameter is the empty string, the gateway uses the General group.

### Returns

True if the ID was added to the gateway's buddy list; False, otherwise.

### Usage

This method adds the buddy to the buddy list for the gateway's ID and sends a subscription request (to automatically get presence information about the buddy's online status) to the remote buddy. It does not wait for a response from the buddy, so it returns True (and the gateway adds the buddy to the list) even if the buddy denies the subscription request. Use the listener CFC [onAddBuddyResponse](#) method to monitor the buddy's response. If the CFEvent.data.MESSAGE field value is decline, the listener method can call the gatewayHelper object [removeBuddy](#) method to remove the buddy from the buddy list.

### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## addDeny

### Description

Tells the IM server to add the specified user to the deny list for the gateway's user ID. If the gateway's permit mode value is DENY\_SOME, the specified user cannot receive messages on the gateway's presence state.

### Syntax

```
Boolean = addDeny(name, nickname, group)
```

### See also

[addPermit](#), [getDenyList](#), [getPermitList](#), [getPermitMode](#), [removeDeny](#), [removePermit](#), [setPermitMode](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
name	The unique instant messaging user name for the person about whom you want to deny access to status messages.
nickname	The nickname that the application can use to refer to the user. Can be the empty string.
group	The name of the group that you want to add the user to in your buddy list. If the group specified does not exist, it is created. If the group parameter is the empty string, the gateway uses the General group.

### Returns

True if the ID was added to the deny list; False, otherwise.

**Note:** *If the XMPP server does not support permission management, this function always returns False*

### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## addPermit

### Description

Tells the IM server to add the specified user to the permit list for the gateway's user ID. If the gateway's permit mode is PERMIT\_SOME, the specified user receive messages on the gateway's presence state.

### Syntax

```
Boolean = addPermit(name, nickname, group)
```

### See also

[addDeny](#), [getDenyList](#), [getPermitList](#), [getPermitMode](#), [removeDeny](#), [removePermit](#), [setPermitMode](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
name	The unique instant messaging user name for the person about whom you want to deny access to status messages.
nickname	The nickname that the application can use to refer to the user. Can be the empty string.
group	The name of the group you want to add the user to in your Buddy List. If the group specified does not exist, it is created. If the group parameter is the empty string, the gateway uses the General group.

### Returns

True if the ID was added to the permit list; false, otherwise.

**Note:** *If the XMPP server does not support permission management, this function always returns False.*

### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## getBuddyInfo

### Description

Gets information about the specified user from the buddy list, deny list, and permit list.

### Syntax

```
array = getBuddyInfo (name)
```

### See also

[addBuddy](#), [getBuddyList](#), [removeBuddy](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
name	The unique instant messaging user name for the person about whom you want to get information.

### Returns

An array of structures, with one structure for each information record found. The method finds one record for each group that the user belongs to in each of the lists (buddy, permit, deny) that contains the specified name. Each structure has the following fields. Some fields might not be meaningful for some IM protocols. If there is no information for a field, it is blank.

Field	Description
BUDDYNAME	The user's unique ID.
BUDDYGROUP	The group to which the user belongs.
BUDDYNICKNAME	The nickname that you have assigned to the user.
BUDDYPROTOCOL	The instant messaging protocol. JABBER (for XMPP) or SAMETIME, or an empty string (if the server did not return a value).

Field	Description
BUDDYSTATUS	<p>The user's presence state, can be any of the following:</p> <ul style="list-style-type: none"> <li>• ONLINE</li> <li>• OFFLINE</li> <li>• AWAY</li> <li>• DND (displays as DO NOT DISTURB)</li> <li>• NA (displays as NOT AVAILABLE)</li> <li>• FREE_TO_CHAT (displays as FREE TO CHAT)</li> <li>• IDLE</li> </ul> <p><b>XMPP only</b></p> <ul style="list-style-type: none"> <li>• NA (displays as NOT AVAILABLE)</li> <li>• FREE_TO_CHAT (displays as FREE TO CHAT)</li> <li>• IDLE</li> </ul> <p><b>Sametime only</b></p> <ul style="list-style-type: none"> <li>• IDLE</li> </ul>
BUDDYSIGNONTIME	The date and time when the user signed onto the IM server. Empty if the user is not currently signed on. Always an empty string for XMPP and Sametime.
BUDDYSTATUSTIME	The date and time when the user's status most recently changed.
BUDDYCUSTOMAWAYMESSAGE	The custom away message that the user has set to explain the current status, if any.
BUDDYOWNER	A string representing the client and protocol associated with this ID, in the format <i>client@protocol</i> .
BUDDYLISTTYPE	<p>The type of list that this buddy record is in; one of the following:</p> <ul style="list-style-type: none"> <li>• BUDDY_LIST The list of users whose presence status information the gateway can receive.</li> <li>• DENY_LIST The list of users who cannot get presence information about the gateway ID.</li> <li>• PERMIT_LIST The list of users who can send presence information messages to the gateway ID.</li> <li>• REVERSE_LIST The list of users who do not allow messages to us.</li> </ul>
BUDDYIDLETIME	If the buddy status is IDLE, how long the buddy has been idle. Always 0 for XMPP or SameTime.
BUDDYISMOBILE	True or False, indicating whether the user is on a mobile device. Always False for XMPP or SameTime.
BUDDYWARNINGPERCENT	The user's warning percentage value. Always 0 for XMPP or SameTime.

### Example

See GatewayHelper example , in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods. For an example of using this method to get the buddy custom away message, see [onBuddyStatus](#).

## getBuddyList

### Description

Gets the buddy list for the gateway's user ID.

#### Syntax

```
array = getBuddyList()
```

#### See also

[addBuddy](#), [getBuddyInfo](#), [removeBuddy](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

#### Returns

An array of IDs (buddy names) of the users on the gateway's buddy list, a list of instant messaging IDs that this gateway normally communicates with.

#### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## getCustomAwayMessage

#### Description

Returns the gateway's custom away message if it has been set by the gatewayHelper object `setStatus` method.

#### Syntax

```
string = getCustomAwayMessage()
```

#### See also

[getStatusAsString](#), [getStatusTimeStamp](#), [isOnline](#), [setStatus](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

#### Returns

The gateway's custom away message if it has been set by the GatewayHelper object `setStatus` method.

#### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## getDenyList

#### Description

Returns the list of users that the IM server has been told not to send state information about the gateway, if the permit mode is set to DENY\_SOME.

#### Syntax

```
array = getDenyList()
```

#### See also

[addDeny](#), [addPermit](#), [getPermitList](#), [getPermitMode](#), [removeDeny](#), [removePermit](#), [setPermitMode](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Returns

An array of IDs (buddy names) of the users on the gateway's deny list, the list of IDs to which the IM server does not send presence status information.

*Note: If the XMPP server does not support permission management, this function always returns False.*

### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## getName

### Description

Returns the gateway's user name.

### Syntax

```
string = getName()
```

### See also

[getProtocolName](#), [numberOfMessagesReceived](#), [numberOfMessagesSent](#), [setNickName](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Returns

The gateway's user name, as specified in gateway configuration file.

### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## getNickName

### Description

Returns the gateway's nickname (display name), if it has been set using the gatewayHelper object `setNickName` method.

### Syntax

```
string = getNickName()
```

### See also

[getName](#), [getProtocolName](#), [numberOfMessagesReceived](#), [numberOfMessagesSent](#), [setNickName](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Returns

The gateway's nickname, if any; empty string, otherwise.

### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## getPermitList

### Description

Returns the list of users that the IM server has been told to send state information about the gateway.

### Syntax

```
array = getPermitList()
```

### See also

[addDeny](#), [addPermit](#), [getDenyList](#), [getPermitMode](#), [removeDeny](#), [removePermit](#), [setPermitMode](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Returns

An array of IDs (buddy names) of the users on the gateway's permit list, the list of IDs to which the IM server sends presence status information if the permit mode is set to PERMIT\_SOME.

**Note:** If the XMPP server does not support permission management, this function always returns False.

### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## getPermitMode

### Description

Gets the gateway's permit mode from the IM server. The permit mode determines whether all users can get the gateway's online state information, or whether the server uses a permit list or a deny list to control which users get state information.

### Syntax

```
string = getPermitMode()
```

### See also

[addDeny](#), [addPermit](#), [getDenyList](#), [getPermitList](#), [removeDeny](#), [removePermit](#), [setPermitMode](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Returns

The gateway's permit mode; one of the following values:

Mode	Description
PERMIT_ALL	(Default) Permits all users to be aware of the gateway's online presence and state.
PERMIT_SOME	Permits only users in the permit list to be aware of the gateway's online presence and state.
DENY_SOME	Prevents the users in the deny list from being aware of the gateway's online presence and state.

**Note:** If the XMPP server does not support permission management, this function always returns PERMIT\_ALL.

### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## getProtocolName

### Description

Gets the name of the gateway's instant messaging protocol.

### Syntax

```
string = getProtocolName()
```

### See also

[getName](#), [getNickName](#), [numberOfMessagesReceived](#), [numberOfMessagesSent](#), [setNickName](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Returns

The gateway's protocol, as determined by the gateway type; one of the following values:

- JABBER (for XMPP)
- SAMETIME

### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## getStatusAsString

### Description

Gets the online status of the gateway as a text string.

### Syntax

```
string = getStatusAsString()
```

### See also

[getCustomAwayMessage](#), [getStatusTimeStamp](#), [isOnline](#), [setStatus](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Returns

The gateway's online status; one of the following:

- ONLINE
- OFFLINE
- AWAY
- DO NOT DISTURB

**XMPP only**

- NOT AVAILABLE
- FREE TO CHAT

**Sametime only**

- IDLE

**Usage**

The DO NOT DISTURB, NOT AVAILABLE, and FREE TO CHAT strings differ from the status values that you use in the `setStatus` method, which does not allow spaces in the status names.

**Example**

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## getStatusTimeStamp

**Description**

Gets the date and time that the gateway changed its online status.

**Syntax**

```
date-time object = getStatusTimeStamp()
```

**See also**

[getCustomAwayMessage](#), [getStatusAsString](#), [isOnline](#), [setStatus](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

**Returns**

The date and time that the gateway changed its online status, normally by calling the `setStatus` gatewayHelper object method.

**Example**

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## isOnline

**Description**

Determines whether the gateway is connected to the instant messaging server.

**Syntax**

```
Boolean = isOnline()
```

**See also**

[getCustomAwayMessage](#), [getStatusAsString](#), [getStatusTimeStamp](#), [setStatus](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

#### Returns

True, if the gateway is connected to the IM server; False, otherwise.

#### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## numberOfMessagesReceived

#### Description

Gets the number of messages received by the gateway since it was started.

#### Syntax

```
integer = numberOfMessagesReceived()
```

#### See also

[getName](#), [getNickName](#), [getProtocolName](#), [numberOfMessagesSent](#), [setNickName](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

#### Returns

The number of messages received by the gateway since it was started.

#### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## numberOfMessagesSent

#### Description

Gets the number of messages sent by the gateway since it was started.

#### Syntax

```
integer = numberOfMessagesSent()
```

#### See also

[getName](#), [getNickName](#), [getProtocolName](#), [numberOfMessagesReceived](#), [setNickName](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

#### Returns

The number of messages sent by the gateway since it was started.

#### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## removeBuddy

### Description

Removes an ID from a group in the buddy list for the gateway and tells the IM server not to send the gateway messages with the buddy's online presence state.

### Syntax

```
Boolean = removeBuddy(name, group)
```

### See also

[addBuddy](#), [getBuddyInfo](#), [getBuddyList](#), [removeDeny](#), [removePermit](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
name	The unique instant messaging user name for the person to remove from the buddy list.
group	The name of the group from which you want to remove the user. If the parameter is the empty string, the gateway uses the General group.

### Returns

True if the ID was removed from the group; False, otherwise.

### Usage

If the user is in multiple groups in your buddy list, you remove the buddy separately from each group. The IM server does not stop sending status updates until you remove the name from all groups.

### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## removeDeny

### Description

Removes an ID from a group in the deny list for the gateway. If the gateway's permit mode is DENY\_SOME, the specified user can receive messages on the gateway's presence state.

### Syntax

```
Boolean = removeDeny(name, group)
```

### See also

[addDeny](#), [addPermit](#), [getDenyList](#), [getPermitList](#), [getPermitMode](#), [removeBuddy](#), [removePermit](#), [setPermitMode](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
name	The unique instant messaging user name for the person to remove from the deny list.
group	The name of the group from which you want to remove the user. If the parameter is the empty string, the gateway uses the General group.

### Returns

True if the ID was removed from the group; False, otherwise.

**Note:** *If the XMPP server does not support permission management, this function always returns False.*

### Usage

If the user is in multiple groups in your deny list, you remove the user separately from each group. The IM server enables sending status updates if you remove the name any group.

### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## removePermit

### Description

Removes an ID from a group in the permit list for the gateway. If the gateway's permit mode is PERMIT\_SOME, the specified user cannot receive messages on the gateway's presence state.

### Syntax

```
Boolean = removePermit(name, group)
```

### See also

[addDeny](#), [addPermit](#), [getDenyList](#), [getPermitList](#), [getPermitMode](#), [removeBuddy](#), [removeDeny](#), [setPermitMode](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
name	The unique instant messaging user name for the person to remove from the permit list.
group	The name of the group from which you want to remove the user. If the parameter is the empty string, the gateway uses the General group.

### Returns

True if the ID was removed from the group; False, otherwise.

**Note:** *If the XMPP server does not support permission management, this function always returns False.*

### Usage

If the user is in multiple groups in your permit list, you remove the user separately from each group. However, the IM server stops sending status updates when you remove the user from the first group.

### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## setNickName

### Description

Sets the gateway's nickname (display name).

### Syntax

```
Boolean = setNickName (name)
```

### See also

[getName](#), [getNickName](#), [getProtocolName](#), [numberOfMessagesReceived](#), [numberOfMessagesSent](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
name	The display name that you want to associate with this gateway. This name is not guaranteed to be unique for the protocol.

### Returns

True if the nickname got set; false, otherwise.

### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## setPermitMode

### Description

Sets the gateway's permit mode on the IM server. The permit mode determines whether all users can get the gateway's online state information, or whether the server uses a permit list or a deny list to control which users get state information.

### Syntax

```
Boolean = setPermitMode (permitMode)
```

### See also

[addDeny](#), [addPermit](#), [getDenyList](#), [getPermitList](#), [getPermitMode](#), [removeDeny](#), [removePermit](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
permitMode	<p>The permission mode, one of the following:</p> <ul style="list-style-type: none"><li>• <code>PERMIT_ALL</code> Permits all users to be aware of the gateway's online presence and state. This is the default mode if you do not call this function.</li><li>• <code>PERMIT_SOME</code> Permits only users in the permit list to be aware of the gateway's online presence and state.</li><li>• <code>DENY_SOME</code> Prevents all users in the deny list from being aware of the gateway's online presence and state.</li></ul>

### Returns

True if the permit mode was set; False otherwise.

**Note:** *If the XMPP server does not support permission management, this function returns False to all values except `PERMIT_ALL`.*

### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## setStatus

### Description

Sets the online presence status of the gateway, including any custom away message.

### Syntax

```
Boolean = setStatus(status, customAwayMsg)
```

### See also

[getCustomAwayMessage](#), [getStatusAsString](#), [getStatusTimeStamp](#), [isOnline](#), Using the GatewayHelper object in the *Developing ColdFusion Applications*

### Parameters

Parameter	Description
status	<p>The gateway's online presence status; one of the following:</p> <ul style="list-style-type: none"><li>• ONLINE</li><li>• AWAY</li><li>• DND (Do Not Disturb)</li><li>• NA (Not Available)</li><li>• FREE_TO_CHAT</li><li>• IDLE</li></ul> <p><b>XMPP only</b></p> <ul style="list-style-type: none"><li>• NA (Not Available)</li><li>• FREE_TO_CHAT</li><li>• IDLE</li></ul> <p><b>Sametime only:</b></p> <ul style="list-style-type: none"><li>• IDLE</li></ul>
customAwayMsg	A text string containing a custom message for the status. Can be the empty string if you do not need a custom away message.

### Returns

True, if the operation was successful; False, otherwise. Passing an invalid status for the protocol causes this method to return False.

### Usage

Do not use the `setStatus` method to go offline. Although the method accepts a parameter of `OFFLINE`, the gateway immediately resets itself to be online. To set the gateway offline, stop the gateway instance in the ColdFusion Administrator, or use the `stopGatewayInstance` method in the `CFIDE.adminapi.eventgateway` CFC.

### Example

See GatewayHelper example, in the *Developing ColdFusion Applications*, which uses all GatewayHelper class methods.

## SMS Gateway CFEvent structure and commands

This section describes the detailed contents of the following structures that you use in the SMS Gateway listener CFCs and CFML `SendGatewayMessage` functions:

### More Help topics

[“SMS Gateway incoming message CFEvent structure”](#) on page 1528

[“SMS gateway message sending commands”](#) on page 1529

## SMS Gateway incoming message CFEvent structure

The SMS gateway puts the following information in a CFEvent instance that it sends to the CFC listener method:

Field	Value
OriginatorID	Contents of the PDU <code>source_addr</code> field, the address of the device that sent the message.
CfcMethod	Listener CFC method name. Value of the configuration file <code>cfc-method</code> entry, or <code>onIncomingMessage</code> if the configuration file does not have this entry.
Data.MESSAGE	Contents of the <code>short_message</code> field of the PDU.
Data.sourceAddress	The address of the device that sent this message.
Data.destAddress	The address to which the message was sent; an address in the range specified by the gateway configuration file <code>address-range</code> setting.
Data.esmClass	<p>Contents of the PDU <code>esm_class</code> field. Identifies the message type. A number in the range 0-255 representing a Byte value, where bits 2-5 (0-indexed) indicate the message type, and therefore the contents of the <code>data.MESSAGE</code> field, as follows. (Reserved values are omitted.)</p> <p>xx0000xx Normal message</p> <p>xx0001xx SMSC delivery receipt</p> <p>xx0010xx SME Delivery Acknowledgement</p> <p>xx0100xx SME Manual/User Acknowledgement</p> <p>xx0110xx Conversation abort (Korean CDMA only)</p> <p>xx1000xx Intermediate Delivery Notification</p> <p>For more information on this field, see the SMPP specification.</p>
Data.protocol	Contents of the PDU <code>protocol_id</code> field. Meaningful for messages sent from GSM networks only. For more information, see the GSM 03.40 specification.
Data.priority	Contents of the PDU <code>priority_flag</code> field. A message priority level set by the originating SME, in the range 0-3; 0 is the lowest priority and 3 is the highest priority. The specific priority level meaning depends on the originating network. For more details, see the SMPP specification.
Data.registeredDelivery	<p>Contents of the PDU <code>registered_delivery</code> field, indicating the type of delivery receipt or acknowledgement that the sender requested. A number in the range 0-32, representing the sum of the following values:</p> <p>0: No SMS delivery receipt requested <i>or</i></p> <p>1: SMSC delivery receipt requested on delivery success or failure <i>or</i></p> <p>2: SMSC delivery receipt requested on delivery failure only</p> <p>Plus</p> <p>0: No SME acknowledgement requested <i>or</i></p> <p>4: SME Delivery Acknowledgement requested <i>or</i></p> <p>8: SME Manual/User Acknowledgement requested <i>or</i></p> <p>12: Both Delivery and Manual/User Acknowledgements requested</p> <p>Plus</p> <p>0: No Intermediate notification requested <i>or</i></p> <p>16: Intermediate notification requested</p>

Field	Value
<code>Data.DataCoding</code>	<p>Contents of the PDU <code>data_coding</code> field. Indicates the character set or the noncharacter data type of the message contents, as follows:</p> <p>00000000 SMSC Default Alphabet</p> <p>00000001 IA5 (CCITT T.50)/ASCII (ANSI X3.4)</p> <p>00000010 Octet unspecified (8-bit binary)</p> <p>00000011 Latin 1 (ISO-8859-1)</p> <p>00000100 Octet unspecified (8-bit binary)</p> <p>00000101 JIS (X 0208-1990)</p> <p>00000110 Cyrillic (ISO-8859-5)</p> <p>00000111 Latin/Hebrew (ISO-8859-8)</p> <p>00001000 UCS2 (ISO/IEC-10646)</p> <p>00001001 Pictogram Encoding</p> <p>00001010 ISO-2022-JP (Music Codes)</p> <p>00001101 Extended Kanji JIS(X 0212-1990)</p> <p>00001110 KS C 5601</p> <p>11xxxxxx GSM control use only; see the GSM 03.38 specification</p> <p>For more details, see the SMPP specification.</p>
<code>Data.messageLength</code>	The length of the <code>short_message</code> field.
<code>GatewayType</code>	Always SMS.

For more information on the meanings of some of these fields and how to handle incoming SMS messages an SMS gateway listener CFC method, see Handling incoming messages in the *Developing ColdFusion Applications*.

## SMS gateway message sending commands

ColdFusion applications that use gateways of the Short Message Service (SMS) type can send the following commands to the event gateway in an outgoing message:

### More Help topics

“[submit command](#)” on page 1529

“[submitMulti command](#)” on page 1531

“[data command](#)” on page 1532

## submit command

To send a message to a single destination address in an SMPP SUBMIT\_SM PDU, the structure that you used in the `Data` parameter of a `SendGatewayMessage` function or the return variable of the CFC listener method has the following fields. For more information about these fields, see the documentation for the SUBMIT\_MULTI PDU in the SMPP3.4 specification, which you can download from the SMS Forum at [www.smsforum.net/](http://www.smsforum.net/).

### Required fields

Field	Contents
command	If present, the value must be <code>submit</code> . If you omit this field, the event gateway sends a submit message.
shortMessage or messagePayload	The message contents. You must specify one of these fields, but not both. The SMPP specification imposes a maximum size of 254 bytes on the <code>shortMessage</code> field, and some carriers might limit its size further. The <code>messagePayload</code> field can contain up to 64K bytes; it must start with 0x0424, followed by two bytes specifying the payload length, followed by the message contents.
destAddress	Required. The address to which to send the message.
sourceAddress	The address of this application. You can omit this field; the configuration file specifies the application address.

### Optional fields

You can set default values for the following optional fields in the SMS event gateway configuration file. For information on the default values, see *Configuring an SMS event gateway* in the *Developing ColdFusion Applications*.

destAddress_npi	destAddress_ton	serviceType	
-----------------	-----------------	-------------	--

The following optional fields do not have default values:

alertOnMsgDelivery	EsmClass	priorityFlag	smDefaultMsgId
callbackNum	ItsReplyType	PrivacyIndicator	SmsSignal
callbackNumAtag	ItsSessionInfo	protocolId	SourceAddrSubunit
callbackNumPresInd	LanguageIndicator	registeredDelivery	SourcePort
dataCoding	MoreMsgsToSend	replaceIfPresent	SourceSubaddress
DestAddrSubunit	MsMsgWaitFacilities	SarMsgRefNum	UserMessageReference
DestinationPort	MsValidity	SarSegmentSeqnum	UserResponseCode
DestSubaddress	NumberOfMessages	SarTotalSegments	UssdServiceOp
DisplayTime	PayloadType	scheduleDeliveryTime	validityPeriod

### Example

The following example `onIncomingMessage` method of a listener CFC uses the `submit` command to echo incoming SMS messages to the message originator:

```
<cffunction name="onIncomingMessage" output="no">
    <cfargument name="CFEvent" type="struct" required="yes">
    <!--- Create a return structure that contains the message. --->
    <cfset retValue = structNew()>
    <cfset retValue.command = "submit">
    <cfset retValue.destAddress = arguments.CFEvent.originatorid>
    <cfset retValue.shortMessage = "Echo: " & CFEvent.Data.MESSAGE>
    <!--- Send the message back. --->
    <cfreturn retValue>
</cffunction>
```

## submitMulti command

To send a single text message to multiple recipients using an SMPP SUBMIT\_MULTI PDU, the *Data* parameter of a `SendGatewayMessage` function or the return variable of the CFC listener method usually has the following fields. For more information about these fields, see the documentation for the SUBMIT\_MULTI PDU in the SMPP3.4 specification, which you can download from the SMS Forum at [www.smsforum.net/](http://www.smsforum.net/).

### Required fields

Field	Contents
command	Must be <code>submitMulti</code> .
shortMessage or messagePayload	The message contents. You must specify one of these fields, but not both. The SMPP specification imposes a maximum size of 254 bytes on the <code>shortMessage</code> field, and some carriers might limit its size further. The <code>messagePayload</code> field can contain up to 64K bytes; it must start with 0x0424, followed by two bytes specifying the payload length, followed by the message contents.
destAddress	A ColdFusion array of destination addresses (required).  You cannot specify individual TON and NPI values for these addresses; all must conform to a single setting.
sourceAddress	The address of this application. You can omit this field; the configuration file specifies the application address.

### Optional fields

The following optional fields can have default values set in the SMS event gateway configuration file. For information on the default values see *Configuring an SMS event gateway* in the *Developing ColdFusion Applications*.

destAddress_npi	destAddress_ton	serviceType	
-----------------	-----------------	-------------	--

The following optional fields do not have default values:

alertOnMsgDelivery	DisplayTime	protocolId	SmsSignal
callbackNum	EsmClass	registeredDelivery	SourceAddrSubunit
callbackNumAtag	LanguageIndicator	replaceIfPresent	SourcePort
callbackNumPresInd	MsMsgWaitFacilities	SarMsgRefNum	SourceSubaddress
dataCoding	MsValidity	SarSegmentSeqnum	UserMessageReference
DestAddrSubunit	PayloadType	SarTotalSegments	validityPeriod
DestinationPort	priorityFlag	scheduleDeliveryTime	
DestSubaddress	PrivacyIndicator	smDefaultMsgId	

### Example

The following example `onIncomingMessage` method sends a response that echoes an incoming message to the originator address, and sends a copy of the response to a second address:

```
<cffunction name="onIncomingMessage" output="no">
    <cfargument name="CFEvent" type="struct" required="yes">
    <!--- Get the message. --->
    <cfset data=cfevent.DATA>
    <cfset message="#data.message#">
    <!--- Create the return structure. --->
    <cfset retValue = structNew()>
    <cfset retValue.command = "submitmulti">
    <cfset retValue.destAddresses=arraynew(1)>
    <!--- One destination is incoming message originator;
        get the address from CFEvent originator ID. --->
    <cfset retValue.destAddresses[1] = arguments.CFEvent.originatorid>
    <cfset retValue.destAddresses[2] = "12345">
    <cfset retValue.shortMessage = "echo: " & message>
<cfreturn retValue>
</cffunction>
```

## data command

To send binary data to a single destination address in an SMPP DATA\_SM PDU, the *Data* parameter of a *SendGatewayMessage* function or the return variable of the CFC listener method must have the following fields. For more information about these fields, see the documentation for the SUBMIT\_MULTI PDU in the SMPP3.4 specification, which you can download from the SMS Forum at [www.smsforum.net/](http://www.smsforum.net/).

### Required fields

Field	Contents
command	Must be data.
messagePayload	The message data. To convert data to binary format, use the ColdFusion <i>ToBinary</i> function.
destAddress	The address to which to send the message.
sourceAddress	The address of this application. You can omit this field; the configuration file specifies the application address.

### Optional fields

The following optional fields can have default values set in the SMS event gateway configuration file. For information on the default values see *Configuring an SMS event gateway* in the *Developing ColdFusion Applications*.

destAddress_npi	destAddress_ton	serviceType	
-----------------	-----------------	-------------	--

The following optional fields do not have default values:

alertOnMsgDelivery	DestTelematicsId	NetworkErrorCode	SetDpf
callbackNum	DisplayTime	NumberOfMessages	SmsSignal
callbackNumAtag	EsmClass	PayloadType	SourceAddrSubunit
callbackNumPresInd	ItsReplyType	PrivacyIndicator	SourceBearerType
dataCoding	ItsSessionInfo	QosTimeToLive	SourceNetworkType
DestAddrSubunit	LanguageIndicator	ReceiptedMessgeId	SourcePort

DestBearerType	MessageState	registeredDelivery	SourceSubaddress
DestNetworkType	MoreMsgsToSend	SarMsgRefNum	SourceTelematicsId
DestinationPort	MsMsgWaitFacilities	SarSegmentSeqnum	UserMessageReference
DestSubaddress	MsValidity	SarTotalSegments	UserResponseCode

### Example

The following example `onIncomingMessage` method converts an incoming message to binary data, and sends the binary version of the message back to the originator address:

```
<cffunction name="onIncomingMessage" output="no">
    <cfargument name="CFEvent" type="struct" required="yes">
    <!--- Get the message --->
    <cfset data=CFEvent.DATA>
    <cfset message="#data.message#">
    <!--- Create the return structure --->
    <cfset retValue = structNew()>
    <cfset retValue.command = "data">
    <!--- Sending to incoming message originator; get value from CFEvent. --->
    <cfset retValue.destAddress = arguments.CFEvent.originatorid>
    <cfset retValue.messagePayload = tobinary(tobase64("echo: " & message))>
    <cfreturn retValue>
</cffunction>
```

## CFML event gateway SendGatewayMessage data parameter

The ColdFusion CFML gateway type enables you to invoke CFC methods asynchronously. The structure that you use in the `SendGatewayMessage` function *data* parameter can include two types of fields:

- Any number of fields can contain arbitrary contents for use in by the CFC.
- Several optional fields can configure how the gateway delivers the information to the CFC.

The CFML gateway looks for the following optional fields, and, if they exist, uses them to determine how it delivers the message. Do not use these field names for data that you send to your CFC method.

Field	Use
cfcpath	Overrides the CFC path specified in the ColdFusion Administrator. This field lets you use a single gateway configuration in the ColdFusion Administrator multiple CFCs. This field sets the CFEvent object CFCPATH variable.
method	Specifies the name of the method to invoke in the CFC. The default method is <code>onIncomingMessage</code> . This field lets you use a single gateway configuration in the ColdFusion Administrator for a CFC that has several methods. This field sets the CFEvent object CFMethod variable.
originatorID	Sets the originatorID field of the CFEvent object that ColdFusion delivers to the CFC. The default value is CFMLGateway.
timeout	Sets the time-out, in seconds, during which the listener CFC must process the event request and return before ColdFusion gateway services terminates the request. The default value is the Timeout Request value set on the Server Settings page in the ColdFusion Administrator. Set this value if a request might validly take longer to process than the default time-out; for example, if the request involves a long processing time. This field sets the CFEvent object CFTimeout variable.

### Example

The following example consists of a CFML page that sends a message to a logevent method in the file logger.CFC. The CFML page specifies the CFC and method to call, and sets the OriginatorID.

```
<h3>Sending an event using a generic CFML event gateway and specifying the CFC and method.</h3>
<cfscript>
    status = False;
    props = structNew();
    props.cfcpath="C:\CFusionMX7\gateway\cfc\MyCFCs\logger.cfc";
    props.method="logEvent";
    props.OriginatorID=CGI.SCRIPT_NAME;
    props.Message="Replace me with a variable with data to log";
    props.file="GenericCFCtest";
    props.type="warning";
    status = SendGatewayMessage("DefaultCFC", props);
    if (status IS True)
        WriteOutput('Event Message "#props.Message#" has been sent.');
```

The CFC method uses the OriginatorID and the message, file, and type fields of the CFEvent parameter's data field to specify the log file and message.

```
<cfcomponent>
    <cffunction name="logEvent" output="no">
        <cfargument name="CFEvent" type="struct" required="yes">
            <cfscript>
                if (NOT IsDefined("CFEvent.Data.file")) {
                    CFEvent.Data.file="defaultEventLog"; }
                if (NOT IsDefined("CFEvent.Data.type")) {
                    CFEvent.Data.type="information"; }
            </cfscript>
            <cflog text="Message from #CFEvent.OriginatorID#: #CFEvent.Data.message#"
                file="#CFEvent.data.file#" type="#CFEvent.Data.type#" >
        </cffunction>
    </cfcomponent>
```

# Chapter 10: ColdFusion C++ CFX Reference

ColdFusion includes CFXAPI classes and methods for building ColdFusion extensions.

## C++ class overview

The following table lists the CFXAPI classes and methods:

Class	Methods
CCFXException class	CCFXException::GetError CCFXException::GetDiagnostics
CCFXQuery class	CCFXQuery::AddRow CCFXQuery::GetColumns CCFXQuery::GetData CCFXQuery::GetName CCFXQuery::GetRowCount CCFXQuery::SetData
CCFXRequest class	CCFXRequest::AddQuery CCFXRequest::AttributeExists CCFXRequest::CreateStringSet CCFXRequest::Debug CCFXRequest::GetAttribute CCFXRequest::GetAttributeList CCFXRequest::GetCustomData CCFXRequest::GetQuery CCFXRequest::ReThrowException CCFXRequest::SetCustomData CCFXRequest::SetVariable CCFXRequest::ThrowException CCFXRequest::Write CCFXRequest::WriteDebug
CCFXStringSet class	CCFXStringSet::AddString CCFXStringSet::GetCount CCFXStringSet::GetIndexForString CCFXStringSet::GetString

## Deprecated class methods

The following CFXAPI classes and methods are deprecated. They do not work, and might cause an error, in later releases.

Class	Deprecated member	Deprecated as of this ColdFusion release
CCFXQuery Class	CCFXQuery::SetQueryString	ColdFusion MX
	CCFXQuery::SetTotalTime	ColdFusion MX
CCFXRequest Class	CCFXRequest::GetSetting	ColdFusion MX

## CCFXException class

An abstract class that represents an exception thrown during processing of a ColdFusion Extension (CFX) procedure.

The [CCFXRequest class](#), [CCFXQuery class](#), and [CCFXStringSet class](#) can throw exceptions of this type. Your ColdFusion Extension code must be written to handle exceptions of this type. For more information, see [CCFXRequest::ThrowException](#) and [CCFXRequest::ReThrowException](#).

### Class methods

<code>virtual LPCSTR GetError()</code>	The <a href="#">CCFXException::GetError</a> function returns a general error message.
<code>virtual LPCSTR GetDiagnostics()</code>	The <a href="#">CCFXException::GetDiagnostics</a> function returns detailed error information.

### CCFXException::GetError

#### Description

Provides basic user output for exceptions that occur during processing.

### CCFXException::GetDiagnostics

#### Description

Provides detailed user output for exception that occur during processing.

#### Example

This code block shows how `GetError` and `GetDiagnostics` work with `ThrowException` and `ReThrowException`.

```
// Write output back to the user here...
pRequest->Write( "Hello from CFX_FOO2!" ) ;
pRequest->ThrowException("User Error", "You goof'd...");

// Output optional debug info
if ( pRequest->Debug() )
{
    pRequest->WriteDebug( "Debug info..." ) ;
}

// Catch ColdFusion exceptions & re-raise them
catch( CCFXException* e )
{
    // This is how you would pull the error information
    LPCTSTR strError = e->GetError();
    LPCTSTR strDiagnostic = e->GetDiagnostics();

    pRequest->ReThrowException( e ) ;
}

// Catch ALL other exceptions and throw them as
// ColdFusion exceptions (DO NOT REMOVE! --
// this prevents the server from crashing in
// case of an unexpected exception)
catch( ... )
{
    pRequest->ThrowException(
        "Error occurred in tag CFX_FOO2",
        "Unexpected error occurred while processing tag." ) ;
}
```

## CCFXQuery class

An abstract class that represents a query used or created by a ColdFusion Extension (CFX). Queries contain one or more columns of data that extend over a varying number of rows.

### Class methods

virtual int AddRow()	<a href="#">CCFXQuery::AddRow</a> adds a row to a query.
virtual CCFXStringSet* GetColumns	<a href="#">CCFXQuery::GetColumns</a> retrieves a list of a query's column names.
virtual LPCSTR GetData( int iRow, int iColumn )	<a href="#">CCFXQuery::GetData</a> retrieves a data element from a row and column of a query.
virtual LPCSTR GetName()	<a href="#">CCFXQuery::GetName</a> retrieves the name of a query.
virtual int GetRowCount()	<a href="#">CCFXQuery::GetRowCount</a> retrieves the number of rows in a query.

<code>virtual void SetData( int iRow, int iColumn, LPCSTR lpszData )</code>	<a href="#">CCFXQuery::SetData</a> sets a data element within a row and column of a query.
<code>virtual void SetQueryString( LPCSTR lpszQuery )</code>	This function is deprecated. It might not work, and might cause an error, in later releases.
<code>virtual void SetTotalTime( DWORD dwMilliseconds )</code>	This function is deprecated. It might not work, and might cause an error, in later releases.

## CCFXQuery::AddRow

### Syntax

```
int CCFXQuery::AddRow(void)
```

### Description

Add a row to the query. Call this function to append a row to a query.

### Returns

Returns the index of the row that was appended to a query.

### Example

The following example shows the addition of two rows to a three-column ('City', 'State', and 'Zip') query:

```
// First row
int iRow ;
iRow = pQuery->AddRow() ;
pQuery->SetData( iRow, iCity, "Minneapolis" ) ;
pQuery->SetData( iRow, iState, "MN" ) ;
pQuery->SetData( iRow, iZip, "55345" ) ;

// Second row
iRow = pQuery->AddRow() ;
pQuery->SetData( iRow, iCity, "St. Paul" ) ;
pQuery->SetData( iRow, iState, "MN" ) ;
pQuery->SetData( iRow, iZip, "55105" ) ;
```

## CCFXQuery::GetColumns

### Syntax

```
CCFXStringSet* CCFXQuery::GetColumns(void)
```

### Description

Retrieves a list of the column names contained in a query.

### Returns

Returns an object of [CCFXStringSet](#) class that contains a list of the columns in the query. ColdFusion automatically frees the memory that is allocated for the returned string set, after the request is completed.

### Example

The following example gets the list of columns, then iterates over the list, writing each column name back to the user:

```
// Get the list of columns from the query
CCFXStringSet* pColumns = pQuery->GetColumns() ;
int nNumColumns = pColumns->GetCount() ;

// Print the list of columns to the user
pRequest->Write( "Columns in query: " ) ;
for( int i=1; i<=nNumColumns; i++ )
{
    pRequest->Write( pColumns->GetString( i ) ) ;
    pRequest->Write( " " ) ;
}
```

## CCFXQuery::GetData

### Syntax

```
LPCSTR CCFXQuery::GetData(int iRow, int iColumn)
```

### Description

Gets a data element from a row and column of a query. Row and column indexes begin with 1. You can determine the number of rows in a query by calling [CCFXQuery::GetRowCount](#). You can determine the number of columns in a query by retrieving the list of columns using [CCFXQuery::GetColumns](#), and then calling [CCFXStringSet::GetCount](#) on the returned string set.

### Returns

Returns the value of the requested data element.

### Parameters

Parameter	Description
iRow	Row to retrieve data from (1-based)
iColumn	Column to retrieve data from (1-based)

### Example

The following example iterates over the elements of a query and writes the data in the query back to the user in a simple, space-delimited format:

```
int iRow, iCol ;
int nNumCols = pQuery->GetColumns()->GetCount() ;
int nNumRows = pQuery->GetRowCount() ;
for ( iRow=1; iRow<=nNumRows; iRow++ )
{
    for ( iCol=1; iCol<=nNumCols; iCol++ )
    {
        pRequest->Write( pQuery->GetData( iRow, iCol ) ) ;
        pRequest->Write( " " ) ;
    }
    pRequest->Write( "<BR>" ) ;
}
```

## CCFXQuery::GetName

### Syntax

```
LPCSTR CCFXQuery::GetName(void)
```

### Description

Returns the name of a query.

### Example

The following example retrieves the name of a query and writes it back to the user:

```
CCFXQuery* pQuery = pRequest->GetQuery() ;  
pRequest->Write( "The query name is: " ) ;  
pRequest->Write( pQuery->GetName() ) ;
```

## CCFXQuery::GetRowCount

### Syntax

```
int CCFXQuery::GetRowCount(void)
```

### Description

Returns the number of rows contained in a query.

### Example

The following example retrieves the number of rows in a query and writes it back to the user:

```
CCFXQuery* pQuery = pRequest->GetQuery() ;  
char buffOutput[256] ;  
wsprintf( buffOutput,  
    "The number of rows in the query is %ld.",  
    pQuery->GetRowCount() ) ;  
pRequest->Write( buffOutput ) ;
```

## CCFXQuery::SetData

### Syntax

```
void CCFXQuery::SetData(int iRow, int iColumn, LPCSTR lpszData)
```

### Description

Sets a data element within a row and column of a query. Row and column indexes begin with 1. Before calling `SetData` for a given row, call `CCFXQuery::AddRow` and use the return value as the row index for your call to `SetData`.

### Parameters

Parameter	Description
iRow	Row of data element to set (1-based)
iColumn	Column of data element to set (1-based)
lpszData	New value for data element

### Example

The following example shows the addition of two rows to a three-column ('City', 'State', and 'Zip') query:

```
// First row
int iRow ;
iRow = pQuery->AddRow() ;
pQuery->SetData( iCity, iRow, "Minneapolis" ) ;
pQuery->SetData( iState, iRow, "MN" ) ;
pQuery->SetData( iZip, iRow, "55345" ) ;

// Second row
iRow = pQuery->AddRow() ;
pQuery->SetData( iCity, iRow, "St. Paul" ) ;
pQuery->SetData( iState, iRow, "MN" ) ;
pQuery->SetData( iZip, iRow, "55105" ) ;
```

## CCFXRequest class

Abstract class that represents a request made to a ColdFusion Extension (CFX). An instance of this class is passed to the main function of your extension DLL. The class provides interfaces that can be used by the custom extension for the following actions:

- Reading and writing variables
- Returning output
- Creating and using queries
- Throwing exceptions

### Class methods

virtual BOOL AttributeExists( LPCSTR lpszName )	<a href="#">CCFXRequest::AttributeExists</a> checks whether the attribute was passed to the tag.
virtual LPCSTR GetAttribute( LPCSTR lpszName )	<a href="#">CCFXRequest::GetAttribute</a> gets the value of the passed attribute.
virtual CCFXStringSet* GetAttributeList()	<a href="#">CCFXRequest::GetAttributeList</a> gets an array of attribute names passed to the tag.
virtual CCFXQuery* GetQuery()	<a href="#">CCFXRequest::GetQuery</a> gets the query that was passed to the tag.
virtual LPCSTR GetSetting( LPCSTR lpszSettingName )	<a href="#">CCFXRequest::GetSetting</a>  This method is deprecated. It might not work, and might cause an error, in later releases.
virtual void Write( LPCSTR lpszOutput )	<a href="#">CCFXRequest::Write</a> writes text output back to the user.
virtual void SetVariable( LPCSTR lpszName, LPCSTR lpszValue )	<a href="#">CCFXRequest::SetVariable</a> sets a variable in the template that contains this tag.
virtual CCFXQuery* AddQuery( LPCSTR lpszName, CCFXStringSet* pColumns )	<a href="#">CCFXRequest::AddQuery</a> adds a query to the template that contains this tag.
virtual BOOL Debug()	<a href="#">CCFXRequest::Debug</a> checks whether the tag contains the <code>Debug</code> attribute.
virtual void WriteDebug( LPCSTR lpszOutput )	<a href="#">CCFXRequest::WriteDebug</a> writes text output into the debug stream.

virtual CCFXStringSet* CreateStringSet()	<a href="#">CCFXRequest::CreateStringSet</a> allocates and returns a CCFXStringSet instance.
virtual void ThrowException( LPCSTR lpszError, LPCSTR lpszDiagnostics )	<a href="#">CCFXRequest::ThrowException</a> throws an exception and ends processing of this request.
virtual void ReThrowException( CCFXException* e )	<a href="#">CCFXRequest::ReThrowException</a> rethrows an exception that has been caught.
virtual void SetCustomData( LPVOID lpvData )	<a href="#">CCFXRequest::SetCustomData</a> sets custom (tag specific) data to carry with a request.
virtual LPVOID GetCustomData()	<a href="#">CCFXRequest::GetCustomData</a> gets custom (tag specific) data for a request.

## CCFXRequest::AddQuery

### Syntax

```
CCFXQuery* CCFXRequest::AddQuery(LPCSTR lpszName, CCFXStringSet* pColumns)
```

### Description

Adds a query to the calling template. The query can be accessed by CFML tags (for example, `cfoutput` or `cftable`) within the template. After calling `AddQuery`, the query is empty (it has 0 rows). To populate the query with data, call the [CCFXQuery::AddRow](#) and [CCFXQuery::SetData](#) functions.

### Returns

Returns a pointer to the query that was added to the template (an object of class `CCFXQuery`). The memory allocated for the returned query is freed automatically by ColdFusion after the request is completed.

### Parameters

Parameter	Description
<code>lpszName</code>	Name of query to add to the template (must be unique)
<code>pColumns</code>	List of column names to be used in the query

### Example

The following example adds a query named 'People' to the calling template. The query has two columns ('FirstName' and 'LastName') and two rows:

```
// Create a string set and add the column names to it
CCFXStringSet* pColumns = pRequest->CreateStringSet() ;
int iFirstName = pColumns->AddString( "FirstName" ) ;
int iLastName = pColumns->AddString( "LastName" ) ;

// Create a query that contains these columns
CCFXQuery* pQuery = pRequest->AddQuery( "People", pColumns ) ;

// Add data to the query
int iRow ;
iRow = pQuery->AddRow() ;
pQuery->SetData( iRow, iFirstName, "John" ) ;
pQuery->SetData( iRow, iLastName, "Smith" ) ;
iRow = pQuery->AddRow() ;
pQuery->SetData( iRow, iFirstName, "Jane" ) ;
pQuery->SetData( iRow, iLastName, "Doe" ) ;
```

## CCFXRequest::AttributeExists

### Syntax

```
BOOL CCFXRequest::AttributeExists(LPCSTR lpszName)
```

### Description

Checks whether the parameter was passed to the tag. Returns True if the parameter is available; False, otherwise.

### Parameters

Parameter	Description
<code>lpszName</code>	Name of the parameter to check (case insensitive)

### Example

The following example checks whether the user passed an attribute named `DESTINATION` to the tag, and throws an exception if the attribute was not passed:

```
if ( pRequest->AttributeExists("DESTINATION")==FALSE )
{
    pRequest->ThrowException(
        "Missing DESTINATION parameter",
        "You must pass a DESTINATION parameter in "
        "order for this tag to work correctly." ) ;
}
```

## CCFXRequest::CreateStringSet

### Syntax

```
CCFXStringSet* CCFXRequest::CreateStringSet(void)
```

### Description

Allocates and returns an instance. Always use this function to create string sets, as opposed to directly using the `new` operator.

### Returns

Returns an object of [CCFXStringSet](#) class. The memory allocated for the returned string set is freed automatically by ColdFusion after the request is completed

### Example

The following example creates a string set and adds three strings to it:

```
CCFXStringSet* pColors = pRequest->CreateStringSet() ;
pColors->AddString( "Red" ) ;
pColors->AddString( "Green" ) ;
pColors->AddString( "Blue" ) ;
```

## CCFXRequest::Debug

### Syntax

```
BOOL CCFXRequest::Debug(void)
```

### Description

Checks whether the tag contains the `Debug` attribute. Use this function to determine whether to write debug information for a request. For more information, see [CCFXRequest::WriteDebug](#).

### Returns

Returns `True` if the tag contains the `Debug` attribute; `False`, otherwise.

### Example

The following example checks whether the `Debug` attribute is present, and if it is, it writes a brief debug message:

```
if ( pRequest->Debug() )
{
    pRequest->WriteDebug( "Top secret debug info" ) ;
}
```

## CCFXRequest::GetAttribute

### Syntax

```
LPCSTR CCFXRequest::GetAttribute(LPCSTR lpszName)
```

### Description

Retrieves the value of the passed attribute. Returns an empty string if the attribute does not exist. (To test whether an attribute was passed to the tag, use [CCFXRequest::AttributeExists](#).)

### Returns

Returns the value of the attribute passed to the tag. If no attribute of that name was passed to the tag, an empty string is returned.

### Parameters

Parameter	Description
lpszName	Name of the attribute to retrieve (case insensitive)

### Example

The following example retrieves an attribute named DESTINATION and writes its value back to the user:

```
LPCSTR lpszDestination = pRequest->GetAttribute("DESTINATION") ;  
    pRequest->Write( "The destination is: " ) ;  
    pRequest->Write( lpszDestination ) ;
```

## CCFXRequest::GetAttributeList

### Syntax

```
CCFXStringSet* CCFXRequest::GetAttributeList(void)
```

### Description

Gets an array of attribute names passed to the tag. To get the value of one attribute, use

[CCFXRequest::GetAttribute](#).

### Returns

Returns an object of class [CCFXStringSet](#) class that contains a list of attributes passed to the tag. The memory allocated for the returned string set is freed automatically by ColdFusion after the request is completed.

### Example

The following example gets the list of attributes and iterates over the list, writing each attribute and its value back to the user.

```
LPCSTR lpszName, lpszValue ;  
    CCFXStringSet* pAttribs = pRequest->GetAttributeList() ;  
    int nNumAttribs = pAttribs->GetCount() ;  
  
    for( int i=1; i<=nNumAttribs; i++ )  
    {  
        lpszName = pAttribs->GetString( i ) ;  
        lpszValue = pRequest->GetAttribute( lpszName ) ;  
        pRequest->Write( lpszName ) ;  
        pRequest->Write( " = " ) ;  
        pRequest->Write( lpszValue ) ;  
        pRequest->Write( "<BR>" ) ;  
    }
```

## CCFXRequest::GetCustomData

### Syntax

```
LPVOID CCFXRequest::GetCustomData(void)
```

### Description

Gets the custom (tag specific) data for the request. This method is typically used from within subroutines of a tag implementation to extract tag data from a request.

### Returns

Returns a pointer to the custom data, or NULL if no custom data has been set during this request using [CCFXRequest::SetCustomData](#).

### Example

The following example retrieves a pointer to a request specific data structure of hypothetical type MYTAGDATA:

```
void DoSomeGruntWork( CCFXRequest* pRequest )
{
    MYTAGDATA* pTagData =
        (MYTAGDATA*)pRequest->GetCustomData() ;

    ... remainder of procedure ...
}
```

## CCFXRequest::GetQuery

### Syntax

```
CCFXQuery* CCFXRequest::GetQuery(void)
```

### Description

Retrieves a query that was passed to a tag. To pass a query to a custom tag, you use the `QUERY` attribute. Set the attribute to the name of a query (created using the `cfquery` tag or another custom tag). The `QUERY` attribute is optional and must be used only by tags that process an existing data set.

### Returns

Returns an object of the [CCFXQuery](#) class that represents the query passed to the tag. If no query was passed to the tag, NULL is returned. The memory allocated for the returned query is freed automatically by ColdFusion after the request is completed.

### Example

The following example retrieves the query that was passed to the tag. If no query was passed, an exception is thrown:

```
CCFXQuery* pQuery = pRequest->GetQuery() ;
if ( pQuery == NULL )
{
    pRequest->ThrowException(
        "Missing QUERY parameter",
        "You must pass a QUERY parameter in "
        "order for this tag to work correctly." ) ;
}
```

## CCFXRequest::ReThrowException

### Syntax

```
void CCFXRequest::ReThrowException(CCFXException* e)
```

### Description

Rethrows an exception that has been caught within an extension procedure. This function is used to avoid having C++ exceptions that are thrown by DLL extension code propagate back into ColdFusion. Catch ALL C++ exceptions that occur in extension code, and either re-throw them (if they are of the [CCFXException class](#)) or create and throw a new exception pointer using [CCFXRequest::ThrowException](#).

### Parameters

Parameter	Description
e	A CCFXException that has been caught

### Example

The following code demonstrates how to handle exceptions in ColdFusion Extension DLL procedures:

```
try
{
    ...Code that could throw an exception...
}
catch( CCFXException* e )
{
    ...Do appropriate resource cleanup here...
    // Re-throw the exception
    pRequest->ReThrowException( e ) ;
}
catch( ... )
{
    // Something nasty happened

    pRequest->ThrowException(
        "Unexpected error occurred in CFX tag", "" ) ;
}
```

## CCFXRequest::SetCustomData

### Syntax

```
void CCFXRequest::SetCustomData(LPVOID lpvData)
```

### Description

Sets custom (tag specific) data to carry with the request. Use this function to store request specific data to pass to procedures within your custom tag implementation.

### Parameters

Parameter	Description
lpvData	Pointer to custom data

### Example

The following example creates a request-specific data structure of hypothetical type MYTAGDATA and stores a pointer to the structure in the request for future use:

```
void ProcessTagRequest( CCFXRequest* pRequest )
{
    try
    {
        MYTAGDATA tagData ;
        pRequest->SetCustomData( (LPVOID)&tagData ) ;

        ... remainder of procedure ...
    }
}
```

## CCFXRequest::SetVariable

### Syntax

```
void CCFXRequest::SetVariable(LPCSTR lpszName, LPCSTR lpszValue)
```

### Description

Sets a variable in the calling template. If the variable name already exists in the template, its value is replaced. If it does not exist, a variable is created. The values of variables created using `SetVariable` can be accessed in the same manner as other template variables (for example, `#MessageSent#`).

### Parameters

Parameter	Description
<code>lpszName</code>	Name of variable
<code>lpszValue</code>	Value of variable

### Example

The following example sets the value of a variable named 'MessageSent' based on the success of an operation performed by the custom tag:

```
BOOL bMessageSent;
...attempt to send the message...
if ( bMessageSent == TRUE )
{
    pRequest->SetVariable( "MessageSent", "Yes" ) ;
}
else
{
    pRequest->SetVariable( "MessageSent", "No" ) ;
}
```

## CCFXRequest::ThrowException

### Syntax

```
void CCFXRequest::ThrowException(LPCSTR lpszError, LPCSTR lpszDiagnostics)
```

### Description

Throws an exception and ends processing of a request. Call this function when you encounter an error that does not allow you to continue processing the request. This function is almost always combined with the [CCFXRequest::ReThrowException](#) to protect against resource leaks in extension code.

### Parameters

Parameter	Description
lpszError	Short identifier for error
lpszDiagnostics	Error diagnostic information

### Example

The following example throws an exception indicating that an unexpected error occurred while processing a request:

```
char buffError[512] ;
    wsprintf( buffError,
        "Unexpected Windows NT error number %ld "
        "occurred while processing request.", GetLastError() ) ;

    pRequest->ThrowException( "Error occurred", buffError ) ;
```

## CCFXRequest::Write

### Syntax

```
void CCFXRequest::Write(LPCSTR lpszOutput)
```

### Description

Writes text output back to the user.

### Parameters

Parameter	Description
lpszOutput	Text to output

### Example

The following example creates a buffer to hold an output string, fills the buffer with data, and writes the output back to the user:

```
CHAR buffOutput[1024] ;
    wsprintf( buffOutput, "The destination is: %s",
        pRequest->GetAttribute("DESTINATION") ) ;
    pRequest->Write( buffOutput ) ;
```

## CCFXRequest::WriteDebug

### Syntax

```
void CCFXRequest::WriteDebug(LPCSTR lpszOutput)
```

### Description

Writes text output into the debug stream. The text is only displayed to the end user if the tag contains the `Debug` attribute. (For more information, see [CCFXRequest::Debug](#).)

**Parameters**

Parameter	Description
lpzOutput	Text to output

**Example**

The following example checks whether the `Debug` attribute is present; if so, it writes a brief debug message:

```
if ( pRequest->Debug() )
{
    pRequest->WriteDebug( "Top secret debug info" ) ;
}
```

## CCFXStringSet class

Abstract class that represents a set of ordered strings. You can add strings to a set and retrieve them by a numeric index (index values for strings are 1-based). To create a string set, use [CCFXRequest::CreateStringSet](#).

**Class methods**

<code>virtual int AddString( LPCSTR lpzString )</code>	<a href="#">CCFXStringSet::AddString</a> adds a string to the end of a list.
<code>virtual int GetCount()</code>	<a href="#">CCFXStringSet::GetCount</a> gets the number of strings contained in a list.
<code>virtual LPCSTR GetString( int iIndex )</code>	<a href="#">CCFXStringSet::GetString</a> gets the string located at the passed index.
<code>virtual int GetIndexForString( LPCSTR lpzString )</code>	<a href="#">CCFXStringSet::GetIndexForString</a> gets the index for the passed string.

### CCFXStringSet::AddString

**Syntax**

```
int CCFXStringSet::AddString(LPCSTR lpzString)
```

**Description**

Adds a string to the end of the list.

**Returns**

The index of the string that was added.

**Parameters**

Parameter	Description
lpzString	String to add to the list

### Example

The following example demonstrates adding three strings to a string set and saving the indexes of the items that are added:

```
CCFXStringSet* pSet = pRequest->CreateStringSet() ;
    int iRed = pSet->AddString( "Red" ) ;
    int iGreen = pSet->AddString( "Green" ) ;
    int iBlue = pSet->AddString( "Blue" ) ;
```

## CCFXStringSet::GetCount

### Syntax

```
int CCFXStringSet::GetCount(void)
```

### Description

Gets the number of strings in a string set. The value can be used with [CCFXStringSet::GetString](#) to iterate over the strings in the set (recall that the index values for strings in the list begin at 1).

### Returns

Returns the number of strings contained in the string set.

### Example

The following example demonstrates using `GetCount` with [CCFXStringSet::GetString](#) to iterate over a string set and write the contents of the list back to the user:

```
int nNumItems = pStringSet->GetCount() ;
    for ( int i=1; i<=nNumItems; i++ )
    {
        pRequest->Write( pStringSet->GetString( i ) ) ;
        pRequest->Write( "<BR>" ) ;
    }
```

## CCFXStringSet::GetIndexForString

### Syntax

```
int CCFXStringSet::GetIndexForString(LPCSTR lpszString)
```

### Description

Searches for a passed string. The search is case-insensitive.

### Returns

If the string is found, its index within the string set is returned. If it is not found, the constant `CFX_STRING_NOT_FOUND` is returned.

### Parameters

Parameter	Description
<code>lpszString</code>	String to search for

### Example

The following example demonstrates a search for a string and throwing an exception if it is not found:

```
CCFXStringSet* pAttribs = pRequest->GetAttributeList() ;

int iDestination = pAttribs->GetIndexForString("DESTINATION") ;
if ( iDestination == CFX_STRING_NOT_FOUND )
{
    pRequest->ThrowException(
        "DESTINATION attribute not found."
        "The DESTINATION attribute is required "
        "by this tag." ) ;
}
```

## CCFXStringSet::GetString

### Syntax

```
LPCSTR CCFXStringSet::GetString(int iIndex)
```

### Description

Retrieves the string located at the passed index (index values are 1-based).

### Returns

Returns the string located at the passed index.

### Parameters

Parameter	Description
iIndex	Index of string to retrieve

### Example

The following example demonstrates `GetString` with `CCFXStringSet::GetCount` to iterate over a string set and write the contents of a list back to the user:

```
int nNumItems = pStringSet->GetCount() ;
for ( int i=1; i<=nNumItems; i++ )
{
    pRequest->Write( pStringSet->GetString( i ) ) ;
    pRequest->Write( "<BR>" ) ;
}
```

# Chapter 11: ColdFusion Java CFX Reference

ColdFusion includes Java interfaces for building ColdFusion custom CFXs in Java.

## Class libraries overview

The following Java interfaces are available for building ColdFusion custom CFXs in Java:

Interface	Methods
Custom tag interface	<code>processRequest</code>
Query interface	<code>addRow</code> <code>getColumnIndex</code> <code>getColumns</code> <code>getData</code> <code>getName</code> <code>getRowCount</code> <code>setData</code>
Request interface	<code>attributeExists</code> <code>debug</code> <code>getAttribute</code> <code>getAttributeList</code> <code>getIntAttribute</code> <code>getQuery</code> <code>getSetting</code>
Response interface	<code>addQuery</code> <code>setVariable</code> <code>write</code> <code>writeDebug</code>

## Custom tag interface

```
public abstract interface CustomTag
```

Interface for implementing custom tags.

Classes that implement this interface can be specified in the `CLASS` attribute of the Java CFX tag. For example, in a class *MyCustomTag*, which implements this interface, the following CFML code calls the `MyCustomTag.processRequest` method:

```
<CFX_MyCustomTag>
```

Other attributes can be passed to the Java CFX tag. Their values are available using the Request object passed to the `processRequest` method.

## Methods

Returns	Syntax	Description
void	<code>processRequest(Request request, Response response)</code>	Processes a request originating from the <code>CFX_mycustomtag</code> tag

## processRequest

### Description

Processes a request originating from the Java CFX tag.

### Category

[Custom tag interface](#)

### Syntax

```
public void processRequest(Request request, Response response)
```

### Throws

**Exception** If an unexpected error occurs while processing the request.

### Parameters

Parameter	Description
<code>request</code>	Parameters (attributes, query, and so on.) for this request
<code>response</code>	Interface for generating response to request (output, variables, queries, and so on)

## Query interface

```
public abstract interface Query
```

Interface to a query used or created by a custom tag. A query contains tabular data organized by named columns and rows.

## Methods

Returns	Method	Description
int	<code>addRow()</code>	Adds a row to the query
int	<code>getColumnIndex(String name)</code>	Gets the index of a column given its name
String[]	<code>getColumnNames()</code>	Gets a list of the column names in a query
String	<code>getData(int iRow, int iCol)</code>	Gets a data element from a row and column of a query

Returns	Method	Description
String	<a href="#">getName()</a>	Gets the name of a query
int	<a href="#">getRowCount()</a>	Gets the number of rows in a query
void	<a href="#">setData(int iRow, int iCol, String data)</a>	Sets a data element in a row and column of a query

## addRow

### Description

Adds a row to a query. Call this method to append a row to a query.

Returns the index of the row that was appended to the query.

### Category

[Query interface](#)

### Syntax

```
public int addRow()
```

### See also

[setData](#), [getData](#)

### Example

The following example demonstrates the addition of two rows to a query that has three columns, *City*, *State*, and *Zip*:

```
// Define column indexes
int iCity = 1, iState = 2, iZip = 3 ;

// First row
int iRow = query.addRow() ;
query.setData( iRow, iCity, "Minneapolis" ) ;
query.setData( iRow, iState, "MN" ) ;
query.setData( iRow, iZip, "55345" ) ;
// Second row
iRow = query.addRow() ;
query.setData( iRow, iCity, "St. Paul" ) ;
query.setData( iRow, iState, "MN" ) ;
query.setData( iRow, iZip, "55105" ) ;
```

## getColumnIndex

### Description

Returns the index of the column, or 0 if no such column exists.

### Category

[Query interface](#)

### Syntax

```
public int getColumnIndex(String name)
```

## See also

[getColumns](#), [getData](#)

## Parameters

Parameter	Description
name	Name of column to get index of (lookup is case-insensitive)

## Example

The following example retrieves the index of the EMAIL column and uses it to output a list of the addresses contained in the column:

```
// Get the index of the EMAIL column
int iEmail = query.getColumnIndex( "EMAIL" ) ;

// Iterate over the query and output list of addresses
int nRows = query.getRowCount() ;
for( int iRow = 1; iRow <= nRows; iRow++ )
{
    response.write( query.getData( iRow, iEmail ) + "<BR>" ) ;
}
```

## getColumns

### Description

Returns an array of strings containing the names of the columns in the query.

### Category

[Query interface](#)

### Syntax

```
public String[] getColumns()
```

## Example

The following example retrieves the array of columns, then iterates over the list, writing each column name back to the user:

```
// Get the list of columns from the query
String[] columns = query.getColumns() ;
int nNumColumns = columns.length ;

// Print the list of columns to the user
response.write( "Columns in query: " ) ;
for( int i=0; i<nNumColumns; i++ )
{
    response.write( columns[i] + " " ) ;
}
```

## getData

### Description

Retrieves a data element from a row and column of a query. Row and column indexes begin with 1. You can find the number of rows in a query by calling `getRowCount`. You can find the number of columns in a query by calling `getColumns`.

Returns the value of the requested data element.

### Category

[Query interface](#)

### Syntax

```
public String getData(int iRow, int iCol)
```

### Throws

`IndexOutOfBoundsException` if an invalid index is passed to the method.

### See also

[setData](#), [addRow](#)

### Parameters

Parameter	Description
iRow	Row to retrieve data from (1-based)
iCol	Column to retrieve data from (1-based)

### Example

The following example iterates over the rows of a query and writes the data back to the user in a simple, space-delimited format:

```
int iRow, iCol ;
int nNumCols = query.getColumns().length ;
int nNumRows = query.getRowCount() ;
for ( iRow = 1; iRow <= nNumRows; iRow++ )
{
    for ( iCol = 1; iCol <= nNumCols; iCol++ )
    {
        response.write( query.getData( iRow, iCol ) + " " ) ;
    }
    response.write( "<BR>" ) ;
}
```

## getName

### Description

Returns the name of a query.

## Category

[Query interface](#)

## Syntax

```
public String getName()
```

## Example

The following example retrieves the name of a query and writes it back to the user:

```
Query query = request.getQuery() ;  
response.write( "The query name is: " + query.getName() ) ;
```

# getRowCount

## Description

Retrieves the number of rows in a query.

Returns the number of rows contained in a query.

## Category

[Query interface](#)

## Syntax

```
public int getRowCount()
```

## Example

The following example retrieves the number of rows in a query and writes it back to the user:

```
Query query = request.getQuery() ;  
int rows = query.getRowCount() ;  
response.write( "The number of rows in the query is "  
+ Integer.toString(rows) ) ;
```

# setData

## Description

Sets a data element in a row and column of a query. Row and column indexes begin with 1. Before calling `setData` for a given row, call `addRow` and use the return value as the row index for your call to `setData`.

## Category

[Query interface](#)

## Syntax

```
public void setData(int iRow, int iCol, String data)
```

## Throws

`IndexOutOfBoundsException` if an invalid index is passed to the method.

**See also**[getData](#), [addRow](#)**Parameters**

Parameter	Description
iRow	Row of data element to set (1-based)
iCol	Column of data element to set (1-based)
data	New value for data element

**Example**

The following example demonstrates the addition of two rows to a query that has three columns, *City*, *State*, and *Zip*:

```
// Define column indexes
int iCity = 1, iState = 2, iZip = 3 ;

// First row
int iRow = query.addRow() ;
query.setData( iRow, iCity, "Minneapolis" ) ;
query.setData( iRow, iState, "MN" ) ;
query.setData( iRow, iZip, "55345" ) ;

// Second row
iRow = query.addRow() ;
query.setData( iRow, iCity, "St. Paul" ) ;
query.setData( iRow, iState, "MN" ) ;
query.setData( iRow, iZip, "55105" ) ;
```

## Request interface

```
public abstract interface Request
```

Interface to a request made to a CustomTag. The interface includes methods for retrieving attributes passed to the tag (including queries) and reading global tag settings.

**Methods**

Returns	Syntax	Description
boolean	<a href="#">attributeExists</a> (String name)	Checks whether the attribute was passed to this tag.
boolean	<a href="#">debug</a> ()	Checks whether the tag contains the <code>debug</code> attribute.
String	<a href="#">getAttribute</a> (String name)	Retrieves the value of the passed attribute.
String[]	<a href="#">getAttributeList</a> ()	Retrieves a list of attributes passed to the tag.
int	<a href="#">getIntAttribute</a> (String name)	Retrieves the value of the passed attribute as an integer.

Returns	Syntax	Description
int	<code>getIntAttribute</code> (String name, int def)	Retrieves the value of the passed attribute as an integer (returns default if the attribute does not exist or is not a valid number).
Query	<code>getQuery</code> ()	Retrieves the query that was passed to this tag.

## attributeExists

### Description

Checks whether the attribute was passed to this tag.

Returns True if the attribute is available; otherwise returns False.

### Category

[Request interface](#)

### Syntax

```
public boolean attributeExists(String name)
```

### See also

[getAttribute](#), [getAttributeList](#)

### Parameters

Parameter	Description
name	Name of the attribute to check (case-insensitive)

### Example

The following example checks whether the user passed an attribute named DESTINATION to the tag; if not, it throws an exception:

```
if ( ! request.attributeExists("DESTINATION") )
{
    throw new Exception(
        "Missing DESTINATION parameter",
        "You must pass a DESTINATION parameter in "
        "order for this tag to work correctly." ) ;
} ;
```

## debug

### Description

Checks whether the tag contains the `debug` attribute. Use this method to determine whether to write debug information for this request. For more information, see [writeDebug](#).

Returns True if the tag contains the `debug` attribute; False, otherwise.

## Category

[Request interface](#)

## Syntax

```
public boolean debug()
```

## See also

[writeDebug](#)

## Example

The following example checks whether the `debug` attribute is present, and if so, it writes a brief debug message:

```
if ( request.debug() )  
{  
    response.writeDebug( "debug info" ) ;  
}
```

# getAttribute

## Description

Retrieves the value of a passed attribute. Returns an empty string if the attribute does not exist (use `attributeExists` to test whether an attribute was passed to the tag). Use `getAttribute(String,String)` to return a default value rather than an empty string.

Returns the value of the attribute passed to the tag. If no attribute of that name was passed to the tag, an empty string is returned.

## Category

[Request interface](#)

## Syntax

```
public String getAttribute(String name)
```

## See also

[attributeExists](#), [getAttributeList](#), [getIntAttribute](#)

## Parameters

Parameter	Description
name	The attribute to retrieve (case-insensitive)

## Example

The following example retrieves an attribute named `DESTINATION` and writes its value back to the user:

```
String strDestination = request.getAttribute("DESTINATION") ;  
response.write( "The destination is: " + strDestination ) ;
```

## getAttributeList

### Description

Retrieves a list of attributes passed to the tag. To retrieve the value of one attribute, use the `getAttribute` method.

Returns an array of strings containing the names of the attributes passed to the tag.

### Category

[Request interface](#)

### Syntax

```
public String[] getAttributeList()
```

### See also

[attributeExists](#)

### Example

The following example retrieves the list of attributes, then iterates over the list, writing each attribute and its value back to the user:

```
String[] attribs = request.getAttributeList() ;
int nNumAttribs = attribs.length ;

for( int i = 0; i < nNumAttribs; i++ )
{
    String strName = attribs[i] ;
    String strValue = request.getAttribute( strName ) ;
    response.write( strName + "=" + strValue + "<BR>" ) ;
}
```

## getIntAttribute

### Description

Retrieves the value of the passed attribute as an integer. Returns -1 if the attribute does not exist. Use `attributeExists` to test whether an attribute was passed to the tag. Use `getIntAttribute(String, int)` to return a default value rather than throwing an exception or returning -1.

Returns the value of the attribute passed to the tag. If no attribute of that name was passed to the tag, -1 is returned.

### Category

[Request interface](#)

### Syntax

```
public int getIntAttribute(String name)
```

### Throws

`NumberFormatException` if the attribute is not a valid number.

### See also

[attributeExists](#), [getAttributeList](#)

### Parameters

Parameter	Description
name	The attribute to retrieve (case-insensitive)

### Example

The following example retrieves an attribute named `PORT` and writes its value back to the user:

```
int nPort = request.getIntAttribute("PORT") ;
if ( nPort != -1 )
    response.write( "The port is: " + String.valueOf(nPort) ) ;
```

## getQuery

### Description

Retrieves the query that was passed to this tag.

To pass a query to a custom tag, you use the `query` attribute. It should be set to the name of a query (created using the `cfquery` tag). The `query` attribute is optional and should be used only by tags that process an existing dataset.

Returns the Query that was passed to the tag. If no query was passed, returns null.

### Category

[Request interface](#)

### Syntax

```
public Query getQuery()
```

### Example

The following example retrieves a query that was passed to a tag. If no query was passed, an exception is thrown:

```
Query query = request.getQuery() ;
if ( query == null )
{
    throw new Exception(
        "Missing QUERY parameter. " +
        "You must pass a QUERY parameter in " +
        "order for this tag to work correctly." ) ;
}
```

## getSetting

### Description

Retrieves the value of a global custom tag setting. Custom tag settings are stored in the CustomTags section of the ColdFusion Registry key.

Returns the value of the custom tag setting. If no setting of that name exists, an empty string is returned.

### Category

[Request interface](#)

### Syntax

```
public String getSetting(String name)
```

### Parameters

Parameter	Description
name	The name of the setting to retrieve (case-insensitive)

### Usage

All custom tags implemented in Java share a registry key for storing settings. To avoid name conflicts, preface the names of settings with the name of your custom tag class. For example, the code below retrieves the value of a setting named *VerifyAddress* for a custom tag class named *MyCustomTag*:

```
String strVerify = request.getSetting("MyCustomTag.VerifyAddress") ;  
if ( Boolean.valueOf(strVerify) )  
{  
    // Do address verification...  
}
```

## Response interface

```
public abstract interface Response
```

Interface to response generated from a custom tag. This interface includes methods for writing output, generating queries, and setting variables in the calling page.

### Methods

Returns	Syntax	Description
Query	<code>addQuery(String name, String[] columns)</code>	Adds a query to the calling template.
void	<code>setVariable(String name, String value)</code>	Sets a variable in the calling template.
void	<code>write(String output)</code>	Outputs text back to the user.
void	<code>writeDebug(String output)</code>	Writes text output into the debug stream.

## addQuery

### Description

Adds a query to the calling template. The query can be accessed by CFML tags in the template. After calling `addQuery`, the query is empty (it has 0 rows). To populate the query with data, call the Query methods `addRow` and `setData`.

Returns the Query that was added to the template.

### Category

[Response interface](#)

### Syntax

```
public Query addQuery(String name, String[] columns)
```

### Throws

**IllegalArgumentException** If the name parameter is not a valid CFML variable name.

### See also

[addRow](#), [setData](#)

### Parameters

Parameter	Description
name	The name of the query to add to the template
columns	The column names to use in the query

### Example

The following example adds a query named *People* to the calling template. The query has two columns (*FirstName* and *LastName*) and two rows:

```
// Create string array with column names (also track columns indexes)
String[] columns = { "FirstName", "LastName" } ;
int iFirstName = 1, iLastName = 2 ;

// Create a query which contains these columns
Query query = response.addQuery( "People", columns ) ;

// Add data to the query
int iRow = query.addRow() ;
query.setData( iRow, iFirstName, "John" ) ;
query.setData( iRow, iLastName, "Smith" ) ;
iRow = query.addRow() ;
query.setData( iRow, iFirstName, "Jane" ) ;
query.setData( iRow, iLastName, "Doe" ) ;
```

## setVariable

### Description

Sets a variable in the calling template. If the variable name specified exists in the template, its value is replaced. If it does not exist, a new variable is created.

### Category

[Response interface](#)

### Syntax

```
public void setVariable(String name, String value)
```

### Throws

**IllegalArgumentException** If the name parameter is not a valid CFML variable name.

### Parameters

Parameter	Description
name	The name of the variable to set
value	The value to set the variable to

### Example

For example, this code sets the value of a variable named *MessageSent* based on the success of an operation performed by the custom tag:

```
boolean bMessageSent ;

...attempt to send the message...

if ( bMessageSent == true )
{
    response.setVariable( "MessageSent", "Yes" ) ;
}
else
{
    response.setVariable( "MessageSent", "No" ) ;
}
```

## write

### Description

Outputs text back to the user.

### Category

[Response interface](#)

### Syntax

```
public void write(String output)
```

### Parameters

Parameter	Description
output	Text to output

### Example

The following example outputs the value of the `DESTINATION` attribute:

```
response.write( "DESTINATION = " +
    request.getAttribute("DESTINATION") ) ;
```

## writeDebug

### Description

Writes text output into the debug stream. This text is displayed to the end-user only if the tag contains the `debug` attribute (check for this attribute using the `Request.debug` method).

### Category

[Response interface](#)

### Syntax

```
public void writeDebug(String output)
```

### See also

[debug](#)

### Parameters

Parameter	Description
output	The text to output

### Example

The following example checks whether the `debug` attribute is present; if so, it writes a brief debug message:

```
if ( request.debug() )
{
    response.writeDebug( "debug info" ) ;
}
```

## Debugging classes reference

The constructors and methods supported by the `DebugRequest`, `DebugResponse`, and `DebugQuery` classes are as follows. These classes also support the other methods of the `Request`, `Response`, and `Query` interfaces, respectively.

### DebugRequest

```
// initialize a debug request with attributes
public DebugRequest( Hashtable attributes ) ;

// initialize a debug request with attributes and a query
public DebugRequest( Hashtable attributes, Query query ) ;

// initialize a debug request with attributes, a query, and settings
public DebugRequest( Hashtable attributes, Query query, Hashtable settings ) ;
```

## DebugResponse

```
// initialize a debug response
public DebugResponse() ;

// print the results of processing
public void printResults() ;
```

## DebugQuery

```
// initialize a query with name and columns
public DebugQuery( String name, String[] columns )
    throws IllegalArgumentException ;

// initialize a query with name, columns, and data
public DebugQuery( String name, String[] columns, String[][] data )
    throws IllegalArgumentException ;
```

# Chapter 12: WDDX JavaScript Objects

You use JavaScript objects and functions to use with WDDX in a ColdFusion application.

## JavaScript object overview

These are the JavaScript objects and functions:

Class	Functions
<code>WddxSerializer</code> object	<code>serialize</code> <code>serializeVariable</code> <code>serializeValue</code> <code>write</code>
<code>WddxRecordset</code> object	<code>addColumn</code> <code>addRows</code> <code>getField</code> <code>getRowCount</code> <code>setField</code> <code>wddxSerialize</code>

WDDX JavaScript objects are defined in the `wddx.js` file; this file is installed in the `CFIDE/scripts` directory.

To use these objects, you must put a JavaScript tag before the code that refers to the objects; for example:

```
<script type="text/javascript" src="/CFIDE/scripts/wddx.js"></script>
```

## WddxSerializer object

The `WddxSerializer` object includes functions that serialize any JavaScript data structure. For more information on using this object, see Using WDDX in the *Developing ColdFusion Applications*.

### Functions

The only function that developers typically call is `serialize`.

Function syntax	Description
<code>object.serialize</code> (rootobj)	Creates a WDDX packet for a passed <code>WddxRecordset</code> instance.
<code>object.serializeVariable</code> (name, obj)	Serializes a property of a structure. If an object is not a string, number, array, Boolean, or a date, <code>WddxSerializer</code> treats it as a structure.
<code>object.serializeValue</code> (obj)	Recursively serializes eligible data in a passed instance.
<code>object.write</code> (str)	Appends data to the serialized data stream.

## serialize

### Description

Creates a WDDX packet for a passed WddxRecordset instance.

### Syntax

```
object.serialize( rootobj )
```

### Parameters

Parameter	Description
object	Instance name of the WddxSerializer object
rootobj	JavaScript data structure to serialize

### Return value

Returns a serialized WDDX packet as a string if the function succeeds, or a null value if an error occurs.

### Usage

Call this function to serialize the data in a WddxRecordset instance.

### Example

This example shows a JavaScript function that you can call to serialize a WddxRecordset instance. It copies serialized data to a form field for display:

```
function serializeData(data, formField)
{
    wddxSerializer = new WddxSerializer();
    wddxPacket = wddxSerializer.serialize(data);
    if (wddxPacket != null)
    {
        formField.value = wddxPacket;
    }
    else
    {
        alert("Couldn't serialize data");
    }
}
```

## serializeVariable

### Description

Serializes a property of a structure. If an object is not a string, number, array, Boolean, or date, WddxSerializer treats it as a structure.

### Syntax

```
object.serializeVariable( name, obj )
```

### Parameters

Parameter	Description
object	Instance name of a WddxSerializer object
name	Property to serialize
obj	Instance name of the value to serialize

### Return value

Returns a Boolean True if serialization was successful; False, otherwise.

This is an internal function; you do not typically call it.

### Example

This example is from the WddxSerializer `serializeValue` function:

```
...
// Some generic object; treat it as a structure
this.write("<struct>");
for (prop in obj)
{
    bSuccess = this.serializeVariable(prop, obj[prop]);
    if (! bSuccess)
    {
        break;
    }
}
this.write("</struct>");
...
```

## serializeValue

### Description

Recursively serializes eligible data in a passed instance. Eligible data includes:

- String
- Number
- Boolean
- Date
- Array
- Recordset
- Any JavaScript object

This function serializes null values as empty strings.

### Syntax

```
object.serializeValue( obj )
```

### Parameters

Parameter	Description
object	Instance name of the WddxSerializer object
obj	Instance name of the WddxRecordset object to serialize

### Return value

Returns a Boolean True if *obj* was serialized successfully; False, otherwise.

### Usage

This is an internal function; you do not typically call it.

### Example

This example is from the WddxSerializer `serialize` function:

```
...
this.wddxPacket = "";
this.write("<wddxPacket version='1.0'><header/><data>");
bSuccess = this.serializeValue(rootObj);
this.write("</data></wddxPacket>");
if (bSuccess)
{
    return this.wddxPacket;
}
else
{
    return null;
}
...
```

## write

### Description

Appends data to a serialized data stream.

### Syntax

```
object.write( str )
```

### Parameters

Parameter	Description
object	Instance name of the WddxSerializer object
str	String to be copied to the serialized data stream

### Return value

Returns an updated serialized data stream as a String.

### Usage

This is an internal function; you do not typically call it.

### Example

This example is from the `WddxSerializer.serializeValue` function:

```
...
else if (typeof(obj) == "number")
{
    // Number value
    this.write("<number>" + obj + "</number>");
}
else if (typeof(obj) == "boolean")
{
    // Boolean value
    this.write("<boolean value='" + obj + "'/>");
}
...
```

## WddxRecordset object

Includes functions that you call as needed when constructing a WDDX record set. For more information on using this object, see Using WDDX in the *Developing ColdFusion Applications*.

### Functions

Function syntax	Description
<code>object.addColumn (name)</code>	Adds a column to all rows in a <code>WddxRecordset</code> instance.
<code>object.addRows (n)</code>	Adds rows to all columns in a <code>WddxRecordset</code> instance.
<code>object.dump (escapeStrings)</code>	Displays <code>WddxRecordset</code> object data.
<code>object.getField (row, col)</code>	Returns the element in a row/column position.
<code>object.getRowCount ()</code>	Indicates the number of rows in a <code>WddxRecordset</code> instance.
<code>object.setField (row, col, value)</code>	Sets the element in a row/column position.
<code>object.wddxSerialize (serializer)</code>	Serializes a record set.

### Returns

HTML table of the `WddxRecordset` object data.

### Usage

Convenient for debugging and testing record sets. The boolean parameter `escapeStrings` determines whether `<>&` characters in string values are escaped as `&lt;`; `&gt;`; `&amp;` in HTML.

### Example

```
<!--- Create a simple query --->
<cfquery name = "q" datasource = "cfdocexamples">
    SELECT Message_Id, Thread_id, Username, Posted
    FROM messages
</cfquery>
<!--- Load the wddx.js file, which includes the dump function --->
<script type="text/javascript" src="/CFIDE/scripts/wddx.js"></script>
<script>
// Use WDDX to move from CFML data to JS
<cfwddx action="cfml2js" input="#q#" topLevelVariable="qj">
// Dump the record set
document.write(qj.dump(true));
</script>
```

## addColumn

### Description

Adds a column to all rows in a WddxRecordset instance.

### Syntax

```
object.addColumn( name )
```

### Parameters

Parameter	Description
object	Instance name of the WddxRecordset object
name	Name of the column to add

### Return value

None.

### Usage

Adds a column to every row of the WDDX record set. Initially the new column's values are set to NULL.

### Example

This example calls the addColumn function:

```
// Create a new record set
rs = new WddxRecordset();

// Add a new column
rs.addColumn("NewColumn");

// Extend the record set by 3 rows
rs.addRows(3);

// Set an element in the first row
// newValue is a previously defined variable
rs.setField(0, "NewColumn", newValue);
```

## addRows

### Description

Adds rows to all columns in a WddxRecordset instance.

### Syntax

```
object.addRows( n )
```

### Parameters

Parameter	Description
object	Instance name of the WddxRecordset object
n	Integer; number of rows to add

### Return value

None.

### Usage

This function adds the specified number of rows to every column of a WDDX record set. Initially, the row/column values are set to NULL.

### Example

This example calls the addRows function:

```
// Create a new record set
rs = new WddxRecordset();

// Add a new column
rs.addColumn("NewColumn");

// Extend the record set by 3 rows
rs.addRows(3);

// Set an element in the first row
// newValue is a previously defined variable
rs.setField(0, "NewColumn", newValue);
```

## getField

### Description

Returns the element in the specified row/column position.

### Syntax

```
object.getField( row, col )
```

### Parameters

Parameter	Description
object	Instance name of the WddxRecordset object
row	Integer; zero-based row number of the value to return
col	Integer or string; column of the value to be returned.

### Return value

Returns the value in the specified row/column position.

### Usage

Call this function to access a value in a WDDX record set.

### Example

This example calls the `getField` function (the variable *r* is a reference to a WddxRecordset instance):

```
for (row = 0; row < nRows; ++row)
{
    o += "<tr>";
    for (i = 0; i < colNames.length; ++i)
    {
        o += "<td>" + r.getField(row, colNames[i]) + "</td>";
    }
    o += "</tr>";
}
```

## getRowCount

### Description

Indicates the number of rows in a WddxRecordset instance.

### Syntax

```
object.getRowCount ( )
```

### Parameters

Parameter	Description
object	Instance name of a WddxRecordset object

### Return value

Integer. Returns the number of rows in the WddxRecordset instance.

### Usage

Call this function before a looping construct to determine the number of rows in a record set.

### Example

This example calls the `getRowCount` function:

```
function dumpWddxRecordset(r)
{
// Get row count
  nRows = r.getRowCount();
...
  for (row = 0; row < nRows; ++row)
...
}
```

## setField

### Description

Sets the element in the specified row/column position.

### Syntax

```
object.setField( row, col, value )
```

### Parameters

Parameter	Description
object	Instance name of a WddxRecordset object
row	Integer; row that contains the element to set
col	Integer or string; the column containing the element to set
value	Value to set

### Return value

None.

### Usage

Call this function to set a value in a WddxRecordset instance.

### Example

This example calls the `setField` function:

```
// Create a new recordset
rs = new WddxRecordset();

// Add a new column
rs.addColumn("NewColumn");

// Extend the record set by 3 rows
rs.addRows(3);

// Set an element in the first row
// newValue is a previously defined variable
rs.setField(0, "NewColumn", newValue);
```

## wddxSerialize

### Description

Serializes a record set.

### Syntax

```
object.wddxSerialize( serializer )
```

### Parameters

Parameter	Description
object	Instance name of the WddxRecordset object
serializer	WddxSerializer instance

### Return value

Returns a Boolean True if serialization was successful; False, otherwise.

### Usage

This is an internal function; you do not typically call it.

### Example

This example is from the WddxSerializer `serializeValue` function:

```
...
else if (typeof(obj) == "object")
{
    if (obj == null)
    {
        // Null values become empty strings
        this.write("<string></string>");
    }
    else if (typeof(obj.wddxSerialize) == "function")
    {
        // Object knows how to serialize itself
        bSuccess = obj.wddxSerialize(this);
    }
    ...
}
```

# Chapter 13: ColdFusion ActionScript Functions

ColdFusion includes two server-side ActionScript functions, `CF.query` and `CF.http`, including specific syntax and methods.

## CF.query

### Description

Performs queries against ColdFusion data sources.

### Return value

Returns a RecordSet object.

### Syntax

```
CF.query
    (
        {
            datasource:"data source name",
            sql:"SQL stmts",
            username:"username",
            password:"password",
            maxrows:number,
            timeout:milliseconds
        }
    )
```

### Arguments

Arguments	Req/Opt	Description
datasource	Required	Name of the data source from which the query retrieves data.
sql	Required	SQL statement.
username	Optional	Username. Overrides the username specified in the data source setup.
password	Optional	Password. Overrides the password specified in the data source setup.
maxrows	Optional	Maximum number of rows to return in the record set.
timeout	Optional	Maximum number of seconds for the query to execute before returning an error indicating that the query has timed out. Can only be used in named arguments.

### Usage

You can code the `CF.query` function using named or positional arguments. You can invoke all supported arguments using the named argument style, as follows:

```
CF.query({datasource:"datasource", sql:"sql stmt",
    username:"username", password:"password", maxrows:"maxrows",
    timeout:"timeout"});
```

**Note:** The named argument style uses curly braces {} to surround the function arguments.

Positional argument style, which is a shorthand coding style, does not support all arguments. Use the following syntax to code the `CF.query` function using positional arguments:

```
CF.query(datasource, sql);  
CF.query(datasource, sql, maxrows);  
CF.query(datasource, sql, username, password);  
CF.query(datasource, sql, username, password, maxrows);
```

**Note:** Do not use curly braces {} with positional arguments.

You can manipulate the record set returned by the `CF.query` function using methods in the `RecordSet` ActionScript class. The following are some of the methods available in the `RecordSet` class:

- `RecordSet.getColumnNames`
- `RecordSet.getLength`
- `RecordSet.getItemAt`
- `RecordSet.getItemID`
- `RecordSet.sortItemsBy`
- `RecordSet.getNumberAvailable`
- `RecordSet.filter`
- `RecordSet.sort`

For more information on using server-side ActionScript, see *Using Server-Side ActionScript* in the *Developing ColdFusion Applications*. For more detailed information about the `RecordSet` ActionScript class, see *Using Flash Remoting*.

### Example

```
// Define a function to do a basic query
// Note use of positional arguments
function basicQuery()
{
    result = CF.query("myquery", "cust_data", "SELECT * from tblParks");
    return result;
}

// Example function declaration using named arguments
function basicQuery()
{
    result = CF.query({datasource:"cust_data", sql:"SELECT * from tblParks"});
    return result;
}

// Example of the CF.query function using maxrows argument
function basicQueryWithMaxRows()
{
    result = CF.query("cust_data", "SELECT * from tblParks", 25);
    return result;
}

// Example of the CF.query function with username and password
function basicQueryWithUser()
{
    result = CF.query("cust_data", "SELECT * from tblParks",
        "wsburroughs", "migraine1");
    return result;
}
```

## CF.http

### Description

Executes HTTP POST and GET operations on files. (POST operations upload MIME file types to a server, or post cookie, formfield, URL, file, or CGI variables directly to a server.)

### Return value

Returns an object containing properties that you reference to access data.

### Syntax

```
CF.http
({
    method:"get or post",
    url:"URL",
    username:"username",
    password:"password",
    resolveurl:"yes or no",
    params:arrayvar,
    path:"path",
    file:"filename"
})
```

## Arguments

Arguments	Req/Opt	Description
method	Required	One of two arguments: <ul style="list-style-type: none"> <li>• get: downloads a text or binary file or creates a query from the contents of a text file.</li> <li>• post: sends information to the server page or CGI program for processing. Requires the <code>params</code> argument.</li> </ul>
url	Required	The absolute URL of the host name or IP address of the server on which the file resides. The URL must include the protocol (http or https) and host name.
username	Optional	When required by a server, a username.
password	Optional	When required by a server, a password.
resolveurl	Optional	<p>For Get and Post methods.</p> <ul style="list-style-type: none"> <li>• Yes or No. Default is No.</li> </ul> <p>For GET and POST operations, if Yes, the page reference that is returned into the <code>Filecontent</code> property has its internal URLs fully resolved, including port number, so that links remain intact. The following HTML tags, which can contain links, are resolved:</p> <ul style="list-style-type: none"> <li>- <code>img src</code></li> <li>- <code>a href</code></li> <li>- <code>form action</code></li> <li>- <code>applet code</code></li> <li>- <code>script src</code></li> <li>- <code>embed src</code></li> <li>- <code>embed pluginspace</code></li> <li>- <code>body background</code></li> <li>- <code>frame src</code></li> <li>- <code>bgsound src</code></li> <li>- <code>object data</code></li> <li>- <code>object classid</code></li> <li>- <code>object codebase</code></li> <li>- <code>object usemap</code></li> </ul>
params	Optional	<p>HTTP parameters passed as an array of objects. Supports the following parameter types:</p> <ul style="list-style-type: none"> <li>• name</li> <li>• type</li> <li>• value</li> </ul> <p>CF.http params are passed as an array of objects. The <code>params</code> argument is required for POST operations.</p>
path	Optional	The path to the directory in which to store files. When using the <code>path</code> argument, the <code>file</code> argument is required.
file	Optional	Name of the file that is accessed. For GET operations, defaults to the name specified in the <code>url</code> argument. Enter path information in the <code>path</code> argument. This argument is required if you are using the <code>path</code> argument.

## Usage

You can write the `CF.http` function using named arguments or positional arguments. You can invoke all supported arguments using the named argument style, as follows:

```
CF.http({method:"method", url:"URL", username:"username", password:"password",  
        resolveurl:"yes or no", params:arrayvar,  
        path:"path", file:"filename"});
```

**Note:** The named argument style uses curly braces `{}` to surround the function arguments.

Positional arguments let you use a shorthand coding style. However, not all arguments are supported for the positional argument style. Use the following syntax to code the `CF.http` function using positional arguments:

```
CF.http(url);  
CF.http(method, url);  
CF.http(method, url, username, password);  
CF.http(method, url, params, username, password);
```

**Note:** Do not use curly braces `{}` with positional arguments.

The following parameters can only be passed as an array of objects in the `params` argument in the `CF.http` function:

Parameter	Description
name	The variable name for data that is passed
type	The transaction type: <ul style="list-style-type: none"><li>• URL</li><li>• FormField</li><li>• Cookie</li><li>• CGI</li><li>• File</li></ul>
value	Value of URL, FormField, Cookie, File, or CGI variables that are passed

The `CF.http` function returns data as a set of object properties, as described in the following table:

Property	Description
Text	A Boolean value that indicates whether the specified URL location contains text data.
Charset	The charset used by the document specified in the URL.  HTTP servers normally provide this information, or the charset is specified in the charset parameter of the Content-Type header field of the HTTP protocol. For example, the following HTTP header announces that the character encoding is EUC-JP:  Content-Type: text/html; charset=EUC-JP
Header	Raw response header. For example:  HTTP/1.1 200 OK  Date: Mon, 04 Mar 2002 17:27:44 GMT  Server: Apache/1.3.22 (Unix) mod_perl/1.26  Set-Cookie: MM_cookie=207.22.48.162.4731015262864476; path=/; expires=Wed, 03-Mar-04 17:27:44 GMT; domain=adobe.com  Connection: close  Content-Type: text/html
Filecontent	File contents, for text and MIME files.
Mimetype	MIME type. Examples of MIME types include text/html, image/png, image/gif, video/mpeg, text/css, and audio/basic.
responseHeader	Response header. If there is only one header key, its value can be accessed as simple type. If there are multiple header keys, the values are put in an array in a responseHeader structure.
Statuscode	HTTP error code and associated error string. Common HTTP status codes returned in the response header include:  400: Bad Request  401: Unauthorized  403: Forbidden  404: Not Found  405: Method Not Allowed

You access these attributes using the `get` function:

```
function basicGet()
{
url = "http://localhost:8100/";

// Invoke with just the url. This is an HTTP GET.
result = CF.http(url);
return result.get("Filecontent");
}
```

**Note:** For more information on using server-side ActionScript, see *Using Server-Side ActionScript in the Developing ColdFusion Applications*.

### Example

The following examples show a number of the ways to use the `CF.http` function:

```
function postWithNamedArgs()
{
    // Set up the array of Post parameters.
    params = new Array();
    params[1] = {name:"arg1", type:"FormField", value:"value1"};
    params[2] = {name:"arg2", type:"URL", value:"value2"};
    params[3] = {name:"arg3", type:"CGI", value:"value3"};

    url = "http://localhost:8100/";

    path = application.getContext("/").getRealPath("/");
    file = "foo.txt";

    result = CF.http({method:"post", url:url, username:"karl", password:"salsa",
        resolveurl:true, params:params, path:path, file:file});

    if (result)
        return result.get("StatusCode");
    return null;
}

// Example of a basic HTTP GET operation
// Shows that HTTP GET is the default
function basicGet()
{
    url = "http://localhost:8100/";

    // Invoke with just the url. This is an HTTP GET.
    result = CF.http(url);
    return result.get("Filecontent");
}

// Example showing simple array created to pass params arguments
function postWithParams()
{
    // Set up the array of Post parameters. These are just like cfhttpparam tags.
    params = new Array();
    params[1] = {name:"arg2", type:"URL", value:"value2"};
```

```
url = "http://localhost:8100/";

// Invoke with the method, url, and params
result = CF.http("post", url, params);
return result.get("Filecontent");
}

// Example with username and params arguments
function postWithParamsAndUser()
{
    // Set up the array of Post parameters. These are just like cfhttpparam tags.
    params = new Array();
    params[1] = {name:"arg2", type:"URL", value:"value2"};

    url = "http://localhost:8100/";

    // Invoke with the method, url, params, username, and password
    result = CF.http("post", url, params, "karl", "salsa");
    return result.get("Filecontent");
}
```
